EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT VOLTAGE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs after 10 seconds.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 7

2. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT VOLTAGE**

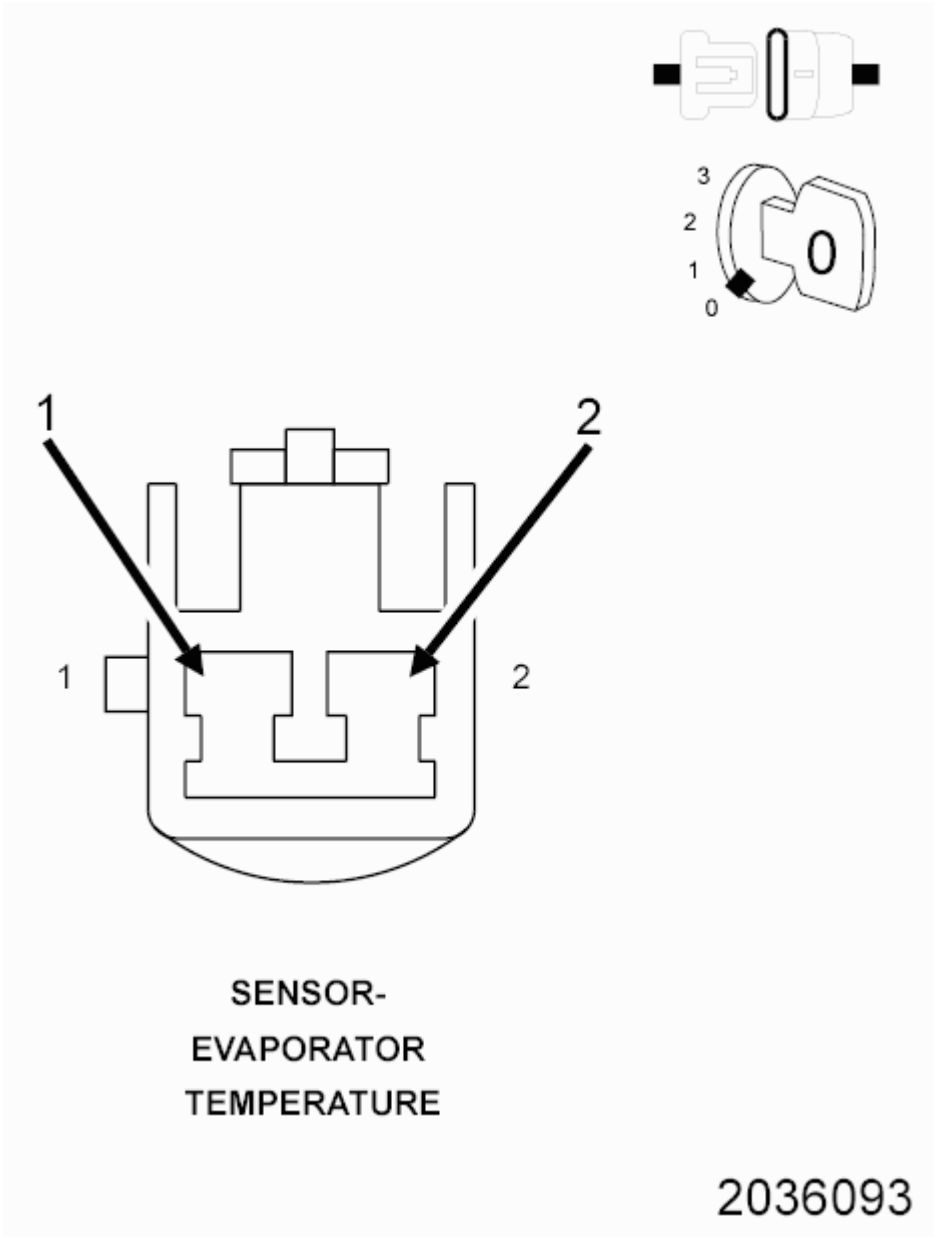

Fig. 4: Checking Evaporator Temperature Sensor Signal Circuit Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Evaporator Temperature Sensor harness connector.

NOTE: Due to the small terminal and pin size of the Evaporator Temperature Sensor and harness connector, make sure to not damage the terminals in this process.

3. Connect a jumper wire between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the Evaporator Temperature Sensor harness connector.
4. Ignition on, engine not running.
5. With the scan tool, read the Evaporator Temperature Sensor voltage.

   Is the voltage below 0.1 volt?

   Yes

   - Replace the Evaporator Temperature Sensor in accordance with the Service Information.
   - Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 3

3. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

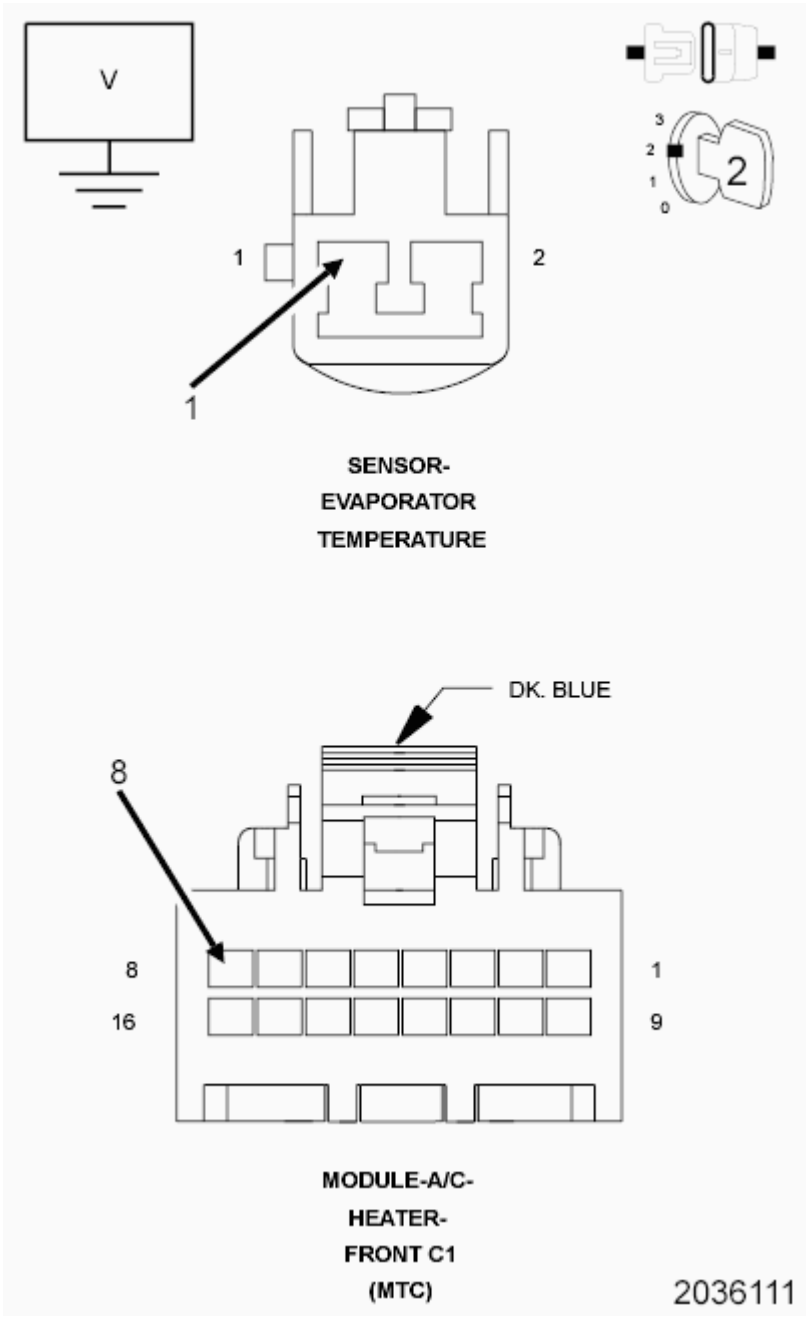

Fig. 5: Checking Evaporator Temperature Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the jumper wire from the Evaporator Temperature Sensor harness connector.
3. Disconnect the A/C Heater Control C1 harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit

Is there any voltage present?

Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
- Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

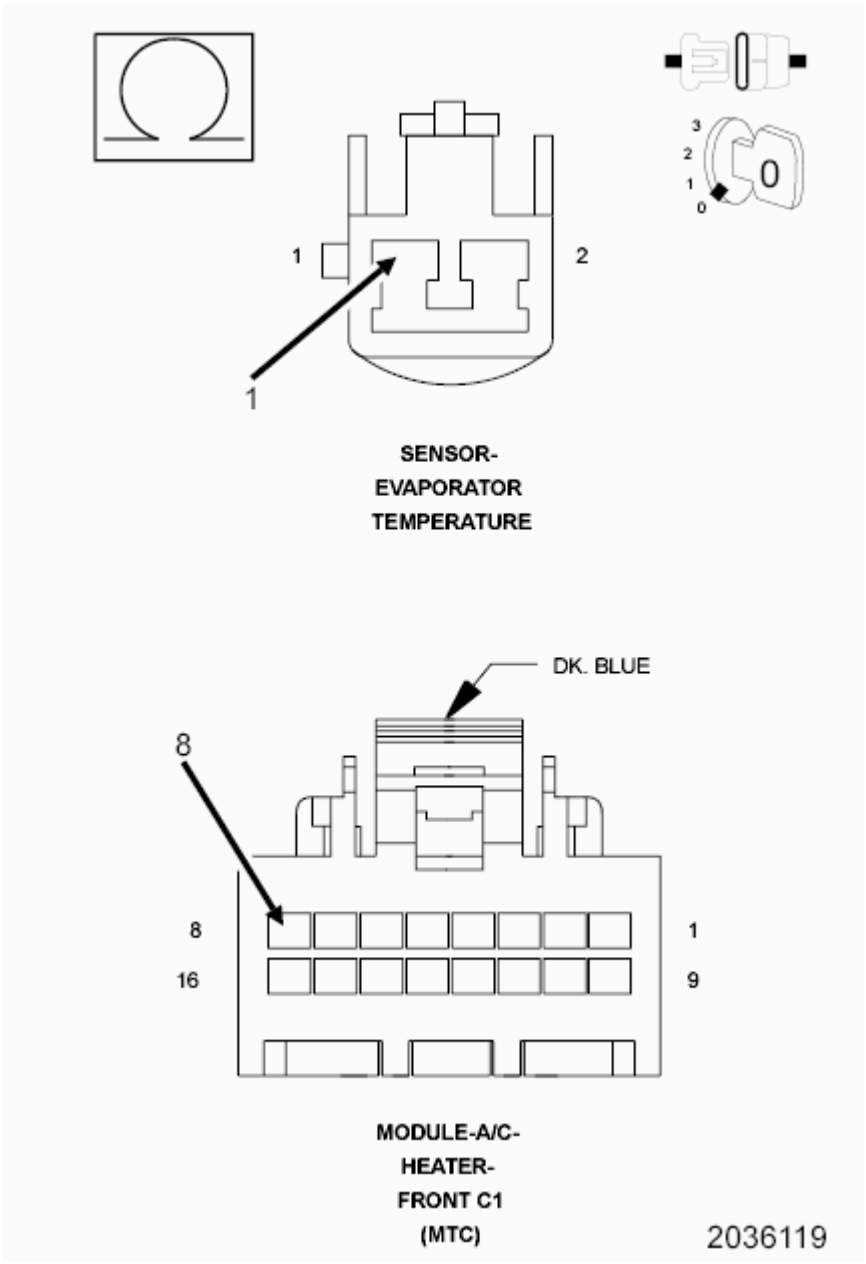

Fig. 6: Checking Evaporator Temperature Sensor Signal Circuit For An Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the A/C Heater Control C1 harness connector and the Evaporator Temperature Sensor harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open or high

resistance.

- Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 5

5. **CHECK THE (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

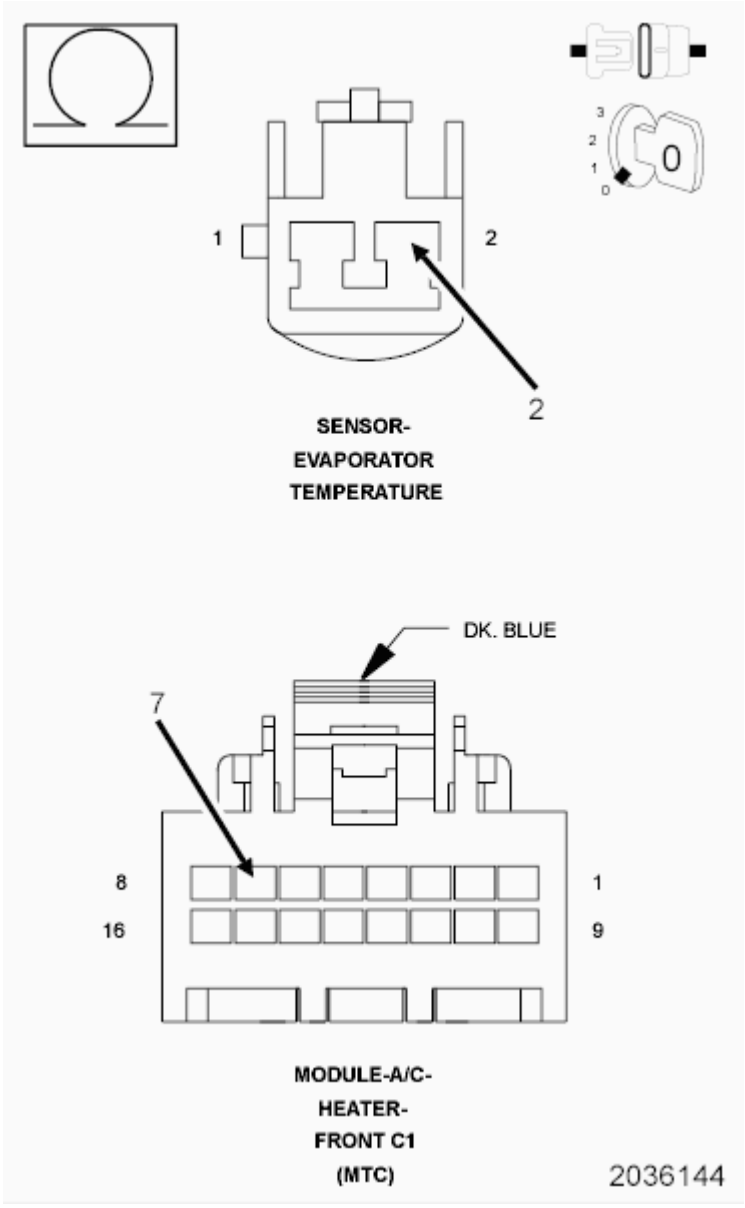

Fig. 7: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C121) Sensor Ground circuit between the A/C Heater Control C1

harness connector and the Evaporator Temperature Sensor harness connector.

Is the resistance above 1.0 Ohm?

Yes

- Repair the (C121) Sensor Ground circuit for an open.
- Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
   1. Replace the Evaporator Temperature Sensor in Accordance with the Service Information.
   2. Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
   3. Cycle the ignition off for 30 seconds then back on and wait a minimum of 5 seconds.
   4. With the Scan tool read HVAC DTCs.

   Does this DTC reset?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.
7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   4. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   5. Wiggle the wiring and connectors while checking for shorted and open circuits.
   6. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

Yes

- Repair as necessary.
- Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B1040-PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE

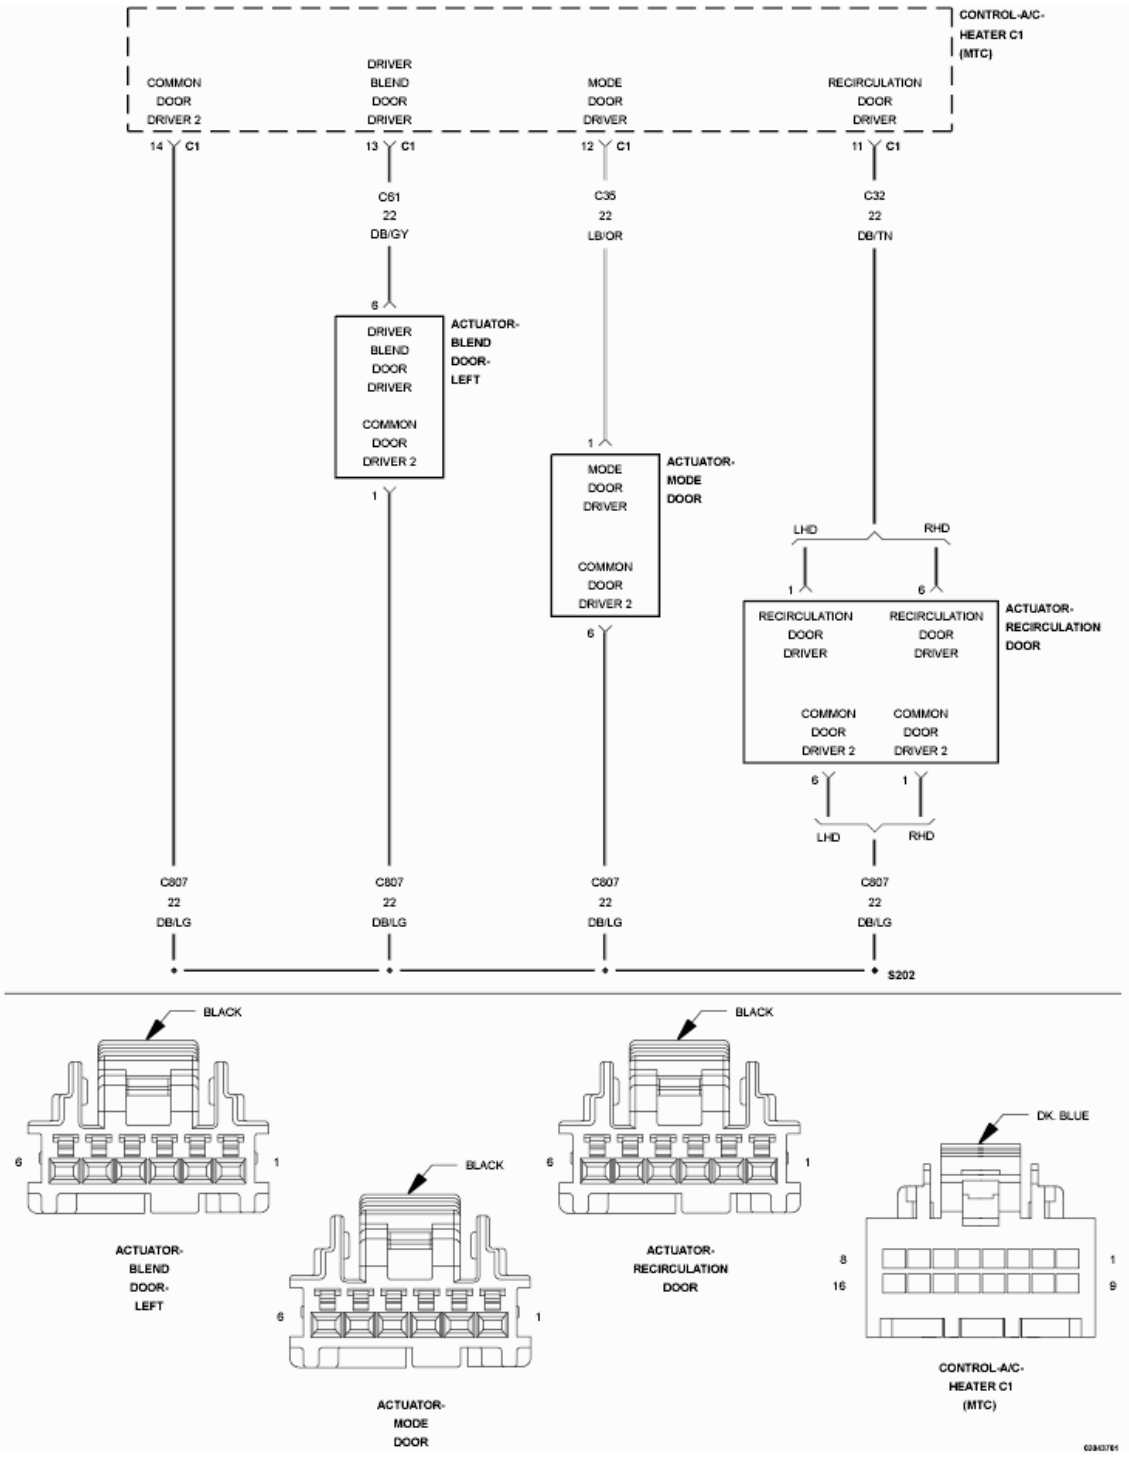

Fig. 8: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar DTCs can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  With the ignition on and an actuator movement is commanded by the A/C Heater Control or during an HVAC Actuator Calibration Test.

- **Set Condition:**

  If an actuator move is commanded by A/C Heater Control and an overcurrent condition is detected in either clockwise or counterclockwise movement for the period of five seconds. If the A/C Heater Control detects valid current draw for 10 seconds, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO VOLTAGE
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
MODE DOOR BINDING
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 3

      No

- Go to step 2

2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go to step 3

      No

      - Go to step 9
3. **CHECK THE (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

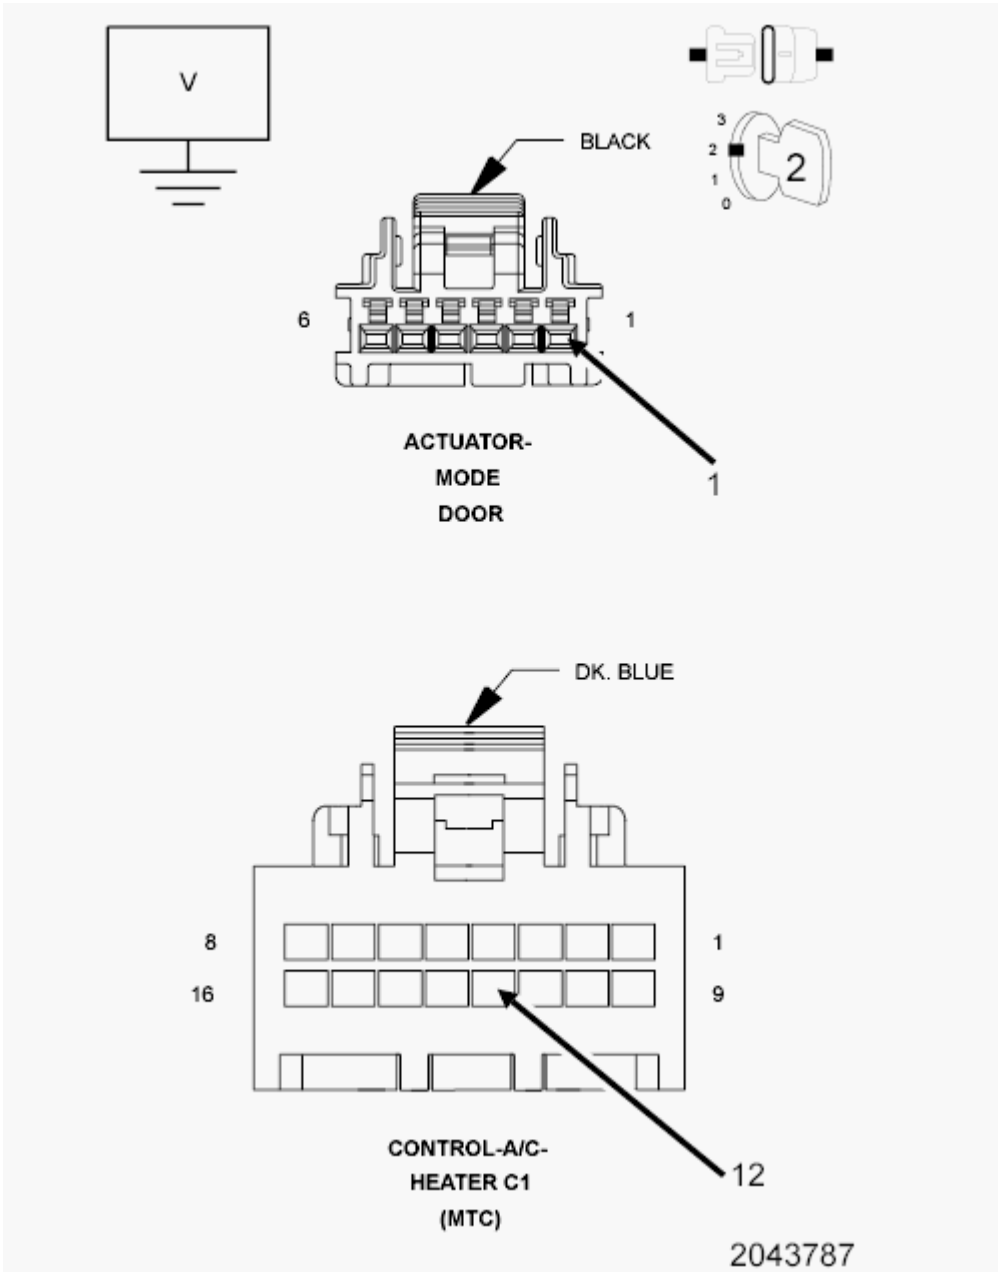

Fig. 9: Checking Mode Door Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Mode Door Actuator harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (C35) Mode Door Driver circuit.

   Is there any voltage present?

Yes

- Repair the (C35) Mode Door Driver circuit for a short to voltage.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO VOLTAGE**

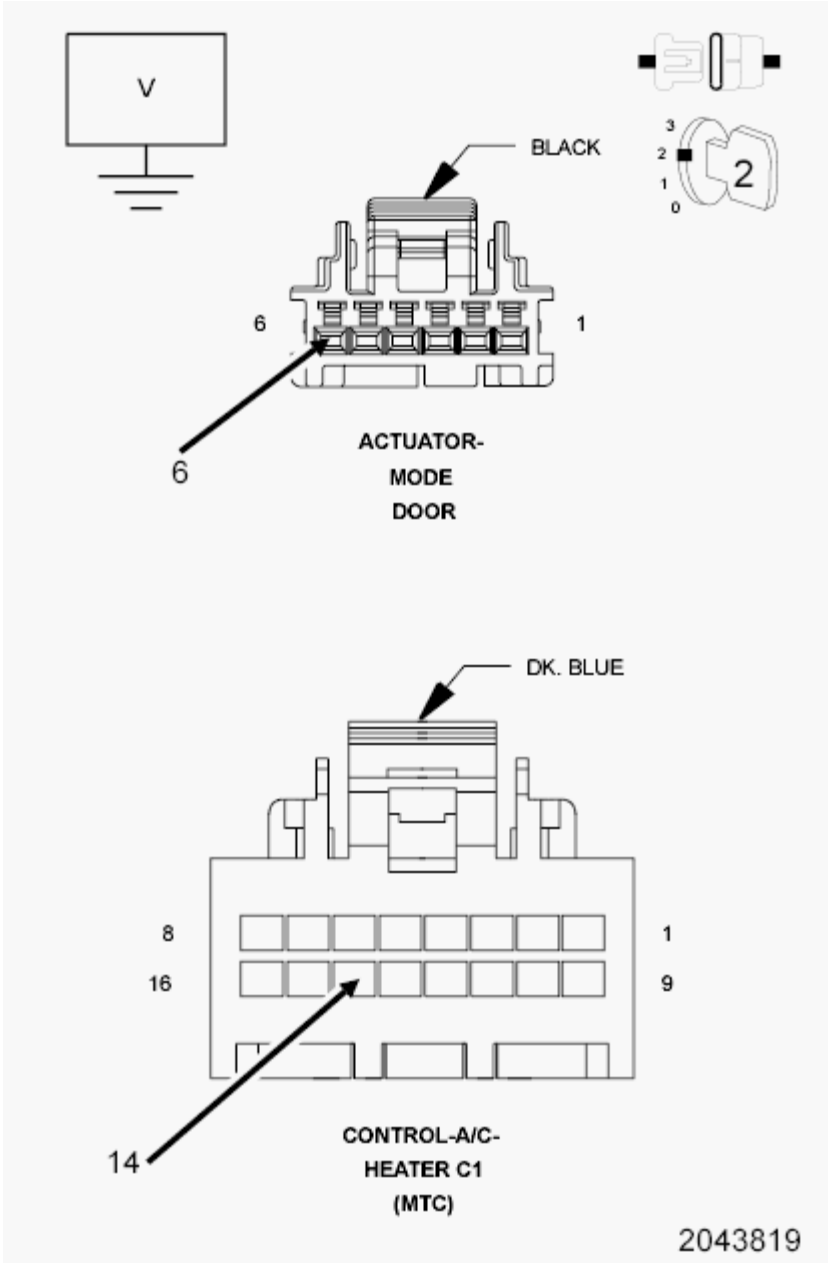

Fig. 10: Checking Common Door Driver 2 Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Measure the voltage of the (C807) Common Door Driver 2 circuit.

   Is there any voltage present?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK THE (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

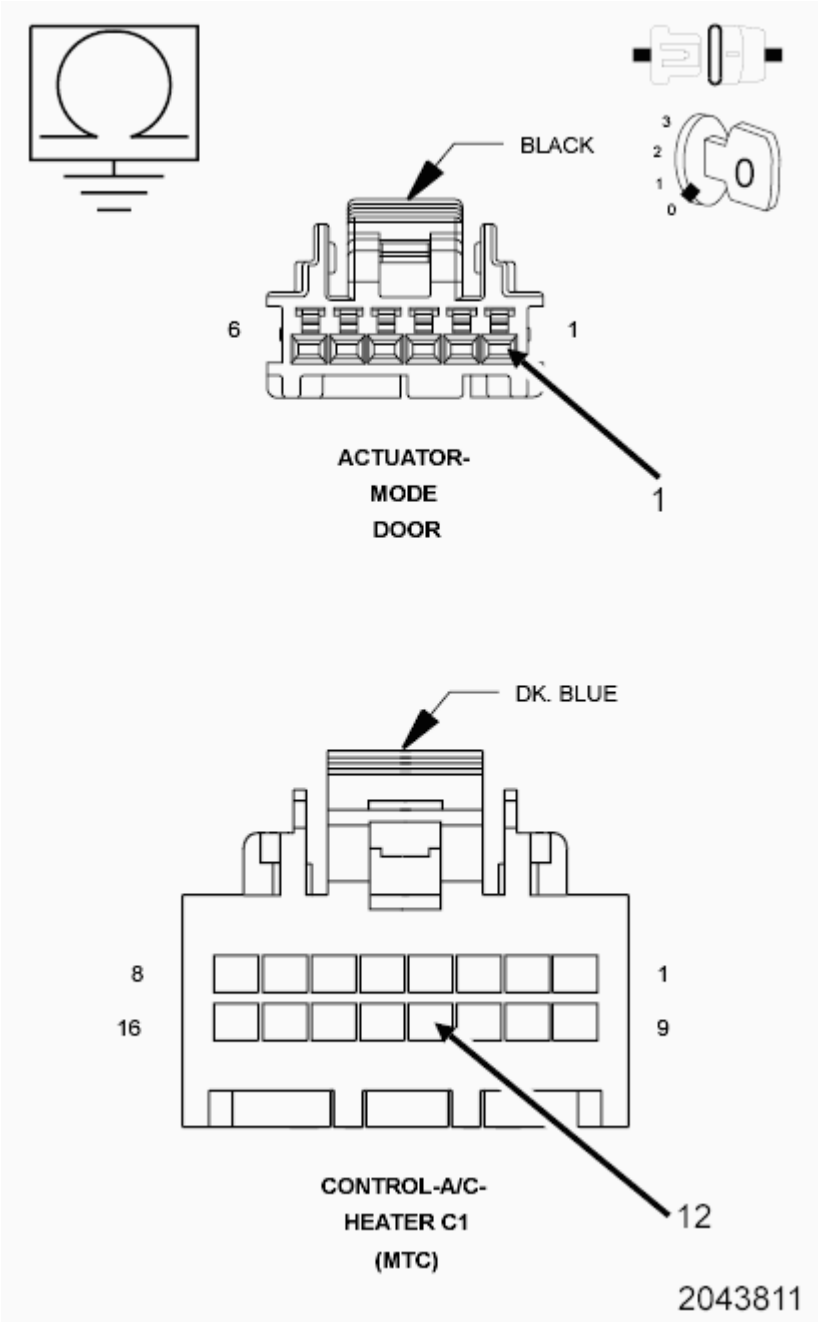

Fig. 11: Checking Mode Door Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between ground and the (C35) Mode Door Driver circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (C35) Mode Door Driver circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**

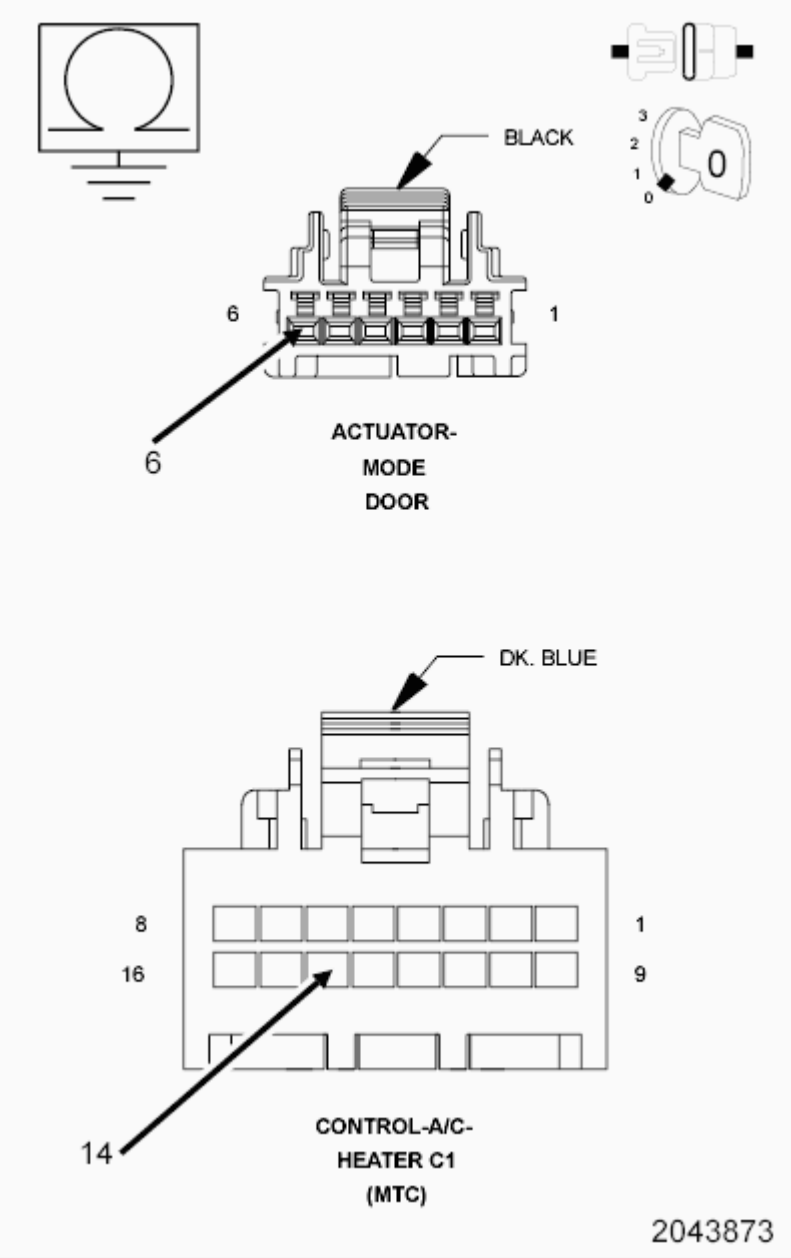

Fig. 12: Checking Common Door Driver 2 Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Measure the resistance between ground and the (C807) Common Door Driver 2 circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK THE MODE DOOR**
   1. Remove the Mode Door Actuator and check the Mode Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Mode Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 8

8. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs and perform the HVAC System Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
    5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    6. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

    No

    - Test complete.

B1043-PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN

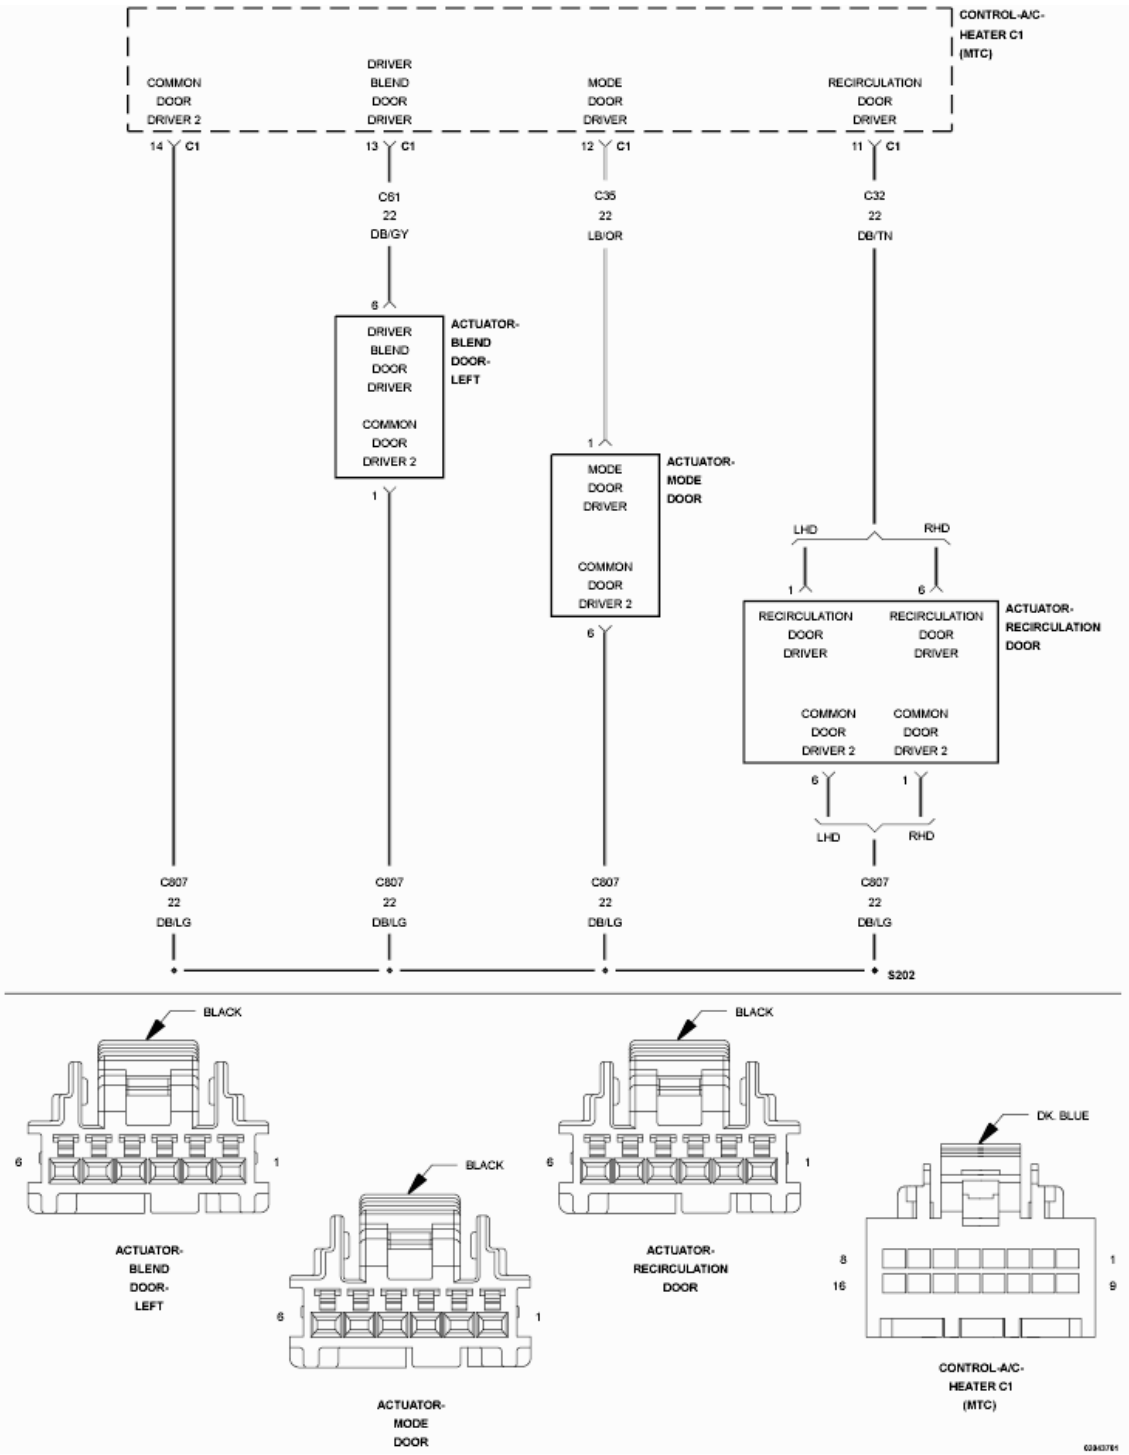

Fig. 13: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar DTCs can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  With the ignition on and when a HVAC Actuator Calibration Test is performed.

- **Set Condition:**

  If an HVAC Actuator Calibration Test is performed the A/C Heater Control detects there are no feedback pulses detected in that direction, the controller commands the actuator in the opposite direction. If no feedback pulses are detected in either direction this DTC will set. If the A/C Heater Control detects a valid pulse feedback in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C35) MODE DOOR DRIVER CIRCUIT OPEN
(C807) COMMON DOOR DRIVER 2 CIRCUIT OPEN
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR OTHER DTCS**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is there more than one Door Control Circuit Open DTC present?

      Yes

      - Repair the (C807) Common Door Driver 2 circuit for an open.

        NOTE: Due to the common shared driver circuit, probable area of concern is the splice, or from the splice to the A/C Heater Control harness connector. Make sure to check all inline connectors.

No

- Go to step 2

2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go to step 4

    No

    - Go to step 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go to step 4

    No

    - Go to step 7

4. **CHECK THE MODE DOOR ACTUATOR**

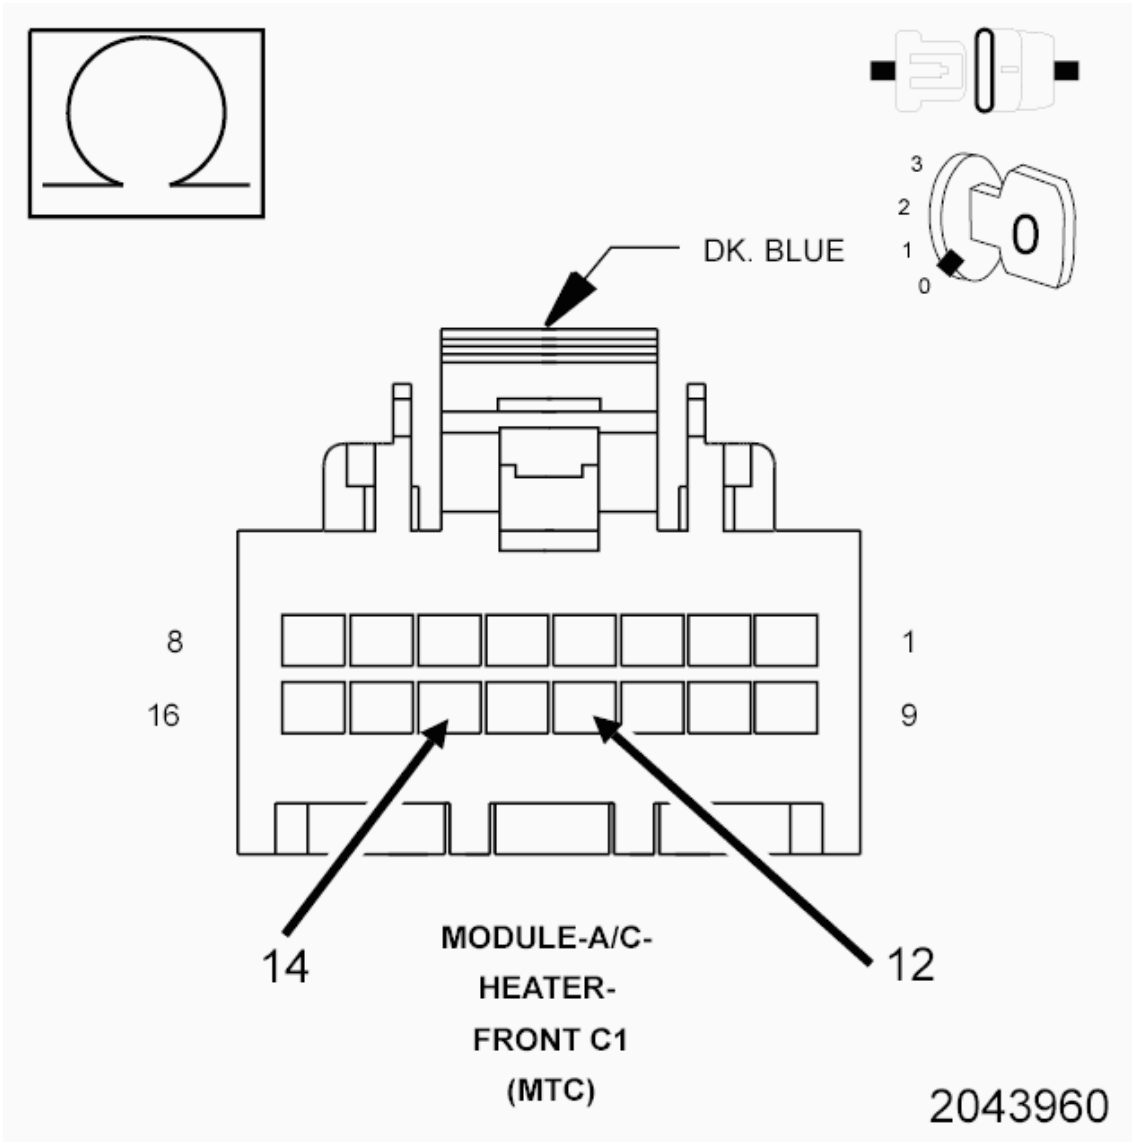

Fig. 14: Checking Mode Door Actuator
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Measure the resistance between the (C35) Mode Door Driver circuit and the (C807) Common Door Driver 2 circuit.

   Is the resistance 38.0 Ohms (± 5.0 Ohms)?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard**

Procedure.

No

- Go to step 5

5. **CHECK THE (C35) MODE DOOR DRIVER CIRCUIT FOR AN OPEN**

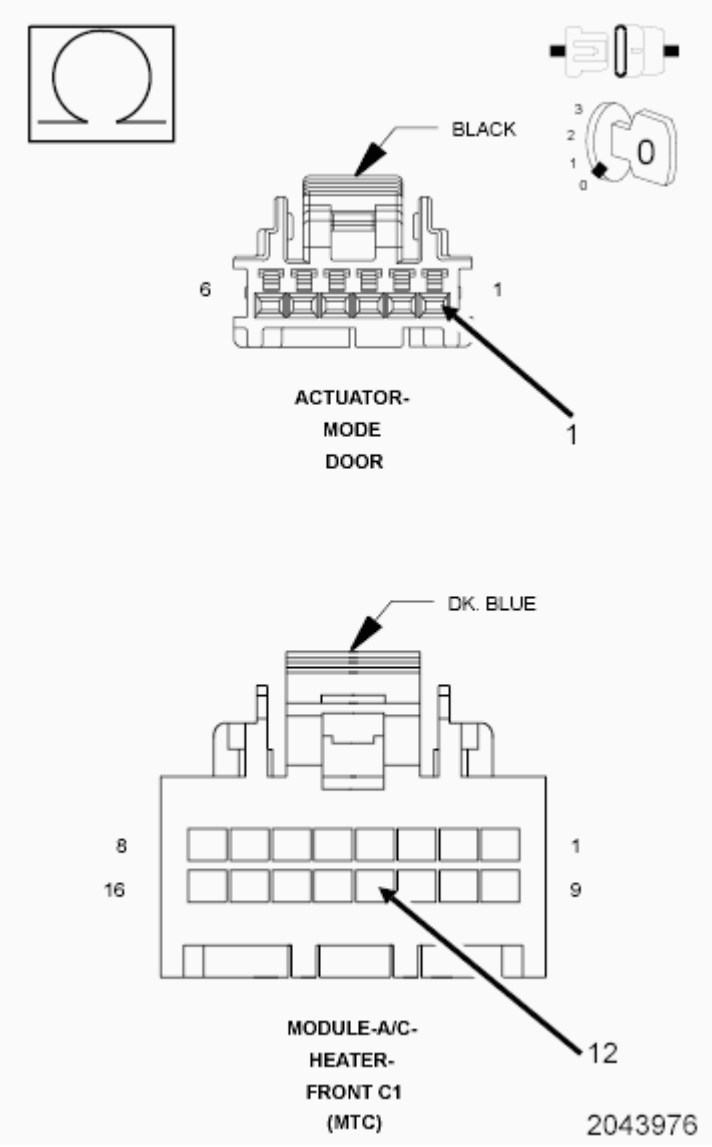

Fig. 15: Checking Mode Door Driver Circuit For An Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Mode Door Actuator harness connector.
3. Measure the resistance of the (C35) Mode Door Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door Actuator harness connector.

Is the resistance above 1.0 Ohm?

Yes

- Repair the (C35) Mode Door Driver circuit for an open or high resistance.
- Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN**

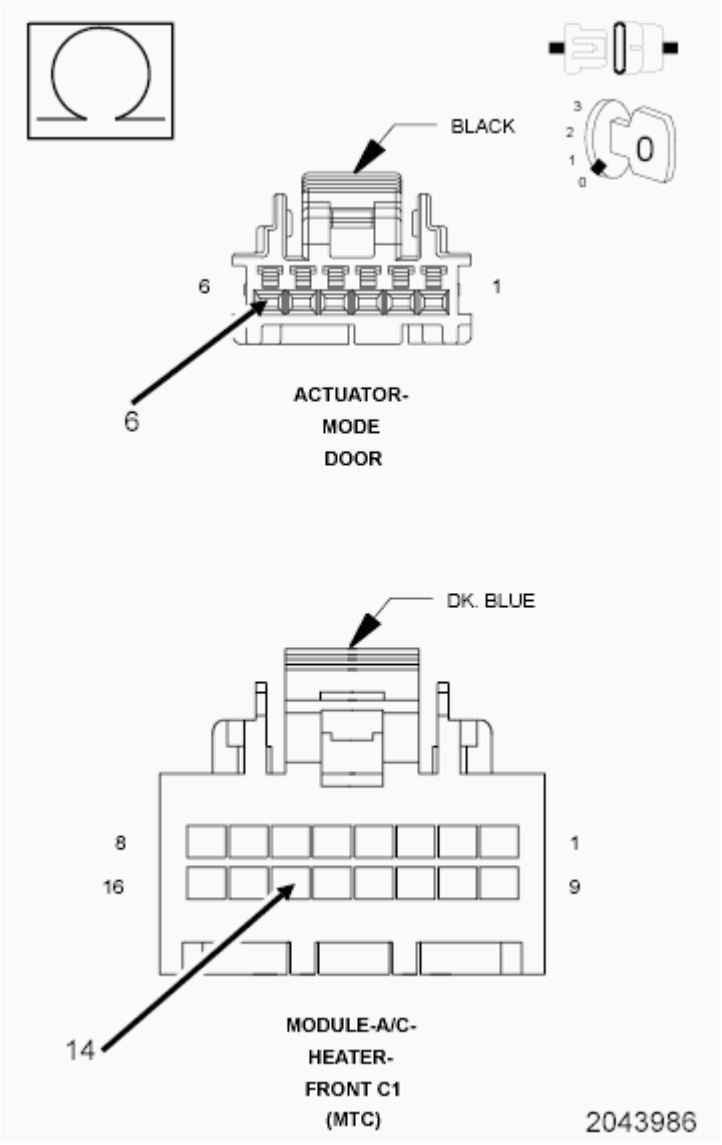

Fig. 16: Checking Common Door Driver 2 Circuit For An Open

Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C807) Common Door Driver 2 circuit between the A/C Heater Control C1 harness connector and the Mode Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for an open or high resistance.

     NOTE: Probable location is the wiring harness splice or the wiring between the splice and the door actuator.

   - Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Replace the Mode Door Actuator in accordance with the Service Information.
   - Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

B1044-PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RELATED DTCS PRESENT
MODE DOOR BINDING
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Are there any Door Control Circuit Open or Door Control Performance DTCs present?

      Yes

      - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 2

2. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 4

      No

      - Go to step 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go to step 4

      No

      - Go to step 6
4. **CHECK THE MODE DOOR**
   1. Remove the Mode Door Actuator and check the Mode Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Mode Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 5
5. **CHECK THE MODE DOOR ACTUATOR**

1. Replace the Mode Door Actuator in accordance with the Service Information.
2. Using the scan tool, erase HVAC DTCs.
3. Using the scan tool, perform the HVAC Actuator Calibration Test.

   Did this DTC reset during HVAC Actuator Calibration Test?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

B1045-PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode

door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar DTCs can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  During normal operation or when ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed or during normal operation and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RELATED DTCS PRESENT
MODE DOOR STOPS
MODE DOOR
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Are there any Door Control Circuit Open or Door Control Performance DTCs present?

      Yes

      - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 2

2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

       Is this DTC active?

       Yes

       - Go to step 4

       No

       - Go to step 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

       Did this DTC change from Stored to Active while performing the HVAC System Test?

       Yes

       - Go to step 4

       No

       - Go to step 6
4. **CHECK THE MODE DOOR**
    1. Remove the Mode Door Actuator and check the Mode Door stops, linkage (stripped or cracked) and door.

       Were there any problems found?

       Yes

       - Repair or replace the Mode Door as necessary in accordance with the Service Information.
       - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

       No

       - Go to step 5
5. **CHECK THE MODE DOOR ACTUATOR**
    1. Replace the Mode Door Actuator in accordance with the Service Information.
    2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

Did this DTC reset?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE

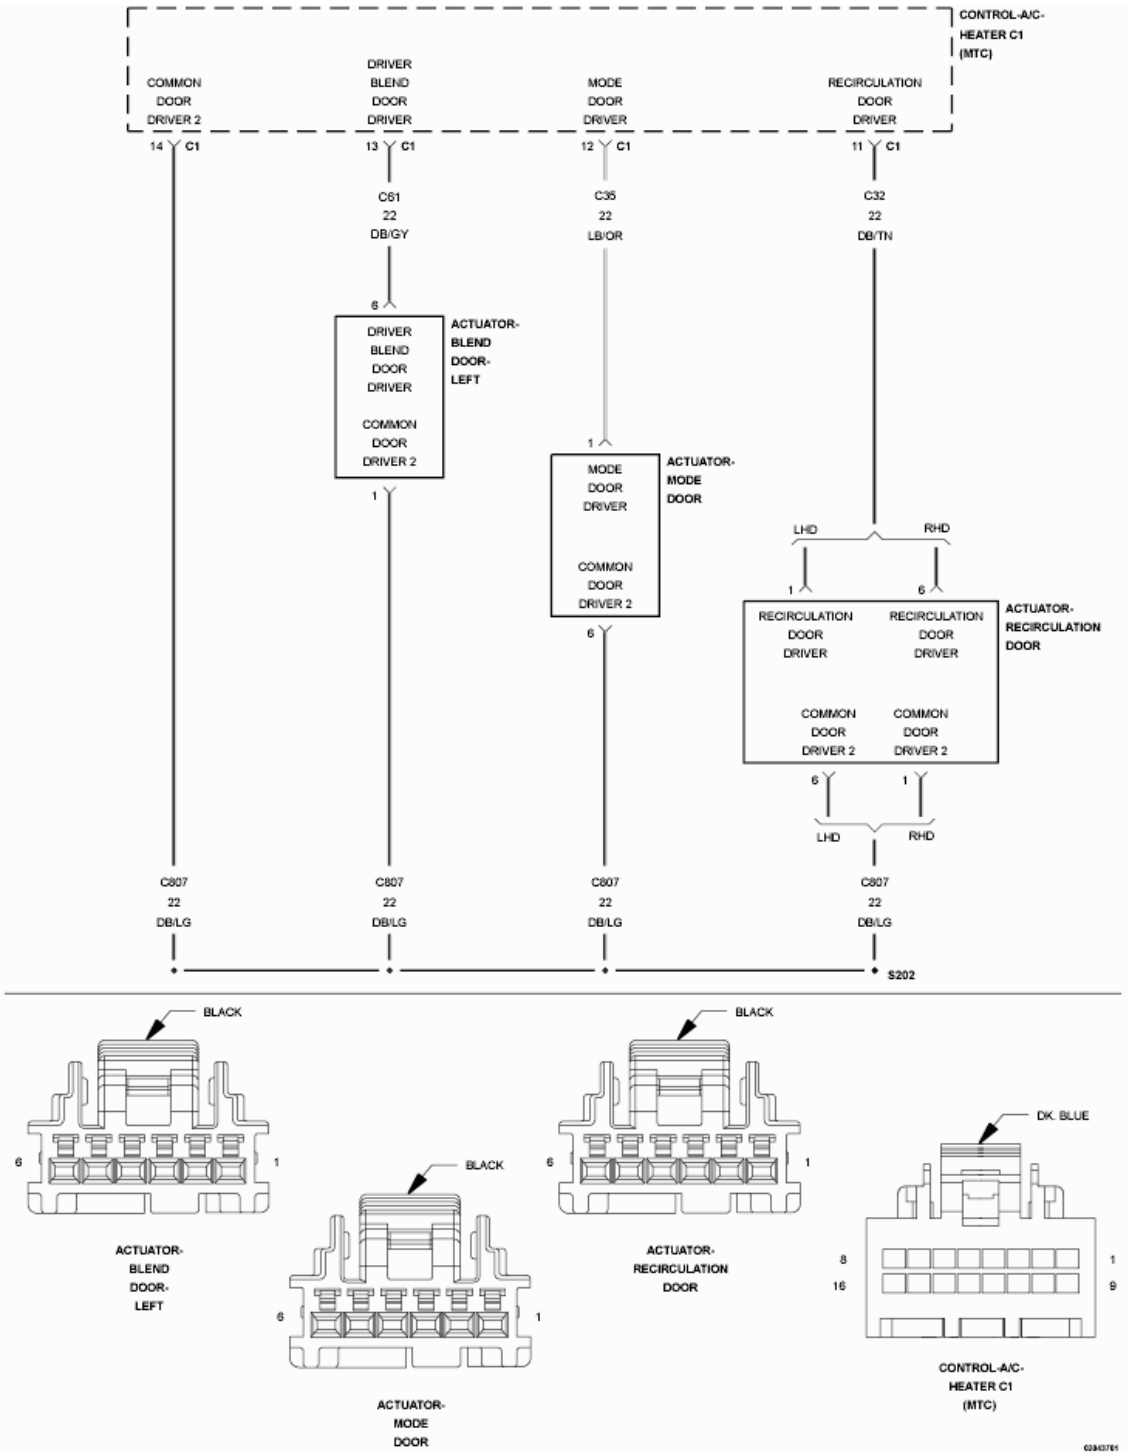

Fig. 17: Common/Mode Door Driver 2 Circuit Schematic

(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
RECIRCULATION DOOR BINDING
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 3

      No

- Go to step 2

2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go to step 3

      No

      - Go to step 9
3. **CHECK THE (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

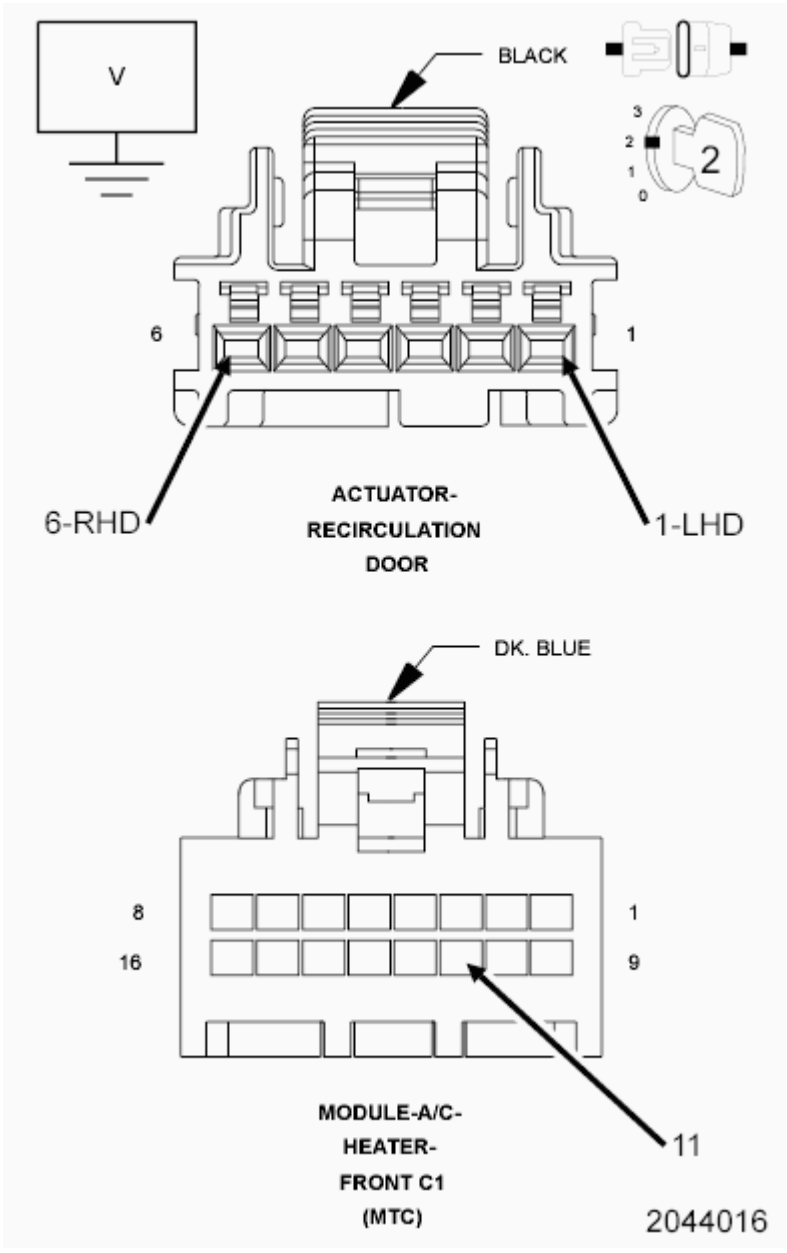

Fig. 18: Checking Recirculation Door Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Recirculation Door Actuator harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (C32) Recirculation Door Driver circuit.

   Is there any voltage present?

Yes

- Repair the (C32) Recirculation Door Driver circuit for a short to voltage.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO VOLTAGE**

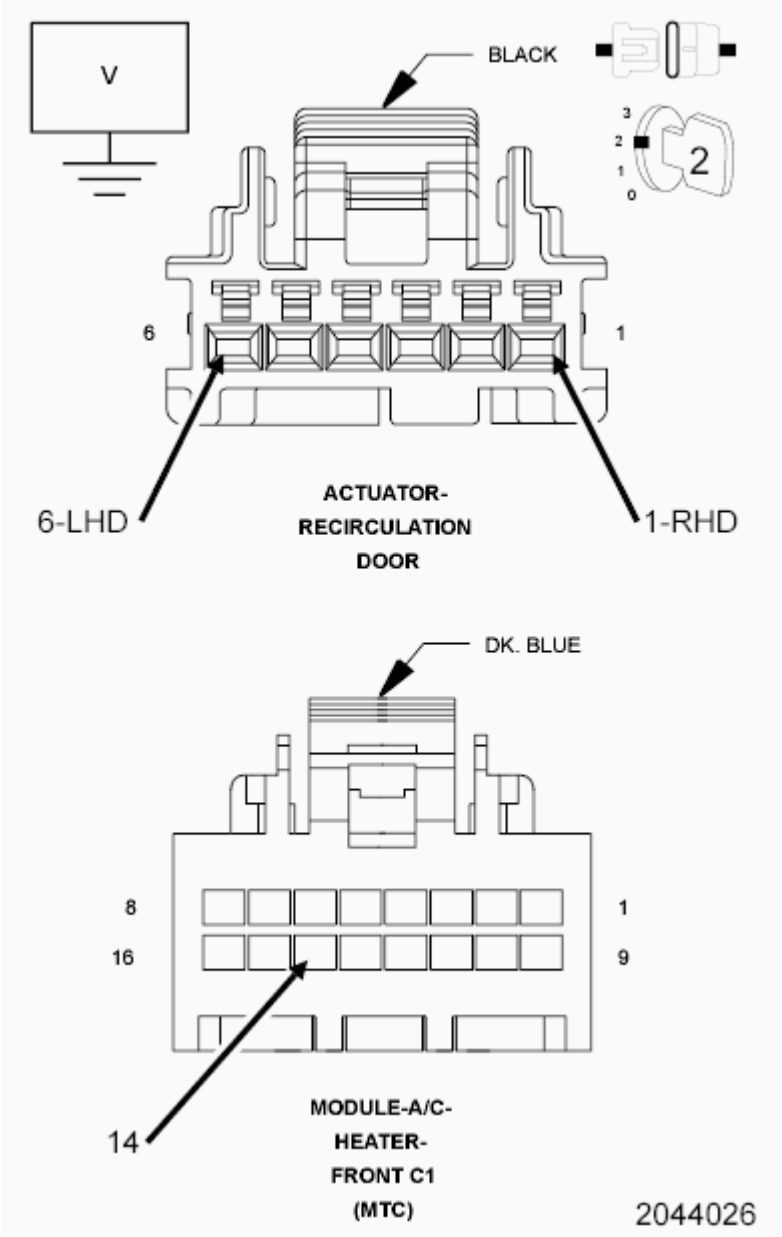

Fig. 19: Checking Common Door Driver 2 Circuit For A Short To Voltage

Courtesy of CHRYSLER LLC

1. Measure the voltage of the (C807) Common Door Driver 2 circuit.

   Is there any voltage present?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK THE (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

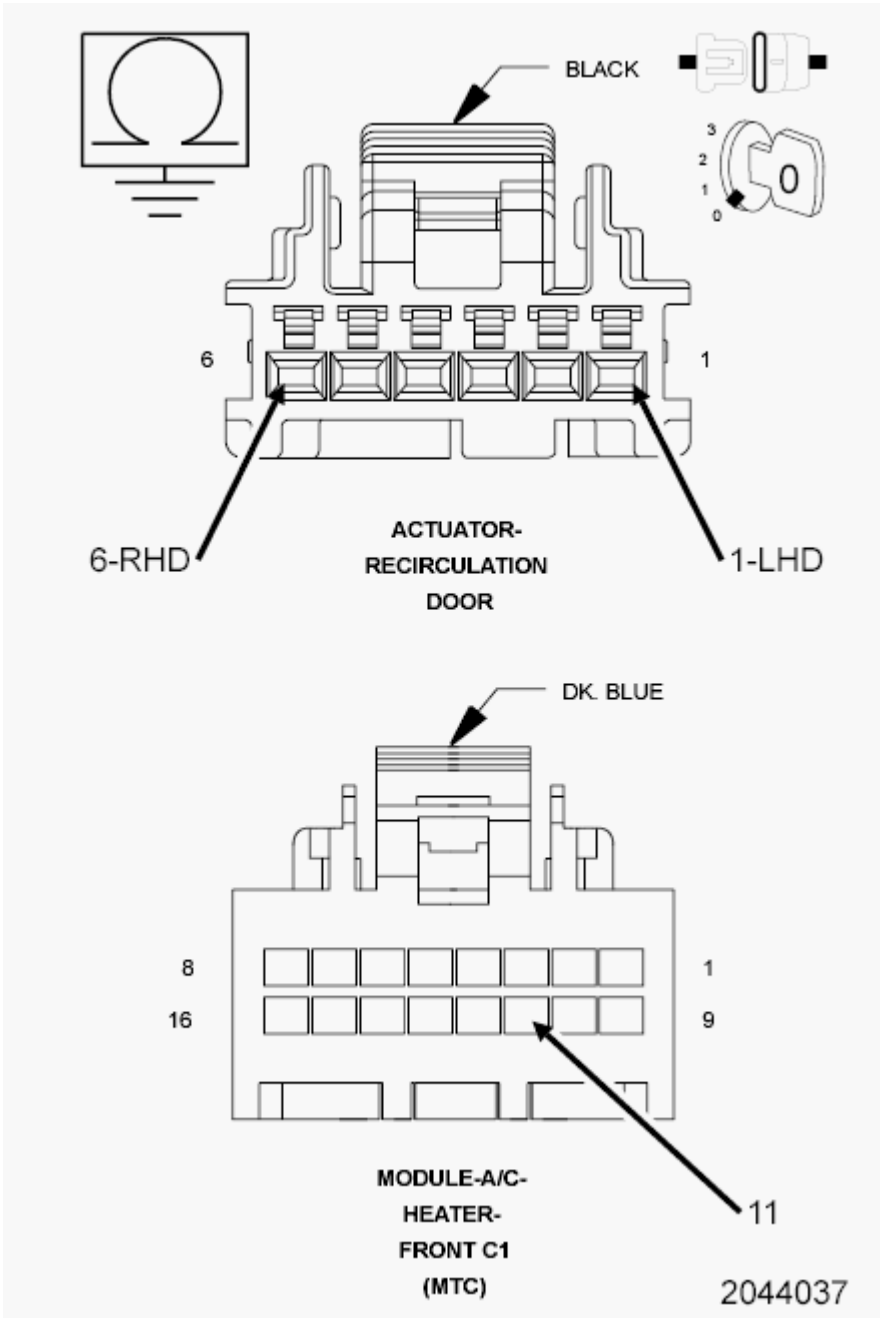

Fig. 20: Checking Recirculation Door Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between ground and the (C32) Recirculation Door Driver circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (C32) Recirculation Door Driver circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**

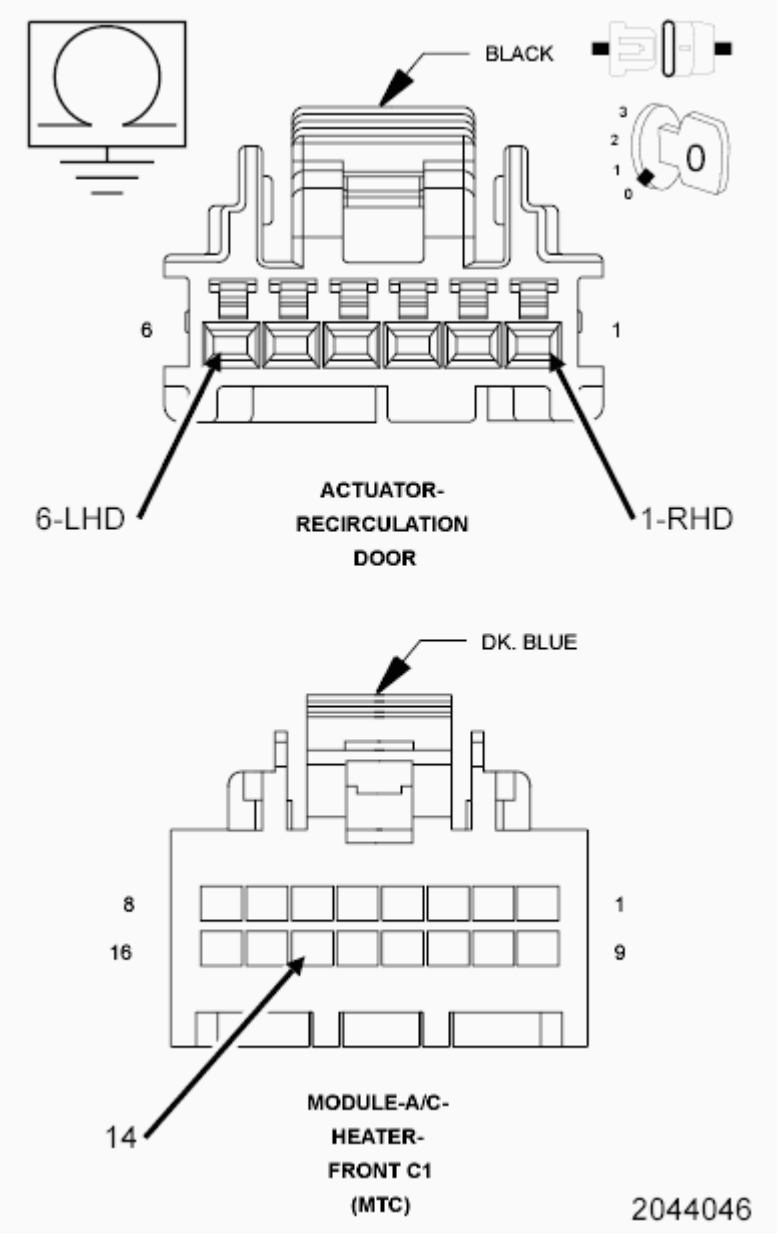

Fig. 21: Checking Common Door Driver 2 Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Measure the resistance between ground and the (C807) Common Door Driver 2 circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK THE RECIRCULATION DOOR**
   1. Remove the Recirculation Door Actuator and check the Recirculation Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Recirculation Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 8

8. **CHECK THE RECIRCULATION DOOR ACTUATOR**
   1. Replace the Recirculation Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
    5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    6. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

    No

    - Test complete.

B105B-RECIRCULATION DOOR CONTROL CIRCUIT OPEN

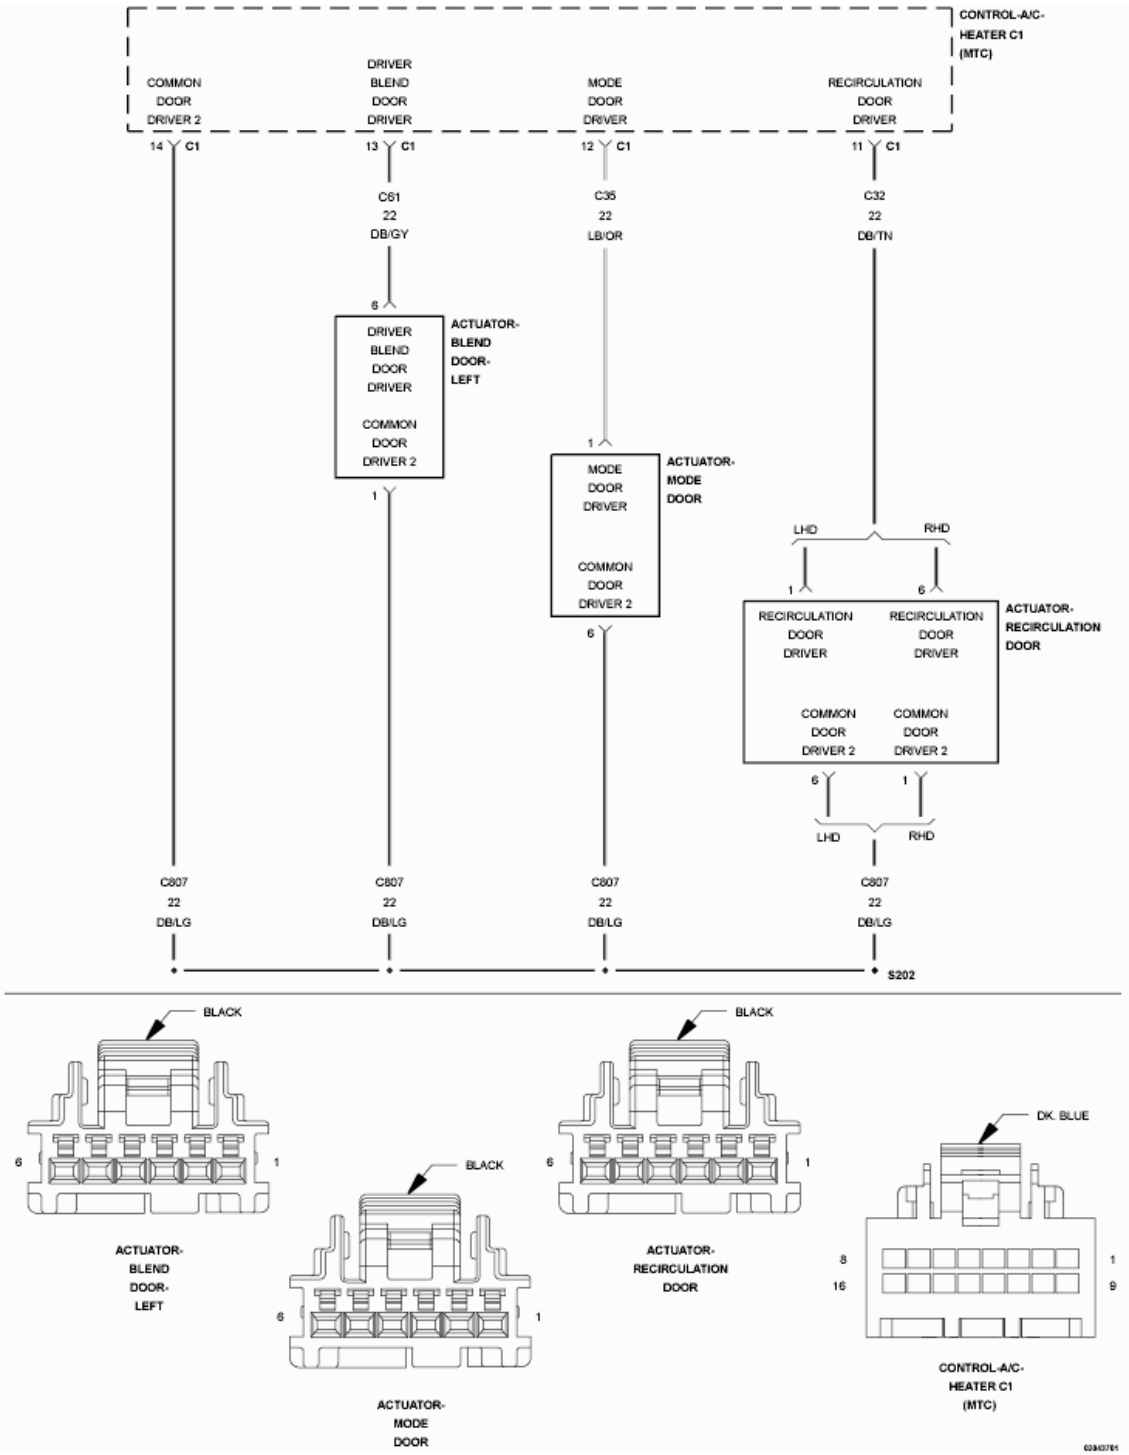

Fig. 22: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar DTCs can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  With the ignition on and when a HVAC Actuator Calibration Test is performed.

- **Set Condition:**

  If an HVAC Actuator Calibration Test is performed the A/C Heater Control detects there are no feedback pulses detected in that direction, the controller commands the actuator in the opposite direction. If no feedback pulses are detected in either direction this DTC will set. If the A/C Heater Control detects a valid pulse feedback in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C32) RECIRCULATION DOOR DRIVER CIRCUIT OPEN
(C807) COMMON DOOR DRIVER 2 CIRCUIT OPEN
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR OTHER DTCS**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is there more than one Door Control Circuit Open DTC present?

      Yes

      - Repair the (C807) Common Door Driver 2 circuit for an open.

        NOTE: Due to the common shared driver circuit, probable area of concern is the splice, or from the splice to the A/C Heater Control harness connector. Make sure to check all inline connectors.

No

- Go to step 2

2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go to step 4

    No

    - Go to step 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go to step 4

    No

    - Go to step 7

4. **CHECK THE RECIRCULATION DOOR ACTUATOR**

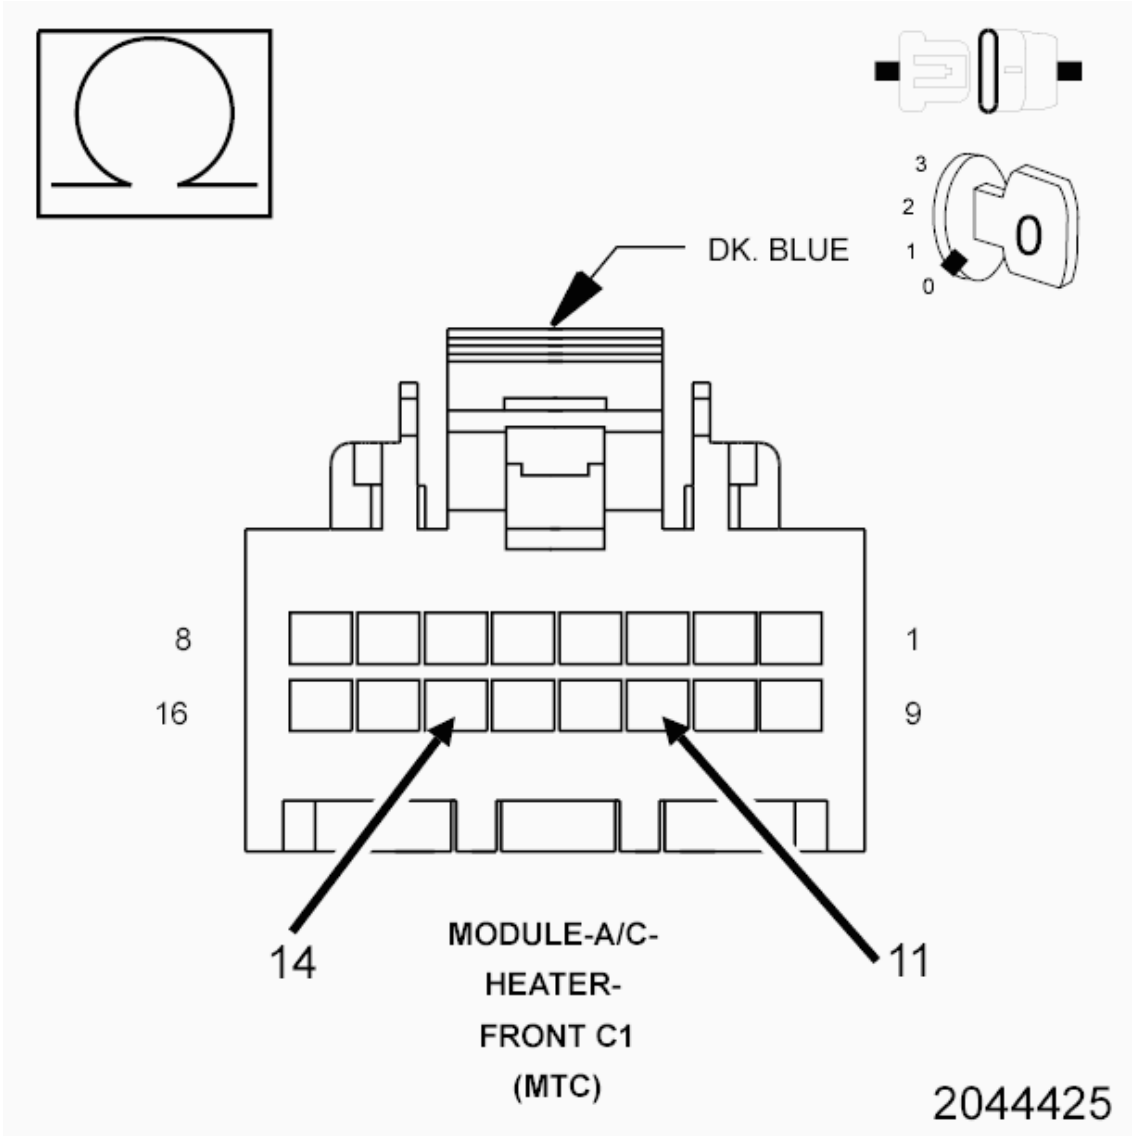

Fig. 23: Checking Recirculation Door Actuator
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C807) Common Door Driver 2 circuit.

   Is the resistance 38.0 Ohms (± 5.0 Ohms)?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC -**

Standard Procedure.

No

- Go to step 5

5. **CHECK THE (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR AN OPEN**

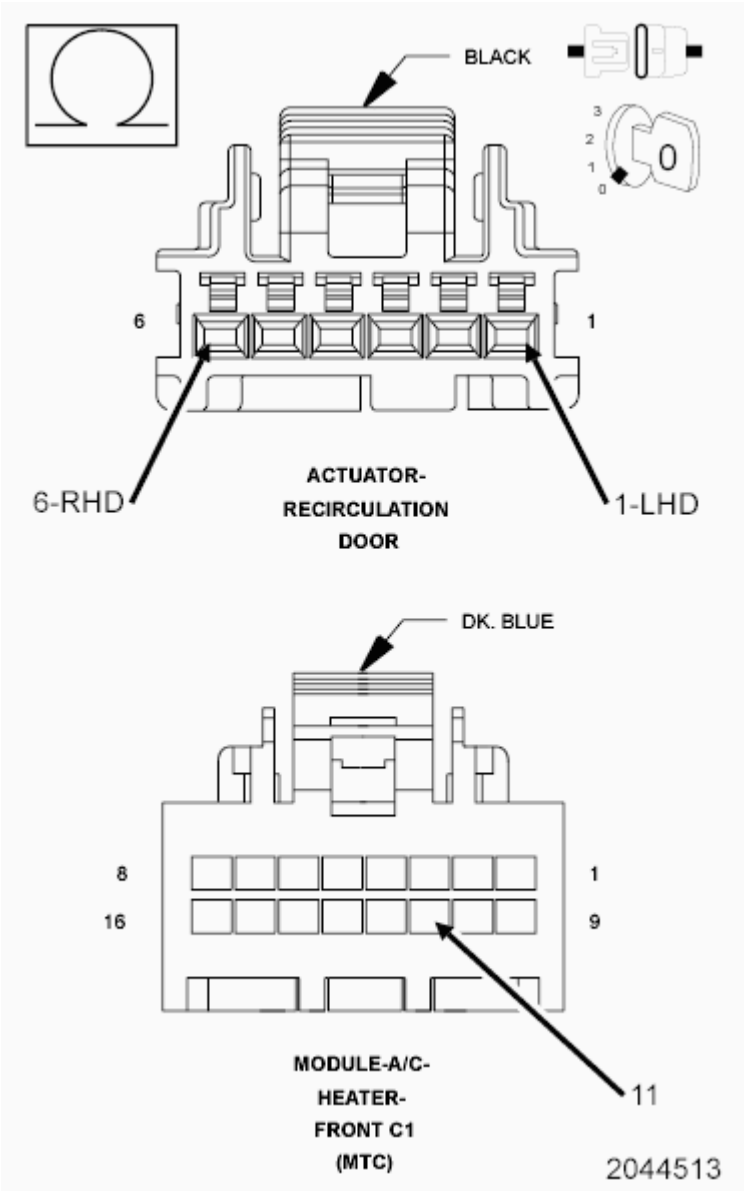

Fig. 24: Checking Recirculation Door Driver Circuit For An Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Recirculation Door Actuator harness connector.
3. Measure the resistance of the (C32) Recirculation Door Driver circuit between the A/C Heater

Control C1 harness connector and the Recirculation Door Actuator harness connector.

Is the resistance above 1.0 Ohm?

Yes

- Repair the (C32) Recirculation Door Driver circuit for an open or high resistance.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN**

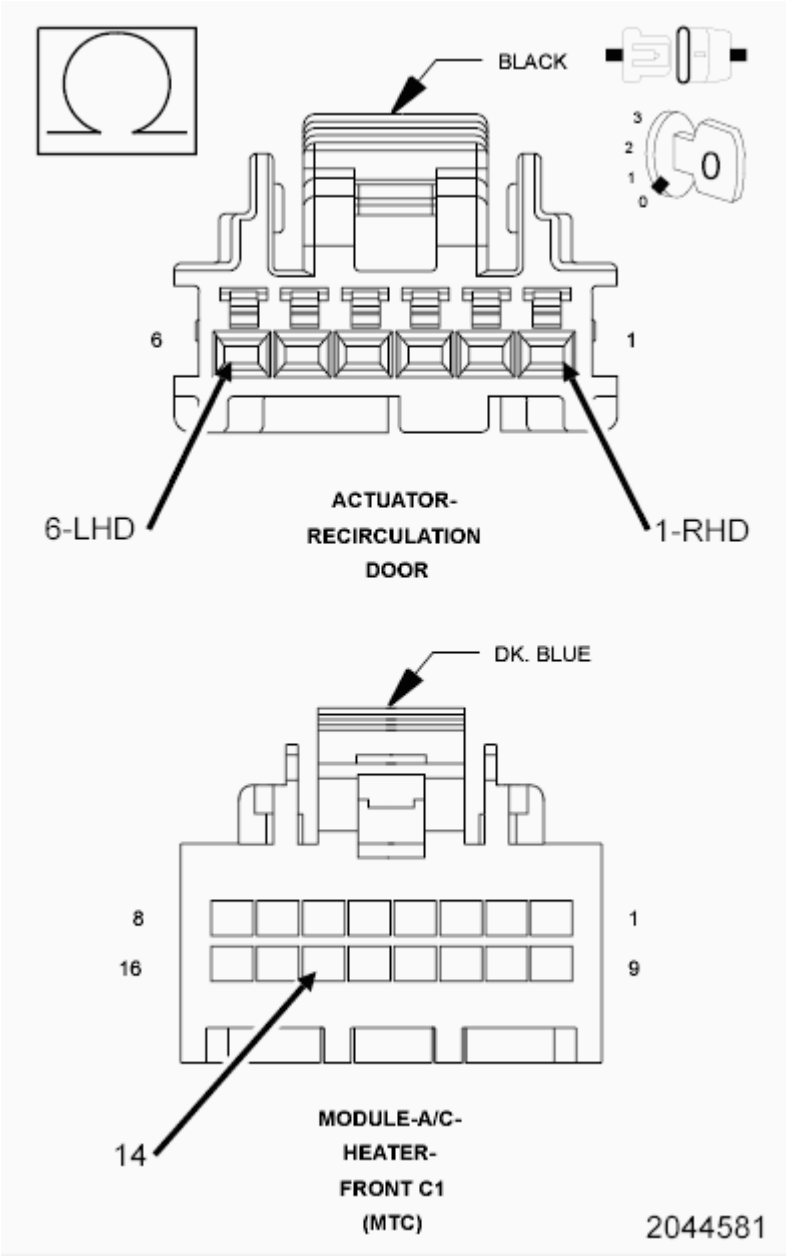

Fig. 25: Checking Common Door Driver 2 Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C807) Common Door Driver 2 circuit between the A/C Heater Control C1 harness connector and the Recirculation Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for an open or high resistance.

NOTE: Probable location is the wiring harness splice or the wiring between the splice and the door actuator.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Replace the Recirculation Door Actuator in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B105C-RECIRCULATION DOOR TRAVEL RANGE TOO SMALL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the

malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RELATED DTCS PRESENT
RECIRCULATION DOOR BINDING
RECIRCULATION DOOR ACTUATOR

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Are there any Door Control Circuit Open or Door Control Performance DTCs present?

      Yes

      - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 2
2. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

Yes

- Go to step 4

No

- Go to step 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

       Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

       Yes

       - Go to step 4

       No

       - Go to step 6
4. **CHECK THE RECIRCULATION DOOR**
    1. Remove the Recirculation Door Actuator and check the Recirculation Door for binding and full travel.

       Were there any problems found?

       Yes

       - Repair or replace the Recirculation Door as necessary in accordance with the Service Information.
       - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

       No

       - Go to step 5
5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
    1. Replace the Recirculation Door Actuator in accordance with the Service Information.
    2. Using the scan tool, erase HVAC DTCs.
    3. Using the scan tool, perform the HVAC Actuator Calibration Test.

       Did this DTC reset during HVAC Actuator Calibration Test?

       Yes

- Replace and program the A/C Heater Control in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

   No

   - Go to step 6

6. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN**

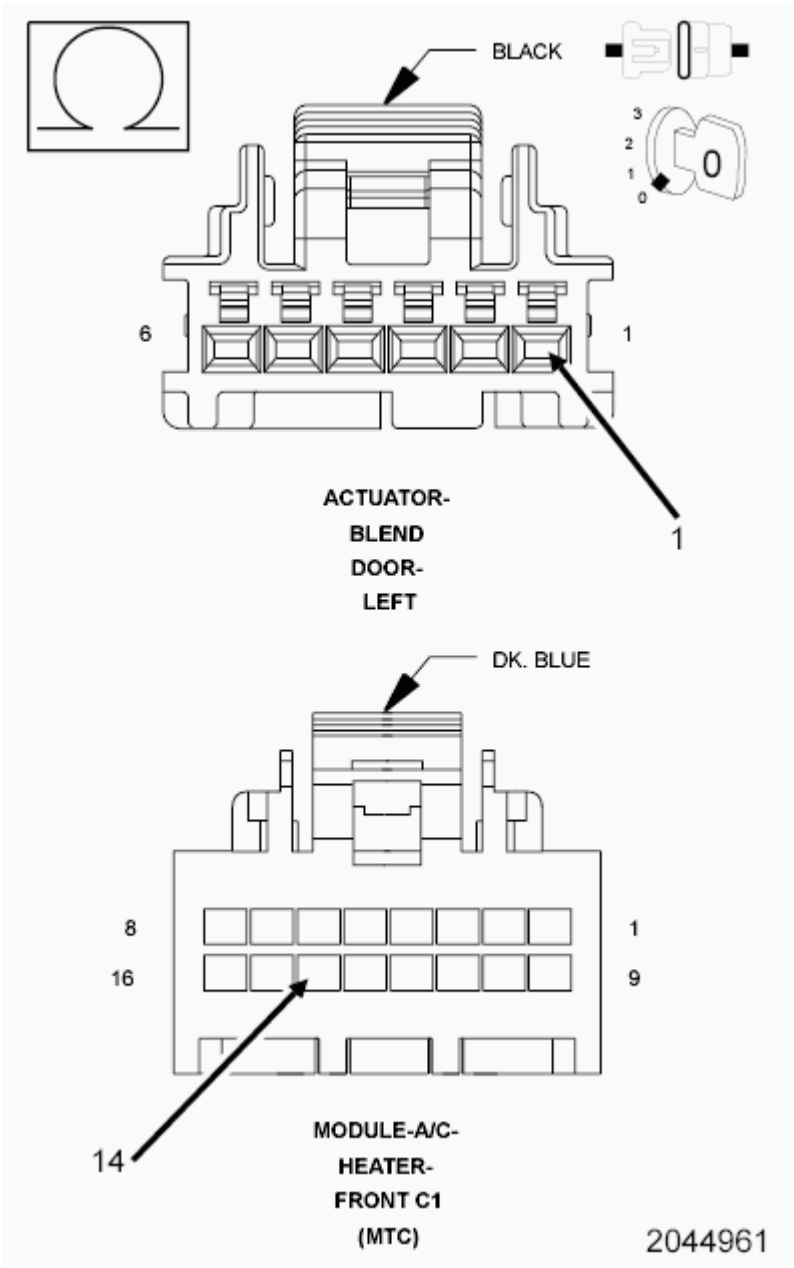

Fig. 34: Checking Common Door Driver 2 Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C807) Common Door Driver 2 circuit between the A/C Heater Control C1 harness connector and the Blend Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for an open or high resistance.

NOTE: Probable location is the wiring harness splice or the wiring between the splice and the door actuator.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Replace the Blend Door Actuator in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B10A6-LEFT BLEND DOOR 1 TRAVEL TOO SMALL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar DTCs can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RELATED DTCS PRESENT
BLEND DOOR BINDING
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Are there any Door Control Circuit Open or Door Control Performance DTCs present?

      Yes

      - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 2
2. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

- Go to step 4

No

- Go to step 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go to step 4

      No

      - Go to step 6
4. **CHECK THE BLEND DOOR**
   1. Remove the Blend Door Actuator and check the Blend Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Blend Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 5
5. **CHECK THE BLEND DOOR ACTUATOR**
   1. Replace the Blend Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs.
   3. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC reset during HVAC Actuator Calibration Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B10A7-LEFT BLEND DOOR TRAVEL TOO LARGE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar DTCs can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  During normal operation or when ever an Actuator Calibration Test is performed.

- **Set Condition:**

The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed or during normal operation and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RELATED DTCS PRESENT
BLEND DOOR STOPS
BLEND DOOR
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open or Door Control Performance DTCs present?

    Yes

    - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

    No

    - Go to step 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go to step 4

    No

- Go to step 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC System Test?

      Yes

      - Go to step 4

      No

      - Go to step 6
4. **CHECK THE BLEND DOOR**
   1. Remove the Blend Door Actuator and check the Blend Door stops, linkage (stripped or cracked) and door.

      Were there any problems found?

      Yes

      - Repair or replace the Blend Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 5
5. **CHECK THE BLEND DOOR ACTUATOR**
   1. Replace the Blend Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC -**

Standard Procedure.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
    5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    6. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

    No

    - Test complete.

B10B2-A/C COOL DOWN TEST PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Controller has software to enable it to perform an A/C Cool Down Test by a command using a scan tool. This test checks for evaporator temperature drop over a predetermined time. If the test fails, this DTC will set. However, certain test conditions are required to perform this test. Failure to run this test within those parameters can result in failure of the test.

- **When Monitored:**

  With ever an A/C Cool Down Test is performed.

- **Set Condition:**

  This DTC is set whenever the A/C Cool Down Test is performed and the desired temperature drop is not achieved by the system. The DTC will go to stored after a successful A/C Cool Down Test.

Possible Causes

A/C SYSTEM WORKING IMPROPERLY

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CONDITIONS FOR A/C COOL DOWN TEST**
    1. The following condition must be met before running the A/C Cool Down test.
    - No Powertrain Control Module (PCM) DTCs present.
    - Condenser cooling fan working properly.
    - No active HVAC evaporator temperature sensor, sun sensor, recirculation, mode, or blend door actuator DTCs present.
    - The refrigerant system must be fully charged.
    - The blower motor must operate correctly in all speeds.
    - The evaporator temperature must be above 12.7° C (55° F).
    - The A/C compressor must be turned off.
    - Blower must be on high.

B160F-TWILIGHT/AMBIENT LIGHT SENSOR 1 INPUT CIRCUIT/PERFORMANCE

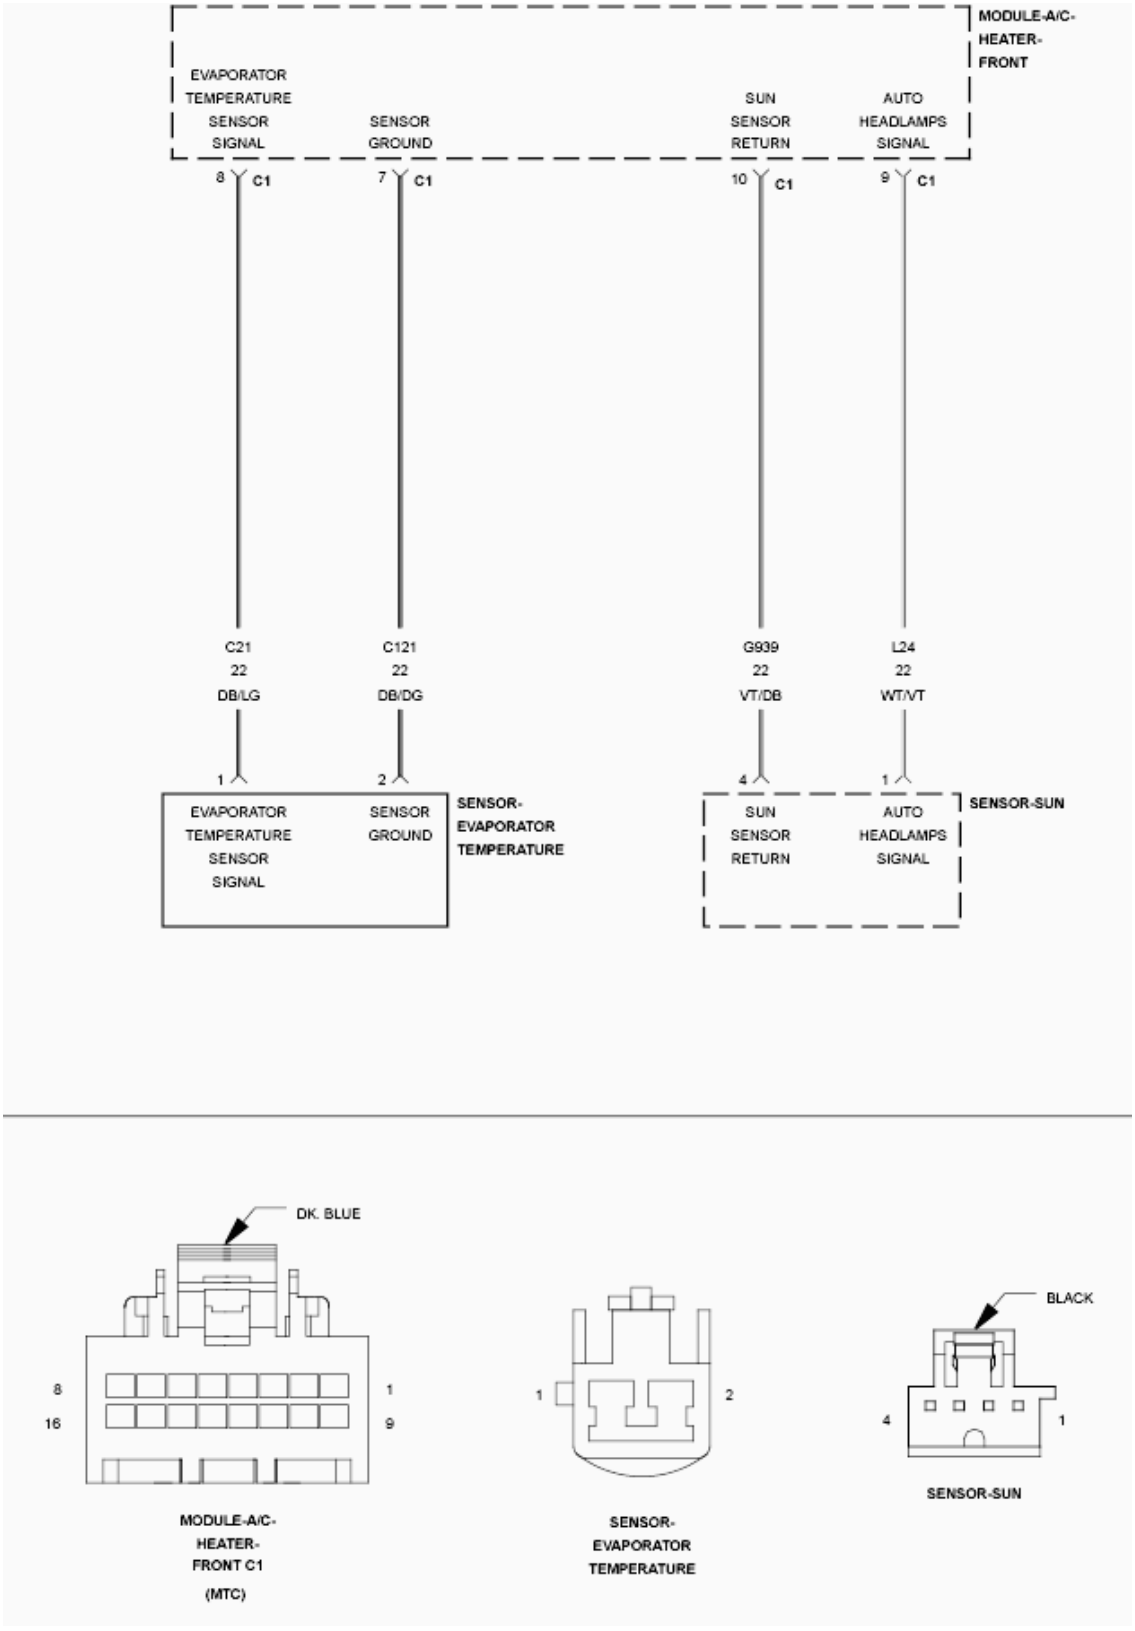

Fig. 35: Evaporator Temperature Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Control to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  Continuously with the ignition on.

- **Set Condition:**

  If the Auto Headlamps Signal input voltage is less than 1.9 Volts and greater than 0.5 of a Volt for period of five seconds. This DTC has a de-maturing time of 10 seconds. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORT TO GROUND
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 4
2. **CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

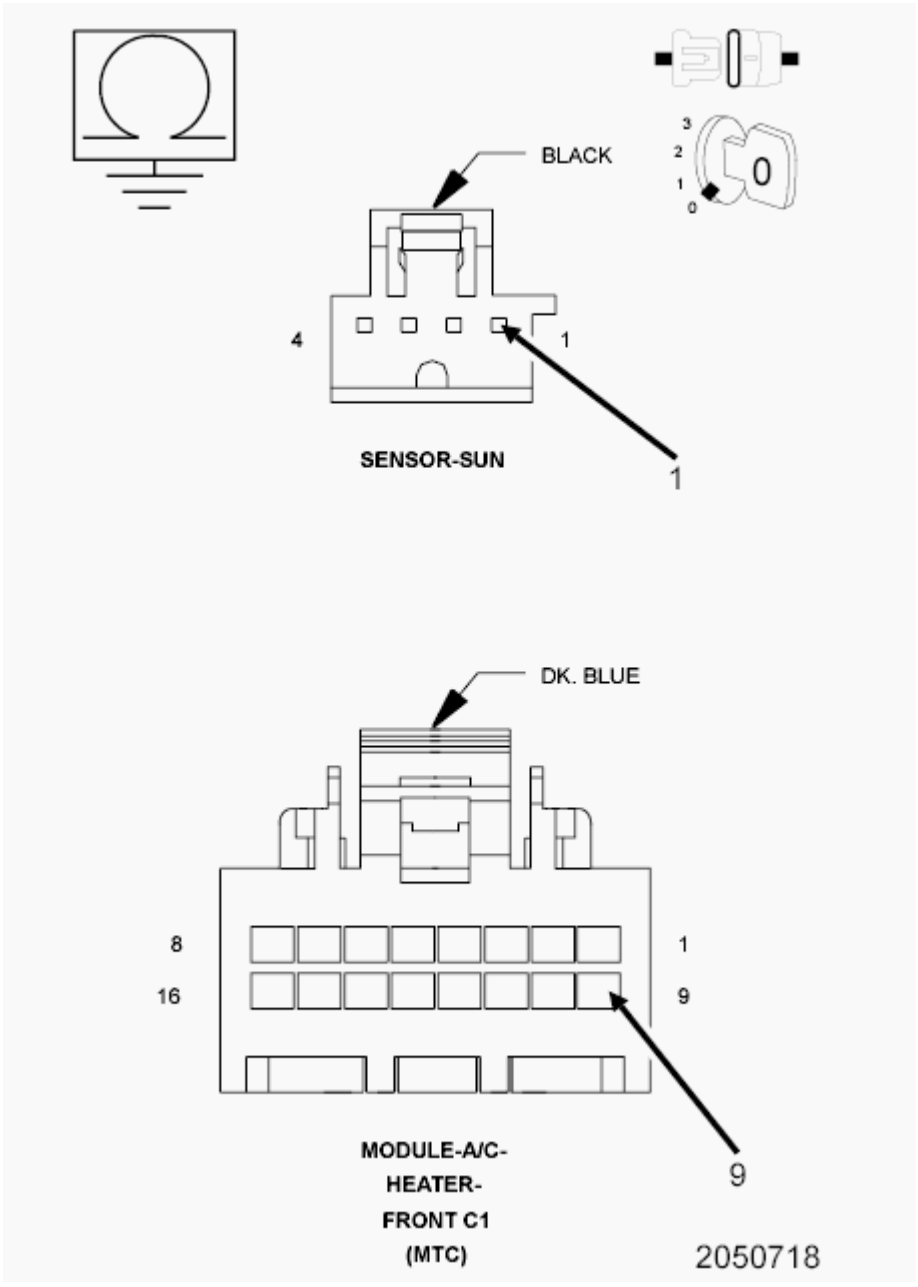

Fig. 36: Checking Auto Headlamps Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Sun Sensor harness connector.
4. Measure the resistance between ground and he (L24) Auto Headlamps Signal circuit.

   Is the resistance below 100k Ohms?

Yes

- Repair the (L24) Auto Headlamps Signal circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 3

3. **CHECK THE A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information.
   2. Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      Did this DTC reset while performing the HVAC Verification Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   4. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   5. Wiggle the wiring and connectors while checking for shorted and open circuits.
   6. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B1610-AMBIENT LIGHT SENSOR 1 INPUT CIRCUIT LOW

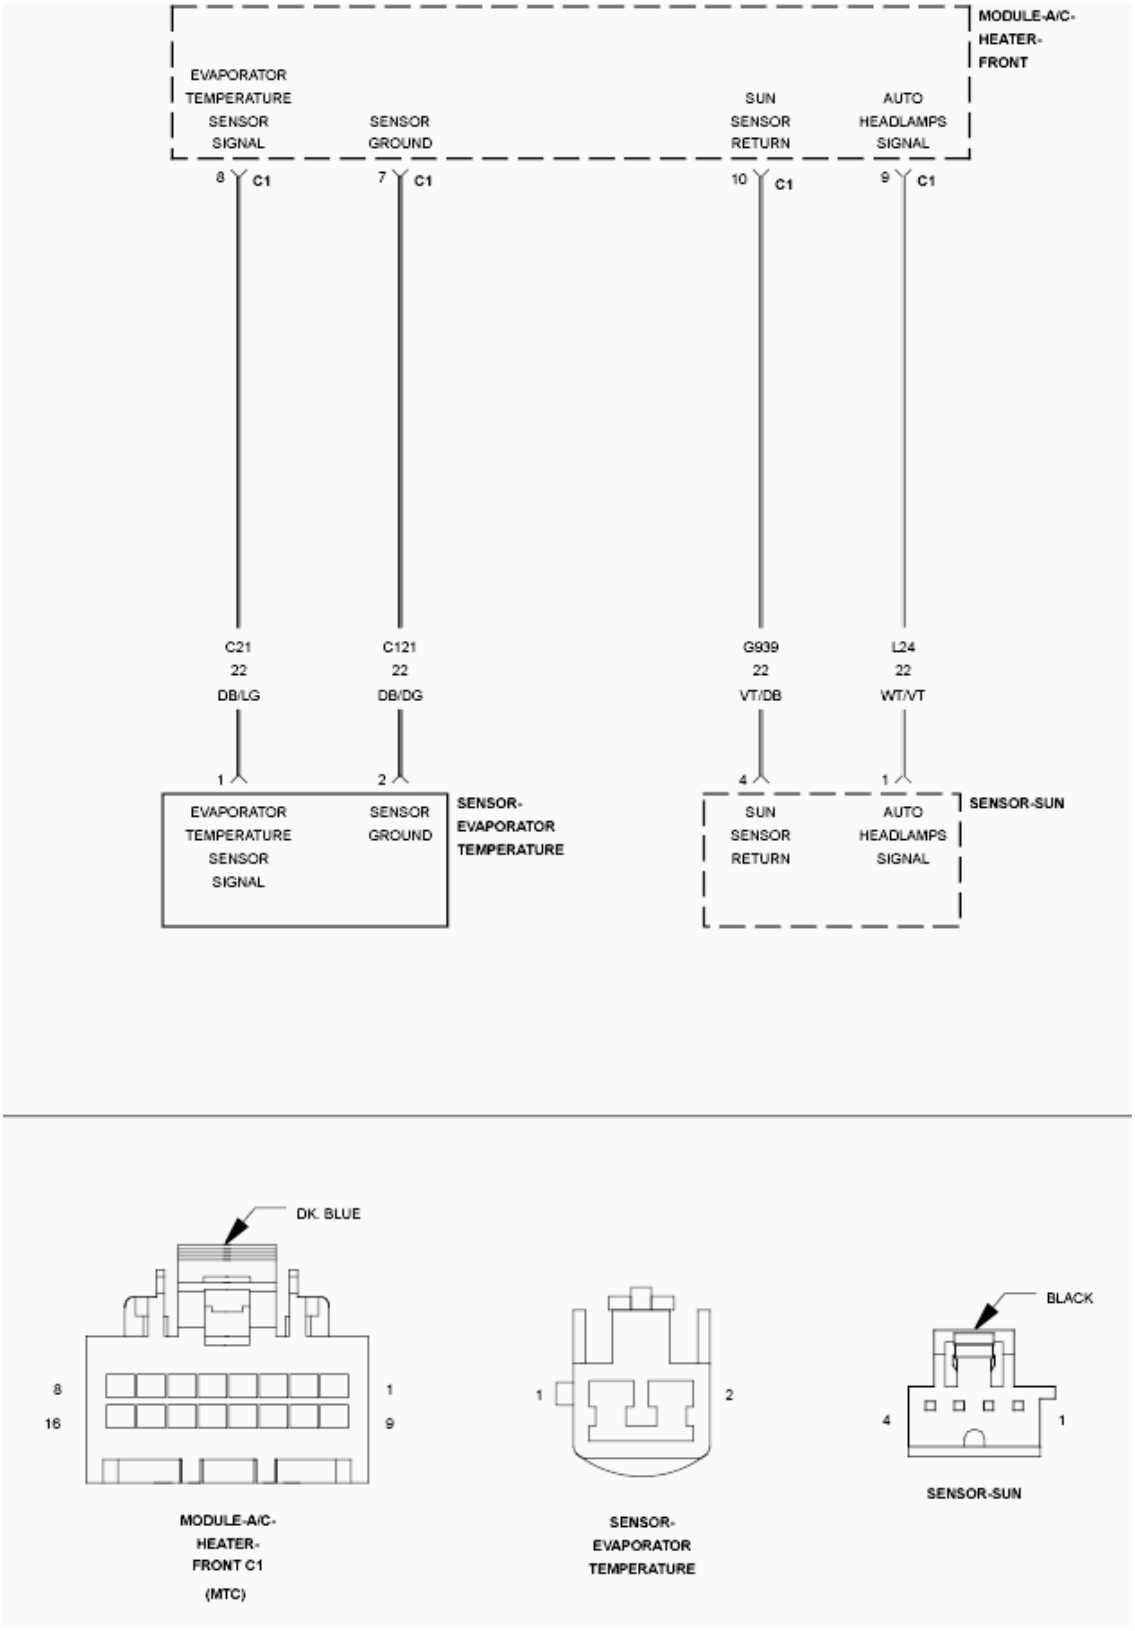

Fig. 37: Evaporator Temperature Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Control to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Twilight or Ambient Light Sensor input voltage is less than 0.5 of a Volt for period of five seconds.

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO GROUND
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 4
2. **CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

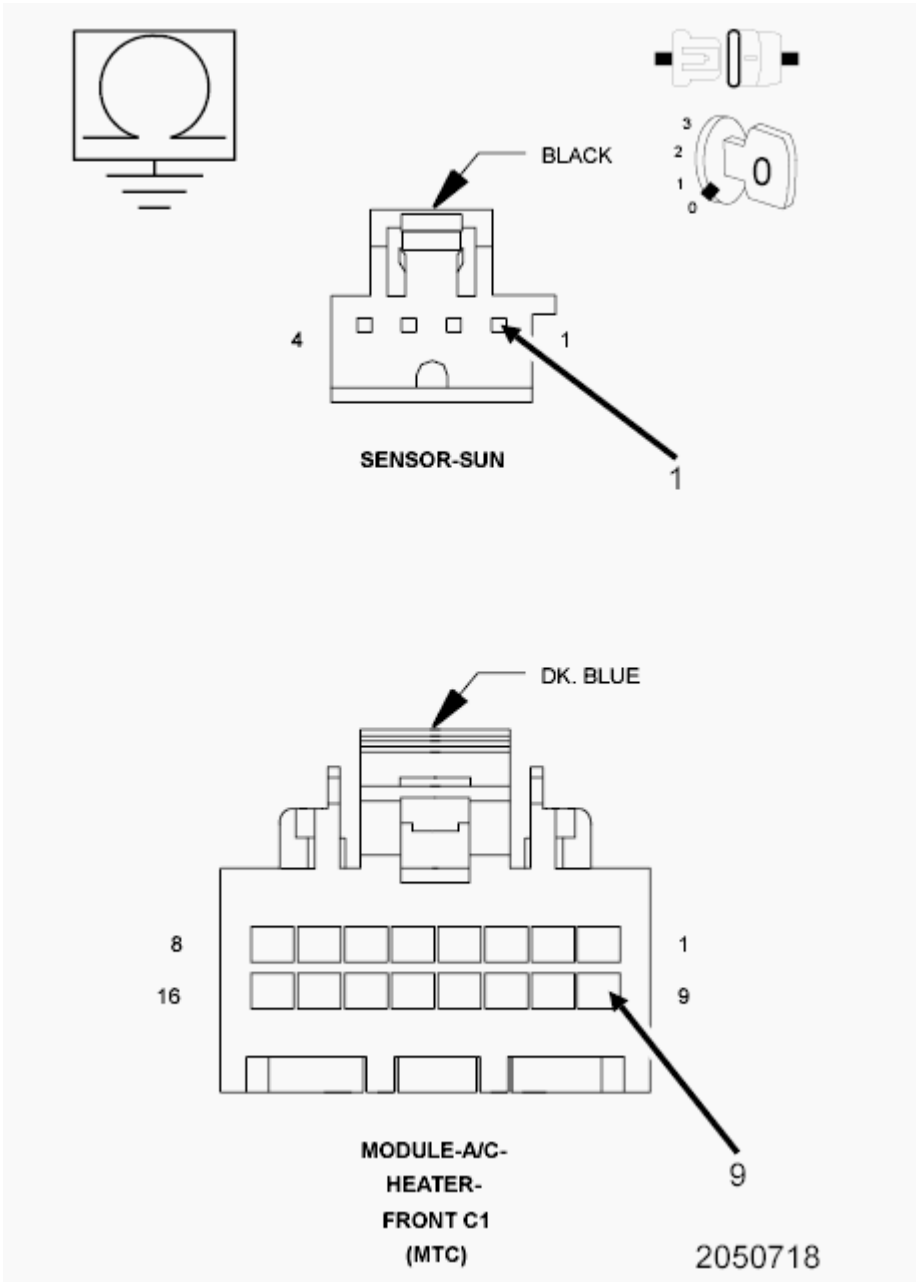

Fig. 38: Checking Auto Headlamps Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C2 harness connector.
3. Disconnect the Sun Sensor harness connector.
4. Measure the resistance between ground and he (L24) Auto Headlamps Signal circuit.

   Is the resistance below 100k Ohms?

Yes

- Repair the (L24) Auto Headlamps Signal circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 3

3. **CHECK THE A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information.
   2. Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      Did this DTC reset while performing the HVAC Verification Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   4. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   5. Wiggle the wiring and connectors while checking for shorted and open circuits.
   6. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B1611-AMBIENT LIGHT SENSOR 1 INPUT CIRCUIT HIGH

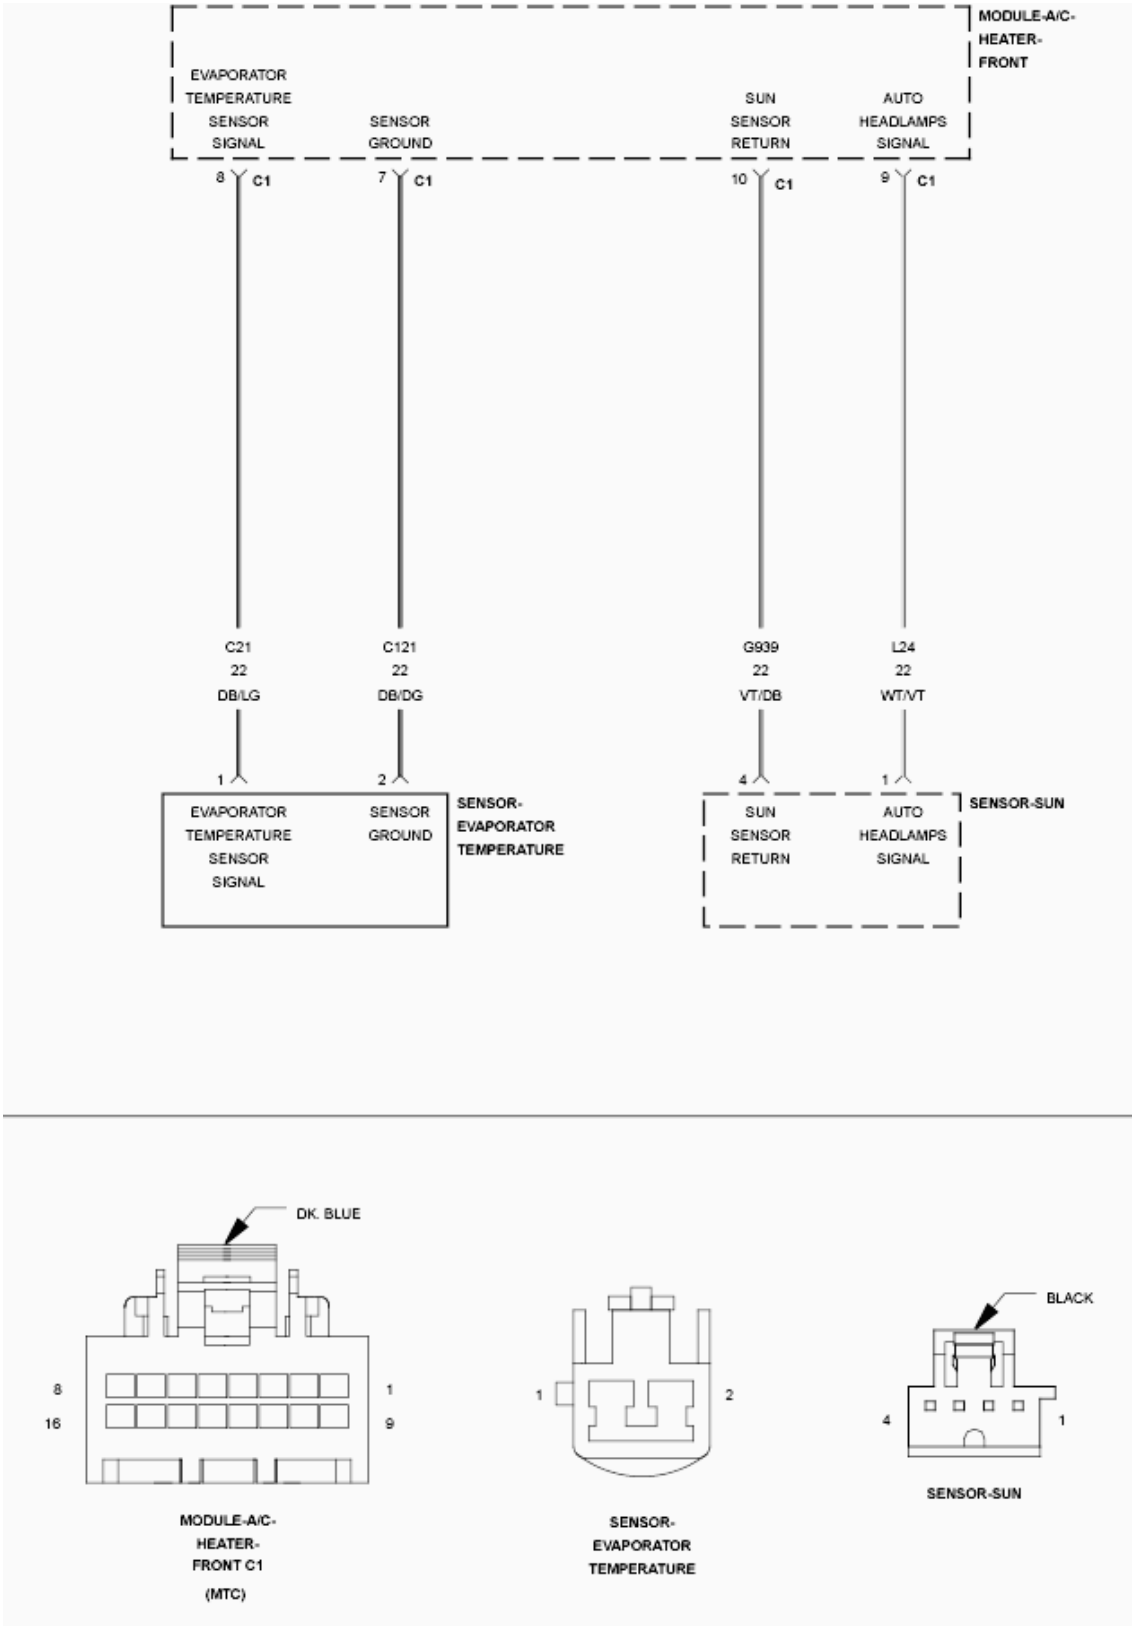

Fig. 39: Evaporator Temperature Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

Theory of Operation

The HVAC A/C Heater Control uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Control to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Twilight or Ambient Light Sensor input voltage is greater than 4.5 Volts for period of five seconds.

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORT TO VOLTAGE
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      NOTE: It can take up to 60 seconds or more for this DTC to mature.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 6
2. **CHECK THE (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

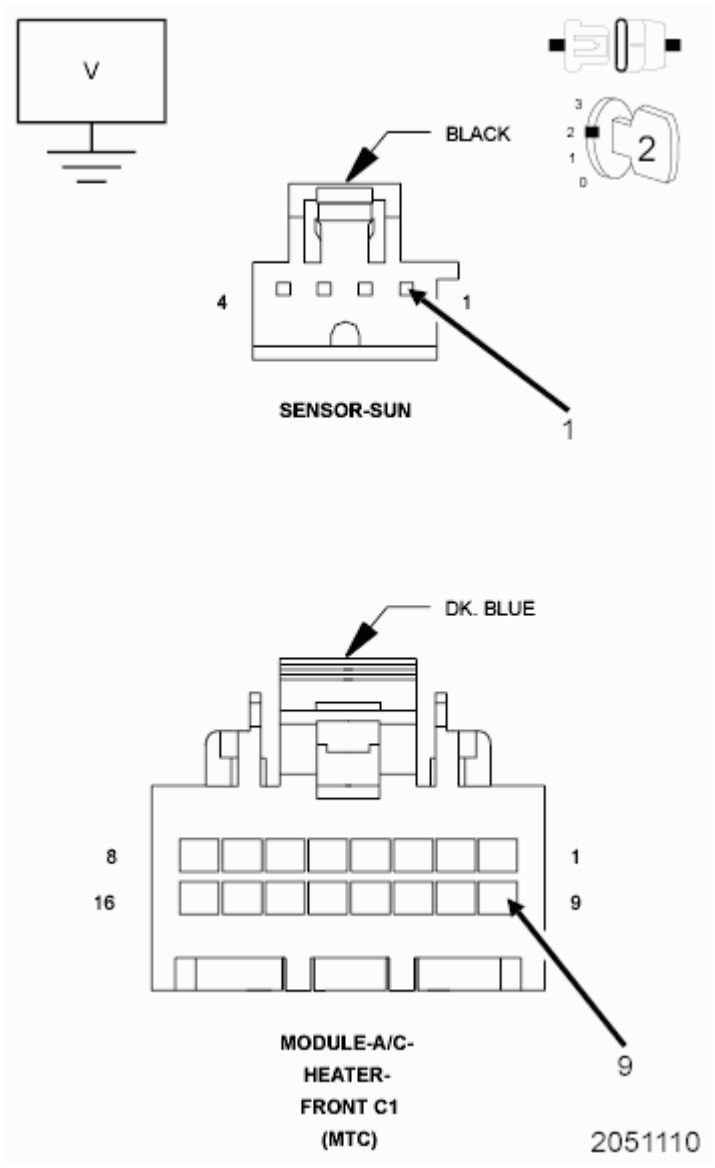

Fig. 40: Checking Auto Headlamps Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (L24) Auto Headlamps Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (L24) Auto Headlamps Signal circuit for a short to voltage.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 3

3. **CHECK THE (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR AN OPEN**

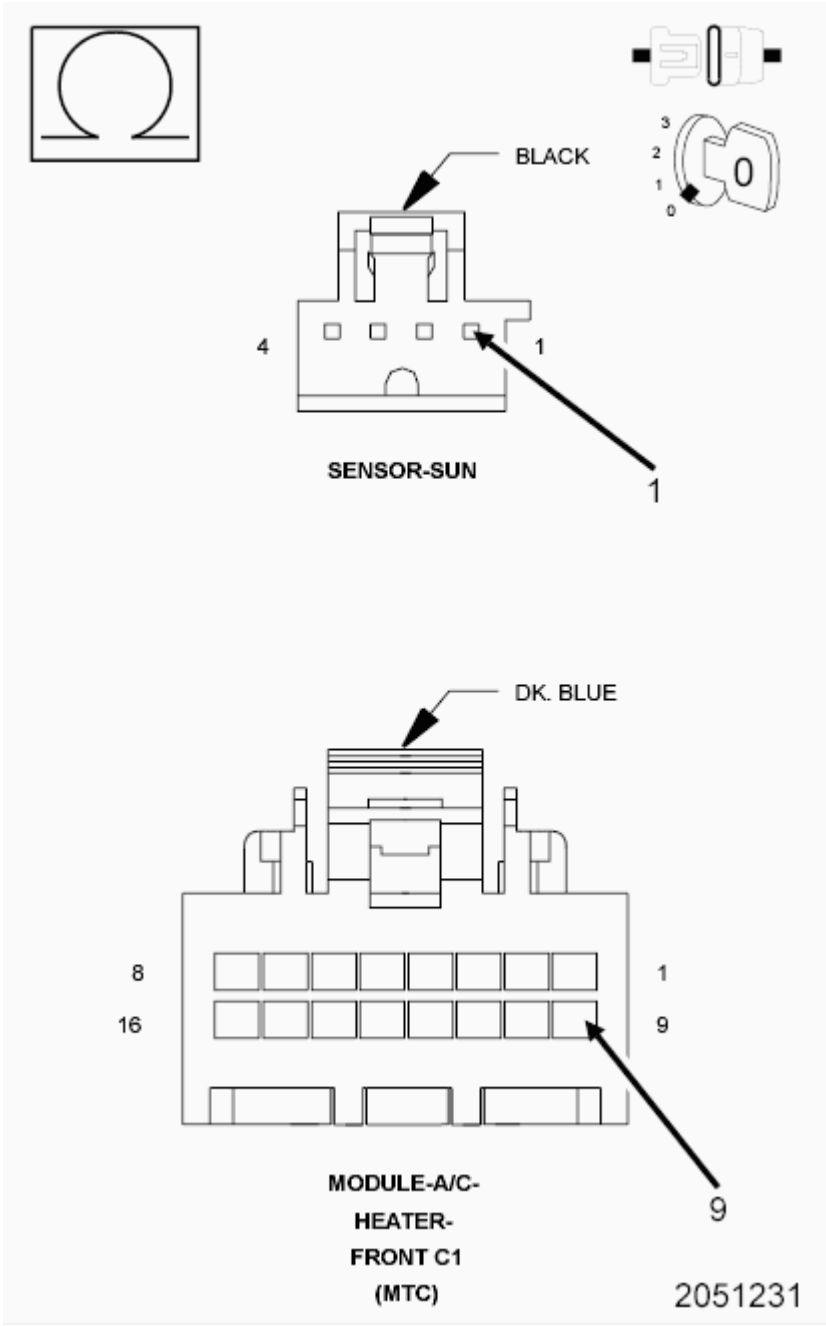

Fig. 41: Checking Auto Headlamps Signal Circuit For An Open

Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Sun Sensor harness connector.
3. Measure the resistance of the (L24) Auto Headlamps Signal circuit between the A/C Heater Control C1 harness connector and the Sun Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go to step 4

   No

   - Repair the (L24) Auto Headlamps Signal circuit for an open.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

4. **CHECK THE (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

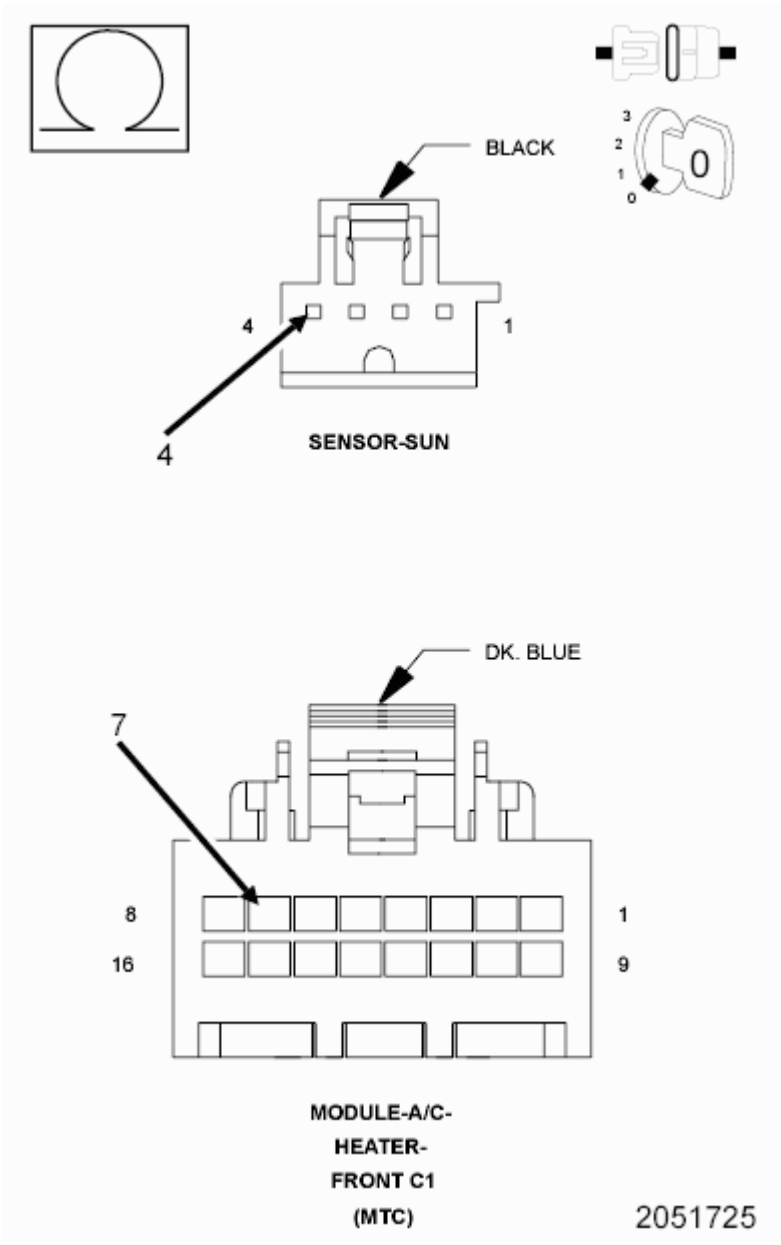

Fig. 42: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C121) Sensor Ground circuit between the A/C Heater Control C1 harness connector and the Sun Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go to step 5

No

- Repair the (C121) Sensor Ground circuit for an open.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

5. **CHECK THE SUN SENSOR AND A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information.
   2. Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   Did this DTC reset while performing the HVAC Verification Test?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B210A-SYSTEM VOLTAGE LOW

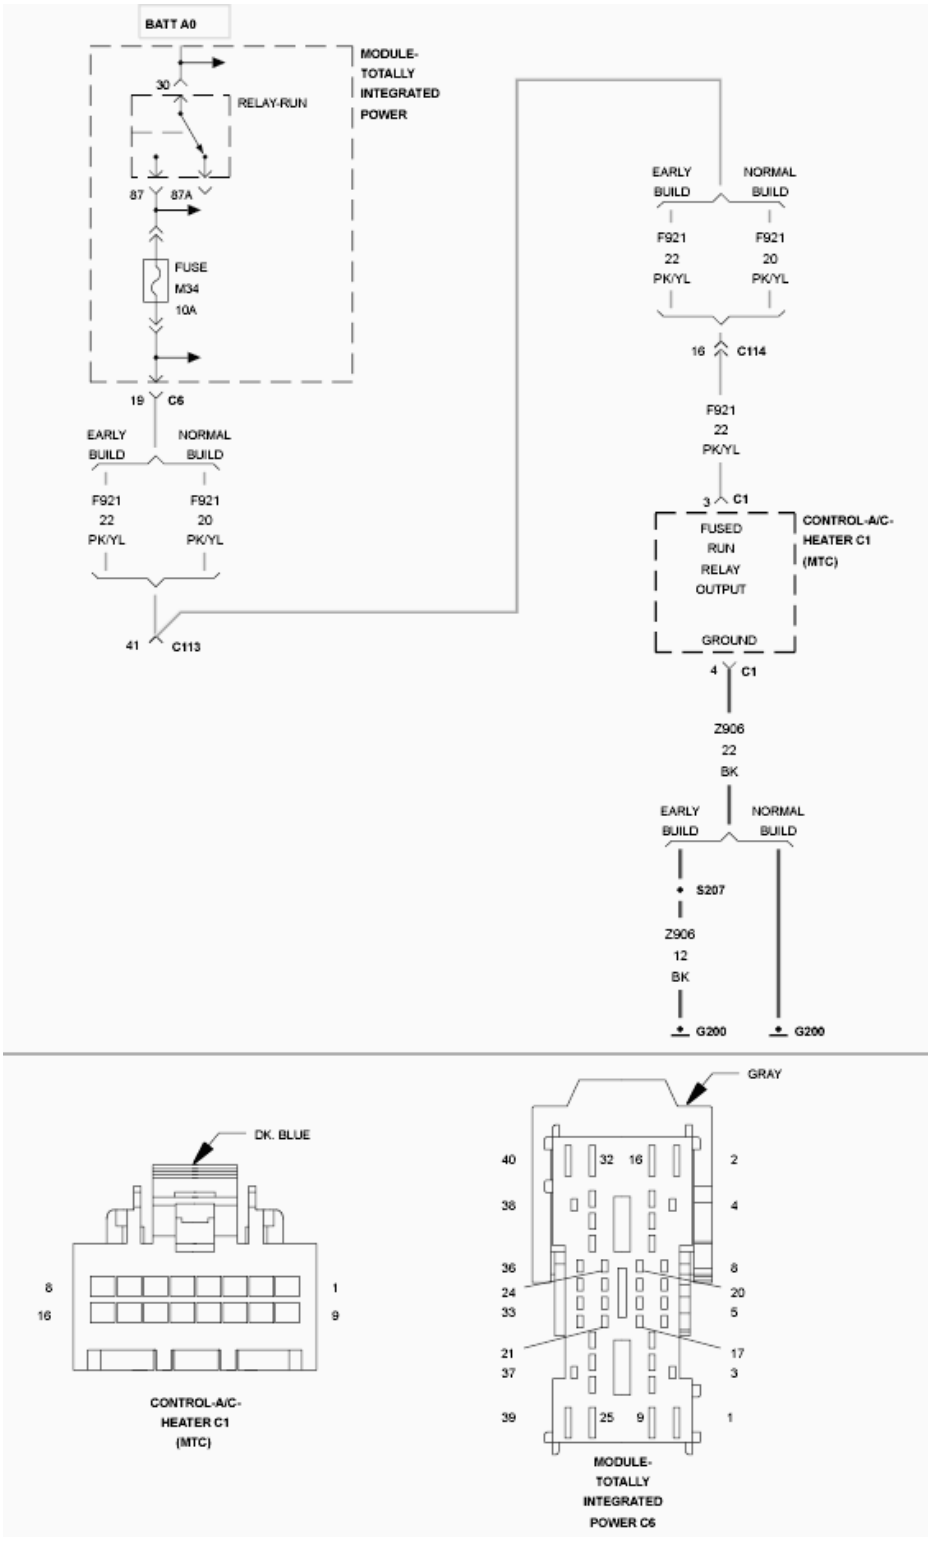

Fig. 43: Fused Run Relay Output Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Control constantly monitors battery and ignition voltage to ensure proper operation. If the voltage to the controller is out of range it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the controller battery voltage is less than or equal to 10.0 Volts for period of 5.0 seconds.

Possible Causes
RELATED CHARGING SYSTEM DTCS PRESENT
(F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN
(Z906) GROUND CIRCUIT OPEN
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR CHARGING SYSTEM DTCS**
   1. Using the scan tool, read PCM DTCs.

      Are there any charging system DTCs present in the Powertrain Control Module (PCM)?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 2
2. **CHECK FOR TOTALLY INTEGRATED POWER MODULE DTCS**
   1. Using the scan tool, read TIPM DTCs.

      Are there any TIPM DTCS present?

Yes

- Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 3

3. **CHECK IF THE DTC IS ACTIVE**
   1. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 4

      No

      - Go to step 6
4. **CHECK THE (F921) FUSED RUN RELAY OUTPUT CIRCUIT FOR AN OPEN**

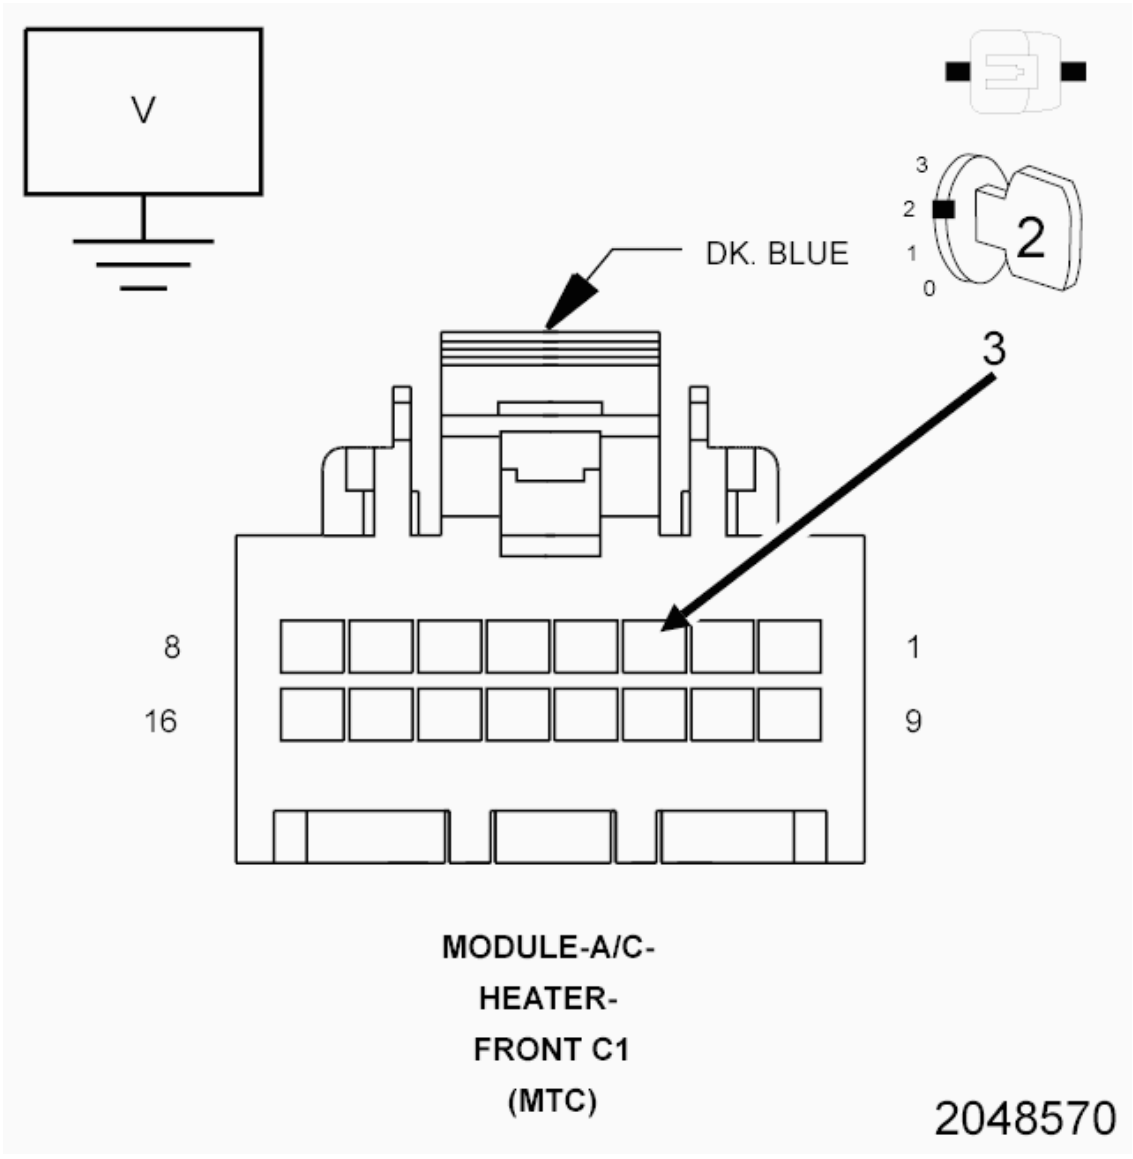

Fig. 44: Checking Fused Run Relay Output Circuit For An Open
Courtesy of CHRYSLER LLC

1. Ignition on, engine not running.
2. While back probing, measure the voltage of the (F921) Fused Run Relay Output circuit in the A/C Heater Control C1 harness connector.

   Is the voltage 10.0 Volts or below?

   Yes

   - Repair the (F921) Fused Run Relay Output circuit for an open or high resistance.

     NOTE: If the fuse is open, make sure to check for a short to ground on

the (F921) Fused Run Relay Output circuit.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 5

5. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN**

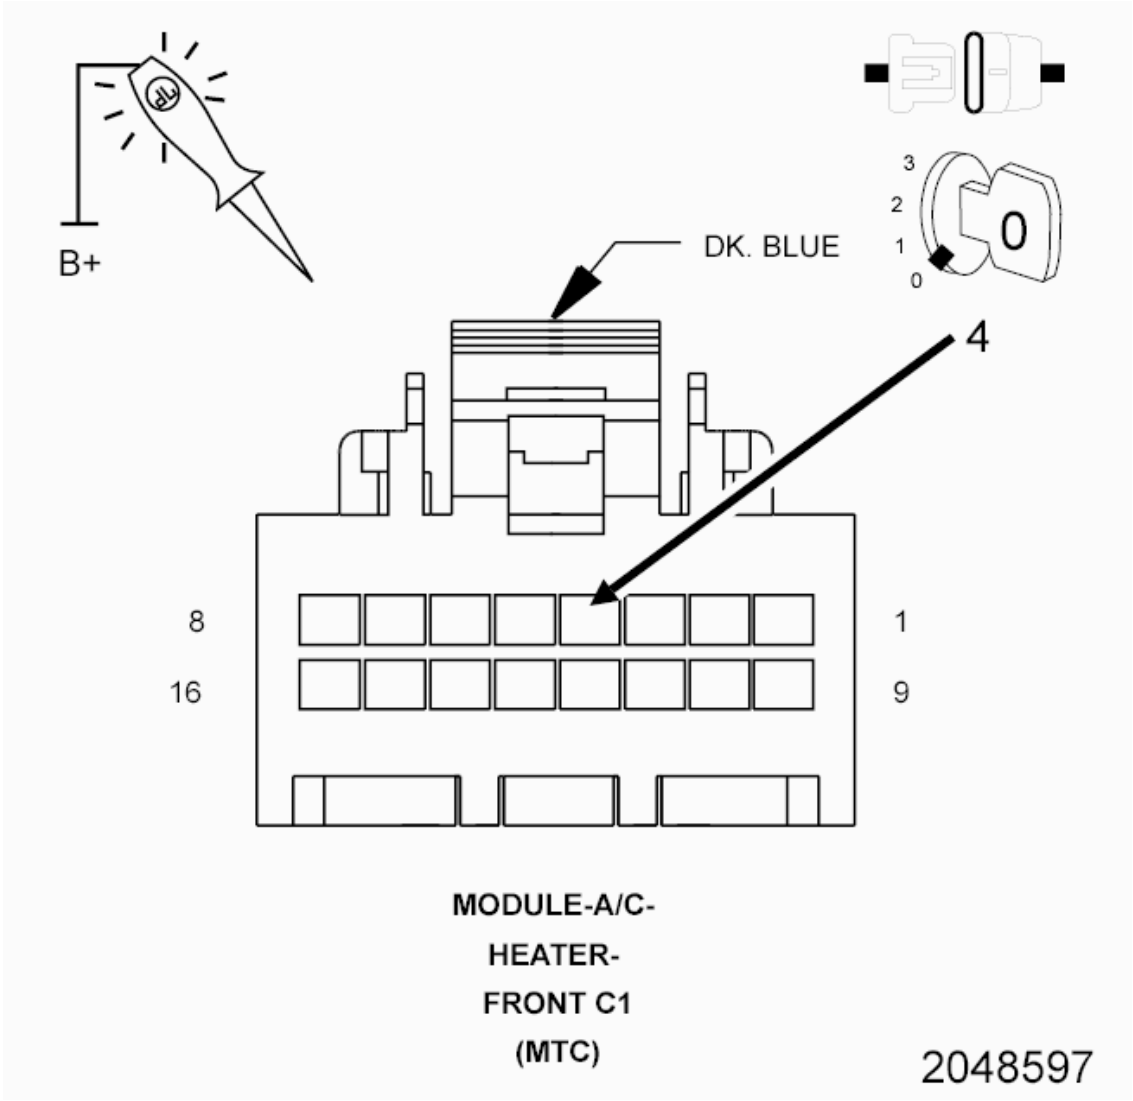

Fig. 45: Checking Ground Circuit For An Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.

3. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Repair the (Z906) Ground circuit for an open.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B210B-SYSTEM VOLTAGE HIGH

Theory of Operation

The A/C Heater Control constantly monitors battery and ignition voltage to ensure proper operation. If the voltage to the controller is out of range it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the controller battery voltage is higher than 16.0 Volts for period of 1.0 second.

Possible Causes
RELATED CHARGING SYSTEM DTCS PRESENT
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR CHARGING SYSTEM DTCS**
   1. Using the scan tool, read PCM DTCs.

      Are there any charging system DTCs present in the Powertrain Control Module (PCM)?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go To step 2
2. **CHECK FOR TOTALLY INTEGRATED POWER MODULE DTCS**
   1. Using the scan tool, read TIPM DTCs.

      Are there any TIPM DTCs present?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 3

3. **CHECK IF THE DTC IS ACTIVE**
   1. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 4

      No

      - Go to step 5
4. **CHECK IF OTHER CONTROLLER ARE REPORTING AN OVER VOLTAGE CONDITION**
   1. Ignition on, engine not running.
   2. With the scan tool read DTCs.

      Are any other controllers reporting an over voltage condition?

      Yes

      - Go to DTC Based Diagnostics and perform the appropriate diagnostic procedure.

      No

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B2214-(HVAC) CLIMATE CONTROL INTERNAL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the A/C Heater Control has an internal fault. This Diagnostic Trouble Code (DTC) has a maturing time of five seconds and a de-maturing time of 10 seconds. If the DTCs status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK THE A/C HEATER CONTROL**

   Repair

   - Check for any controller software updates if applicable. If an update is available, reprogram the controller with the latest software. If no software updates are available, replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

U0010-CAN INTERIOR BUS

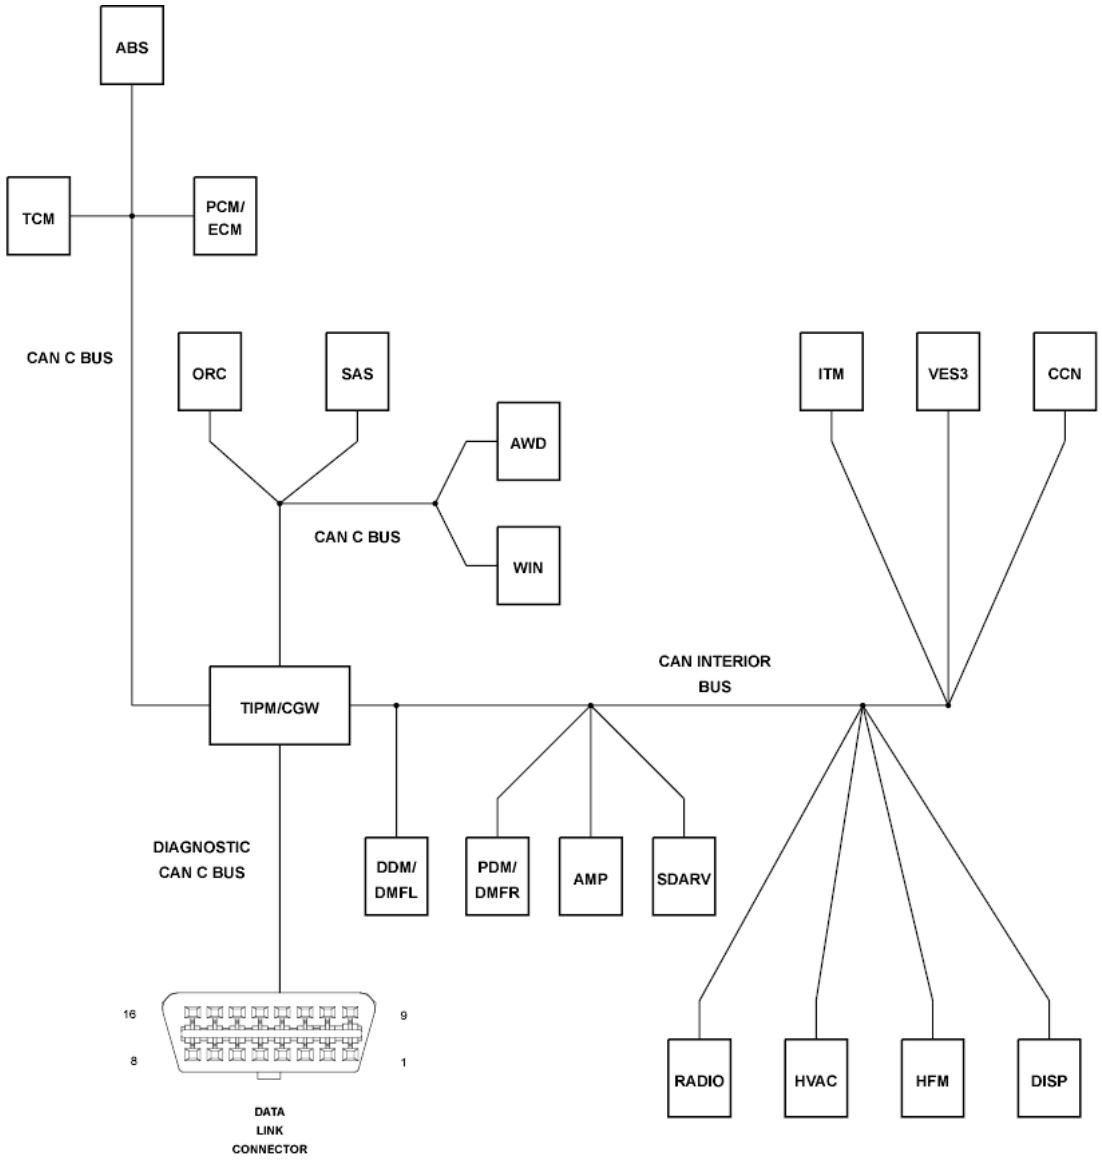

Fig. 47: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously when the ignition is on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  The A/C Heater Control detects a short to ground or a short to voltage on the CAN Bus circuits.

Possible Causes
BUS CIRCUITS SHORTED TO GROUND OR VOLTAGE
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
TIPM POWER AND GROUND
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0010-CAN INTERIOR BUS** diagnostic procedure.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0019-CAN B BUS

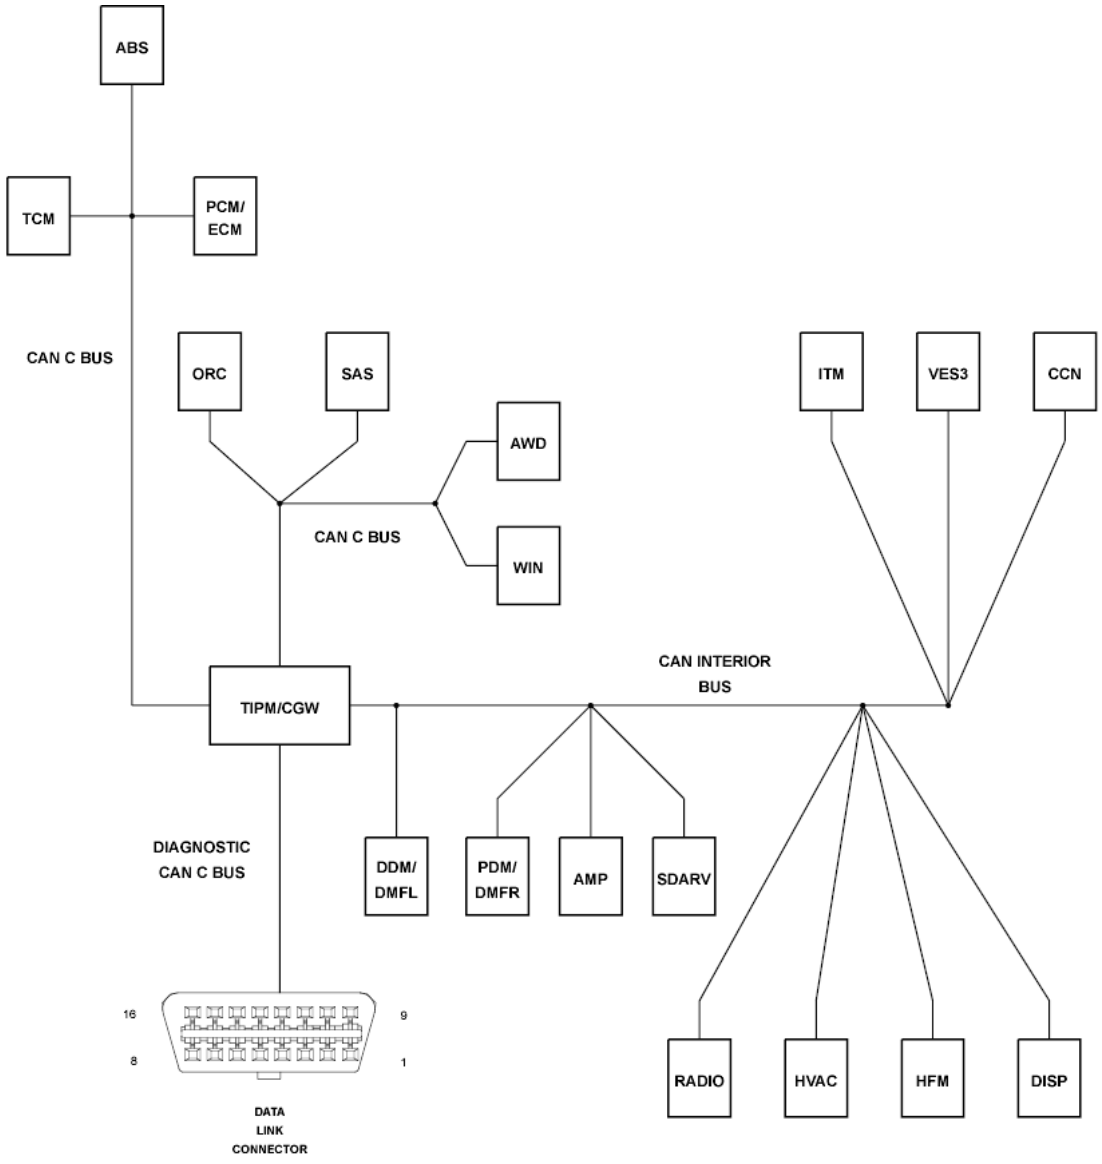

Fig. 48: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously when the ignition is on.

  12-volt battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  If the CAN B Bus (+) or CAN B Bus (-) circuit is open, shorted to voltage, or shorted to ground.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT OPEN
(D54) CAN B BUS (-) CIRCUIT OPEN
(D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND
(D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND
(D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT
ANY CAN B BUS MODULE

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0019-CAN B BUS** diagnostic procedure.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTC diagnostic procedure.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

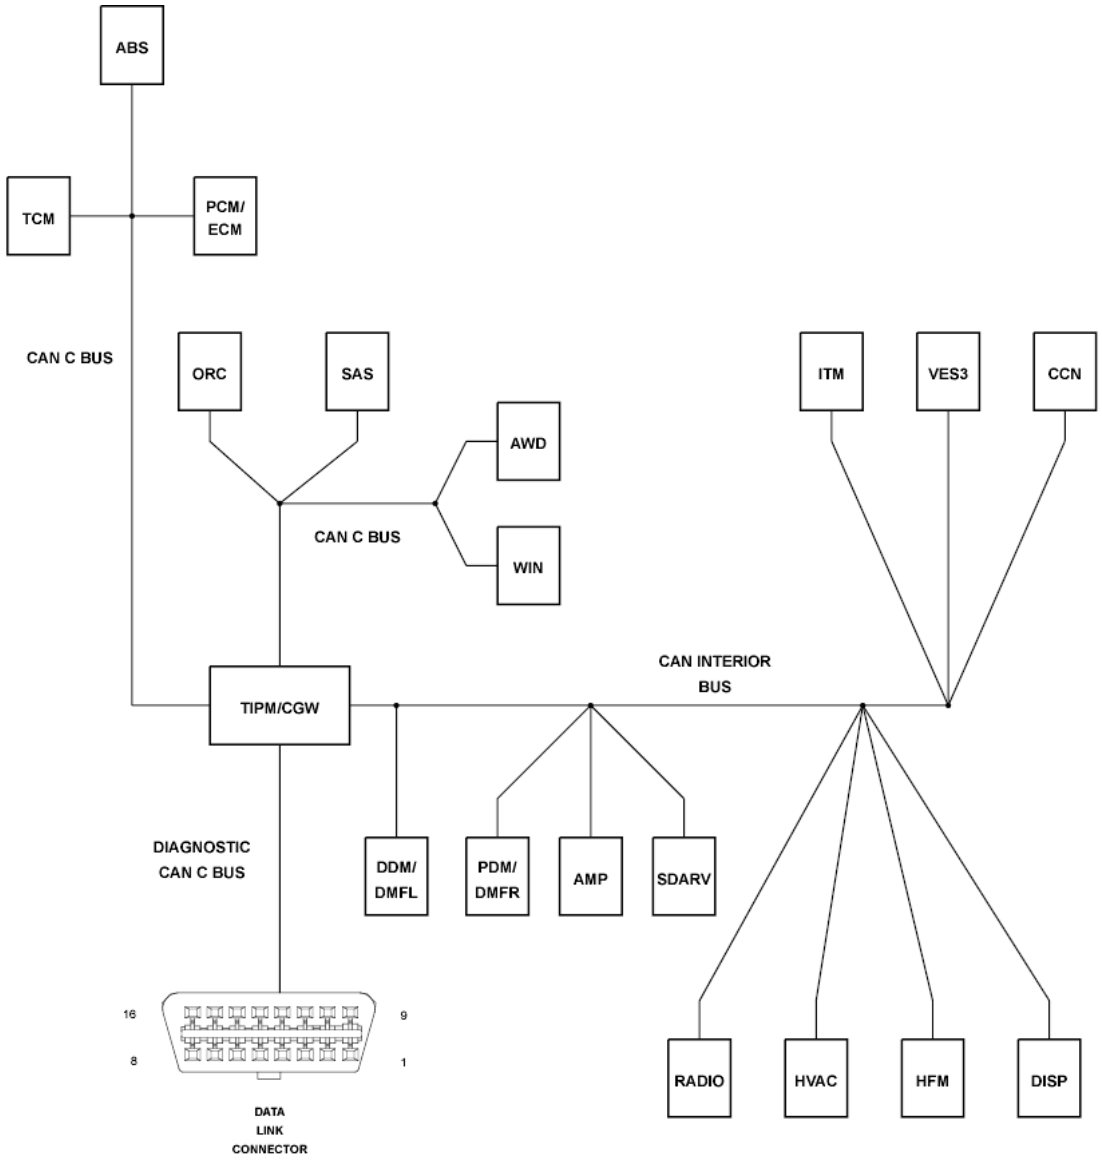

Fig. 49: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously when the ignition is on.

  12-volt battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Totally Integrated Power Module (TIPM) for three seconds.

Possible Causes
BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM/TIPM NOT CONFIGURED CORRECTLY
TIPM POWER AND GROUND
TOTALLY INTEGRATED POWER MODULE
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and 12-volt battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the diagnostic procedure for **U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)**.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTC diagnostic procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

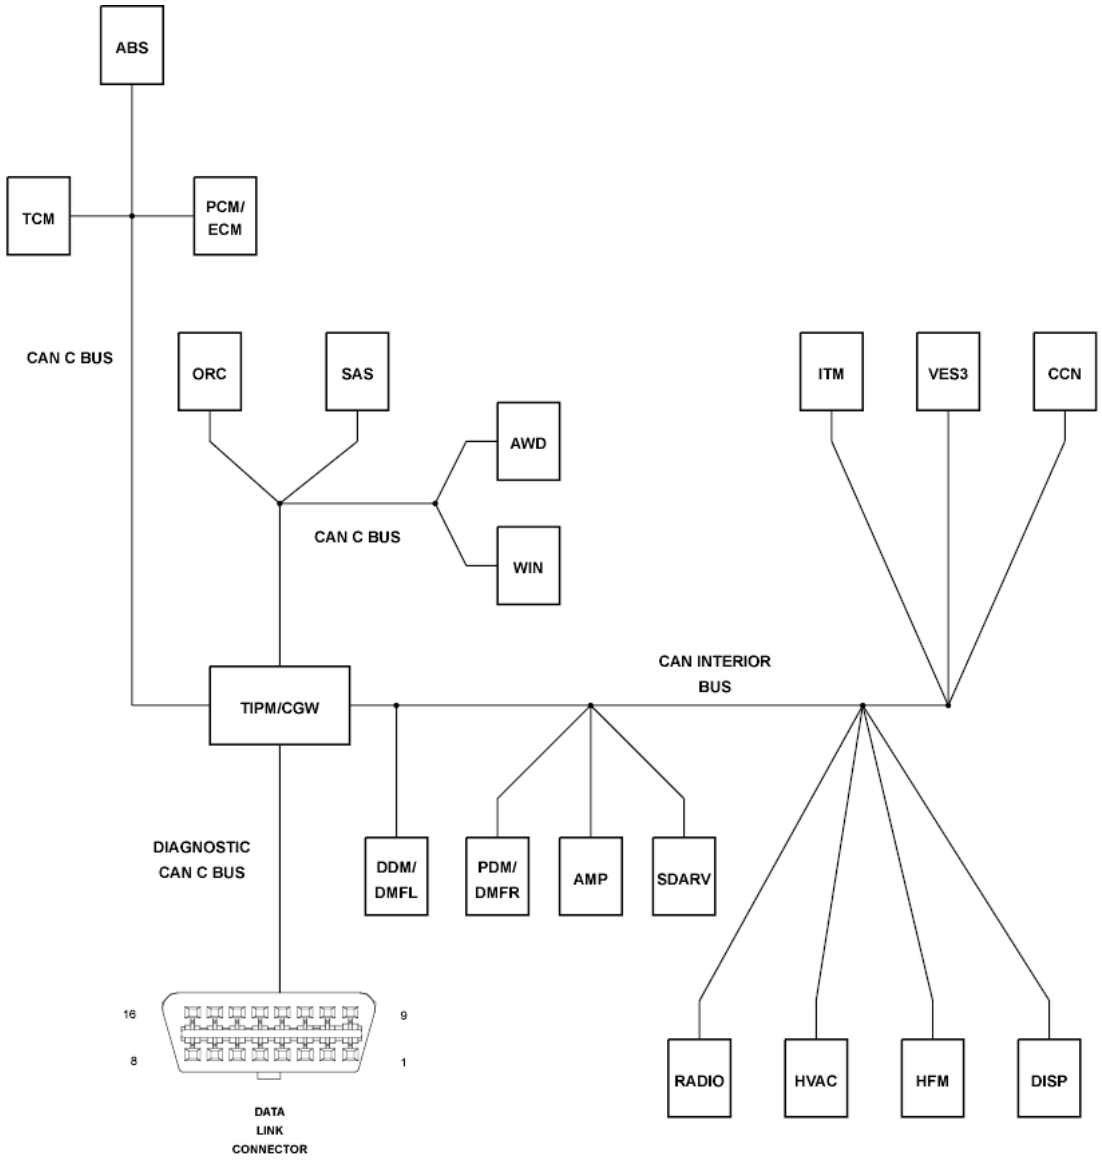

Fig. 50: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Occupant Restraint Controller (ORC) for approximately two to five seconds.

Possible Causes
(D51) OR (D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D52) OR (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ORC POWER AND GROUND
ORC
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and 12-volt battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the diagnostic procedure for **U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)**.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTC diagnostic procedure.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

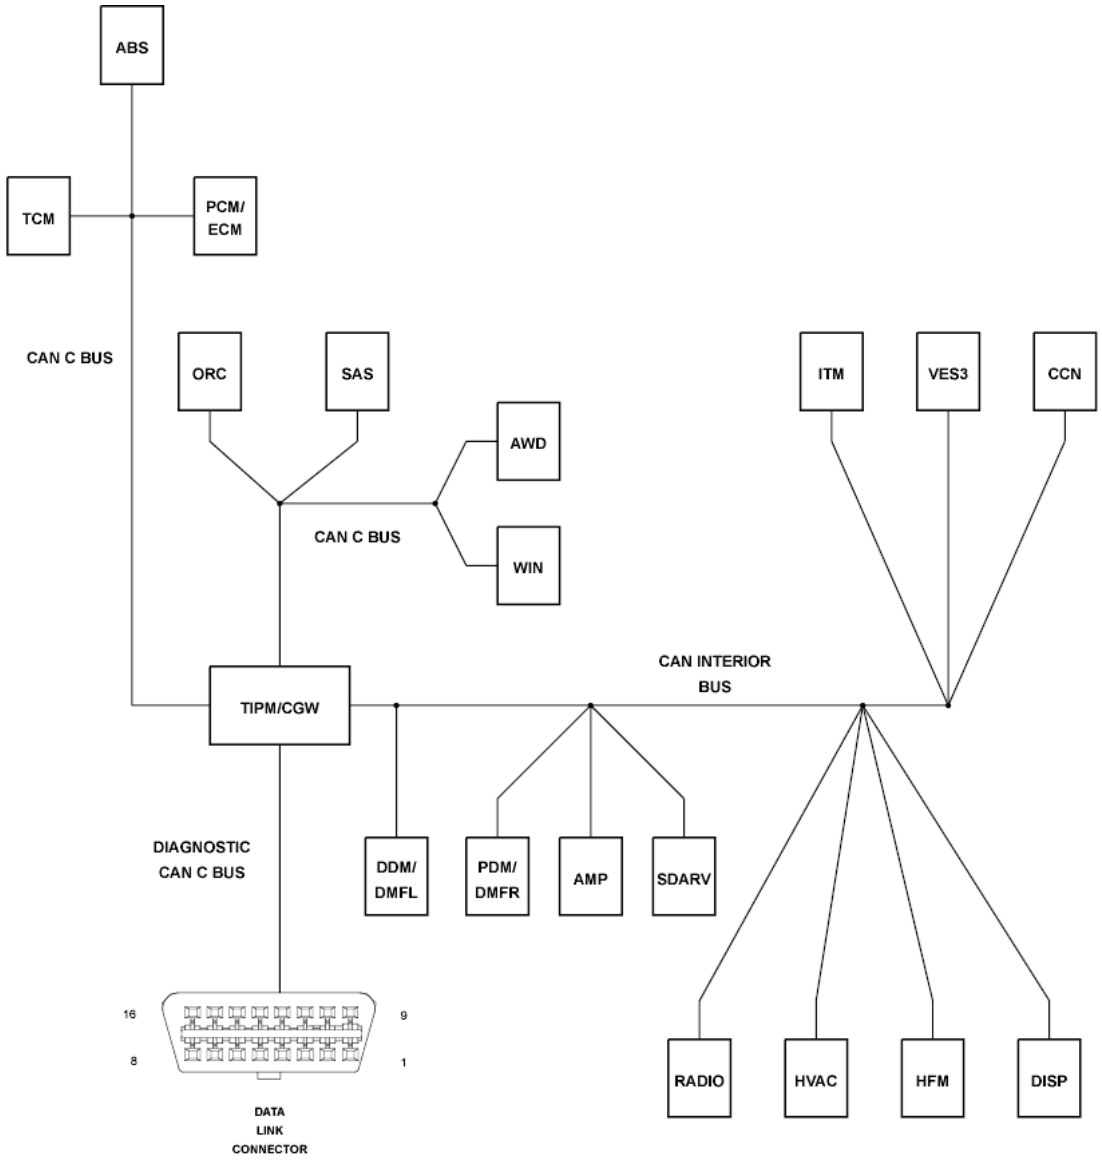

Fig. 51: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Cluster/CCN for approximately two to five seconds.

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
CLUSTER/CCN POWER AND GROUND
CLUSTER/CCN
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and 12-volt battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the diagnostic procedure for **U0155-LOST COMMUNICATION WITH CLUSTER/CCN**.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTC diagnostic procedure.

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER CONTROL MODULE

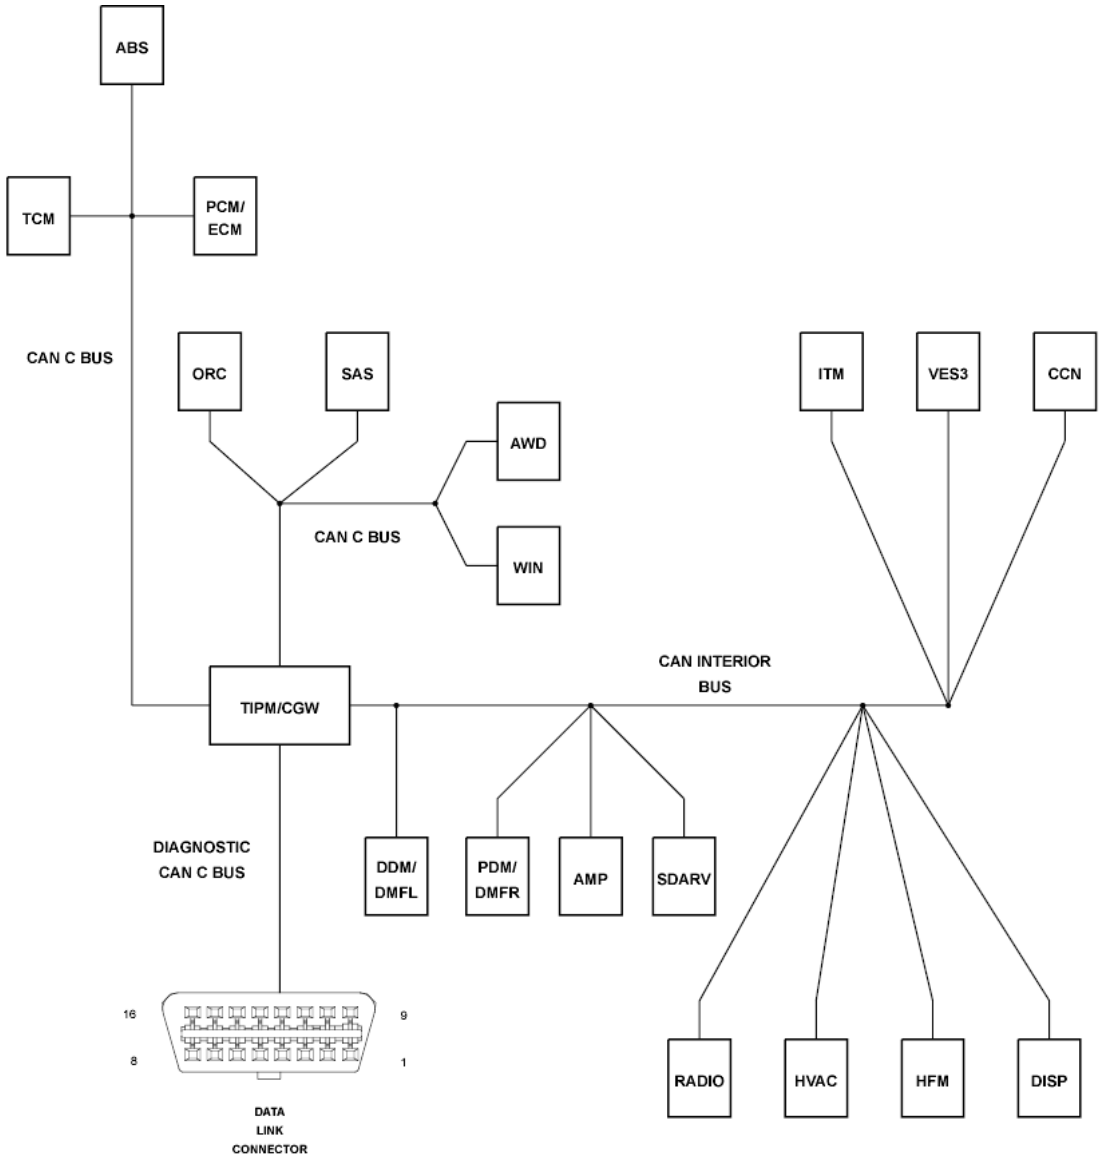

Fig. 52: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Intrusion Transceiver Control Module (ITM) for approximately two to five seconds.

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ITM POWER AND GROUND
INTRUSION TRANSCEIVER CONTROL MODULE
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and 12-volt battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the diagnostic procedure for **U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER CONTROL MODULE**.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTC diagnostic procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (WIN)

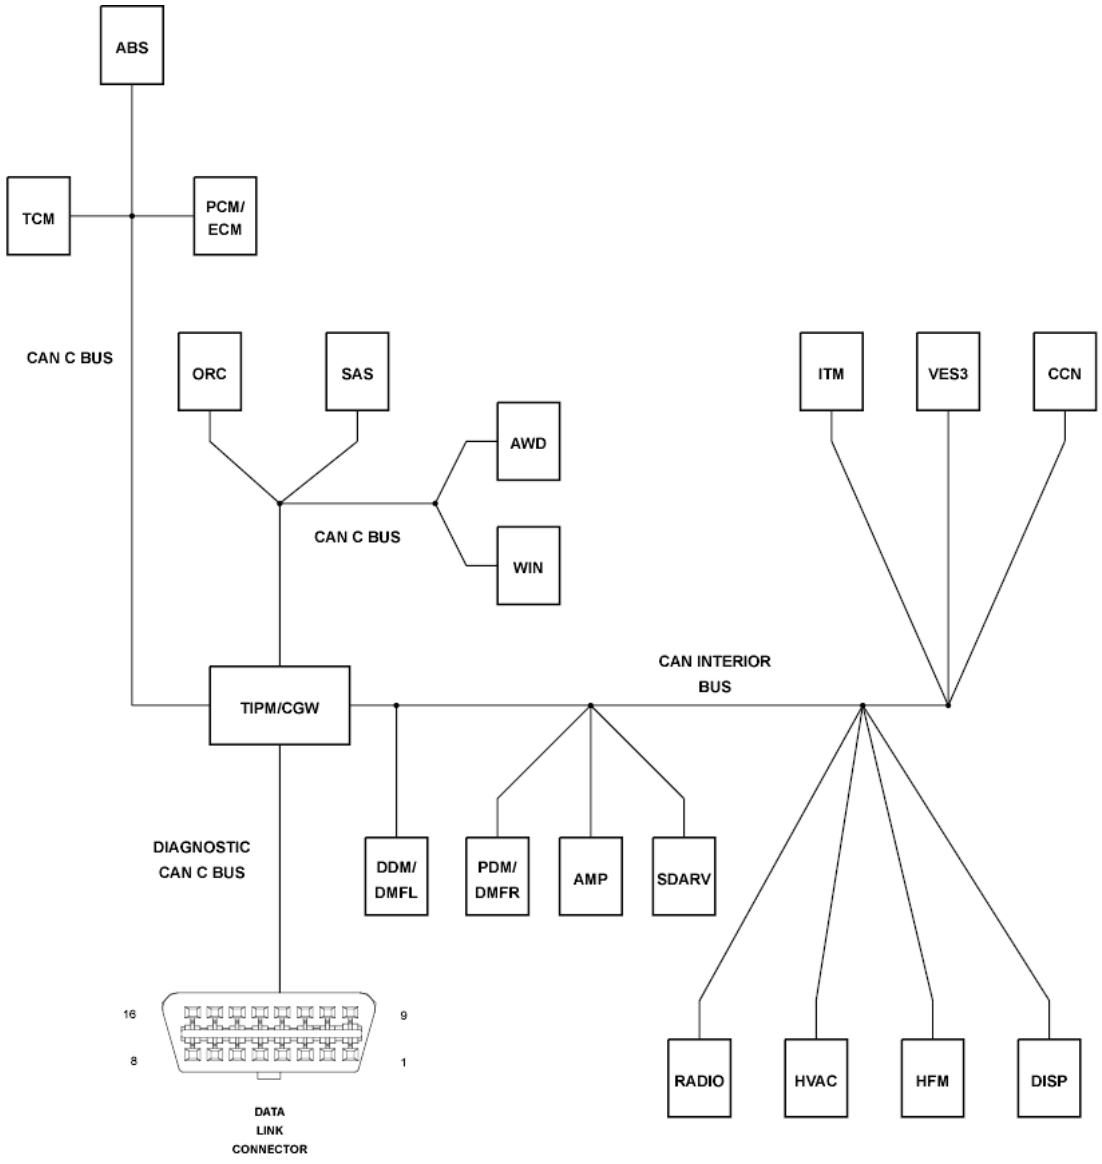

Fig. 53: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Vehicle Security Control Module (also known as the Wireless Ignition Node or WIN) for approximately two to five seconds.

Possible Causes
(D51) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D52) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
WIN POWER AND GROUND
WIRELESS IGNITION NODE
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (WIN)** diagnostic procedure.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0184-LOST COMMUNICATION WITH RADIO

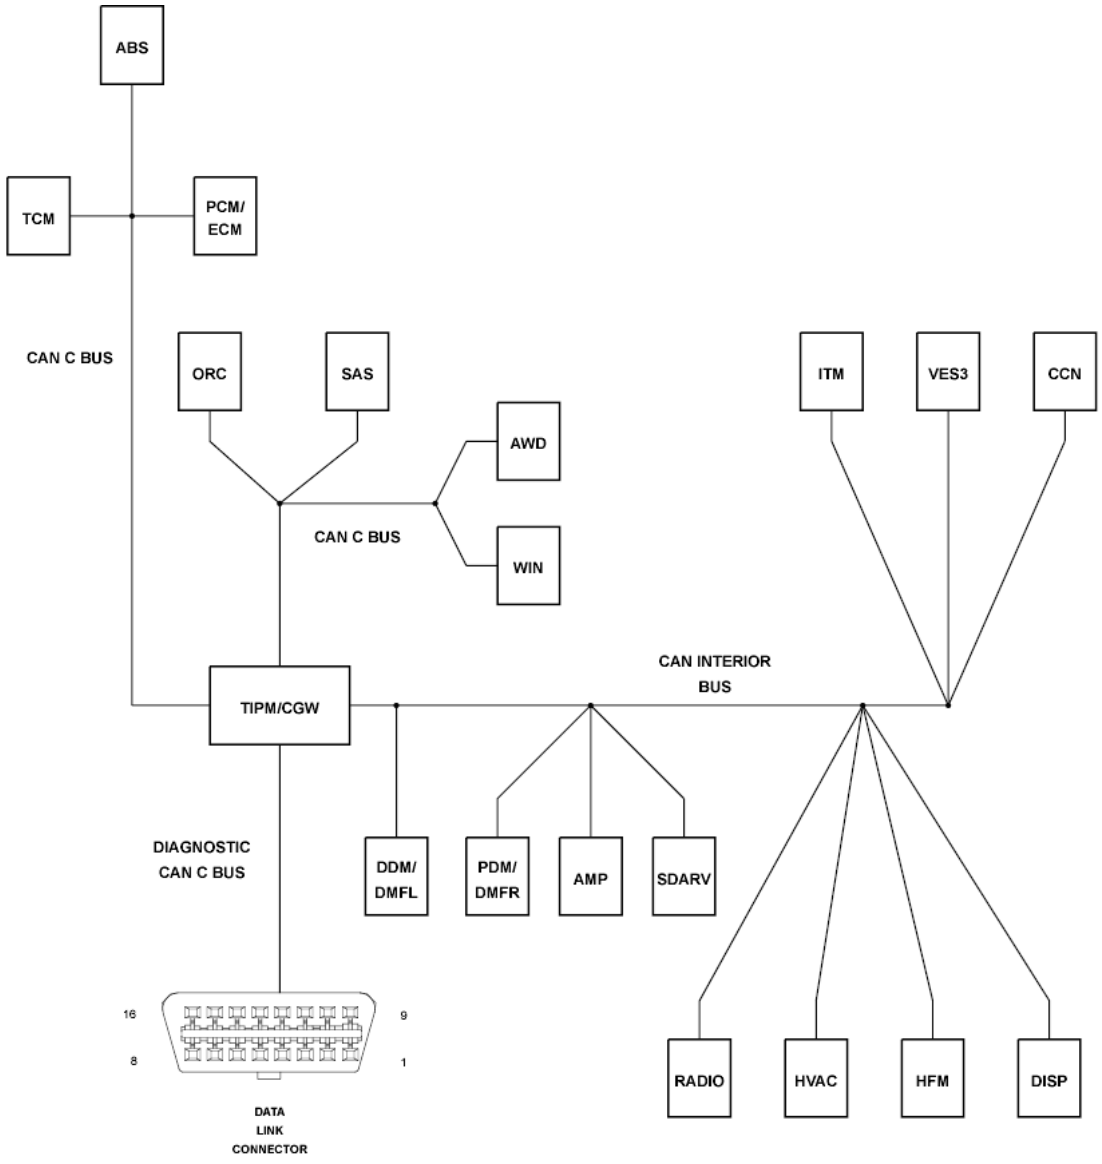

Fig. 54: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Radio for approximately two to five seconds.

Possible Causes
(D51) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D52) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
RADIO POWER AND GROUND
RADIO
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0184-LOST COMMUNICATION WITH RADIO** diagnostic procedure.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

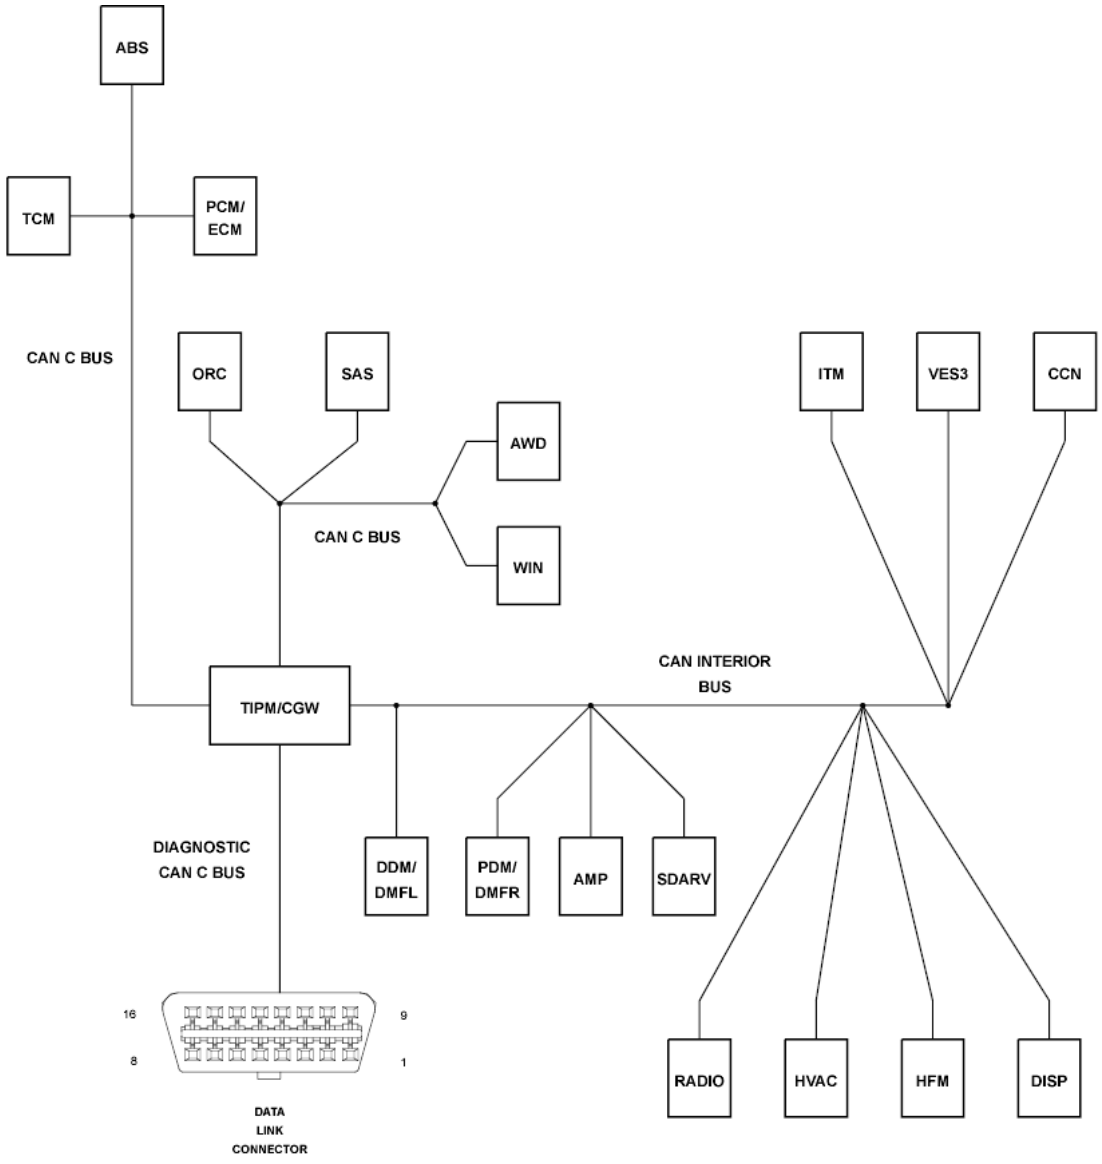

Fig. 55: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Audio Amplifier (AMP) for approximately two to five seconds.

Possible Causes
(D51) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D52) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
AMP POWER AND GROUND
AUDIO AMPLIFIER
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER** diagnostic procedure.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE

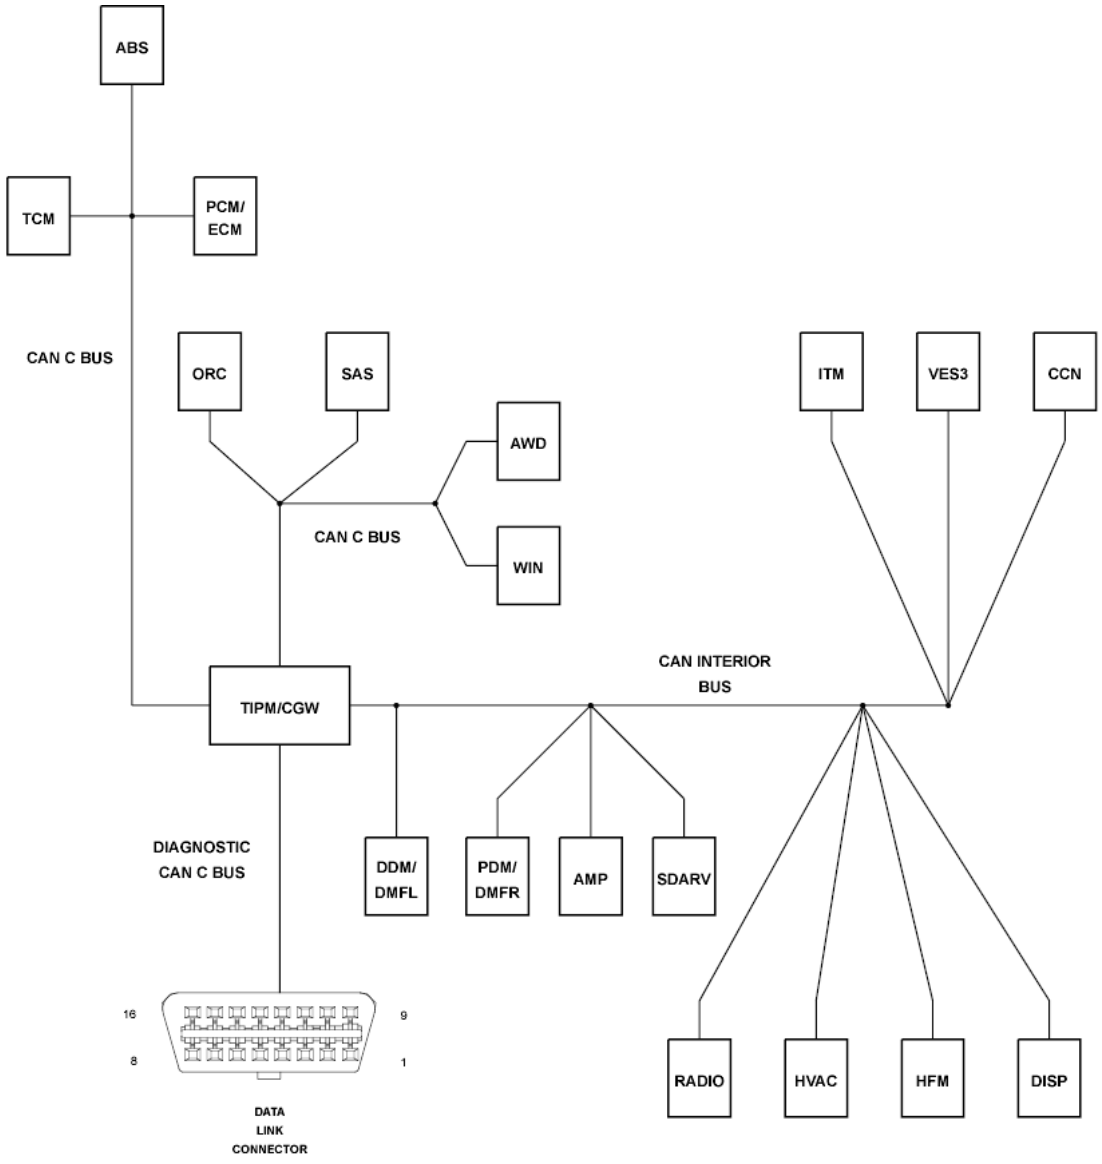

Fig. 56: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Hands Free Phone Module (HFM) for approximately two to five seconds.

Possible Causes
(D51) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D52) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
HFM POWER AND GROUND
HANDS FREE PHONE MODULE
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE** diagnostic procedure.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0203-LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT

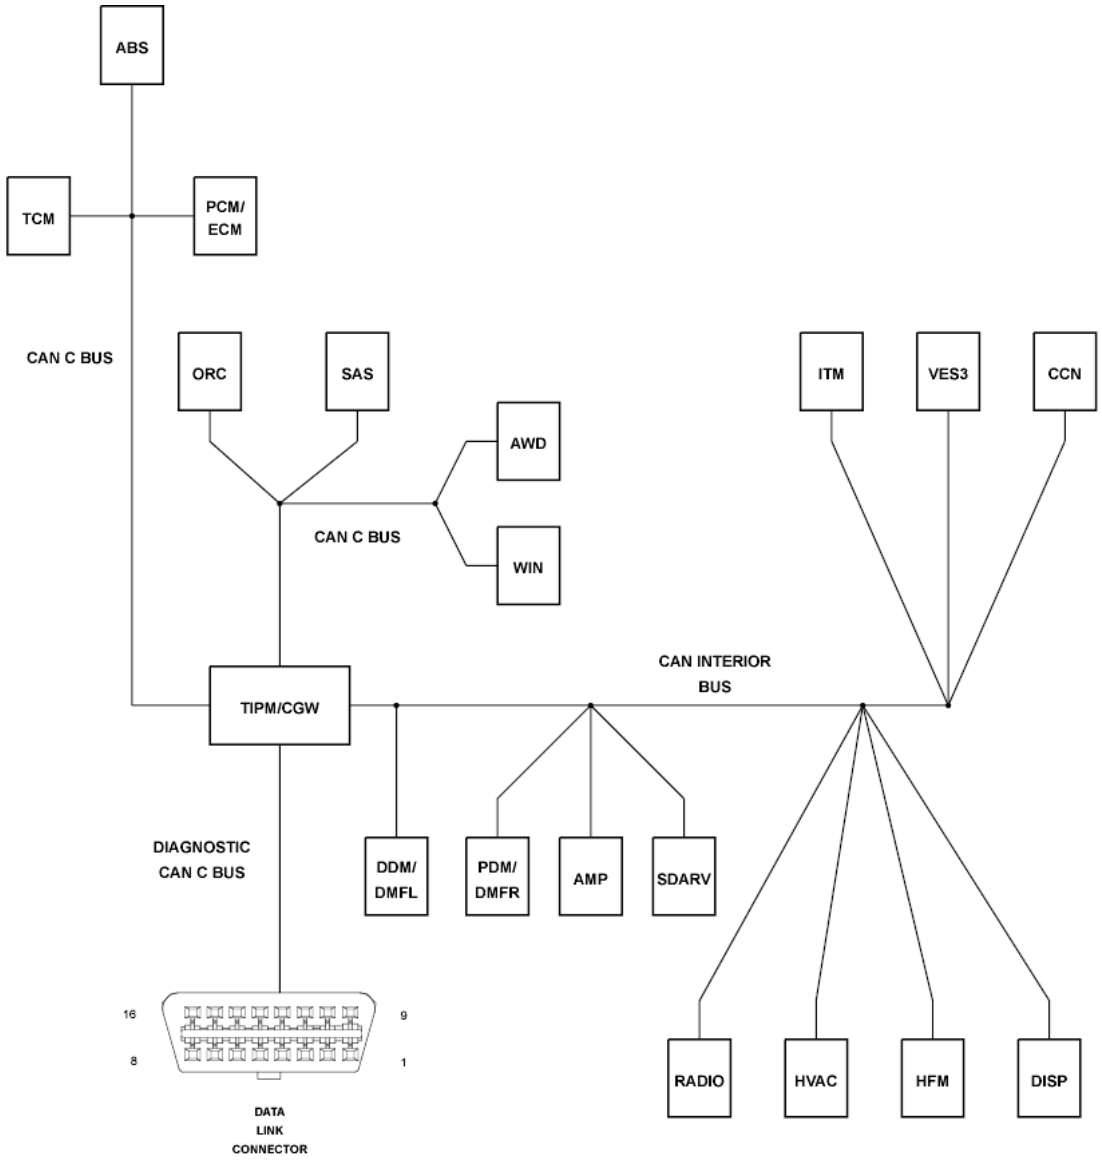

Fig. 57: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Driver Door Module (DDM) for approximately two to five seconds.

Possible Causes
(D51) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D52) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
DDM POWER AND GROUND
DRIVER DOOR MODULE
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0203-LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT** diagnostic procedure.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0249-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE - LAST ROW

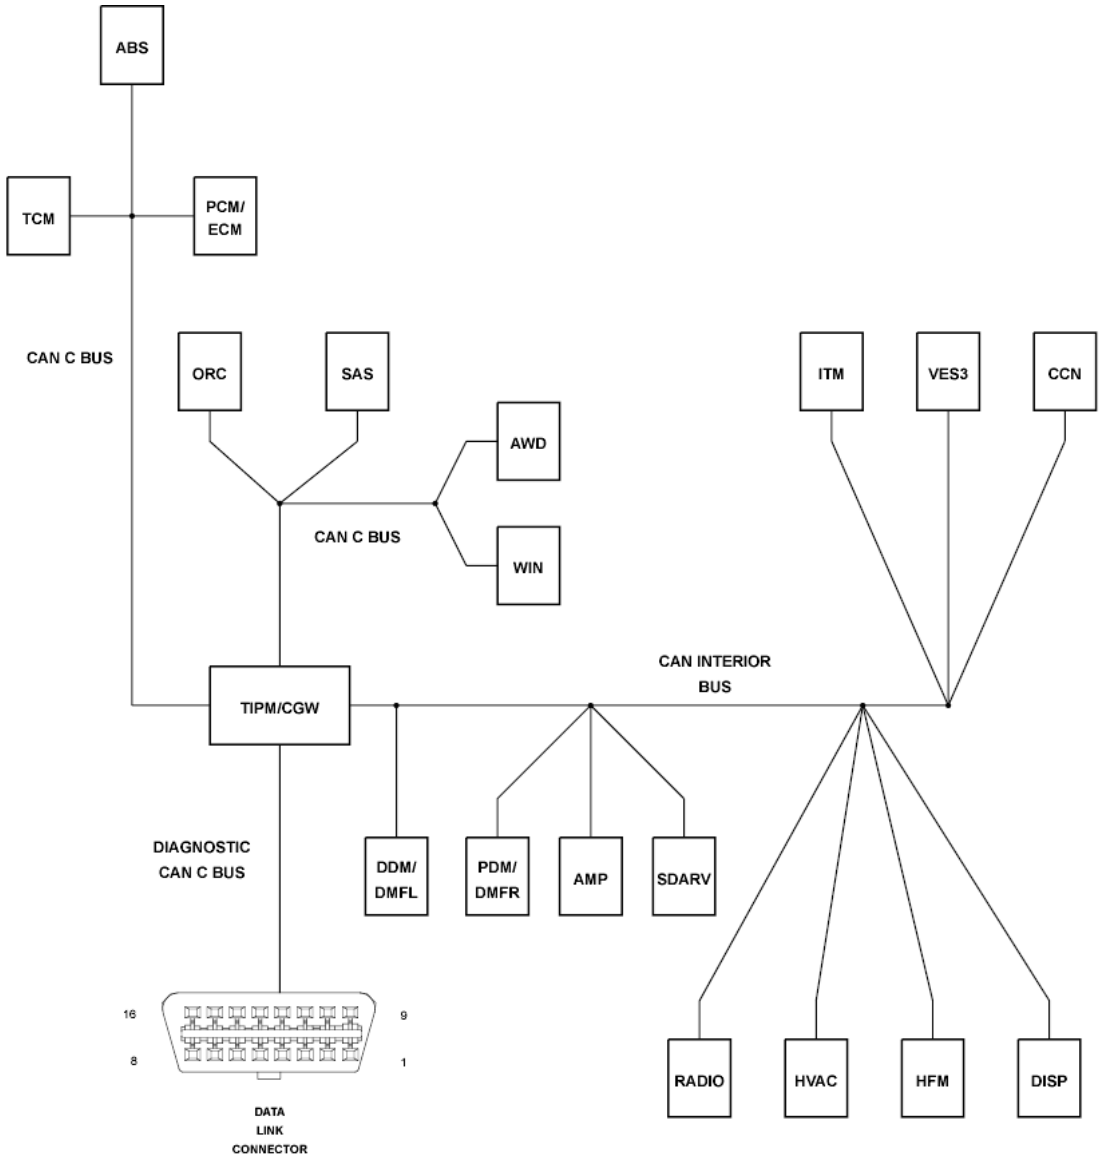

Fig. 58: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Vehicle Entertainment System Control Module (VES) for approximately two to five seconds.

Possible Causes
(D51) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE
(D52) CAN C BUS(-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
VES POWER AND GROUND
VEHICLE ENTERTAINMENT SYSTEM CONTROL MODULE
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0249-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE - LAST ROW** diagnostic procedure.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTCs diagnostic procedure.

B1000-92-A/C SWITCH REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. Many of the switches are momentary switches which are normally open or in the Off position and the

status changes when the switch button or knob is pushed or turned. An active Diagnostic trouble Code (DTC) indicates that the switch is stuck in an On position. A stored DTC indicates that the switch was stuck in a On position for more than two minutes but has since returned to its normal state of Off.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the A/C On/Off Control Switch is stuck in an On position for more than two minutes. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**
   1. Inspect the A/C Heater Control for an object or debris holding the A/C On/Off Control Switch in an On position.

      NOTE: Using the scan tool you can read the On/Off status of the control switch.

      Is the A/C On/Off control switch being held in or stuck On?

      Yes

      - Clean or repair the A/C Heater Control as necessary. If you are unable to clean the switch to where the switch can work properly, replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 2
2. **A/C HEATER CONTROL**
   1. Turn the ignition on.

2. Using the scan tool, erase HVAC DTCs.
3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of two minutes.
4. Using the scan tool, read HVAC DTCs.

   Does the scan tool display this DTC as Active or is the status of the switch reading On?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

B1009-92-RECIRCULATION SWITCH REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. Many of the switches are momentary switches which are normally open or in the Off position and the status changes when the switch button or knob is pushed or turned. An active DTC indicates that the switch is stuck in an On position. A stored Diagnostic trouble Code (DTC) indicates that the switch was stuck in a On position for more than two minutes but has since returned to its normal state of Off.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Recirculation mode switch is stuck in a On position for more than two minutes. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**
    1. Inspect the A/C Heater Control for an object or debris holding the Recirculation mode switch in an On position.

        NOTE: Using the scan tool you can read the On/Off status of the control switch.

        Is the Recirculation mode switch being held in or stuck On?

        Yes

        - Clean or repair the A/C Heater Control as necessary. If you are unable to clean the switch to where the switch can work properly, replace and program the A/C Heater Control in accordance with the Service Information.
        - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

        No

        - Go to step 2
2. **A/C HEATER CONTROL**
    1. Turn the ignition on.
    2. Using the scan tool, erase HVAC DTCs.
    3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of two minutes.
    4. Using the scan tool, read HVAC DTCs.

        Does the scan tool display this DTC as Active or is the status of the switch reading On?

        Yes

        - Replace and program the A/C Heater Control in accordance with the Service Information.
        - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

        No

        - Test complete.
        - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC -**

Standard Procedure.

B1015-92-EBL / REAR DEFROST SWITCH REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. Many of the switches are momentary switches which are normally open or in the Off position and the status changes when the switch button or knob is pushed or turned. An active DTC indicates that the switch is stuck in an On position. A stored Diagnostic Trouble Code (DTC) indicates that the switch was stuck in a On position for more than two minutes but has since returned to its normal state of Off.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Electric Back light (EBL) Electronic Rear Defrost switch is stuck in an On position for more than two minutes. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**
   1. Inspect the A/C Heater Control for an object or debris holding the (EBL) Electronic Rear Defrost switch in an On position.

      NOTE: Using the scan tool you can read the On/Off status of the control switch.

      Is the (EBL) Electronic Rear Defrost switch being held in or stuck in an On?

      Yes

      - Clean or repair the A/C Heater Control as necessary. If you are unable to clean the switch to

where the switch can work properly, replace and program the A/C Heater Control in accordance with the Service Information.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 2

2. **A/C HEATER CONTROL**
   1. Turn the ignition on.
   2. Using the scan tool, erase HVAC DTCs.
   3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of two minutes.
   4. Using the scan tool, read HVAC DTCs.

   Does the scan tool display this DTC as Active or is the status of the switch reading On?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

B1030-11-EVAPORATOR TEMPERATURE SENSOR - CIRCUIT SHORT TO GROUND

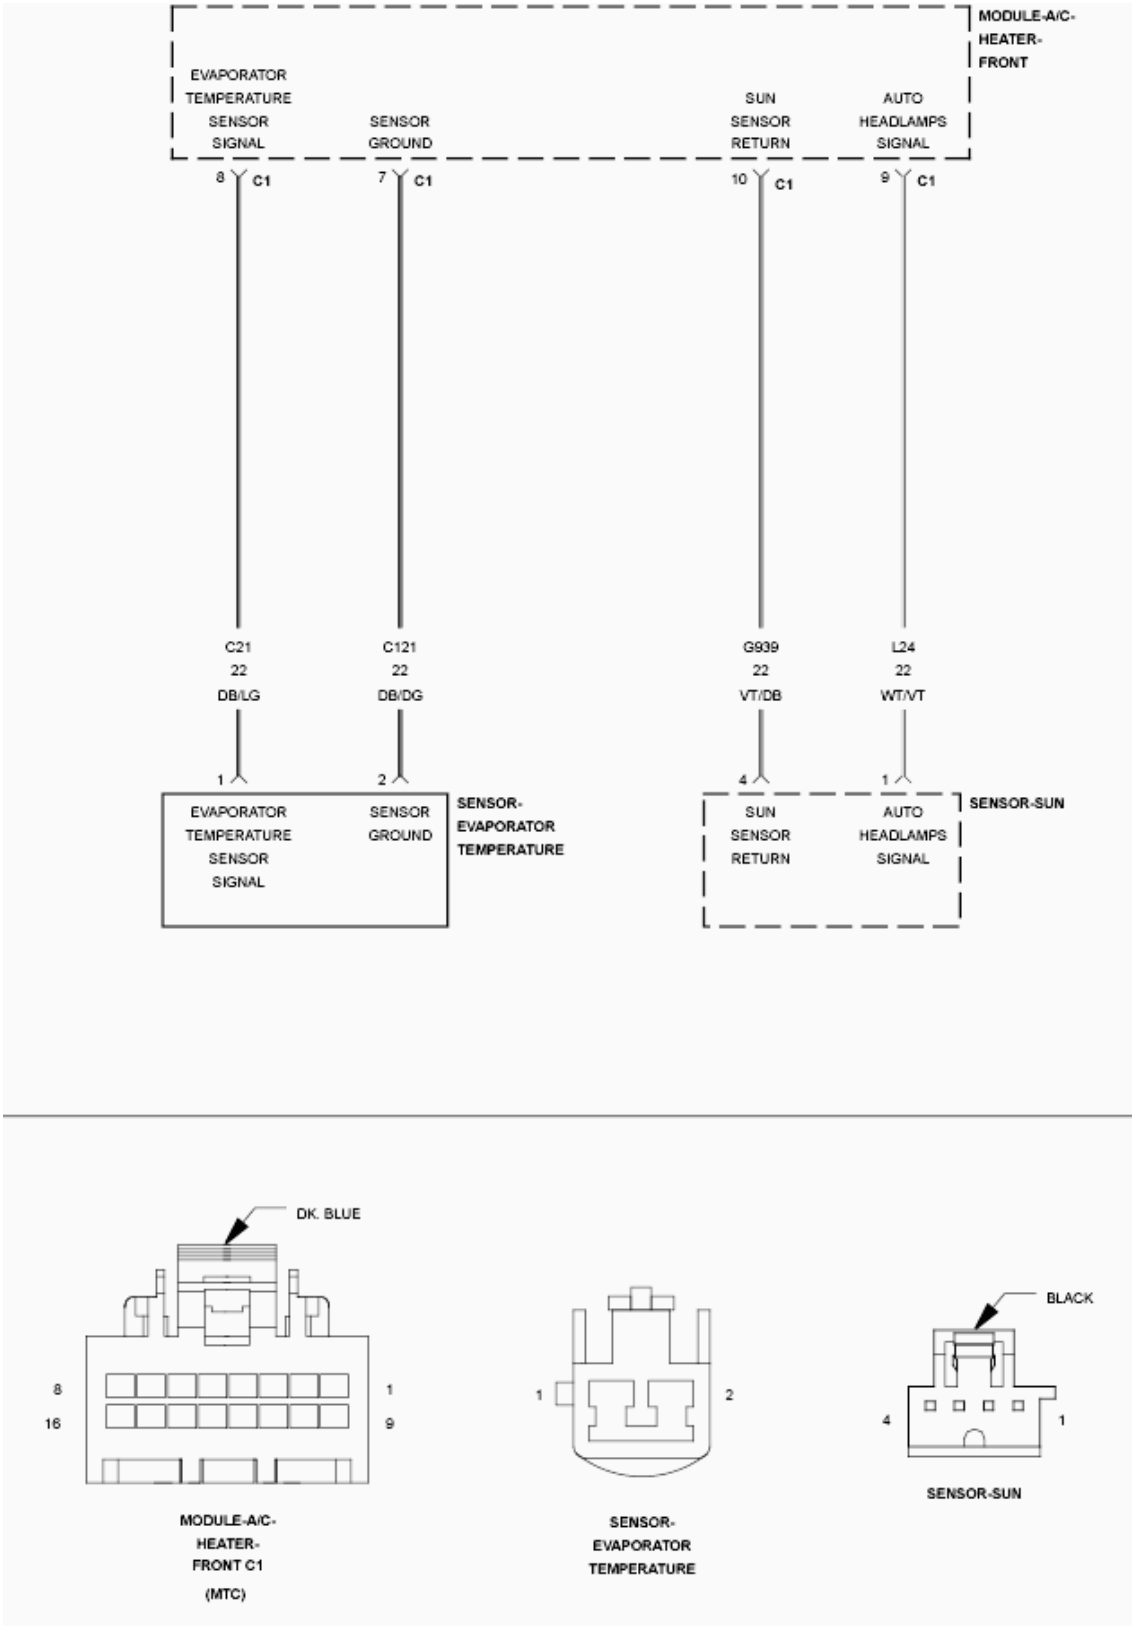

Fig. 59: Evaporator Temperature Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  The Evaporator Temperature Sensor voltage input to the A/C Heater Control is equal to or below 0.9 volts for a continuous period of 1.2 seconds. If the A/C Heater Control detects a valid voltage, the Diagnostic Trouble Code (DTC) will change from active to stored and will stay stored for 100 ignition cycles.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND EVAPORATOR TEMPERATURE SENSOR A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 5
2. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

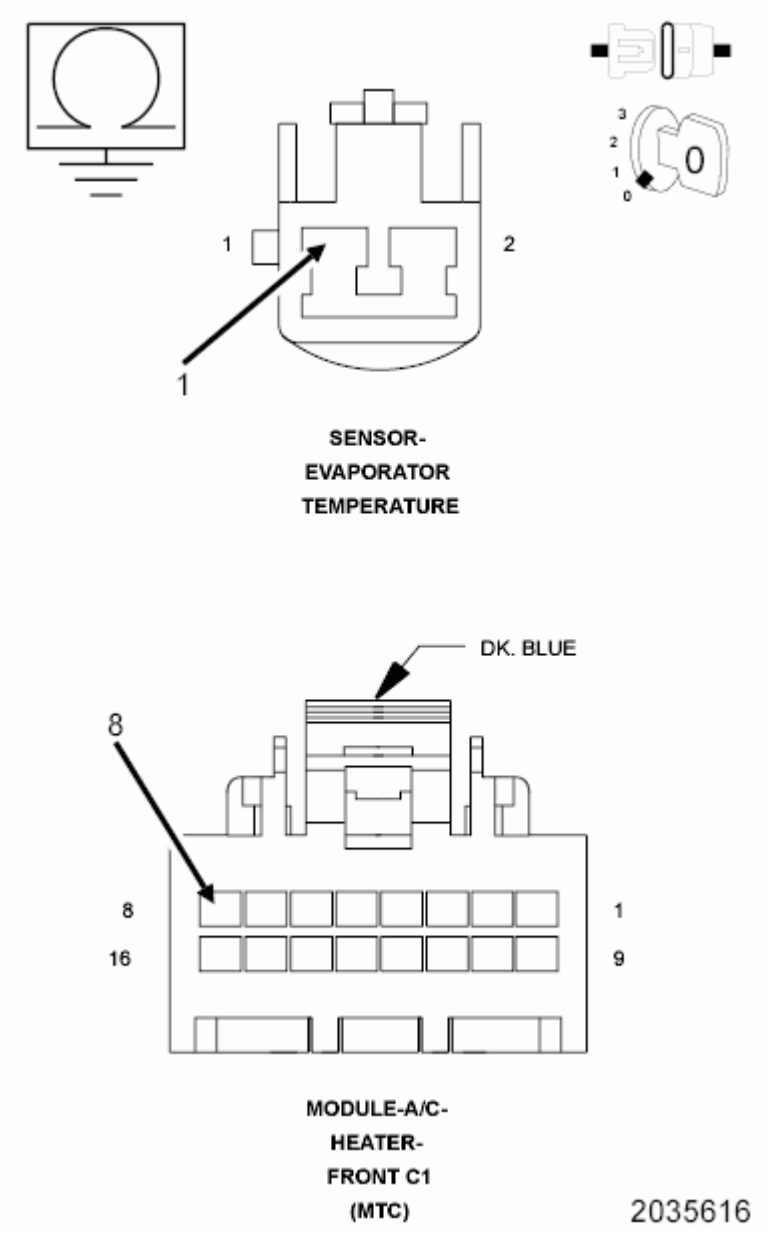

Fig. 60: Checking Evaporator Temperature Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Evaporator Temperature Sensor harness connector.
4. Measure the resistance between ground and the (C21) Evaporator Temperature Sensor Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 3

3. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (C121) SENSOR GROUND CIRCUIT**

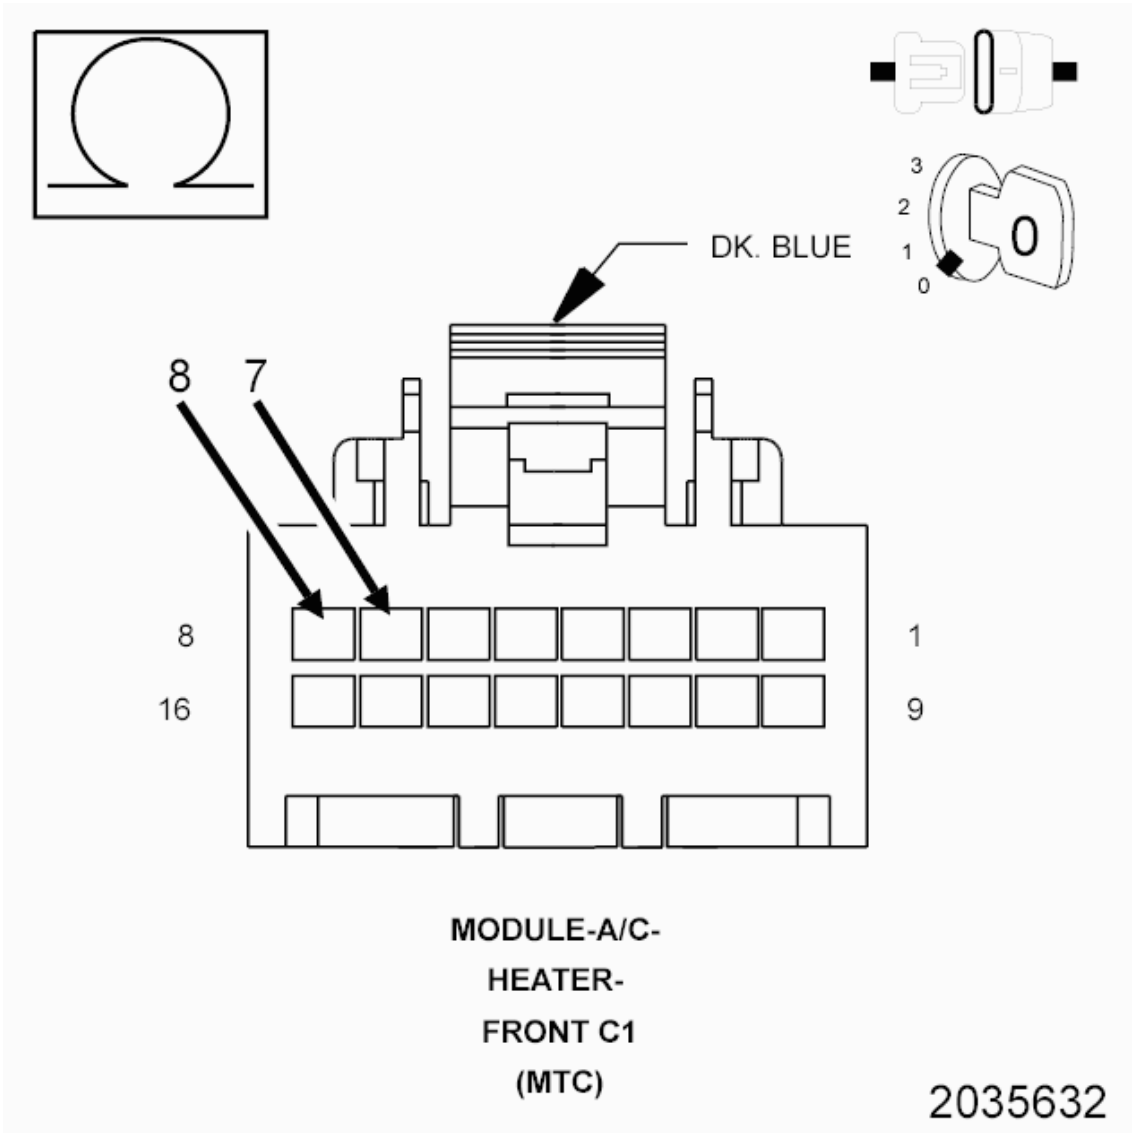

Fig. 61: Checking Evaporator Temperature Sensor Signal Circuit For A Short To Sensor Ground Circuit
Courtesy of CHRYSLER LLC

1. Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the

(C121) Sensor Ground circuit.

Is the resistance below 100k Ohms?

Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to (C121) Sensor Ground circuit.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
   1. Replace the Evaporator Temperature Sensor in Accordance with the Service Information.
   2. Cycle the ignition off for 30 seconds then back on.
   3. With the scan tool, read HVAC DTCs.

   Does this DTC reset?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B1030-12-EVAPORATOR TEMPERATURE SENSOR - CIRCUIT SHORT TO BATTERY

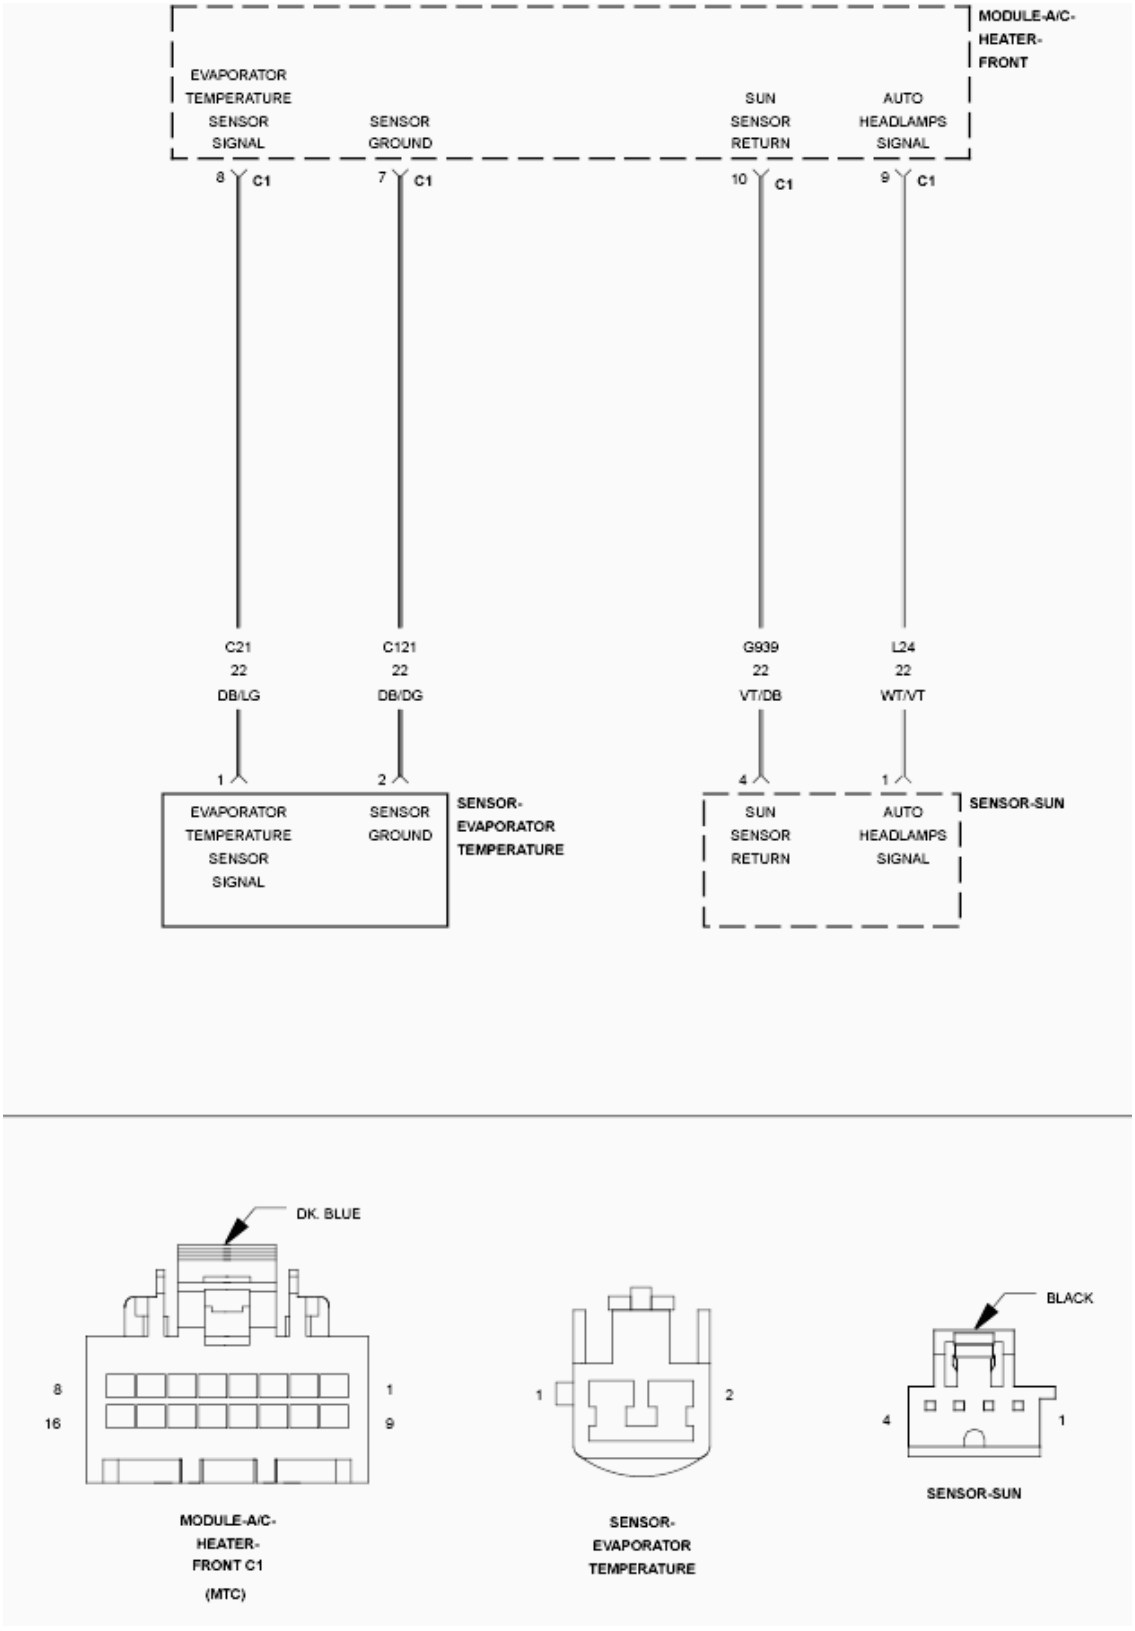

Fig. 62: Evaporator Temperature Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The Evaporator Temperature Sensor resistance changes in conjunction to temperature. The sensor thermistor forms the lower half of a voltage divider and the upper half of the voltage divider is provided by a pull up resistor to 5.0 volts.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  The Evaporator Temperature Sensor voltage input to the A/C Heater Control is equal to or above 4.8 volts for a continuous period of two seconds. If the A/C Heater Control detects a valid voltage, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT VOLTAGE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 7
2. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT VOLTAGE**

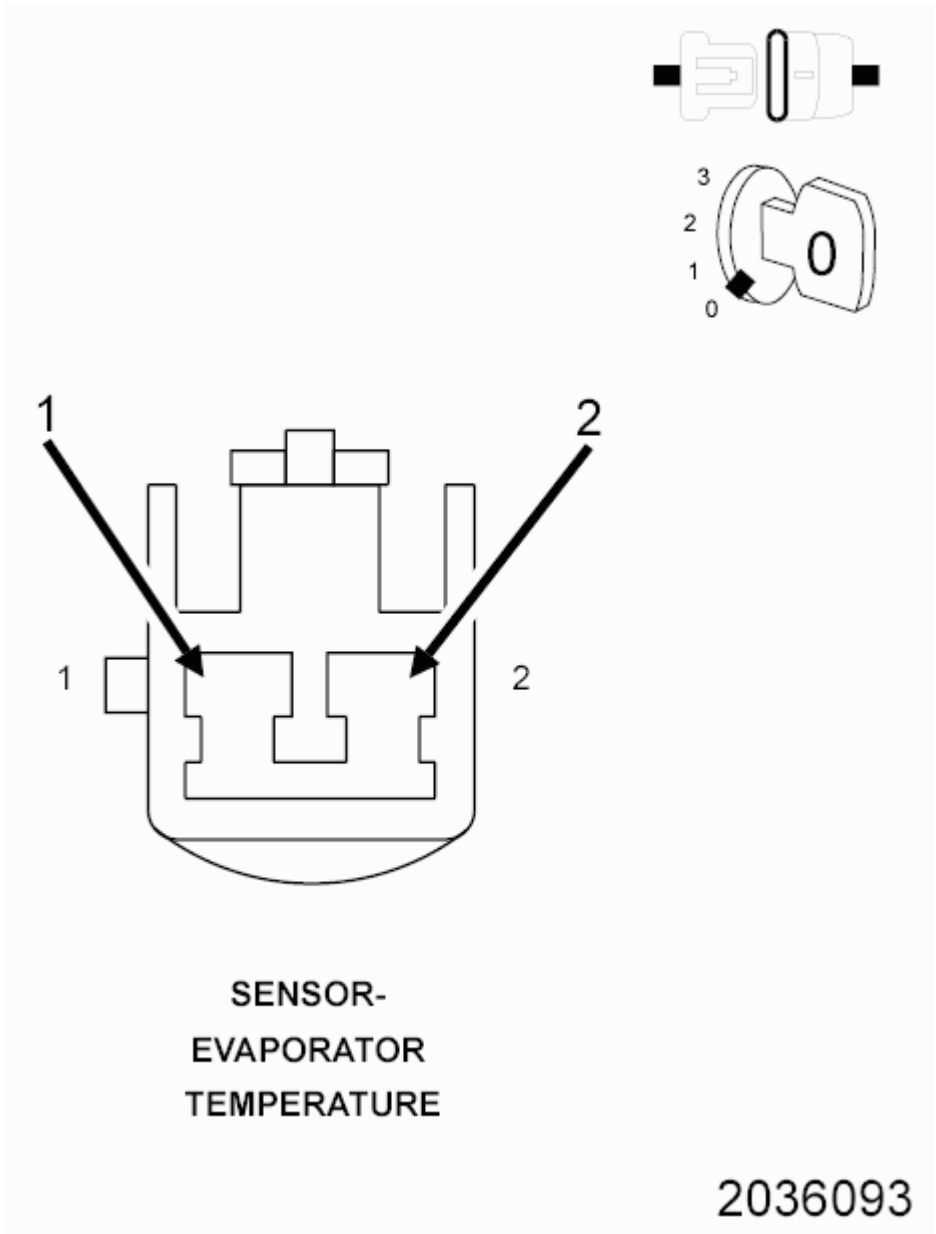

Fig. 63: Checking Evaporator Temperature Sensor Signal Circuit Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Evaporator Temperature Sensor harness connector.

NOTE: Due to the small terminal and pin size of the Evaporator Temperature Sensor and harness connector, make sure to not damage the terminals in this process.

3. Connect a jumper wire between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the Evaporator Temperature Sensor harness connector.

4. Ignition on, engine not running.
5. With the scan tool, read the Evaporator Temperature Sensor voltage.

   Is the voltage below 0.1 of a volt?

   Yes

   - Replace the Evaporator Temperature Sensor in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 3

3. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

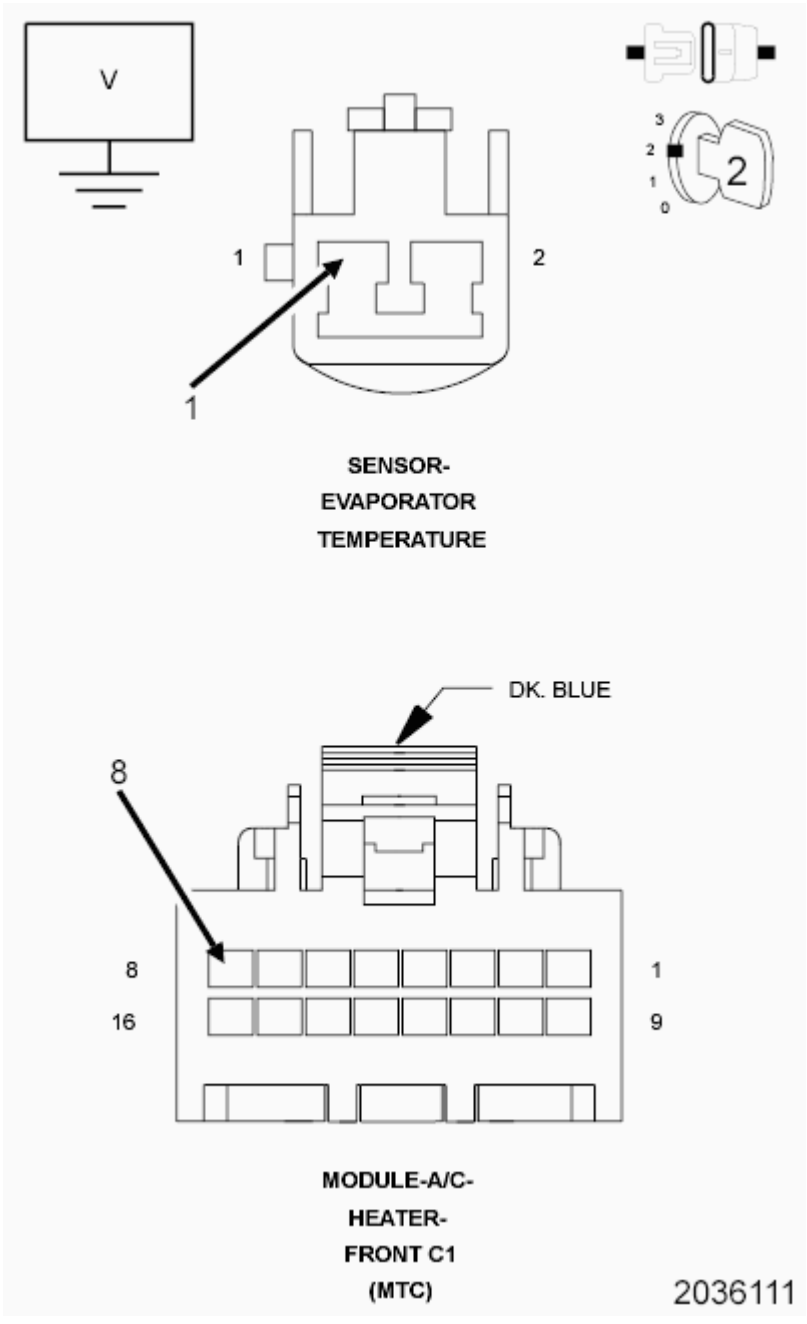

Fig. 64: Checking Evaporator Temperature Sensor Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the jumper wire from the Evaporator Temperature Sensor harness connector.
3. Disconnect the A/C Heater Control C1 harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit

Is there any voltage present?

Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

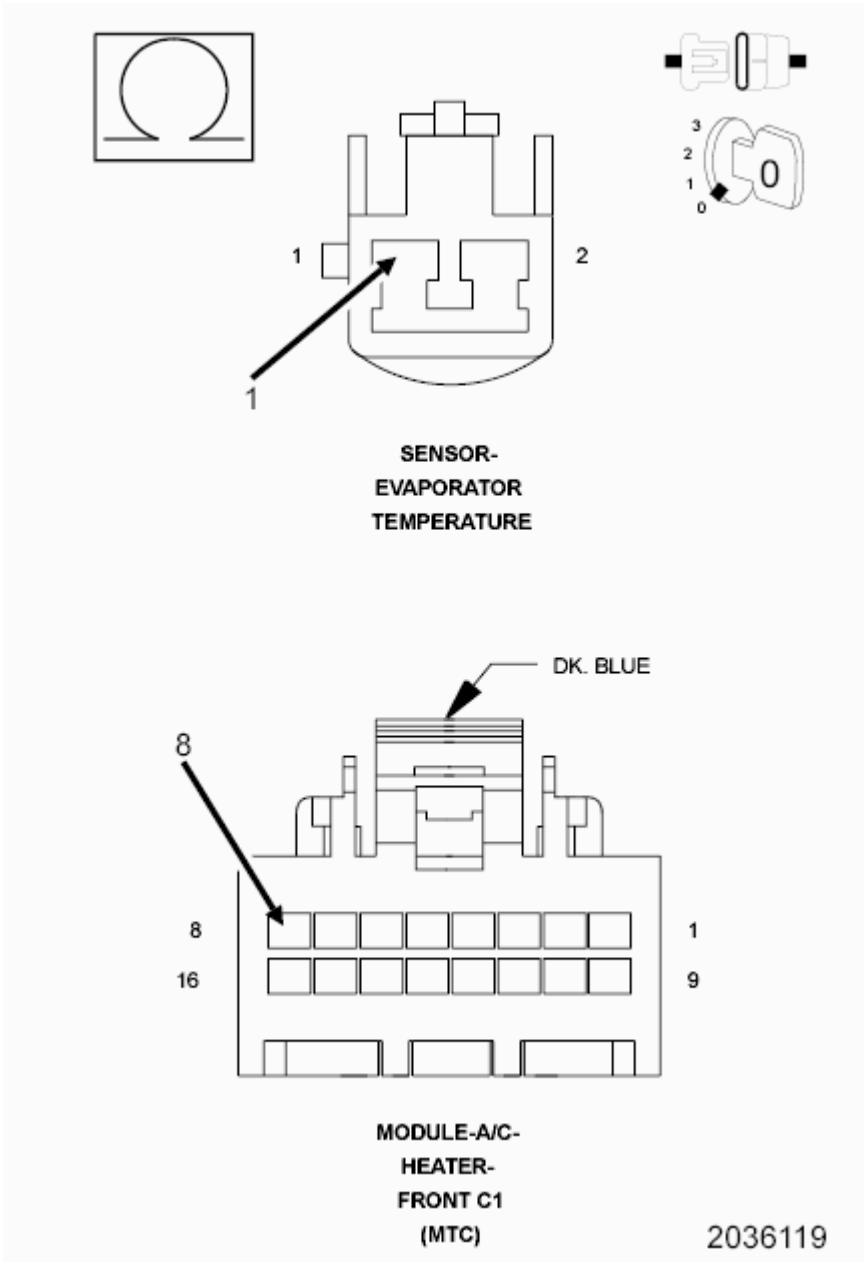

Fig. 65: Checking Evaporator Temperature Sensor Signal Circuit For An Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the A/C Heater Control C1 harness connector and the Evaporator Temperature Sensor harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open or high

resistance.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 5

5. **CHECK THE (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

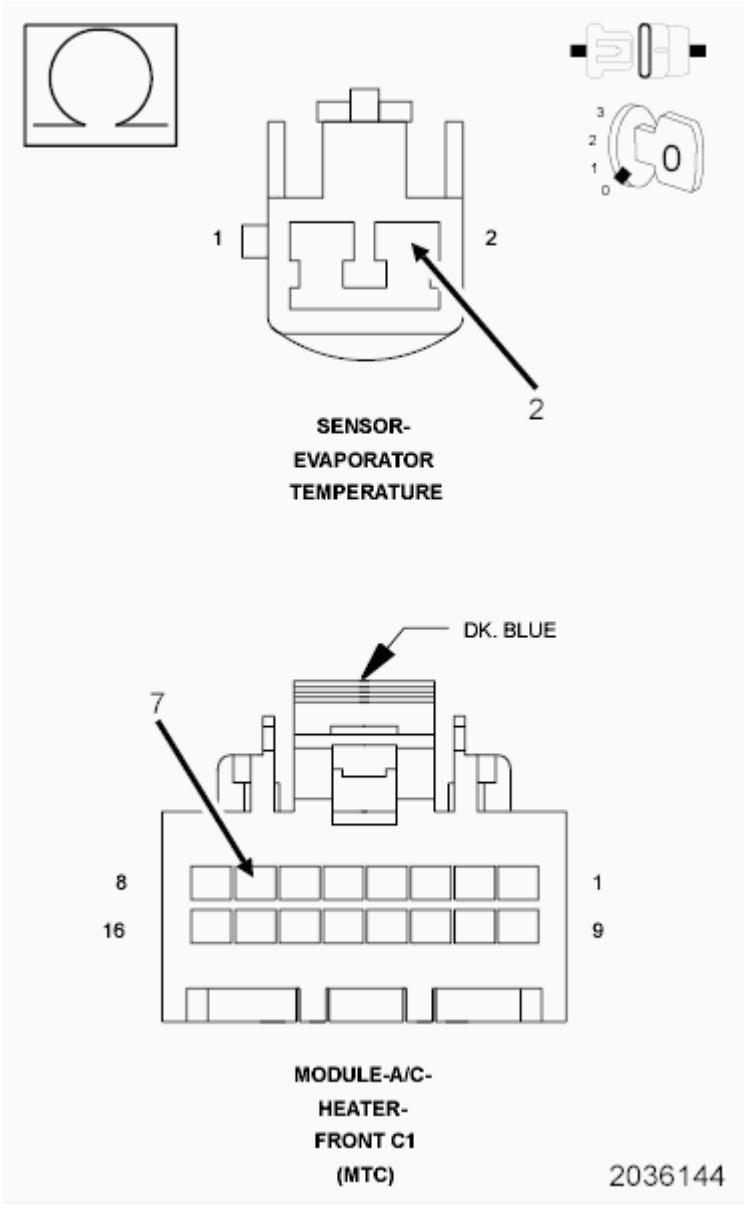

Fig. 66: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C121) Sensor Ground circuit between the A/C Heater Control C1

harness connector and the Evaporator Temperature Sensor harness connector.

Is the resistance above 1.0 Ohm?

Yes

- Repair the (C121) Sensor Ground circuit for an open.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
   1. Replace the Evaporator Temperature Sensor in Accordance with the Service Information.
   2. Cycle the ignition off for 30 seconds then back on.
   3. With the scan tool, read HVAC DTCs.

   Does this DTC reset?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B1058-11-RECIRCULATION DOOR CONTROL - CIRCUIT SHORT TO GROUND

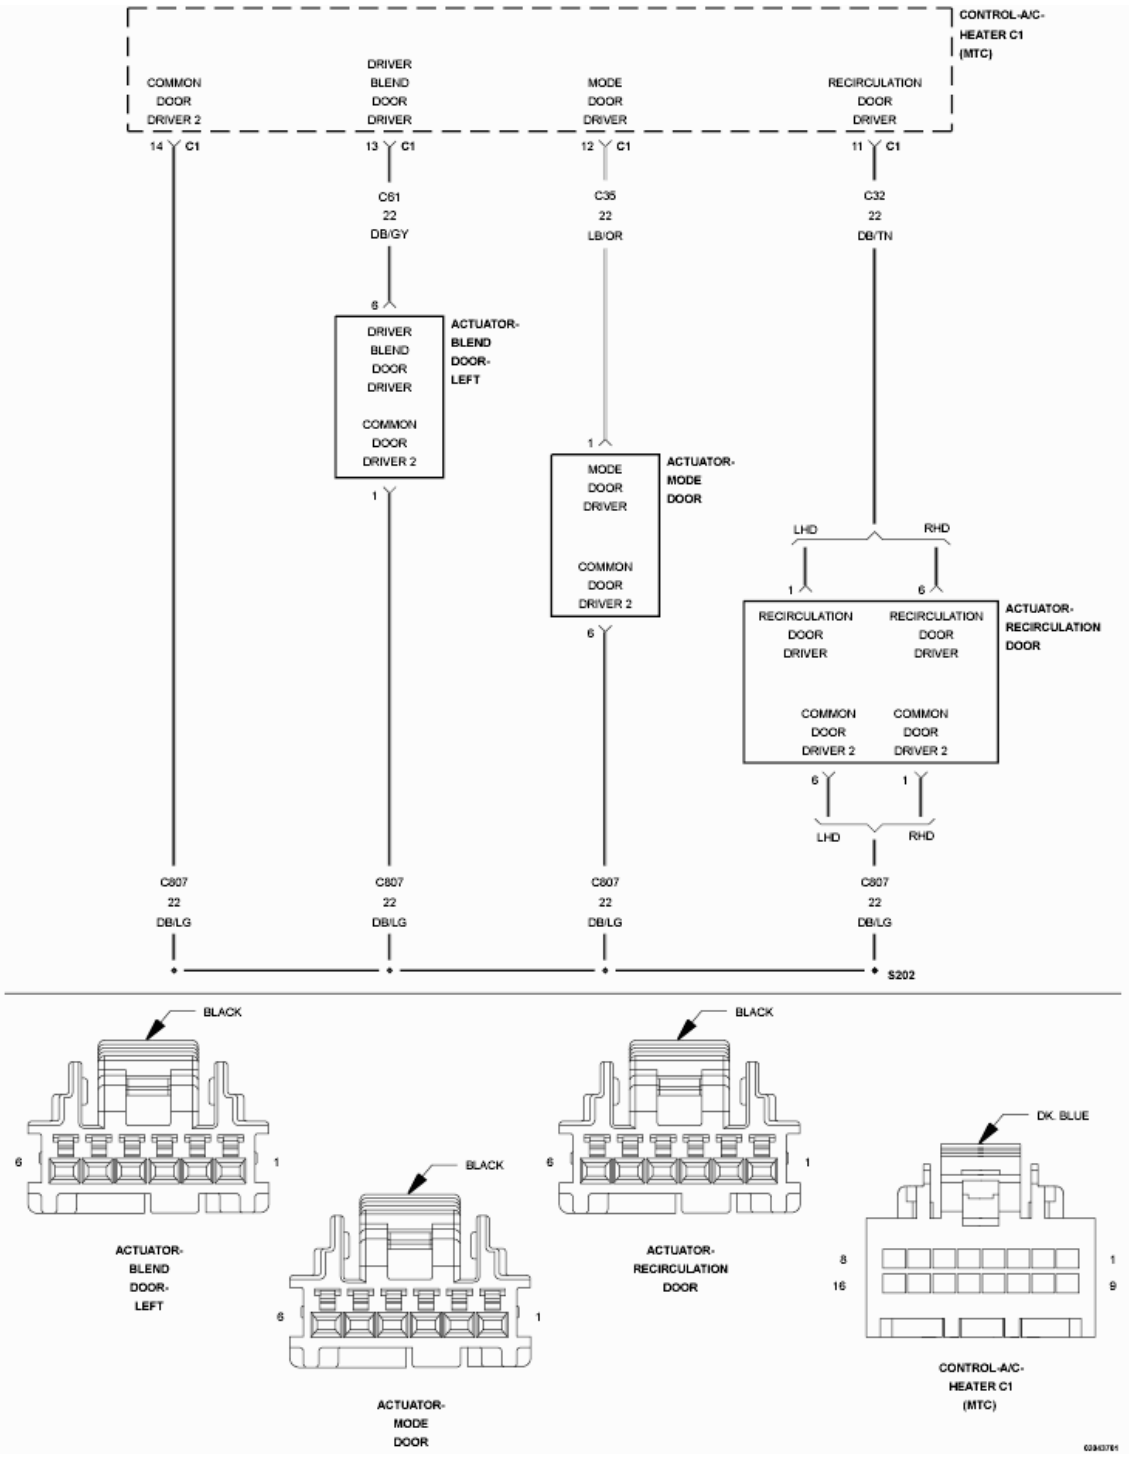

Fig. 67: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  Continuously with the ignition on.

- **Set Condition:**

  The A/C Heater Control detects a short to ground on the Recirculation Door Driver circuit. If the A/C Heater Control detects valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 3

      No

      - Go to step 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

Yes

- Go to step 3

No

- Go to step 6

3. **CHECK THE (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

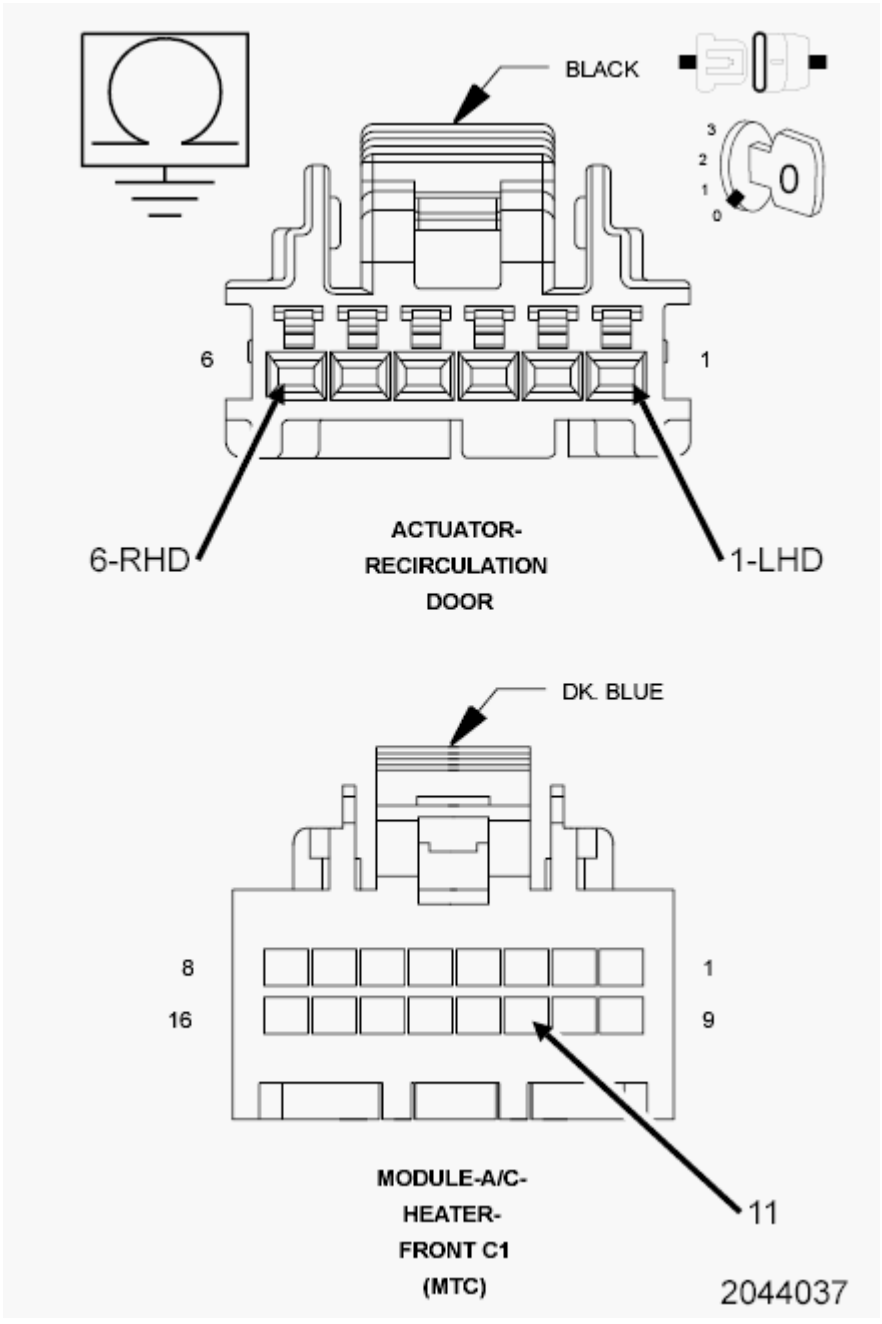

Fig. 68: Checking Recirculation Door Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Recirculation Door Actuator harness connector.
4. Measure the resistance between ground and the (C32) Recirculation Door Driver circuit.

   Is the resistance below 100k Ohms?

Yes

- Repair the (C32) Recirculation Door Driver circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**

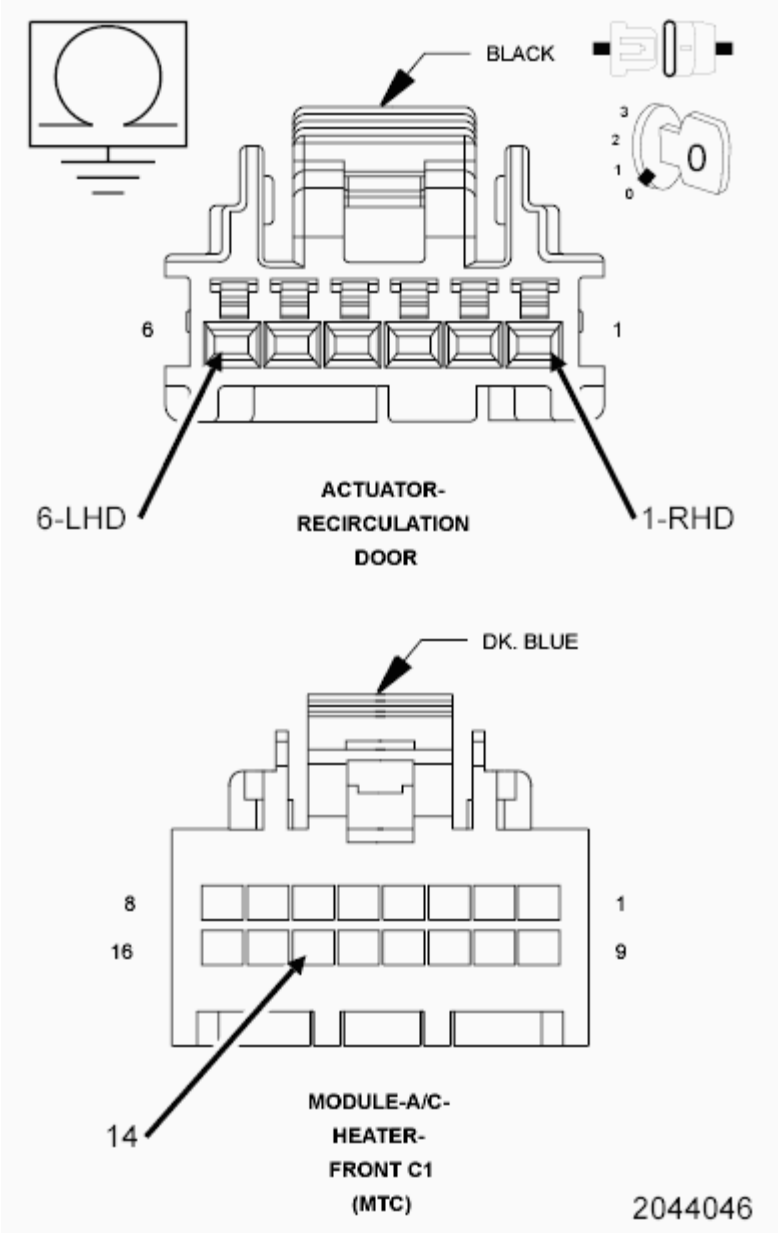

Fig. 69: Checking Common Door Driver 2 Circuit For A Short To Ground

Courtesy of CHRYSLER LLC

1. Measure the resistance between ground and the (C807) Common Door Driver 2 circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
   1. Replace the Recirculation Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B1058-12-RECIRCULATION DOOR CONTROL - CIRCUIT SHORT TO BATTERY

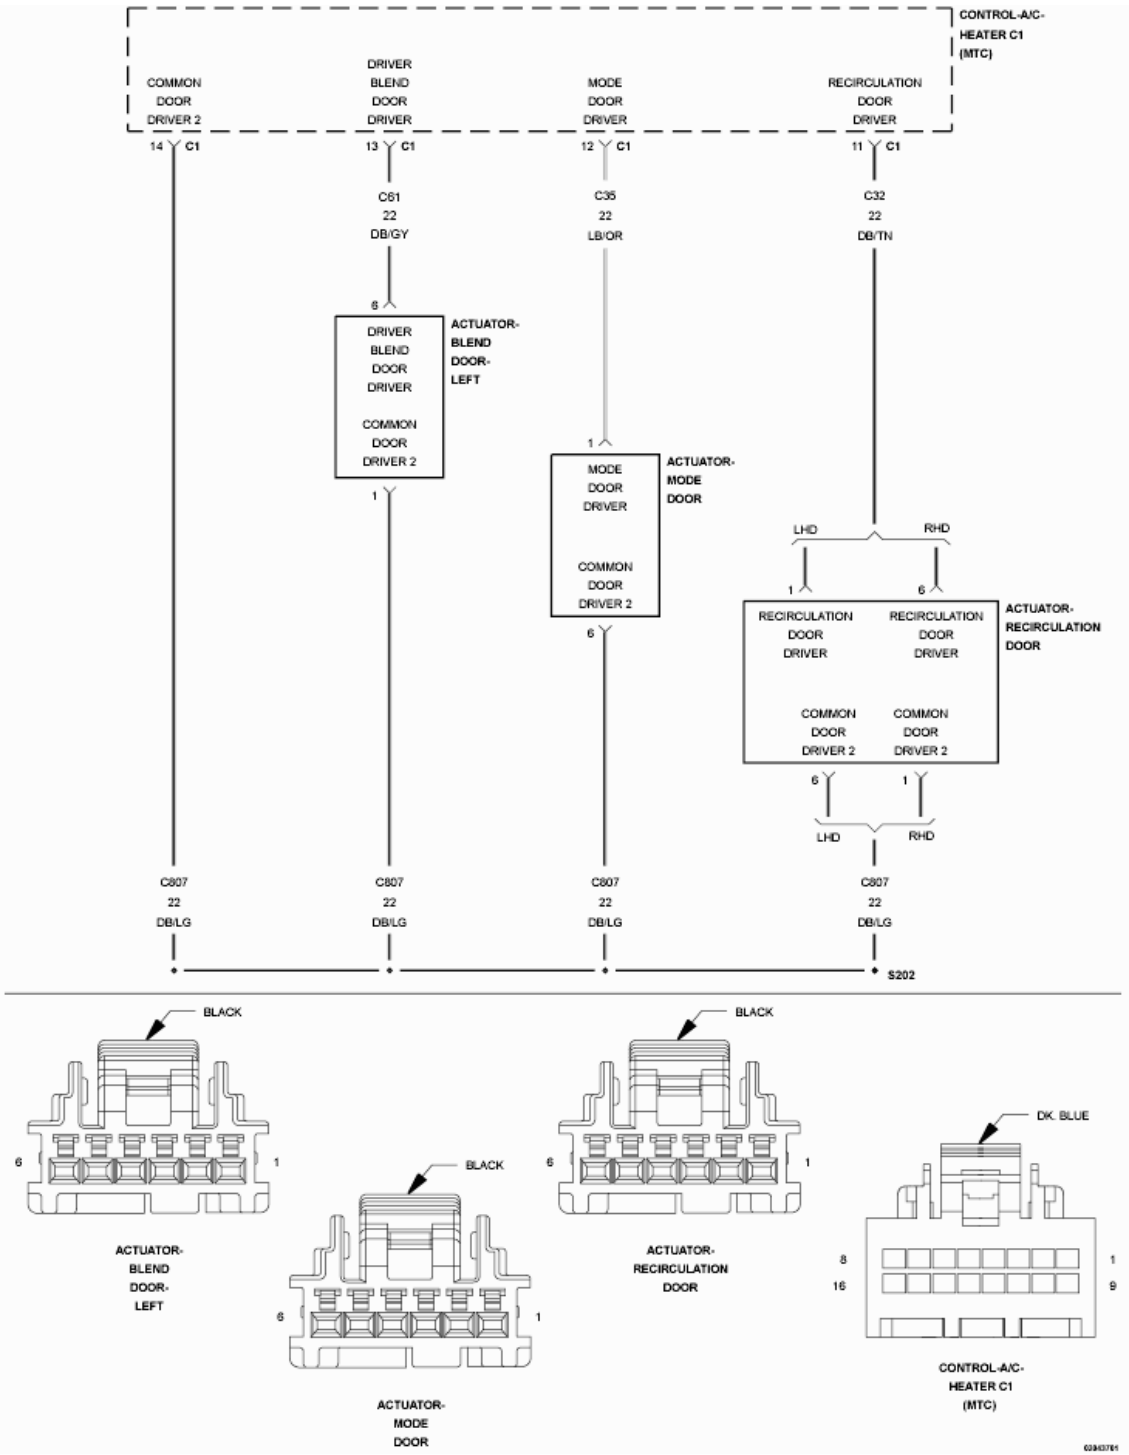

Fig. 70: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. 1. Measure the resistance of the (C807) Common Door Driver 2 circuit between the A/C Heater Control C1 harness connector and the Recirculation Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Replace the Recirculation Door Actuator in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

B1058-92-RECIRCULATION DOOR CONTROL - PERFORMANCE OR INCORRECT OPERATION

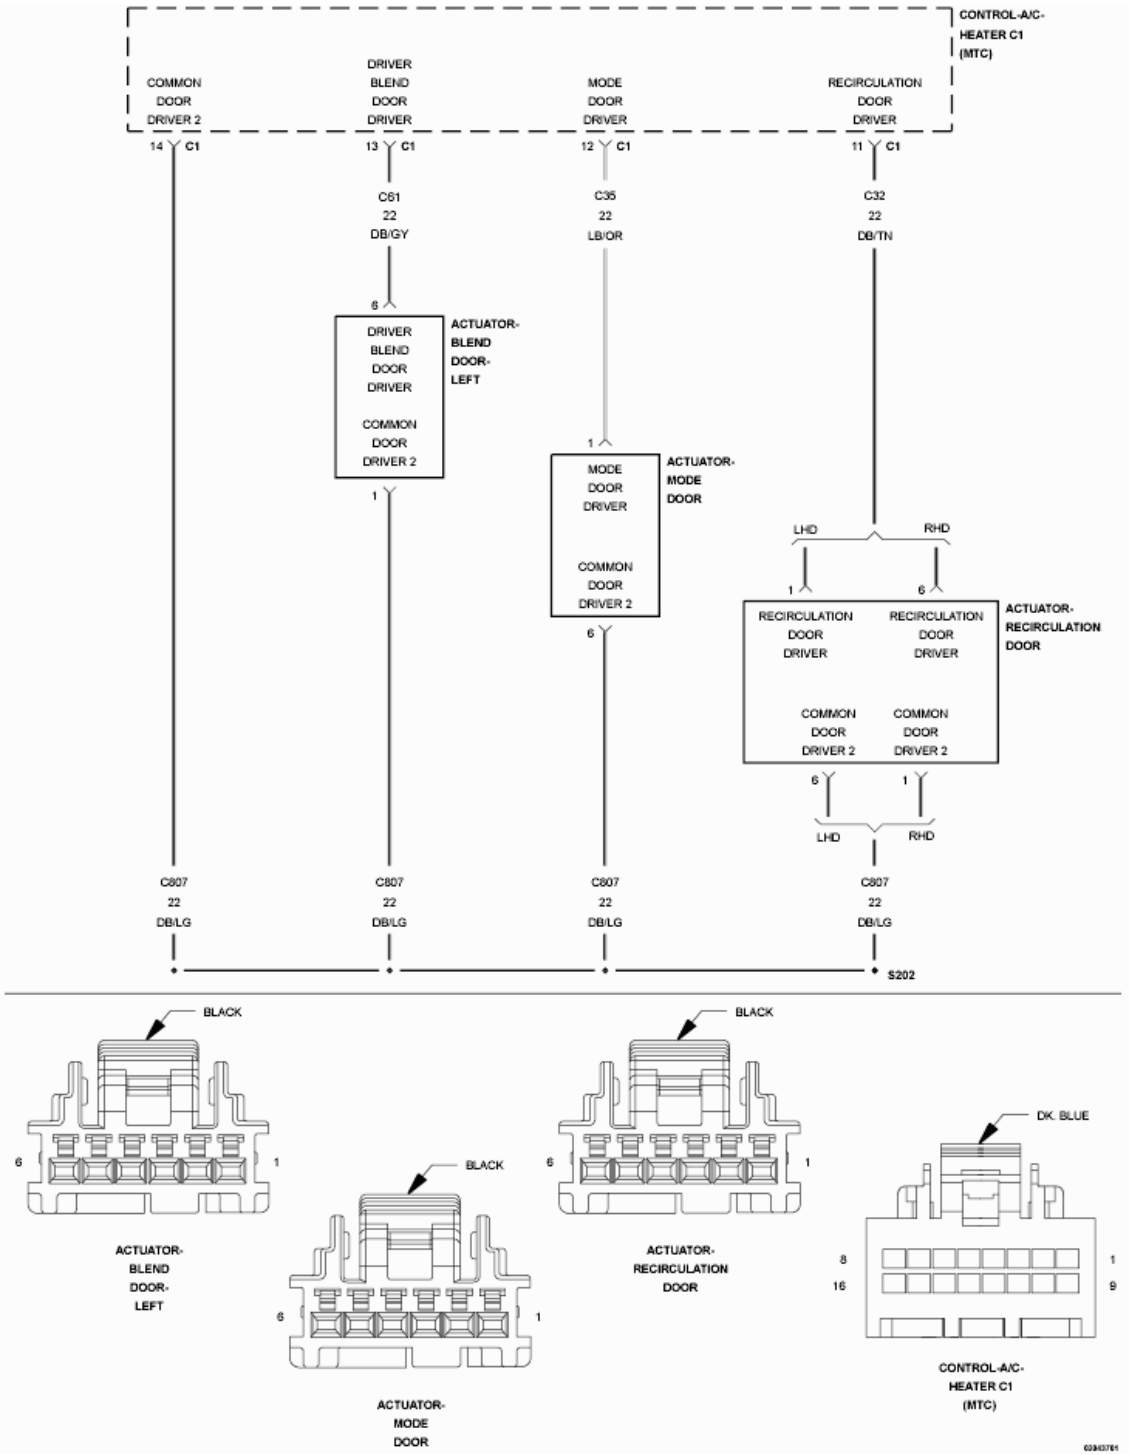

Fig. 77: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  With the ignition on and an actuator movement is commanded by the A/C Heater Control or during an HVAC Actuator Calibration Test.

- **Set Condition:**

  If an actuator move is commanded by A/C Heater Control and no feedback pulses are detected in either clockwise or counterclockwise movement for the period of 15 seconds. If the A/C Heater Control detects valid feedback pulses for 15 seconds, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO VOLTAGE
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
RECIRCULATION DOOR BINDING
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

No

- Go to step 9

2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did any other HVAC DTCs set while performing the Actuator Calibration Test?

      Yes

      - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 3

3. **CHECK THE (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

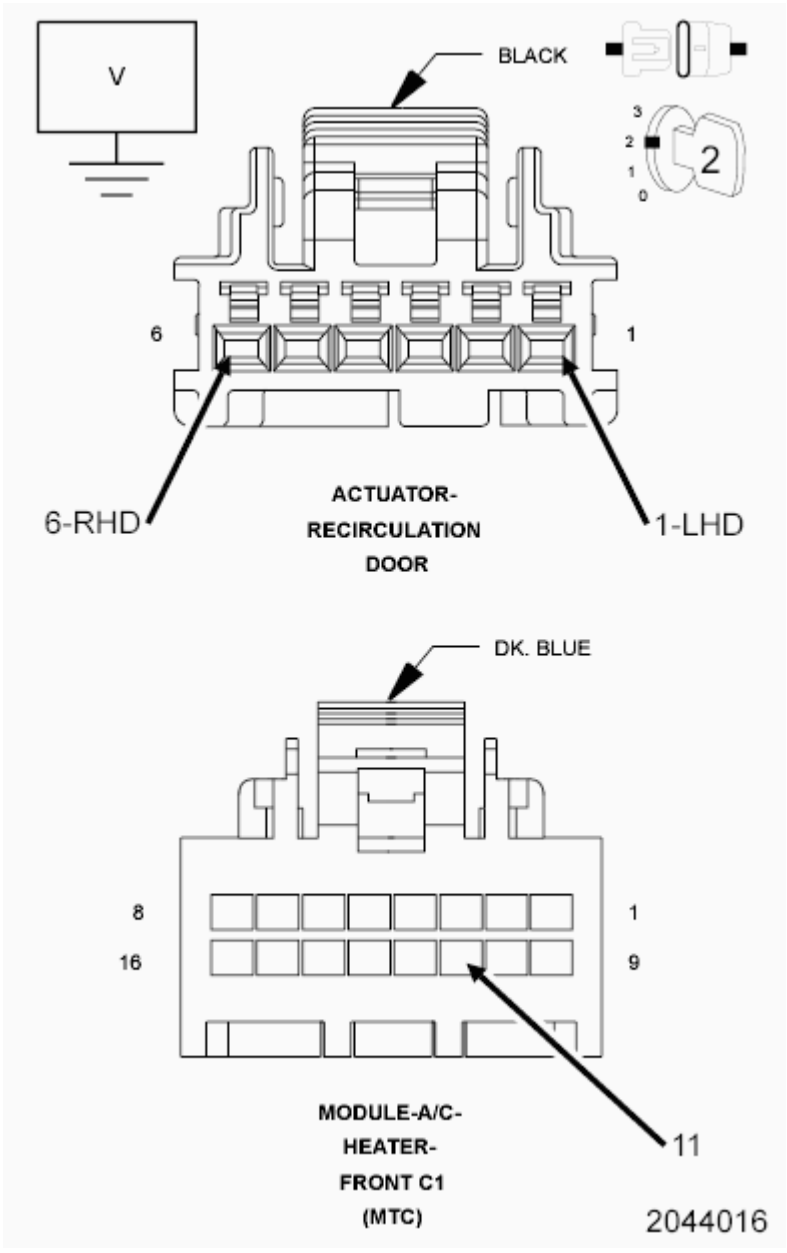

Fig. 78: Checking Recirculation Door Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Recirculation Door Actuator harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (C32) Recirculation Door Driver circuit.

   Is there any voltage present?

Yes

- Repair the (C32) Recirculation Door Driver circuit for a short to voltage.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO VOLTAGE**

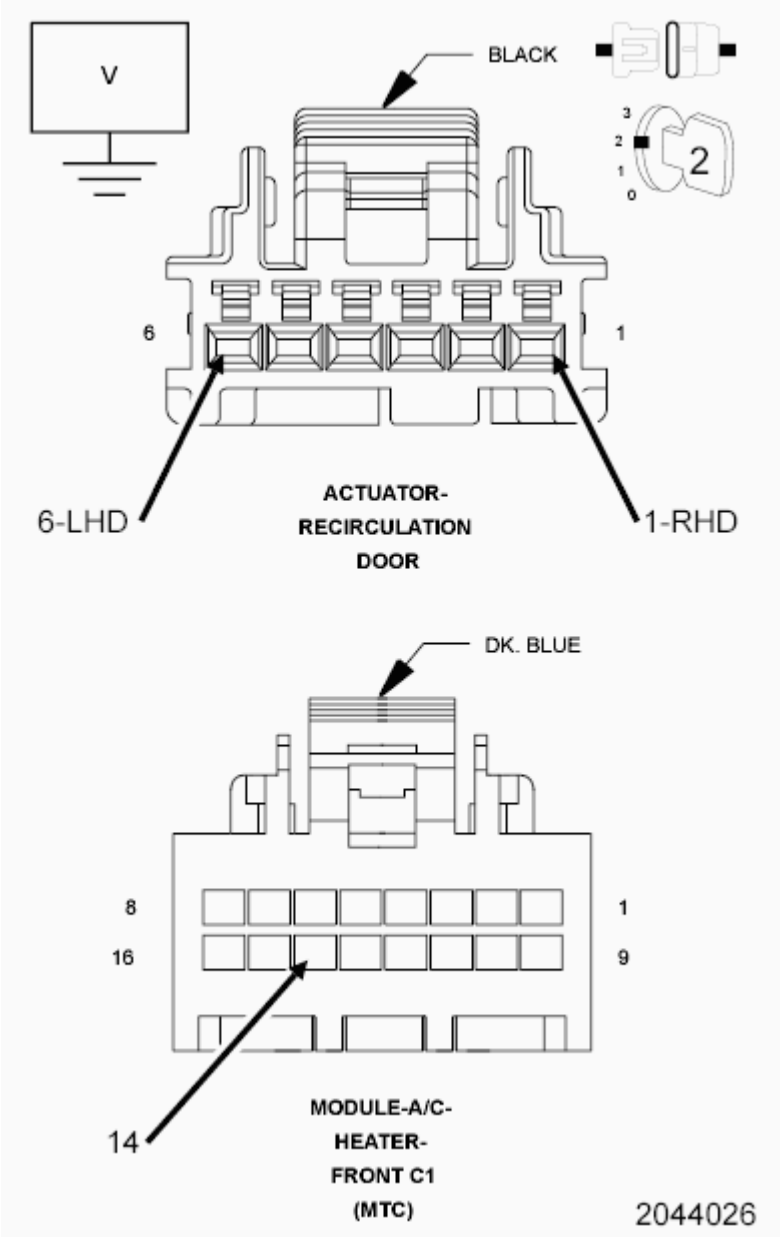

Fig. 79: Checking Common Door Driver 2 Circuit For A Short To Voltage

Courtesy of CHRYSLER LLC

1. Measure the voltage of the (C807) Common Door Driver 2 circuit.

   Is there any voltage present?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK THE (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

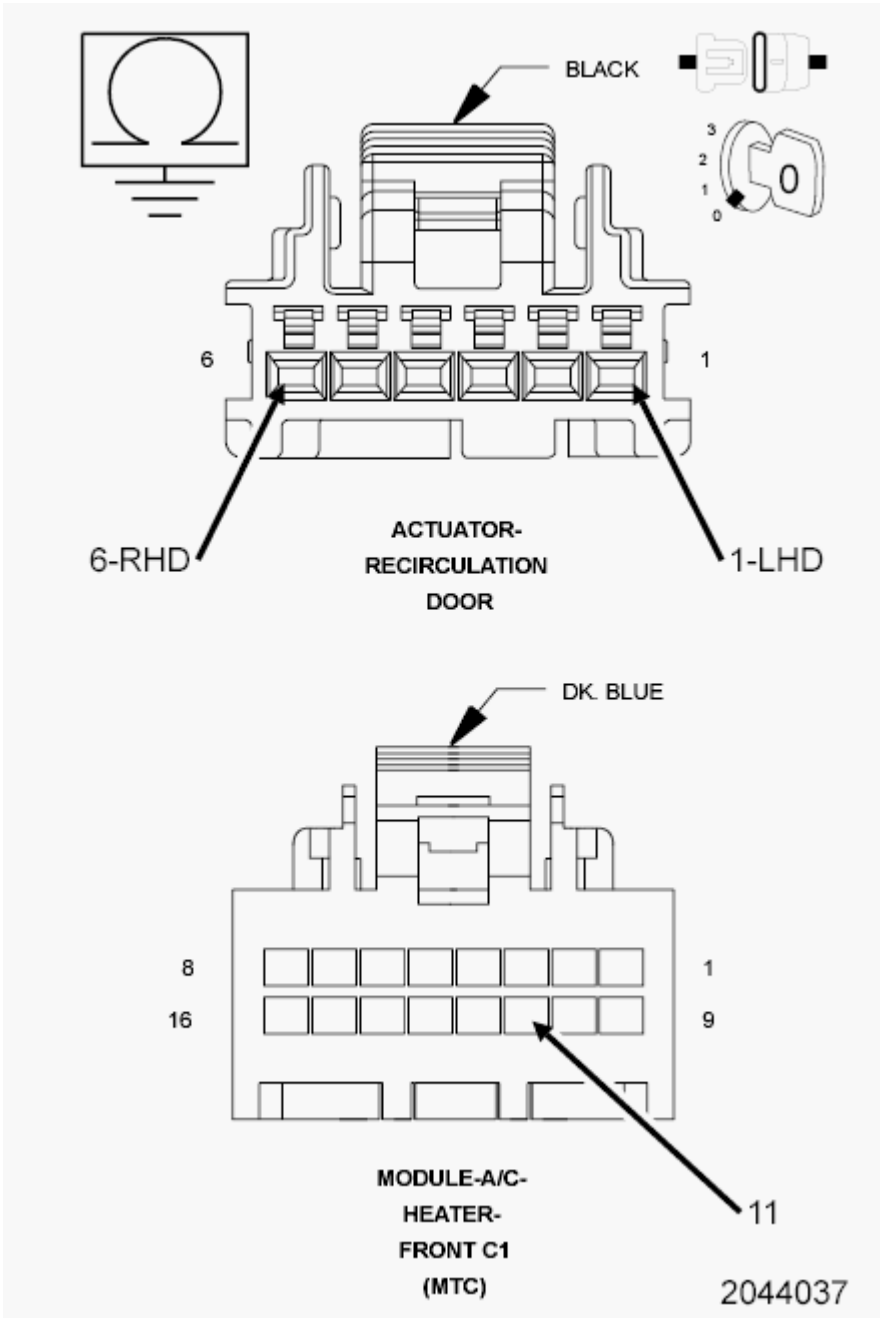

Fig. 80: Checking Recirculation Door Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between ground and the (C32) Recirculation Door Driver circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (C32) Recirculation Door Driver circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**

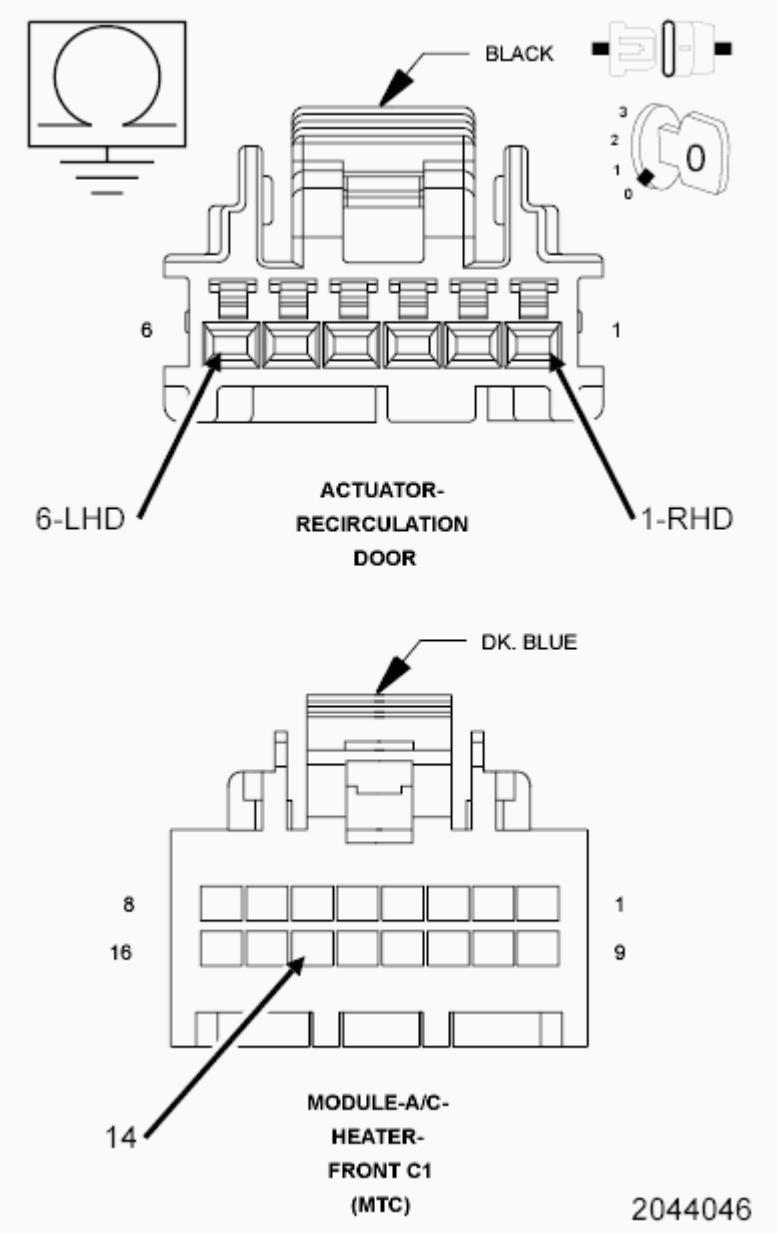

Fig. 81: Checking Common Door Driver 2 Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Measure the resistance between ground and the (C807) Common Door Driver 2 circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK THE RECIRCULATION DOOR**
   1. Remove the Recirculation Door Actuator and check the Recirculation Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Recirculation Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 8

8. **CHECK THE RECIRCULATION DOOR ACTUATOR**
   1. Replace the Recirculation Door Actuator in accordance with the Service Information.
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

    No

    - Test complete.

B105C-00-RECIRCULATION DOOR TRAVEL RANGE TOO SMALL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will

change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RELATED DTCS PRESENT
RECIRCULATION DOOR BINDING
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Short to Voltage, Short to Ground or Open DTCs present?

    Yes

    - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

    No

    - Go to step 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go to step 4

    No

    - Go to step 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration

Test?

Yes

- Go to step 4

No

- Go to step 6

4. **CHECK THE RECIRCULATION DOOR**
   1. Remove the Recirculation Door Actuator and check the Recirculation Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Recirculation Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 5

5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
   1. Replace the Recirculation Door Actuator in accordance with the Service Information.
   2. Using the scan tool, erase HVAC DTCs.
   3. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC reset during HVAC Actuator Calibration Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**

1. The conditions necessary to set the DTC are not present at this time.
2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B105D-00-RECIRCULATION DOOR TRAVEL RANGE TOO LARGE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed or during normal operation and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

   No

   - Test complete.

B10B2-00-A/C COOL DOWN TEST PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Controller has software to enable it to perform an A/C Cool Down Test by a command using a scan tool. This test checks for evaporator temperature drop over a predetermined time. If the test fails, this DTC will set. However, certain test conditions are required to perform this test. Failure to run this test within those parameters can result in failure of the test.

- **When Monitored:**

  With ever an A/C Cool Down Test is performed.

- **Set Condition:**

  This DTC is set whenever the A/C Cool Down Test is performed and the desired temperature drop is not achieved by the system. The DTC will go to stored after a successful A/C Cool Down Test.

Possible Causes
A/C SYSTEM WORKING IMPROPERLY

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CONDITIONS FOR A/C COOL DOWN TEST**

1. The following condition must be met before running the A/C Cool Down test.
   - No Powertrain Control Module (PCM) DTCs present.
   - No Communication DTCs present.
   - Condenser cooling fan working properly.
   - No active HVAC evaporator temperature sensor, sun sensor, recirculation, mode, or blend door actuator DTCs present.
   - The refrigerant system must be fully charged.
   - The blower motor must operate correctly in all speeds.
   - The evaporator temperature must be above 12.7° C (55° F).
   - The A/C compressor must be turned off.
   - Blower must be on high.

B11C2-11-FRONT MODE DOOR 1 CONTROL - CIRCUIT SHORT TO GROUND

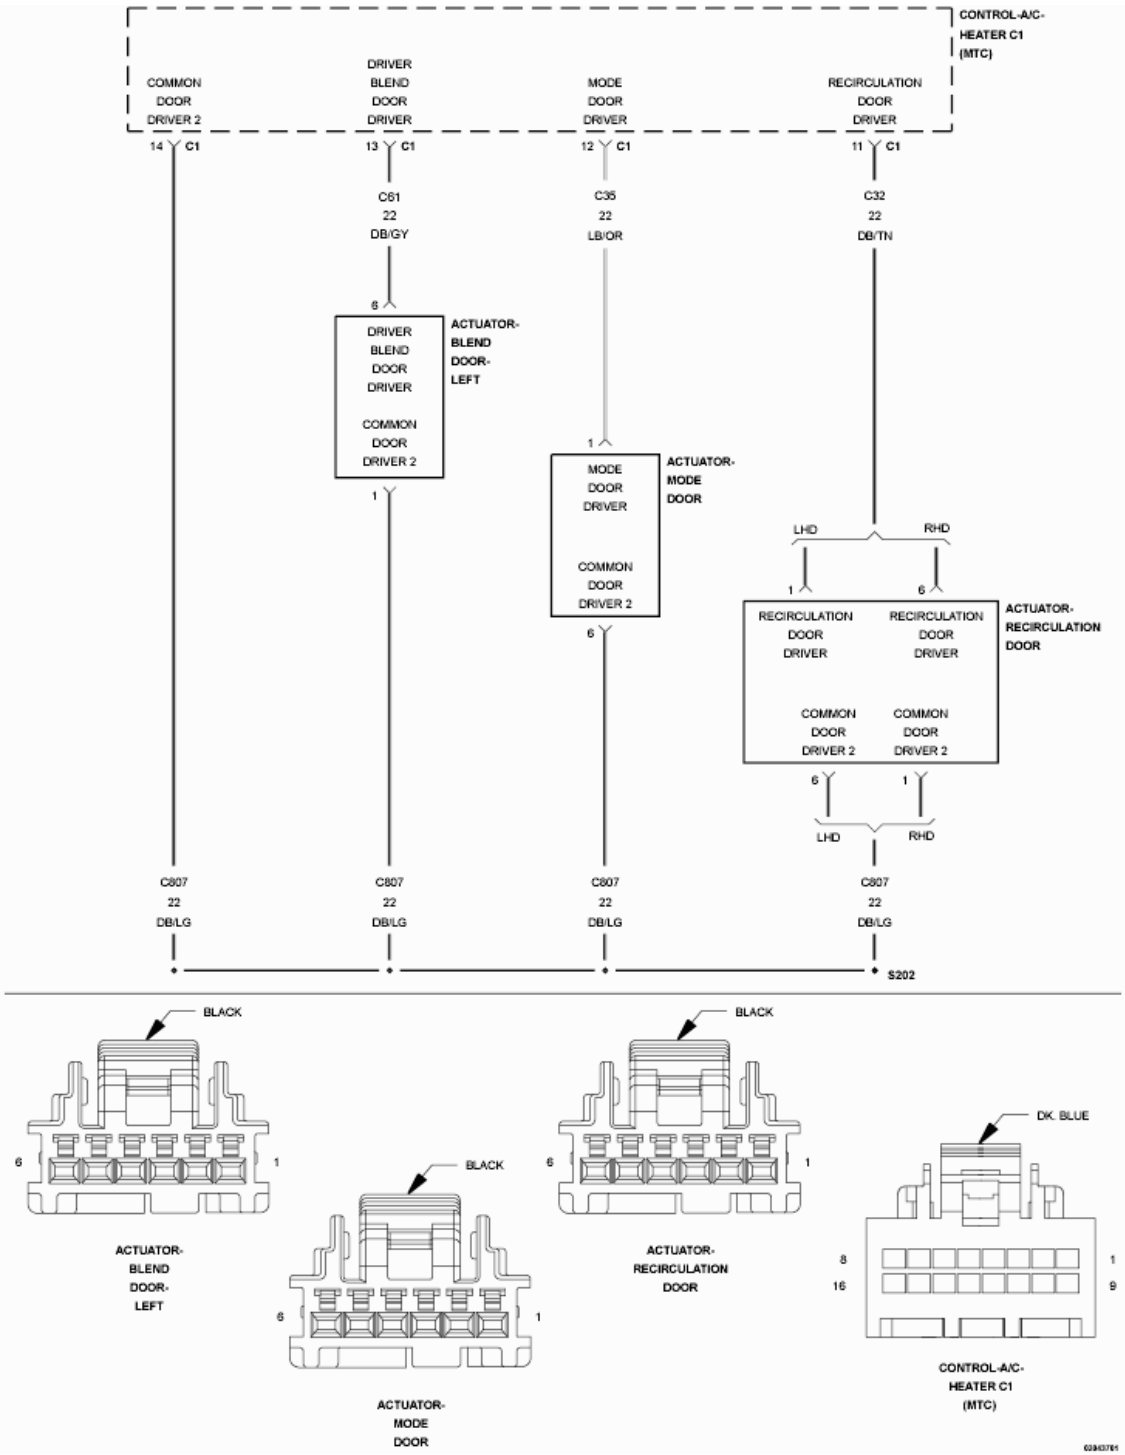

Fig. 82: Common/Mode Door Driver 2 Circuit Schematic

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  Continuously with the ignition on.

- **Set Condition:**

  The A/C Heater Control detects a short to ground on the Mode Door control circuit. If the A/C Heater Control detects valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 3

      No

      - Go to step 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

Yes

- Go to step 3

No

- Go to step 6

3. **CHECK THE (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

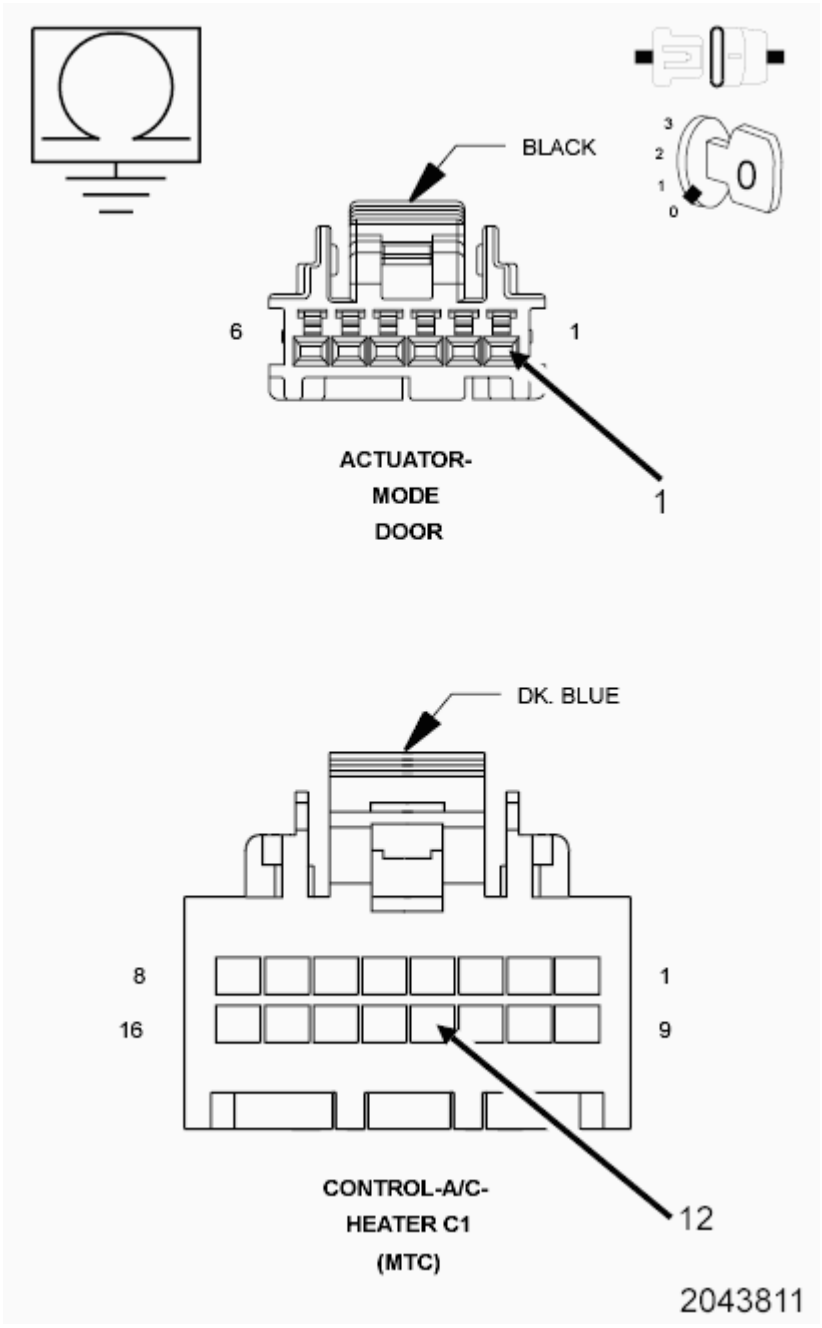

Fig. 83: Checking Mode Door Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Mode Door Actuator harness connector.
4. Measure the resistance between ground and the (C35) Mode Door Driver circuit.

   Is the resistance below 100k Ohms?

Yes

- Repair the (C35) Mode Door Driver circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**

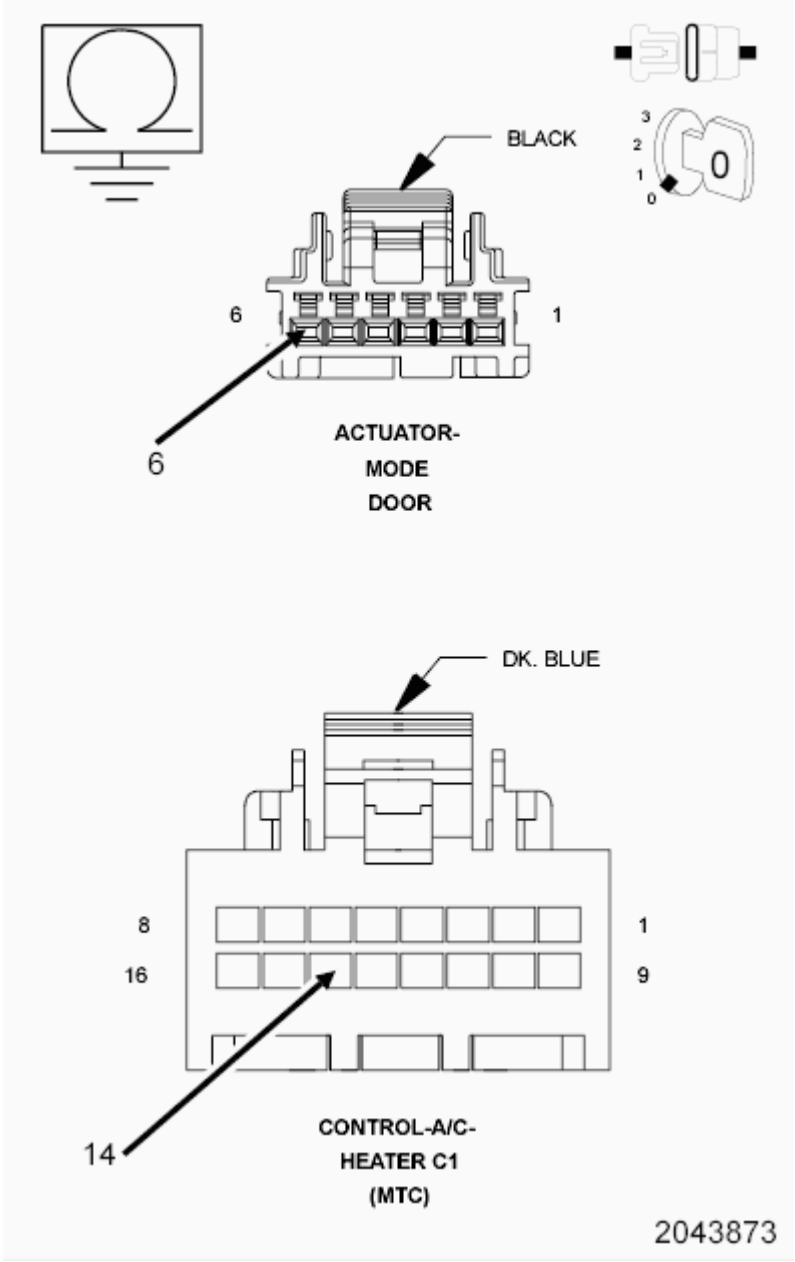

Fig. 84: Checking Common Door Driver 2 Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Measure the resistance between ground and the (C807) Common Door Driver 2 circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Measure the resistance between the (C35) Mode Door Driver circuit and the (C807) Common Door Driver 2 circuit.

   Is the resistance 38.0 Ohms (± 5.0 Ohms)?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK THE (C35) MODE DOOR DRIVER CIRCUIT FOR AN OPEN**

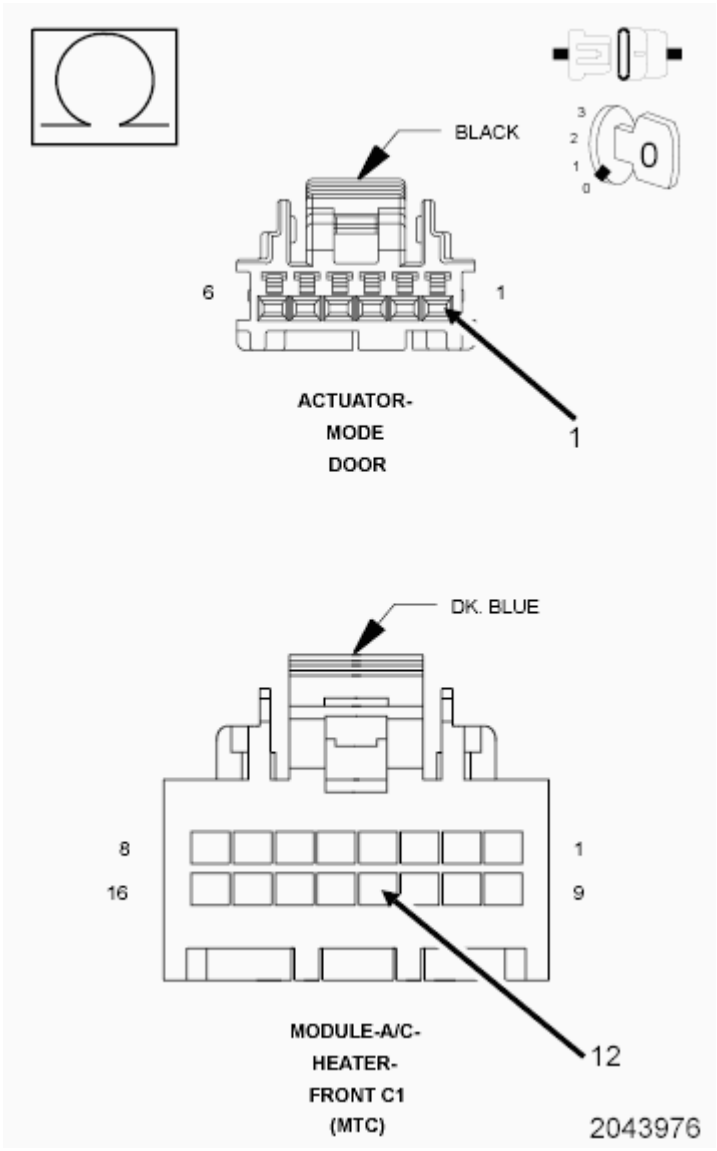

Fig. 90: Checking Mode Door Driver Circuit For An Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Mode Door Actuator harness connector.
3. Measure the resistance of the (C35) Mode Door Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C35) Mode Door Driver circuit for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC -**

Standard Procedure.

No

- Go to step 5

5. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN**

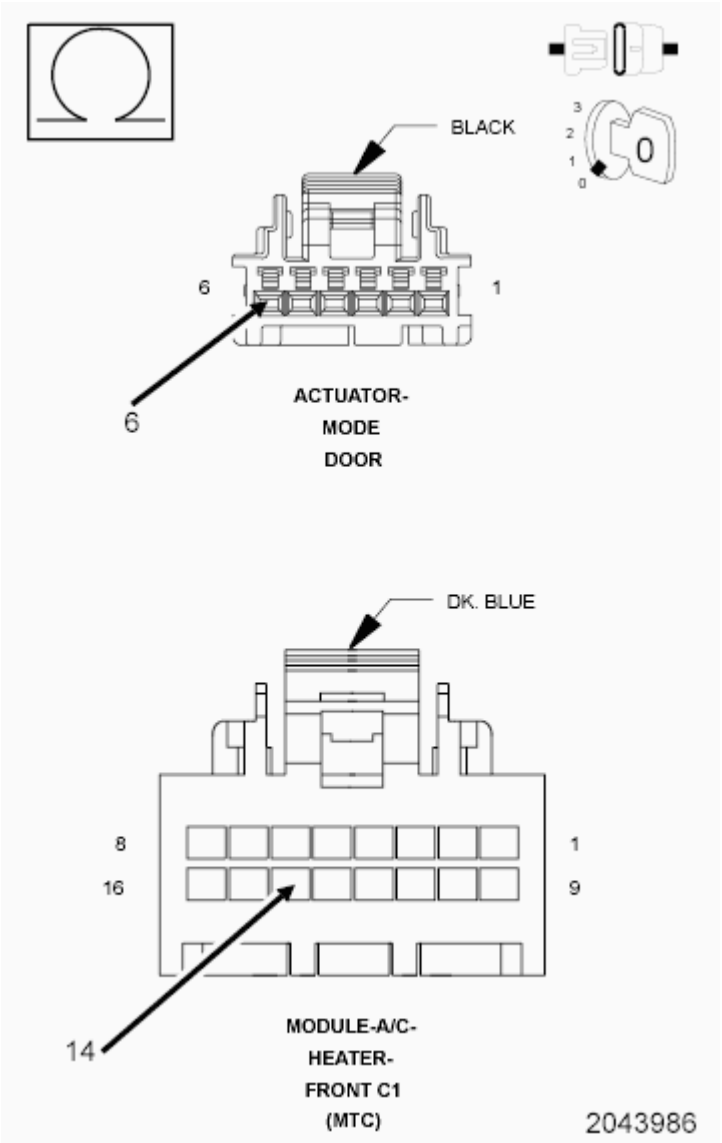

Fig. 91: Checking Common Door Driver 2 Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C807) Common Door Driver 2 circuit between the A/C Heater Control C1 harness connector and the Mode Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

Yes

- Repair the (C807) Common Door Driver 2 circuit for an open or high resistance.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Replace the Mode Door Actuator in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B11C2-92-FRONT MODE DOOR 1 CONTROL - PERFORMANCE OR INCORRECT OPERATION

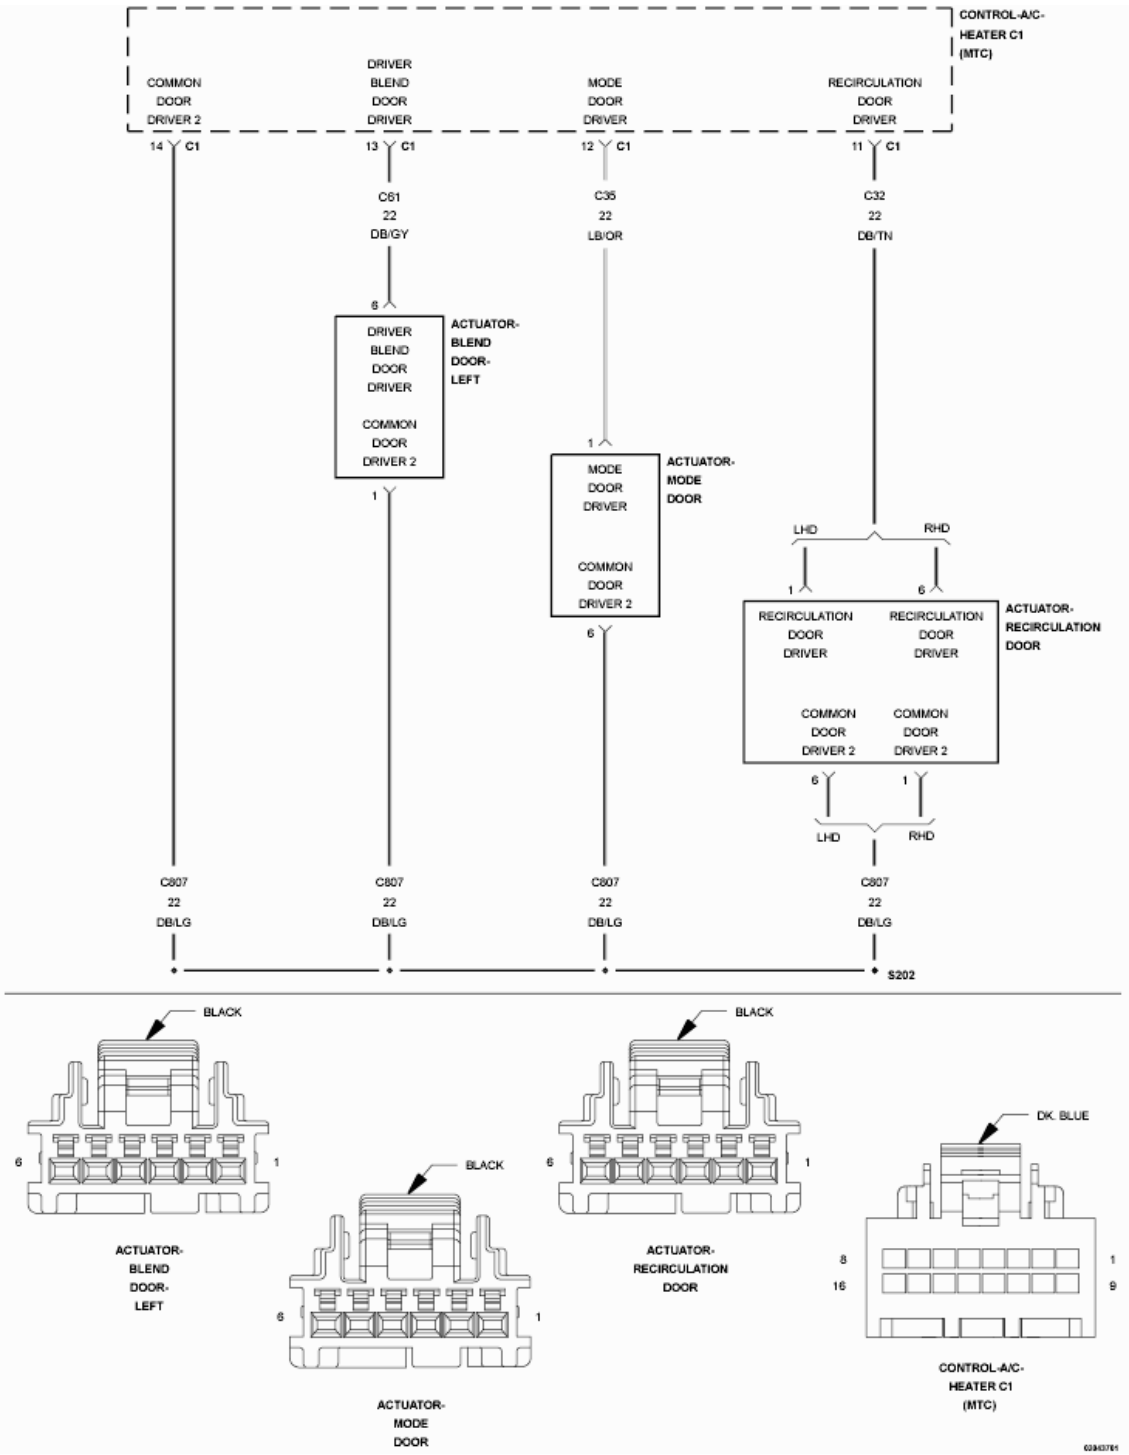

Fig. 92: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  With the ignition on and an actuator movement is commanded by the A/C Heater Control or during an HVAC Actuator Calibration Test.

- **Set Condition:**

  If an actuator move is commanded by A/C Heater Control and no feedback pulses are detected in either clockwise or counterclockwise movement for the period of 15 seconds. If the A/C Heater Control detects valid feedback pulses for 15 seconds, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO VOLTAGE
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
MODE DOOR BINDING
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

No

- Go to step 9

2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did any other HVAC DTCs set while performing the Actuator Calibration Test?

      Yes

      - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 3

3. **CHECK THE (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

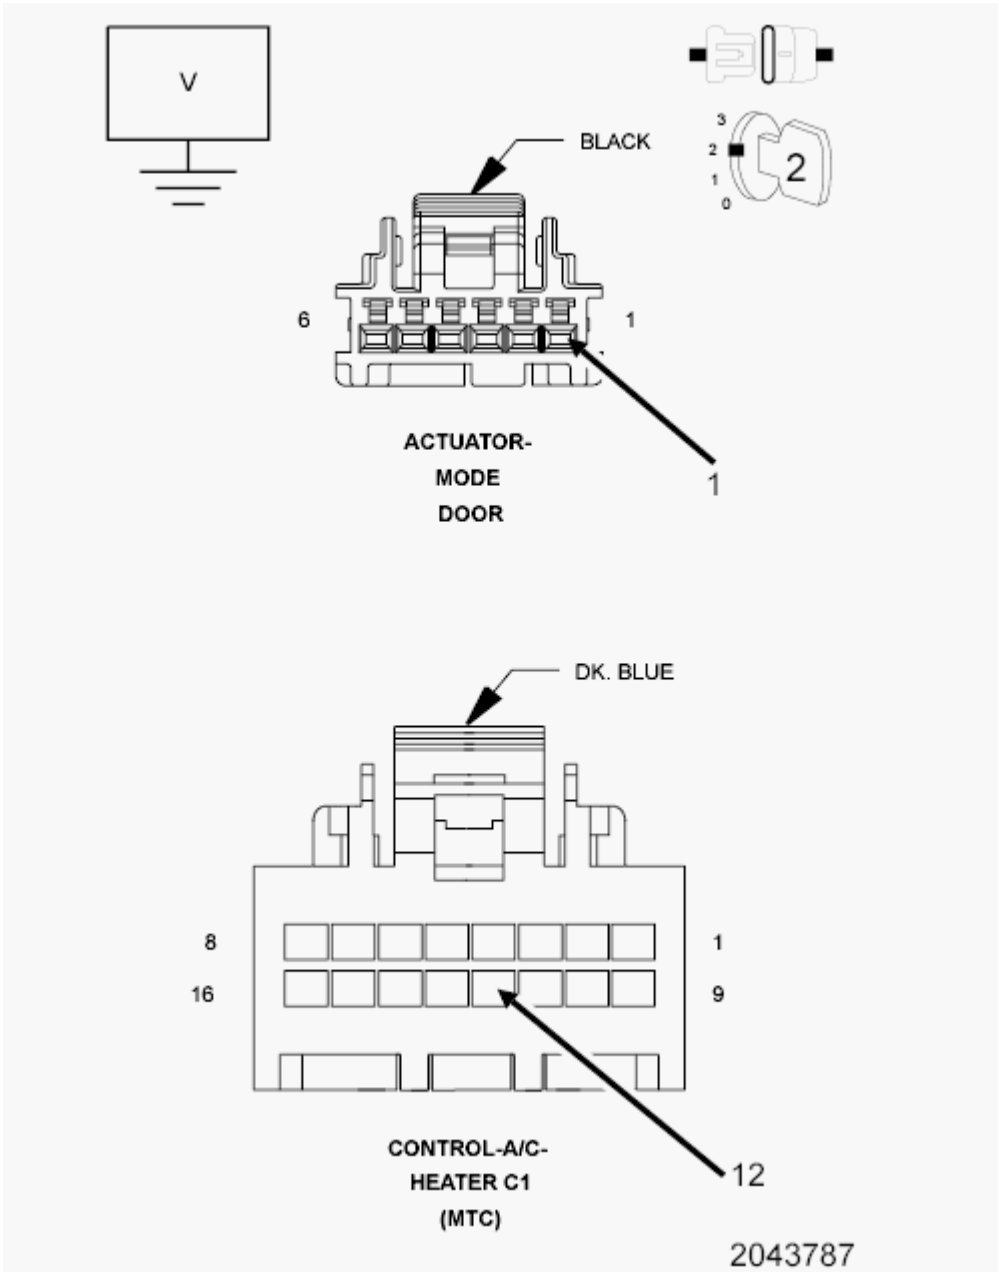

Fig. 93: Checking Mode Door Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Mode Door Actuator harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (C35) Mode Door Driver circuit.

   Is there any voltage present?

Yes

- Repair the (C35) Mode Door Driver circuit for a short to voltage.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO VOLTAGE**

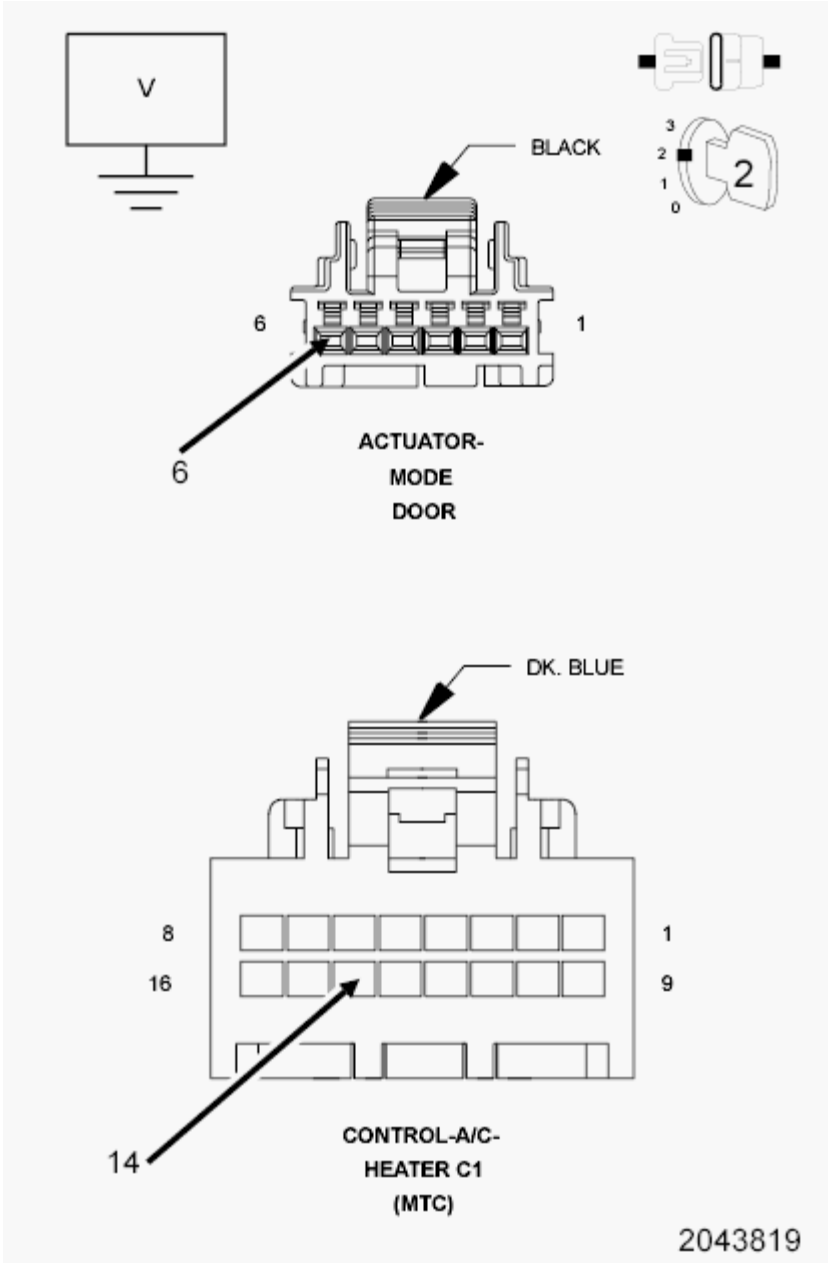

Fig. 94: Checking Common Door Driver 2 Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Measure the voltage of the (C807) Common Door Driver 2 circuit.

   Is there any voltage present?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK THE (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

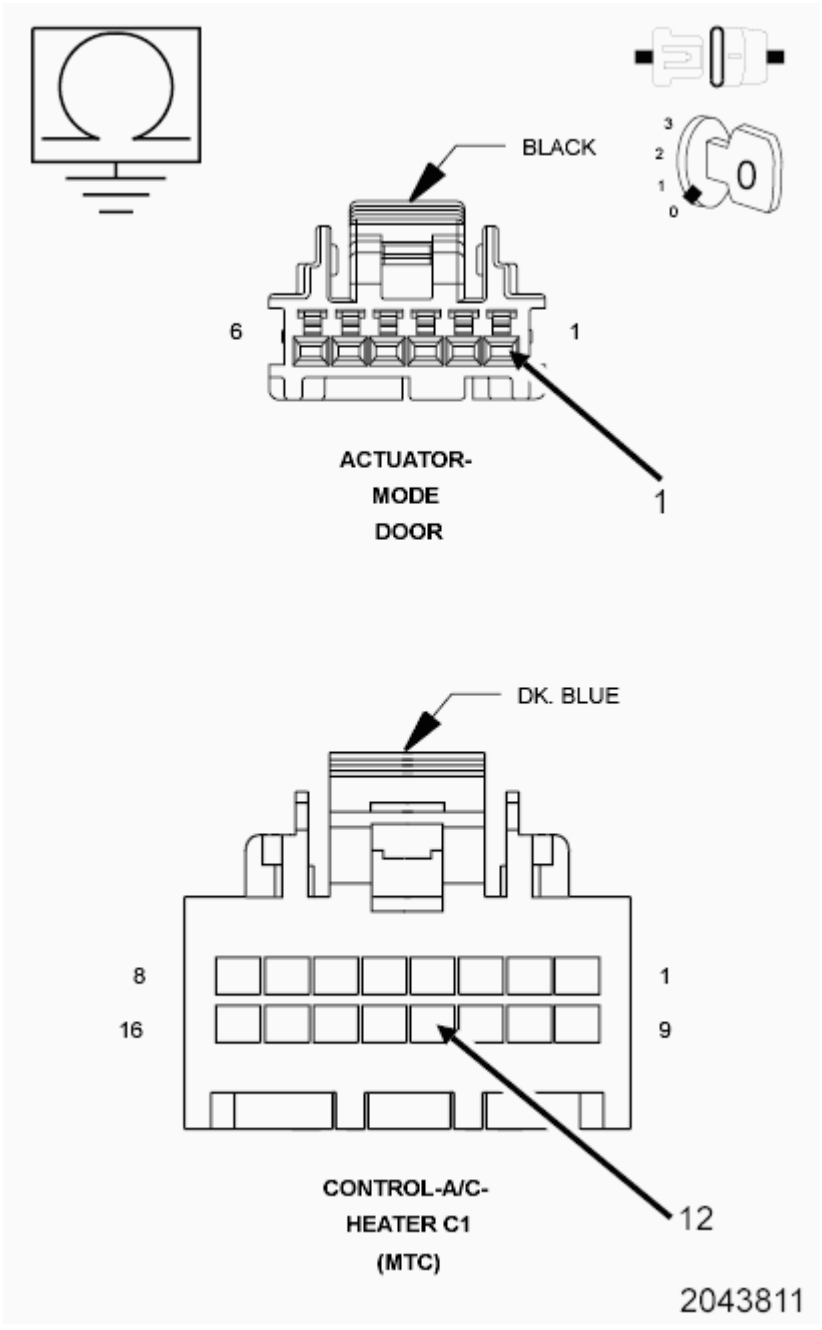

Fig. 95: Checking Mode Door Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between ground and the (C35) Mode Door Driver circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (C35) Mode Door Driver circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**

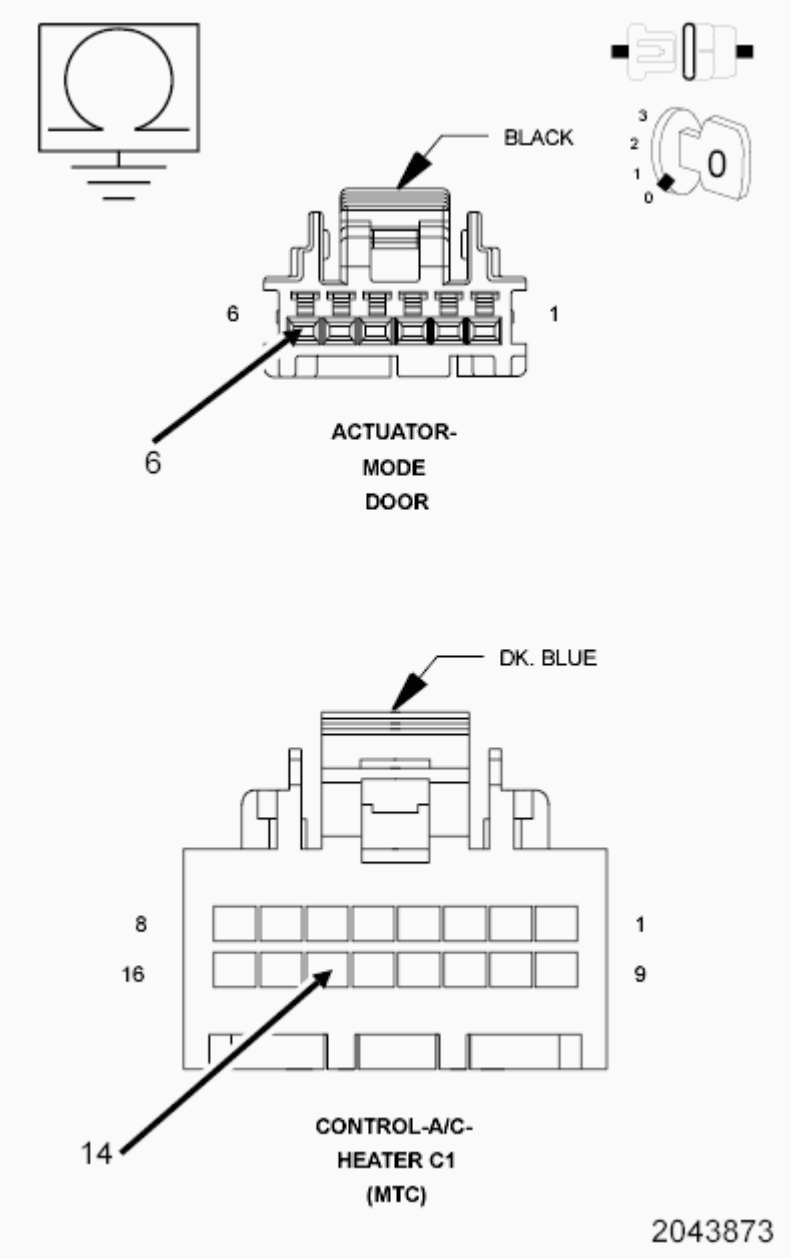

Fig. 96: Checking Common Door Driver 2 Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Measure the resistance between ground and the (C807) Common Door Driver 2 circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK THE MODE DOOR**
   1. Remove the Mode Door Actuator and check the Mode Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Mode Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 8

8. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information.
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

    No

    - Test complete.

B11C3-00-FRONT MODE DOOR 1 TRAVEL RANGE TOO SMALL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RELATED DTCS PRESENT
MODE DOOR BINDING
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Short to Voltage, Short to Ground or Open DTCs present?

    Yes

    - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

    No

    - Go to step 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go to step 4

    No

    - Go to step 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

Yes

- Go to step 4

No

- Go to step 6

4. **CHECK THE MODE DOOR**
   1. Remove the Mode Door Actuator and check the Mode Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Mode Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 5
5. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information.
   2. Using the scan tool, erase HVAC DTCs.
   3. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC reset during HVAC Actuator Calibration Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B11C4-00-FRONT MODE DOOR 1 TRAVEL RANGE TOO LARGE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed or during normal operation and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

RELATED DTCS PRESENT
MODE DOOR STOPS
MODE DOOR

MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Short to Voltage, Short to Ground or Open DTCs present?

    Yes

    - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

    No

    - Go to step 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go to step 4

    No

    - Go to step 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC System Test?

    Yes

    - Go to step 4

    No

- Go to step 6

4. **CHECK THE MODE DOOR**
   1. Remove the Mode Door Actuator and check the Mode Door stops, linkage (stripped or cracked) and door.

      Were there any problems found?

      Yes

      - Repair or replace the Mode Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 5
5. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B11CB-11-MAIN/LEFT TEMPERATURE DOOR CONTROL - CIRCUIT SHORT TO GROUND

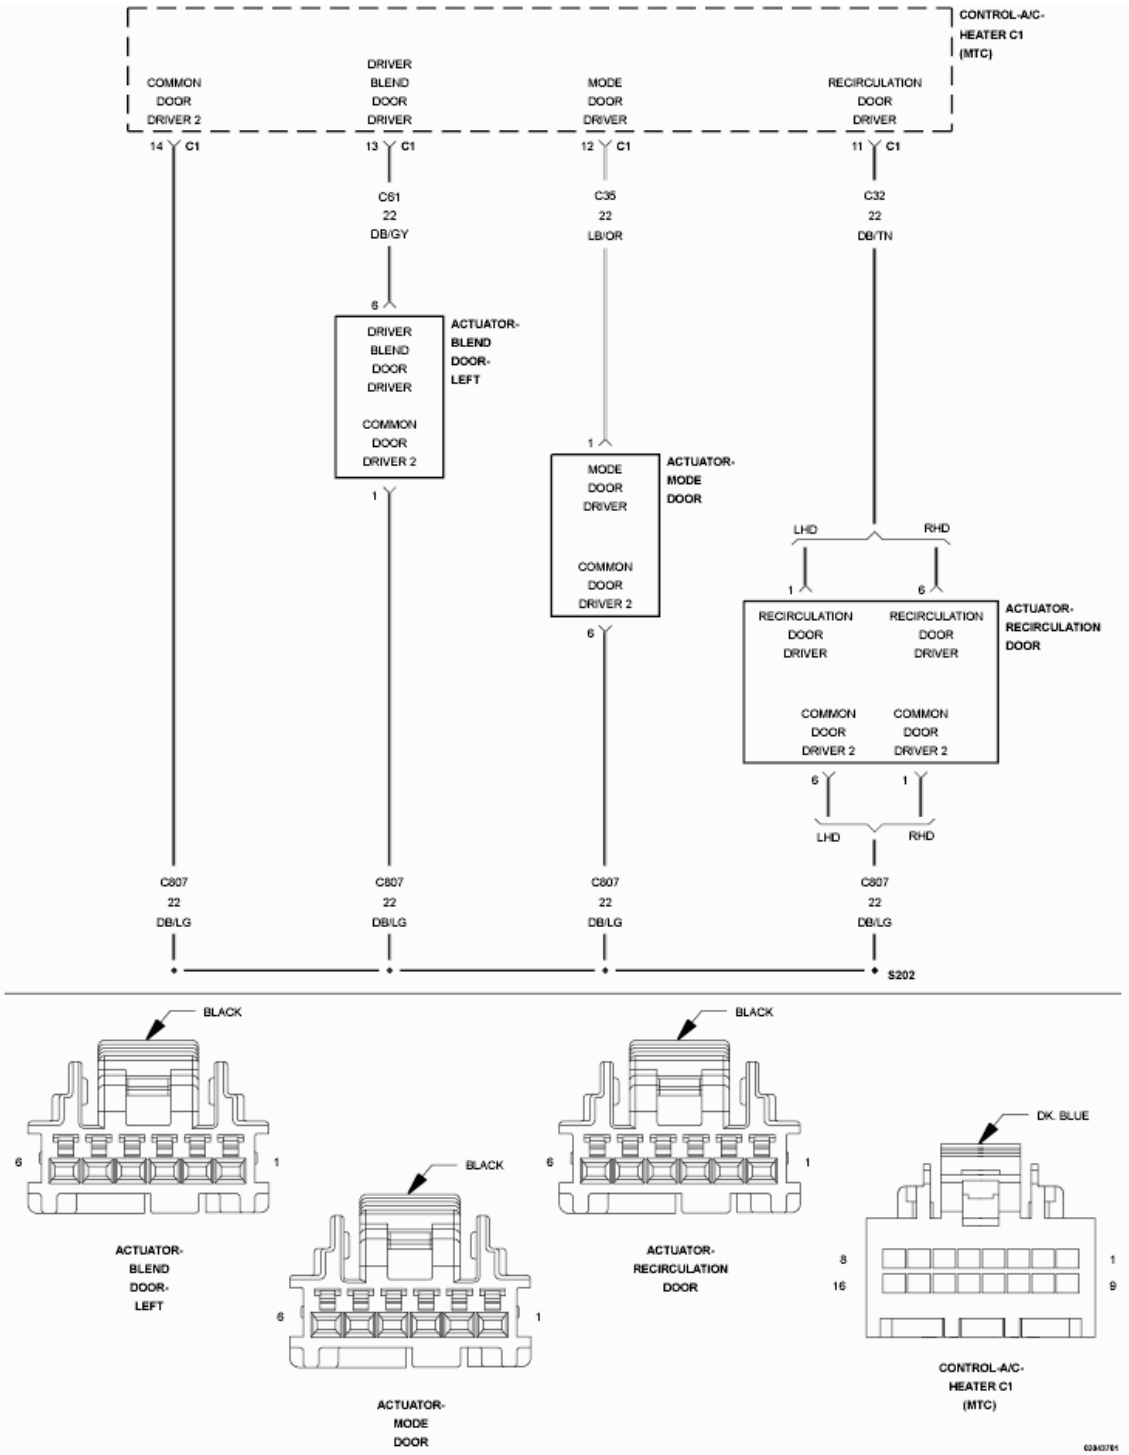

Fig. 97: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  Continuously with the ignition on.

- **Set Condition:**

  The A/C Heater Control detects a short to ground on the Blend Door control circuit. If the A/C Heater Control detects valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C61) BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 3

      No

      - Go to step 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. Using the scan tool, perform the HVAC Actuator Calibration Test.

Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

Yes

- Go to step 3

No

- Go to step 6

3. **CHECK THE (C61) BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

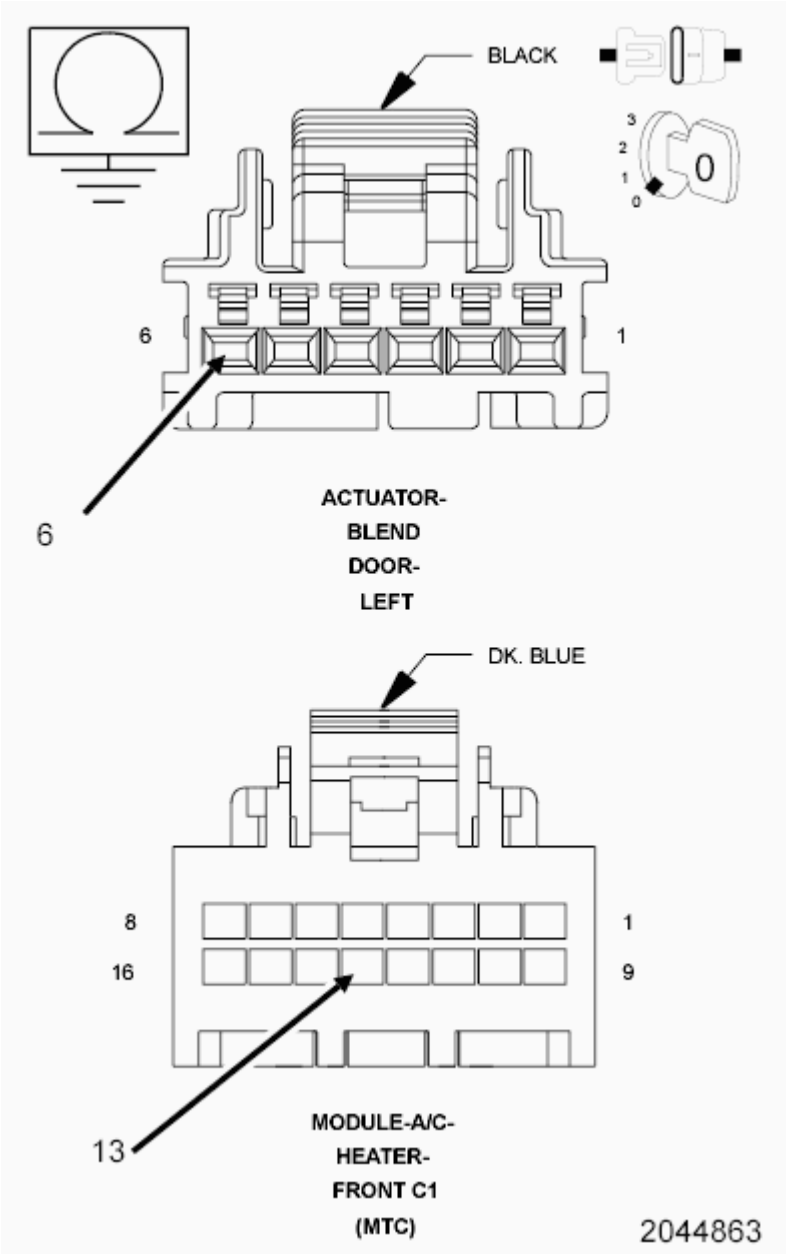

Fig. 98: Checking Blend Door Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Blend Door Actuator harness connector.
4. Measure the resistance between ground and the (C61) Blend Door Driver circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C61) Blend Door Driver circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**

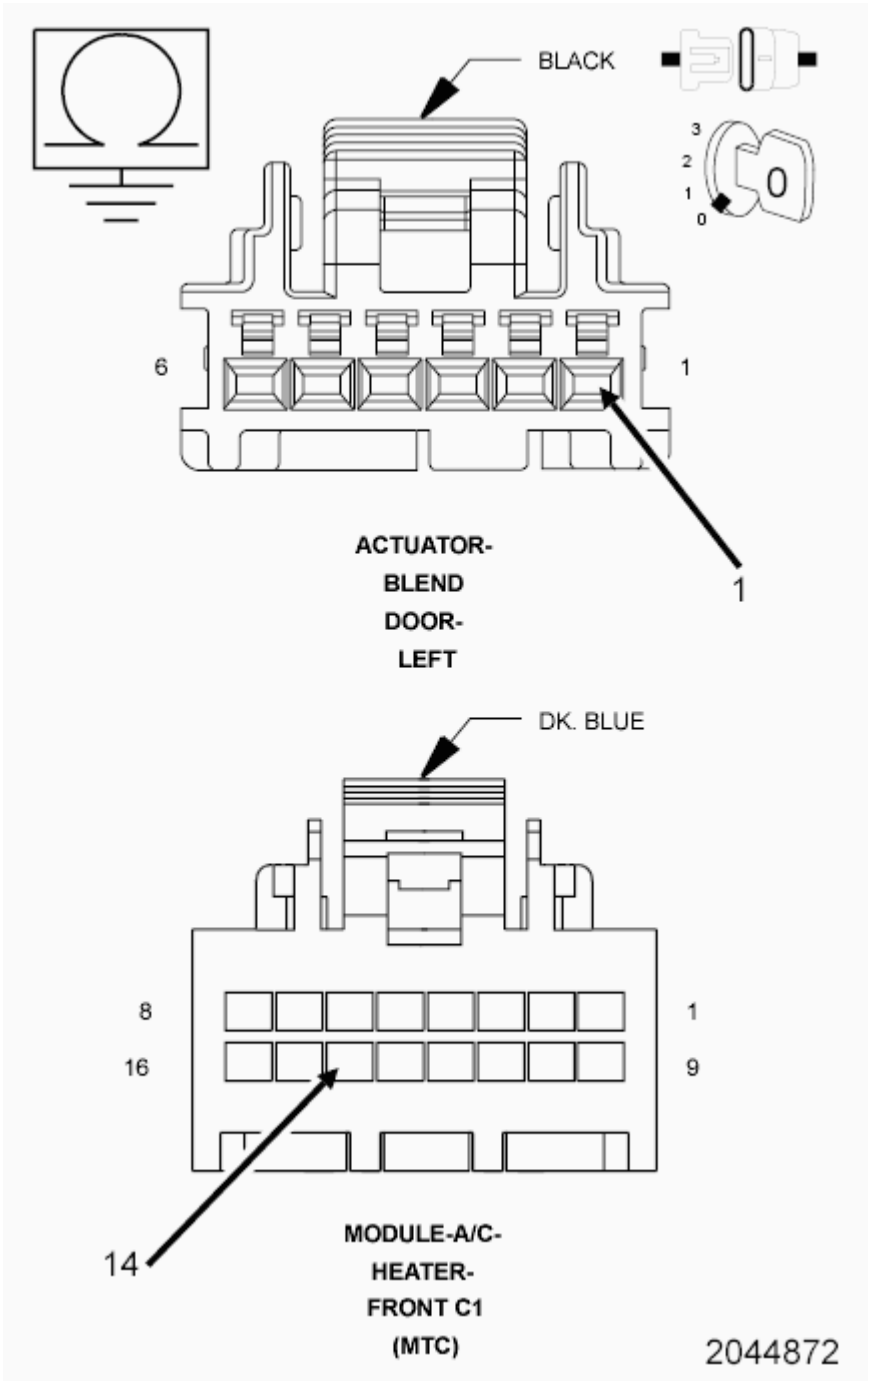

Fig. 99: Checking Common Door Driver 2 Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Measure the resistance between ground and the (C807) Common Door Driver 2 circuit.

   Is the resistance below 100k Ohms?

   Yes

- Repair the (C807) Common Door Driver 2 circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 5

5. **CHECK THE BLEND DOOR ACTUATOR**
   1. Replace the Blend Door Actuator in accordance with the Service Information.
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Measure the resistance between the (C61) Blend Door Driver circuit and the (C807) Common Door Driver 2 circuit.

   Is the resistance 38.0 Ohms (± 5.0 Ohms)?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK THE (C61) BLEND DOOR DRIVER CIRCUIT FOR AN OPEN**

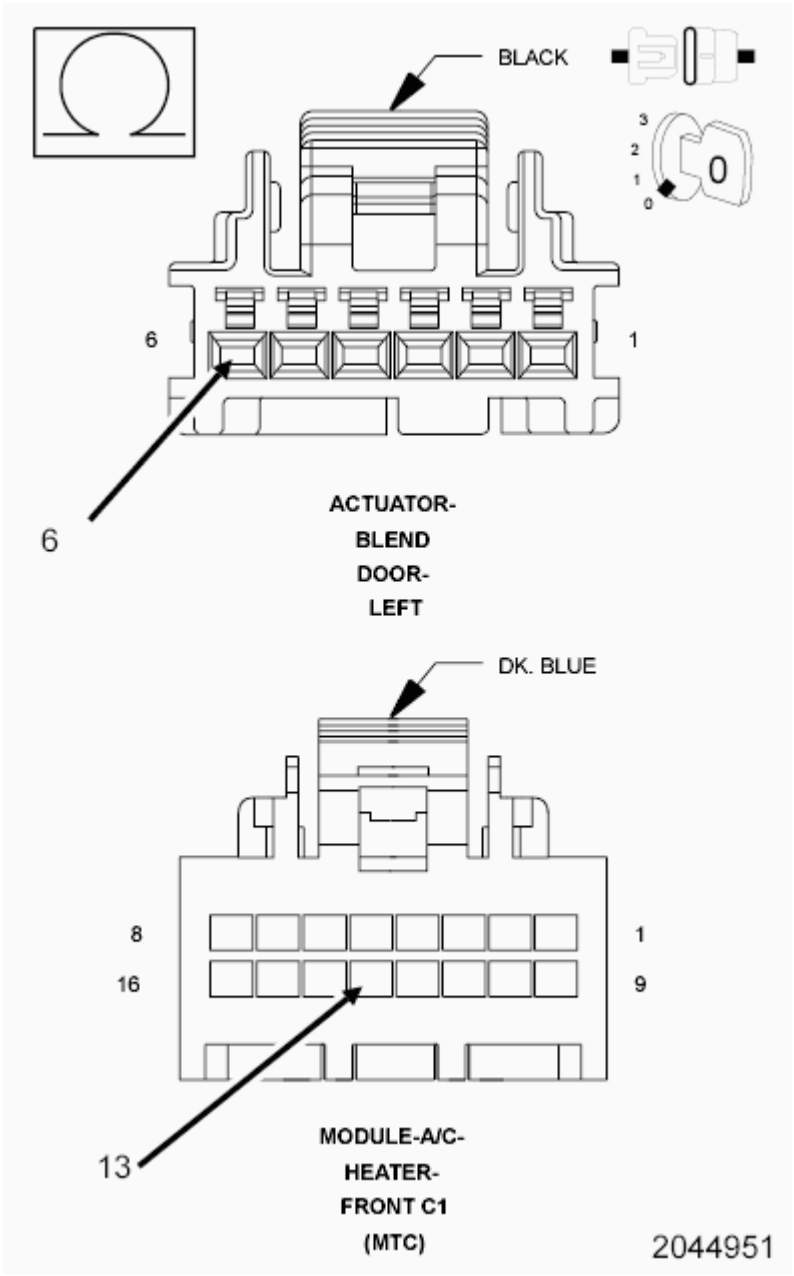

Fig. 105: Checking Blend Door Driver Circuit For An Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Blend Door Actuator harness connector.
3. Measure the resistance of the (C61) Blend Door Driver circuit between the A/C Heater Control C1 harness connector and the Blend Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

- Repair the (C61) Blend Door Driver circuit for an open or high resistance.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 5

5. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN**

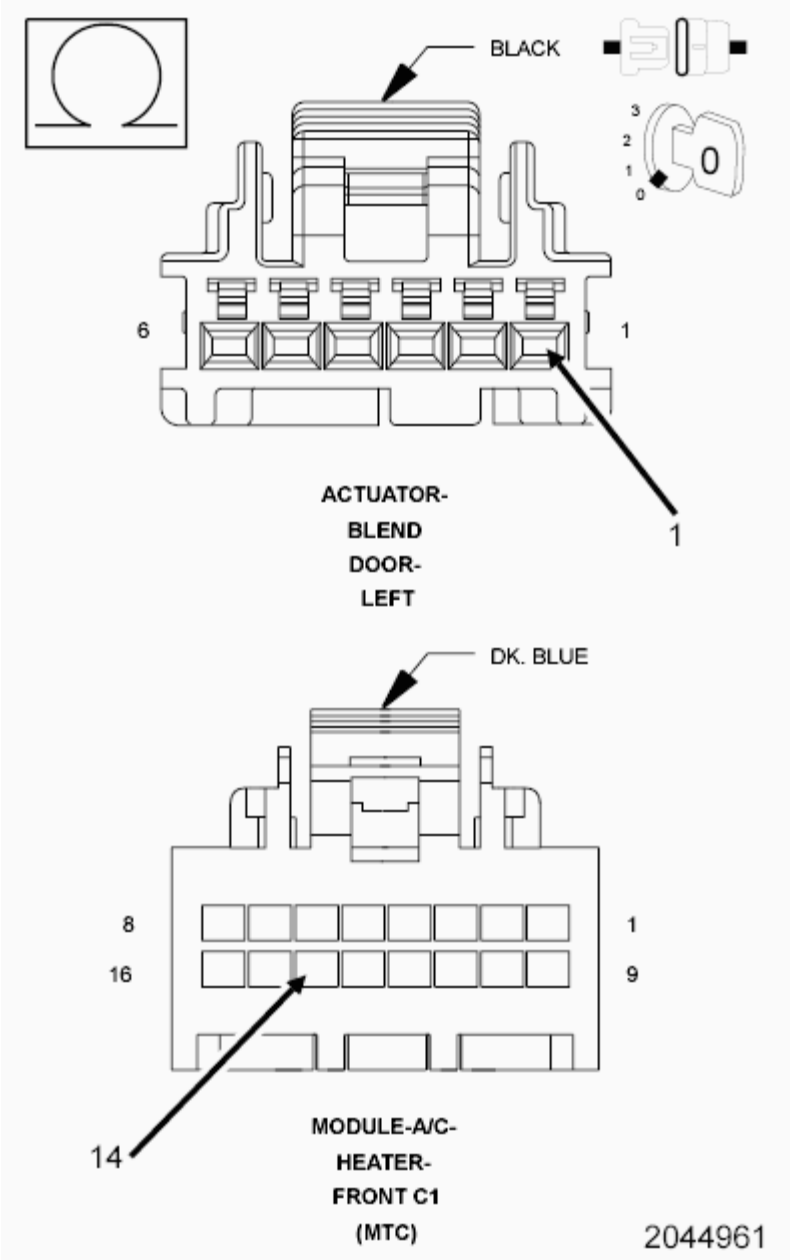

Fig. 106: Checking Common Door Driver 2 Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C807) Common Door Driver 2 circuit between the A/C Heater Control C1 harness connector and the Blend Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Replace the Blend Door Actuator in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

B11CB-92-MAIN/LEFT TEMPERATURE DOOR CONTROL - PERFORMANCE OR INCORRECT OPERATION

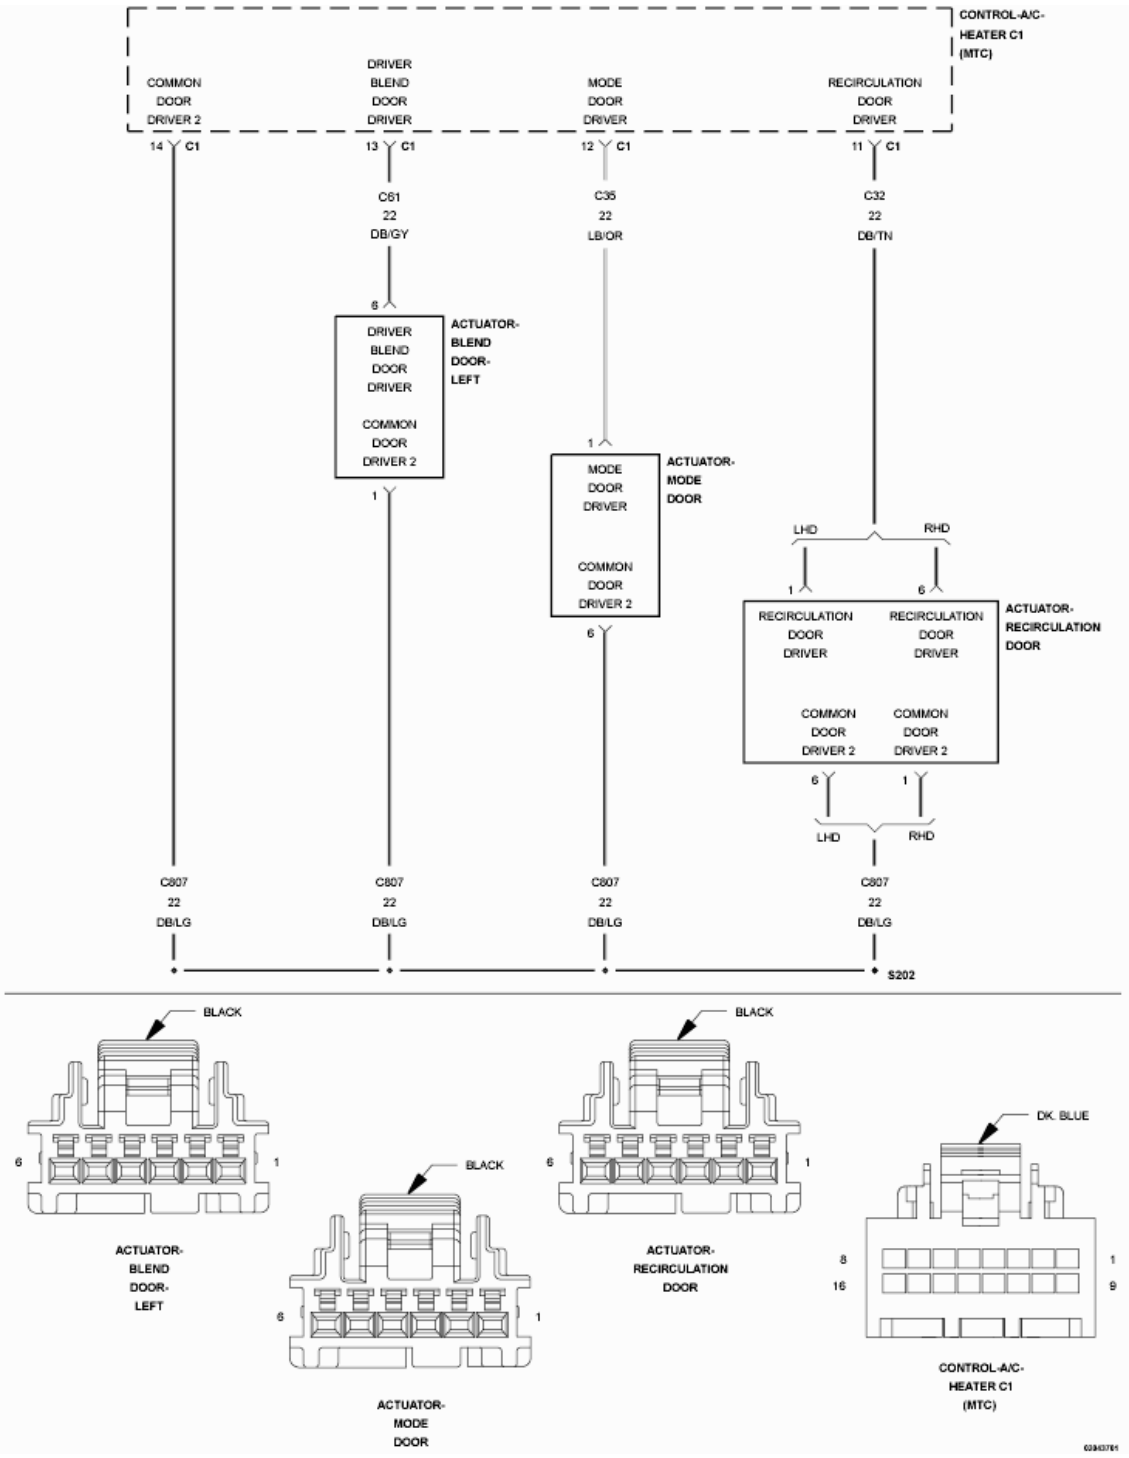

Fig. 107: Common/Mode Door Driver 2 Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  With the ignition on and an actuator movement is commanded by the A/C Heater Control or during an HVAC Actuator Calibration Test.

- **Set Condition:**

  If an actuator move is commanded by A/C Heater Control and no feedback pulses are detected in either clockwise or counterclockwise movement for the period of 15 seconds. If the A/C Heater Control detects valid feedback pulses for 15 seconds, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C61) BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C61) BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO VOLTAGE
(C807) COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
BLEND DOOR BINDING
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

No

- Go to step 9

2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

       Did any other HVAC DTCs set while performing the Actuator Calibration Test?

       Yes

       - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

       No

       - Go to step 3

3. **CHECK THE (C61) BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

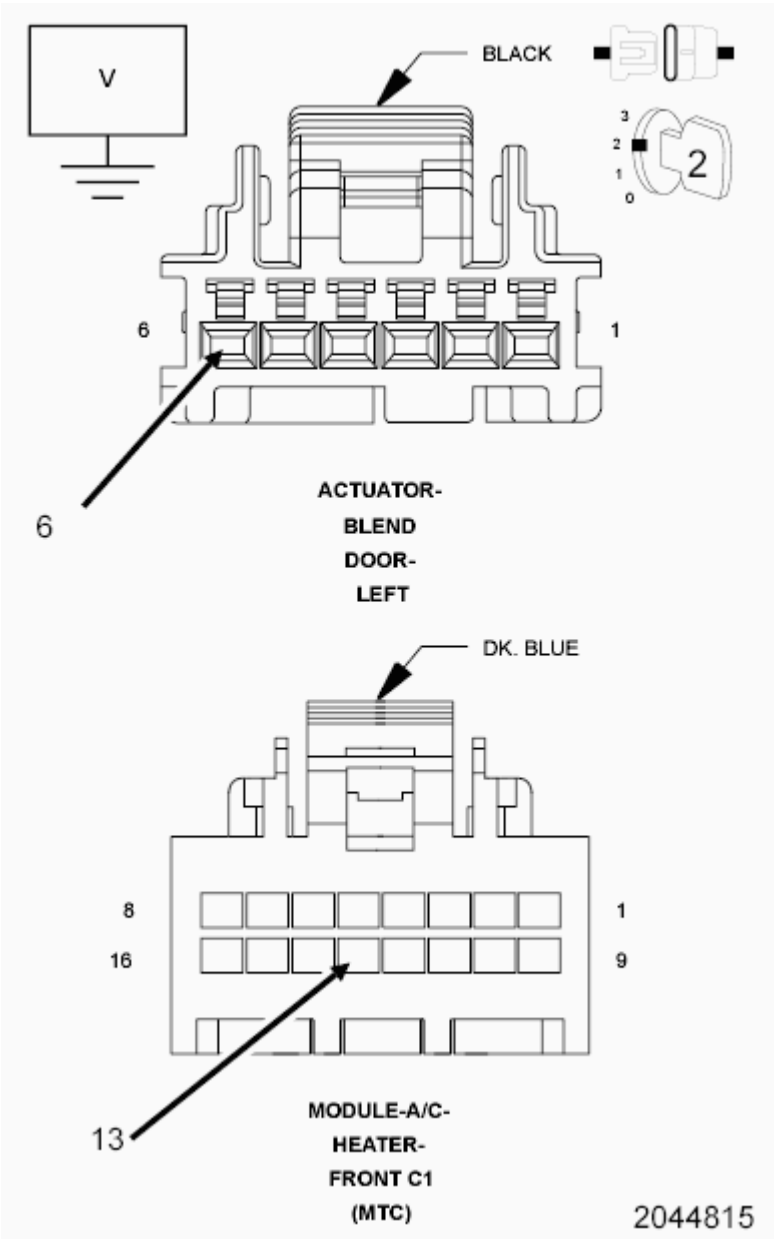

Fig. 108: Checking Blend Door Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Blend Door Actuator harness connector.
4. Ignition on, engine not running.
5. Measure the voltage of the (C61) Blend Door Driver circuit.

   Is there any voltage present?

Yes

- Repair the (C61) Blend Door Driver circuit for a short to voltage.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO VOLTAGE**

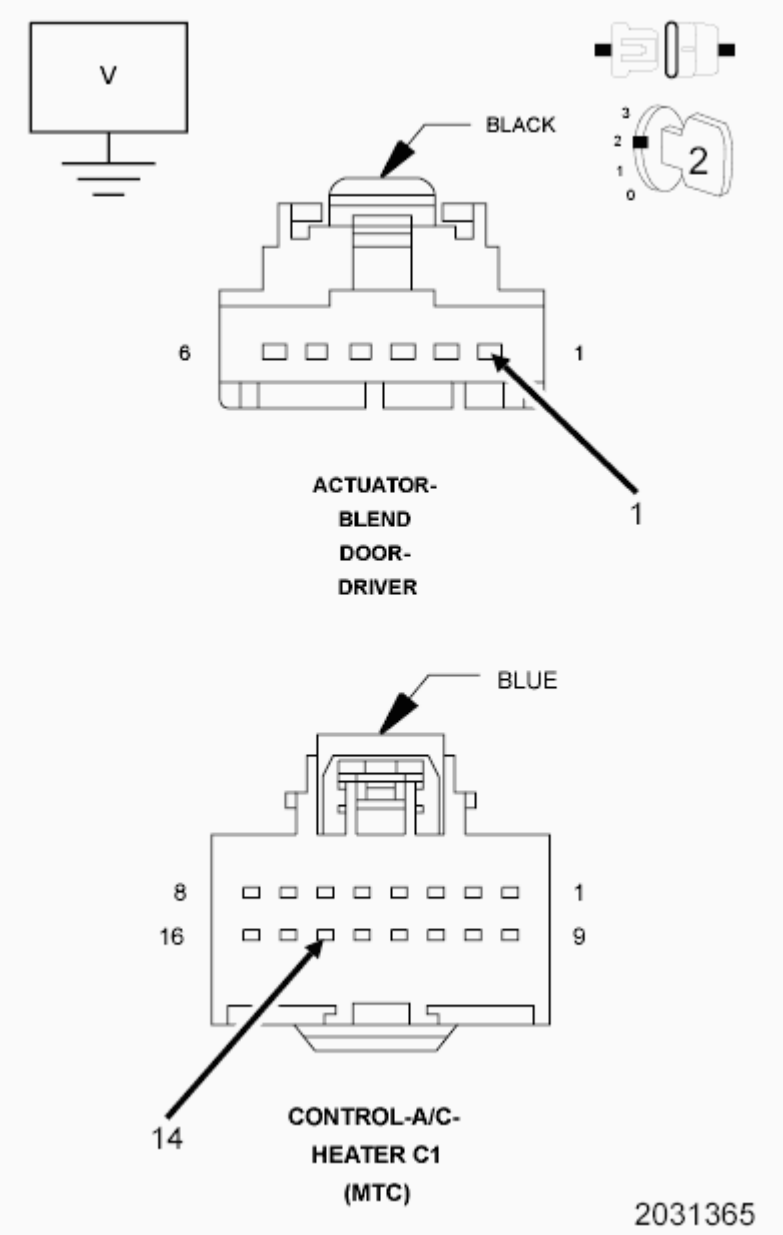

Fig. 109: Checking Common Door Driver 2 Circuit For A Short To Voltage

Courtesy of CHRYSLER LLC

1. Measure the voltage of the (C807) Common Door Driver 2 circuit.

   Is there any voltage present?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK THE (C61) BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

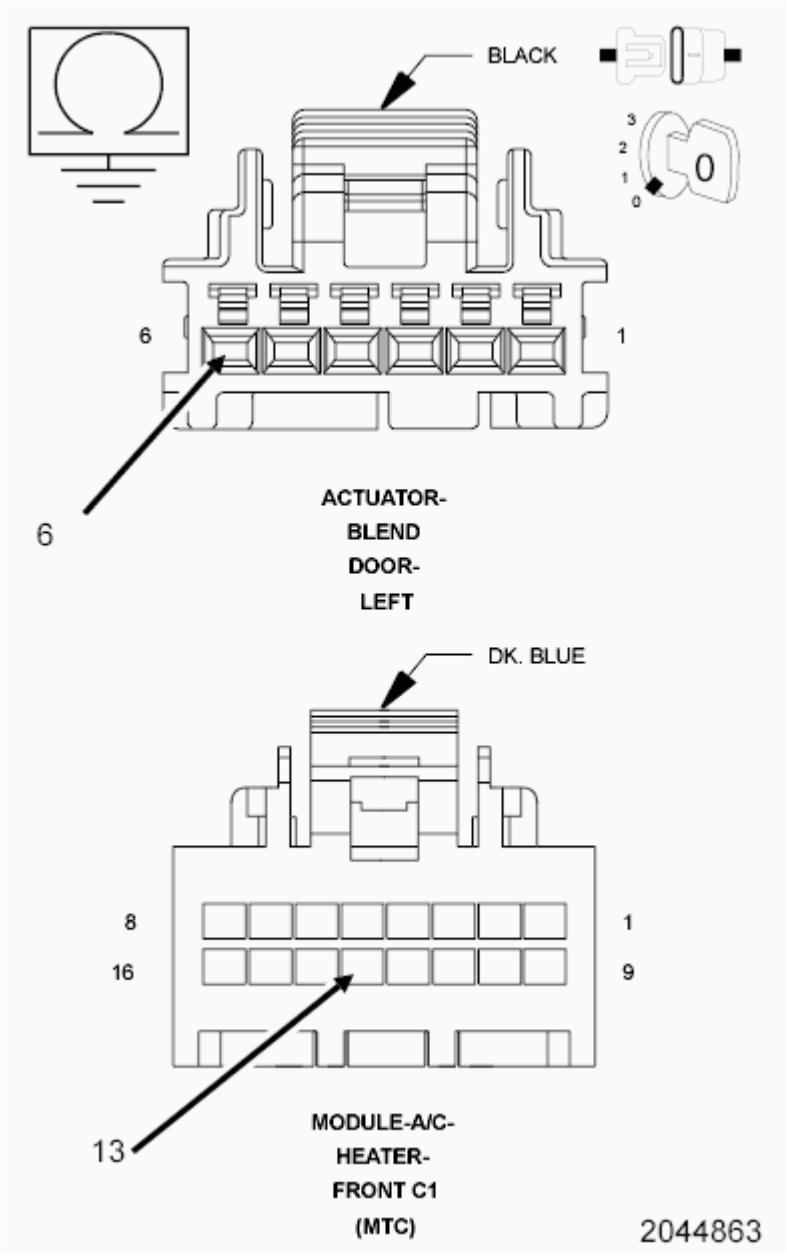

Fig. 110: Checking Blend Door Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Measure the resistance between ground and the (C61) Blend Door Driver circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C61) Blend Door Driver circuit for a short to ground.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**

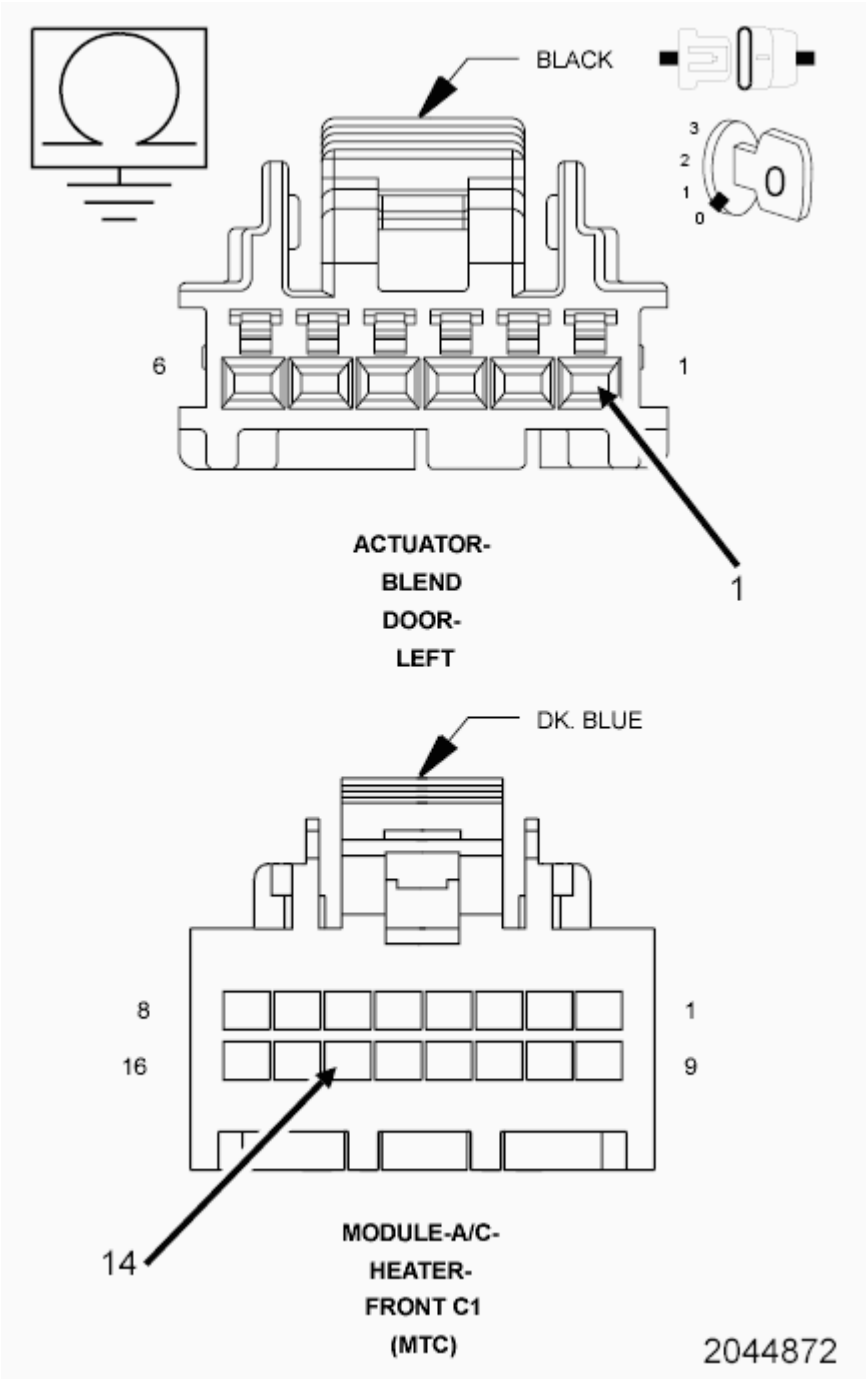

Fig. 111: Checking Common Door Driver 2 Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Measure the resistance between ground and the (C807) Common Door Driver 2 circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C807) Common Door Driver 2 circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK THE BLEND DOOR**
   1. Remove the Blend Door Actuator and check the Blend Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Blend Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 8

8. **CHECK THE BLEND DOOR ACTUATOR**
   1. Replace the Blend Door Actuator in accordance with the Service Information.
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

    No

    - Test complete.

B11CC-00-MAIN/LEFT TEMPERATURE DOOR TRAVEL TOO SMALL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will

change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RELATED DTCS PRESENT
BLEND DOOR BINDING
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Short to Voltage, Short to Ground or Open DTCs present?

    Yes

    - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

    No

    - Go to step 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go to step 4

    No

    - Go to step 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration

Test?

Yes

- Go to step 4

No

- Go to step 6

4. **CHECK THE BLEND DOOR**
   1. Remove the Blend Door Actuator and check the Blend Door for binding and full travel.

      Were there any problems found?

      Yes

      - Repair or replace the Blend Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 5

5. **CHECK THE BLEND DOOR ACTUATOR**
   1. Replace the Blend Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs.
   3. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC reset during HVAC Actuator Calibration Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC

was set.

3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B11CD-00-MAIN/LEFT TEMPERATURE DOOR TRAVEL TOO LARGE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.

- **When Monitored:**

  When ever an Actuator Calibration Test is performed.

- **Set Condition:**

  The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed or during normal operation and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes

RELATED DTCS PRESENT
BLEND DOOR STOPS
BLEND DOOR
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

       Are there any Door Control Circuit Short to Voltage, Short to Ground or Open DTCs present?

       Yes

       - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

       No

       - Go to step 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

       Is this DTC active?

       Yes

       - Go to step 4

       No

       - Go to step 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

       Did this DTC change from Stored to Active while performing the HVAC System Test?

       Yes

- Go to step 4

No

- Go to step 6

4. **CHECK THE BLEND DOOR**
   1. Remove the Blend Door Actuator and check the Blend Door stops, linkage (stripped or cracked) and door.

      Were there any problems found?

      Yes

      - Repair or replace the Blend Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Go to step 5

5. **CHECK THE BLEND DOOR ACTUATOR**
   1. Replace the Blend Door Actuator in accordance with the Service Information.
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B11D9-92-BLOWER SPEED KNOB REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Control constantly monitors the Blower Motor switch or dial for proper operation. If the monitored voltage on that circuit drops below or rises above a predetermined value, a DTC will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the internal blower circuit is less than 0.05 of a volt or greater than 4.95 volts for a period of 1200 msec.

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **REPLACE THE A/C HEATER CONTROL**

   This DTC detects a problem with an internal circuit in the controller and is non serviceable.

   Repair

- Replace and program the A/C Heater Control in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

B160F-11-TWILIGHT/AMBIENT LIGHT SENSOR INPUT - CIRCUIT SHORT TO GROUND

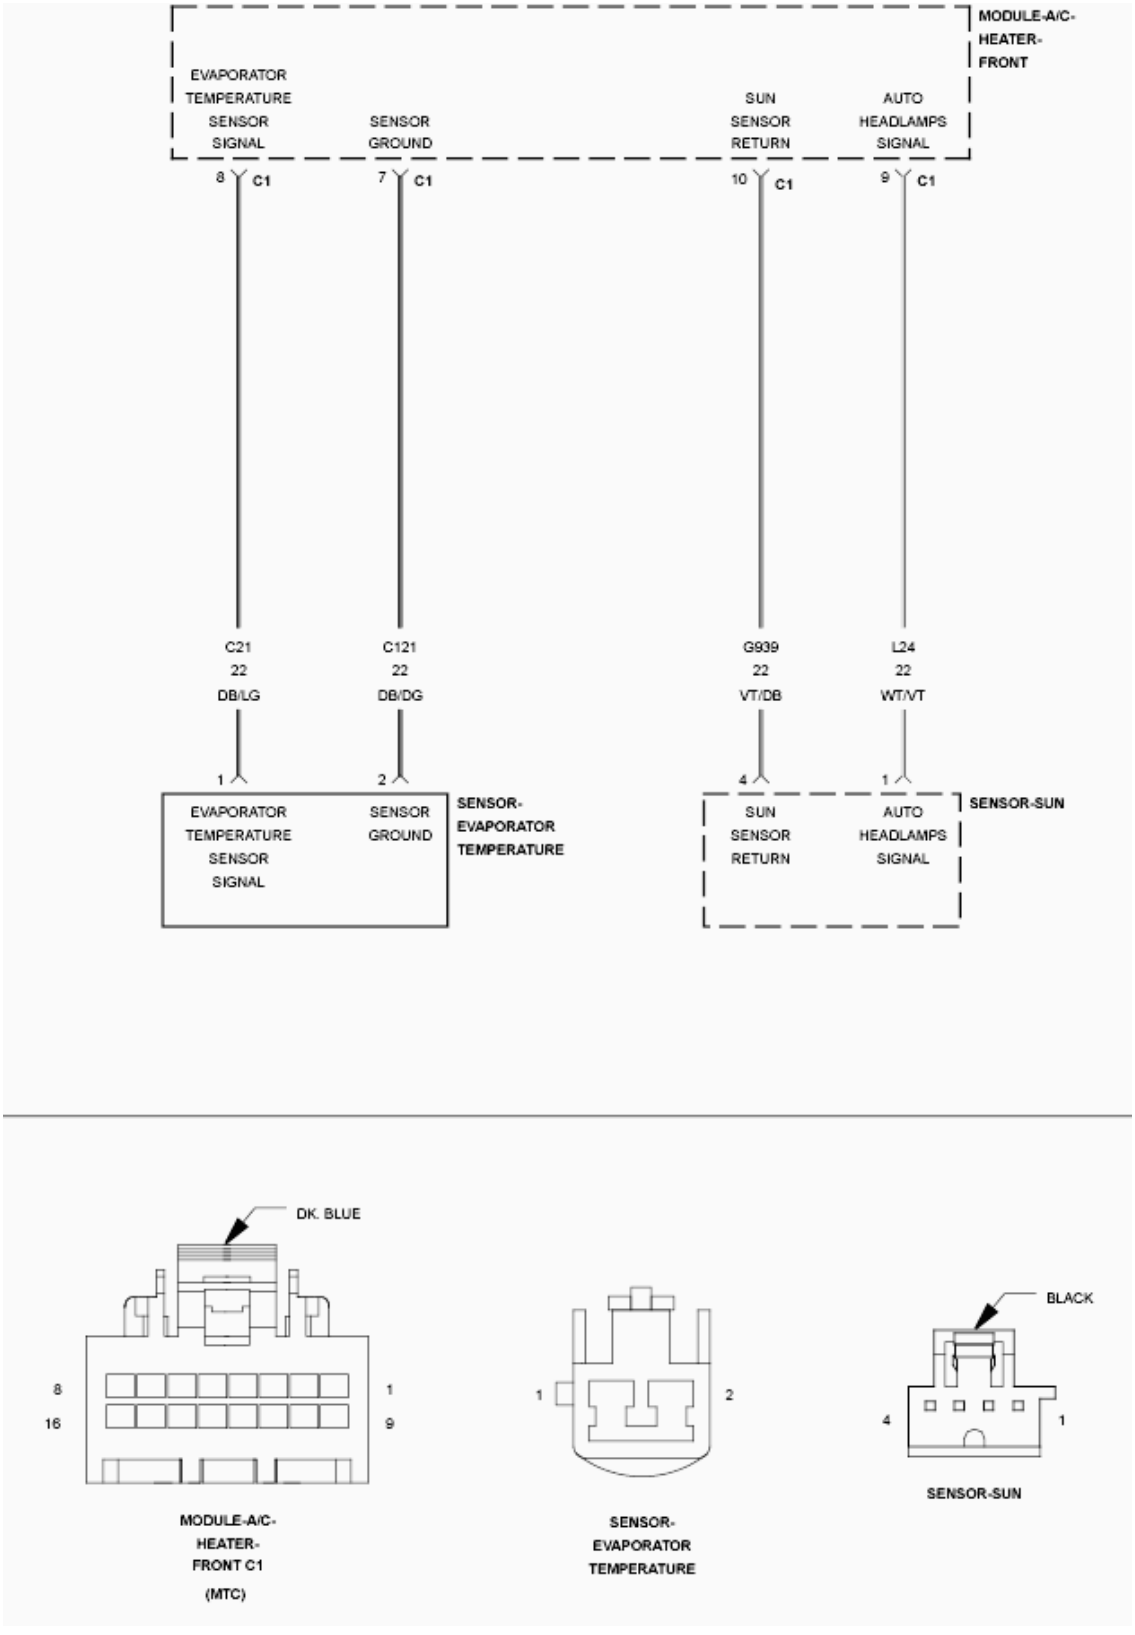

Fig. 112: Evaporator Temperature Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Control to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Twilight or Ambient Light Sensor input voltage is less than 1.05 volts for period of 1.2 seconds.

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO GROUND
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 4
2. **CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

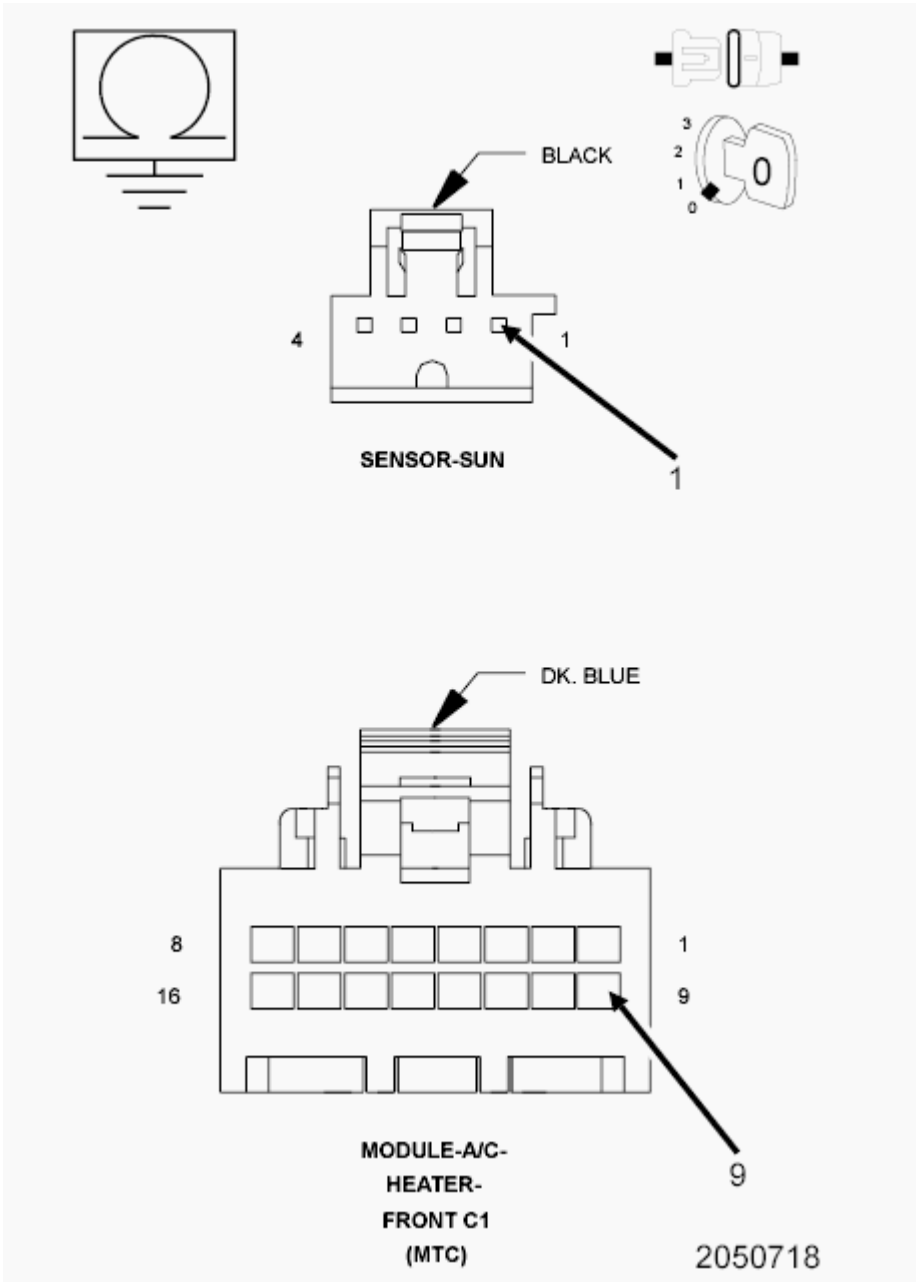

Fig. 113: Checking Auto Headlamps Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C2 harness connector.
3. Disconnect the Sun Sensor harness connector.
4. Measure the resistance between ground and he (L24) Auto Headlamps Signal circuit.

   Is the resistance below 100k Ohms?

Yes

- Repair the (L24) Auto Headlamps Signal circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 3

3. **CHECK THE A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information.
   2. Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      Did this DTC reset while performing the HVAC Verification Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

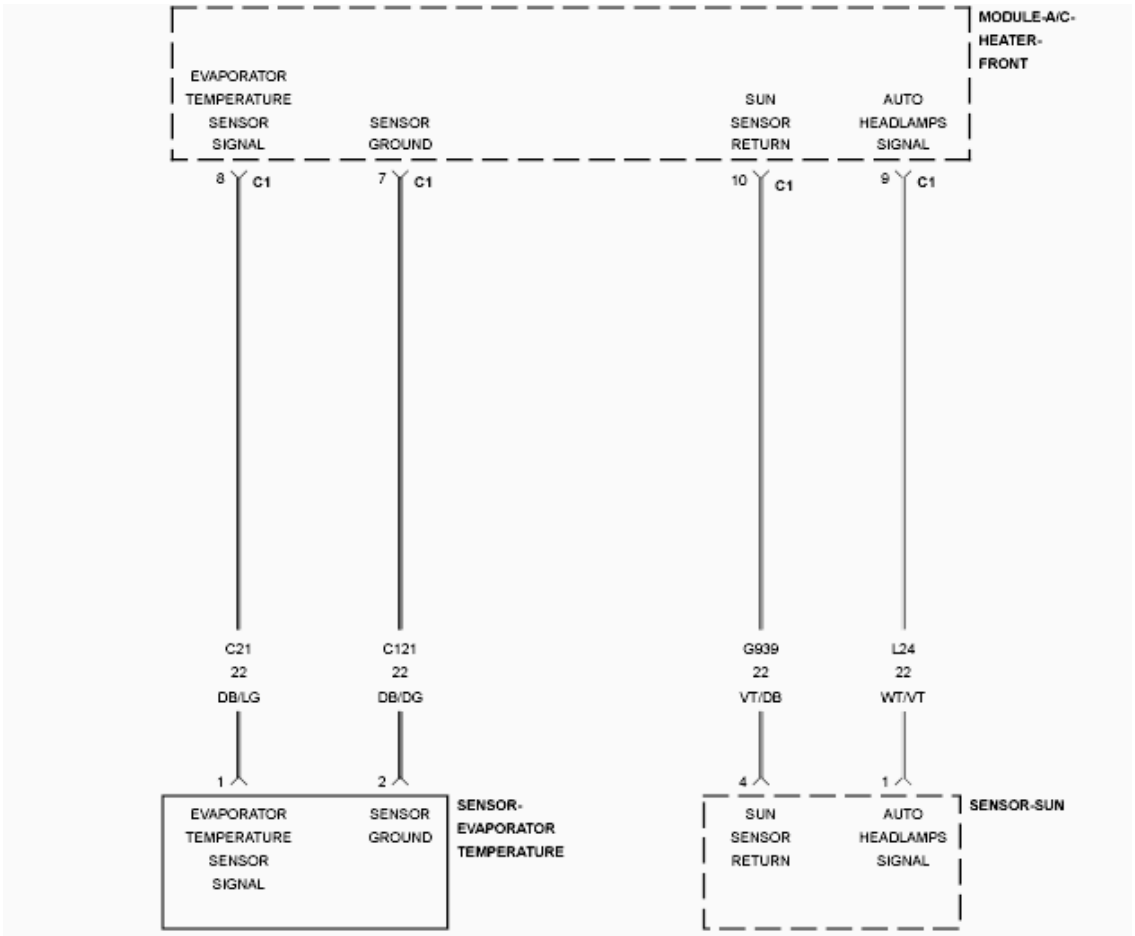
      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

B160F-12-TWILIGHT/AMBIENT LIGHT SENSOR INPUT - CIRCUIT SHORT TO BATTERY



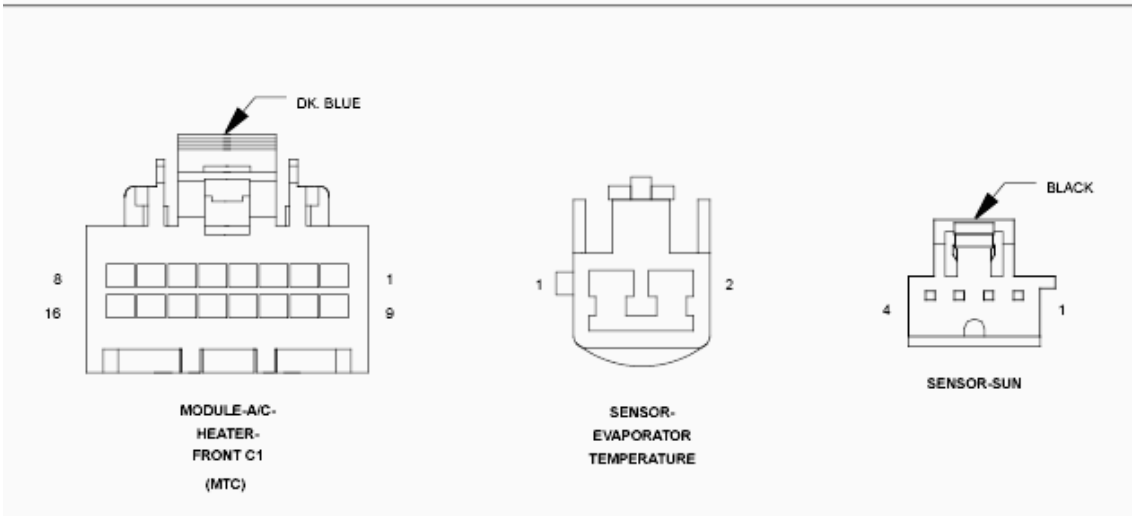


Fig. 114: Evaporator Temperature Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Control to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Twilight or Ambient Light Sensor input voltage is greater than 4.83 volts for period of 1.2 seconds.

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORT TO VOLTAGE
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 6
2. **CHECK THE (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

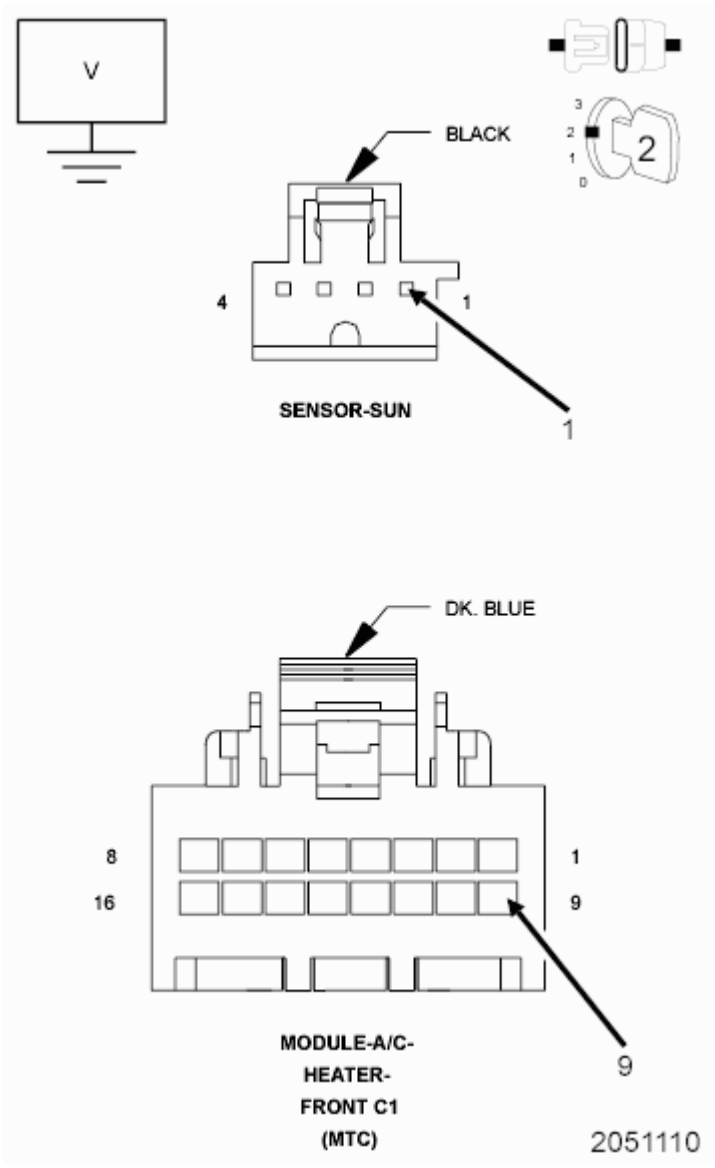

Fig. 115: Checking Auto Headlamps Signal Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Ignition on, engine not running.
4. Measure the voltage of the (L24) Auto Headlamps Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (L24) Auto Headlamps Signal circuit for a short to voltage.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 3

3. **CHECK THE (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR AN OPEN**

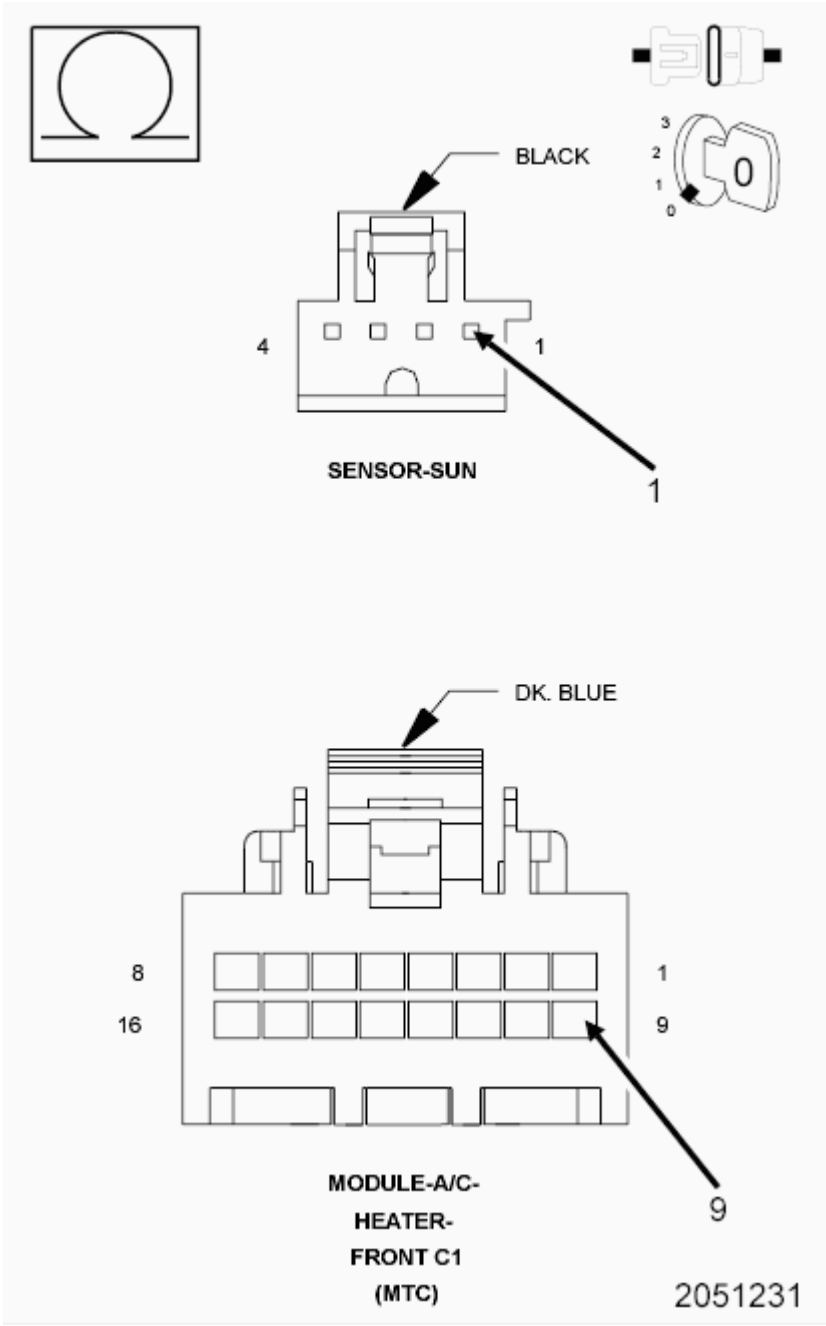

Fig. 116: Checking Auto Headlamps Signal Circuit For An Open

Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the Sun Sensor harness connector.
3. Measure the resistance of the (L24) Auto Headlamps Signal circuit between the A/C Heater Control C1 harness connector and the Sun Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go to step 4

   No

   - Repair the (L24) Auto Headlamps Signal circuit for an open.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

4. **CHECK THE (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

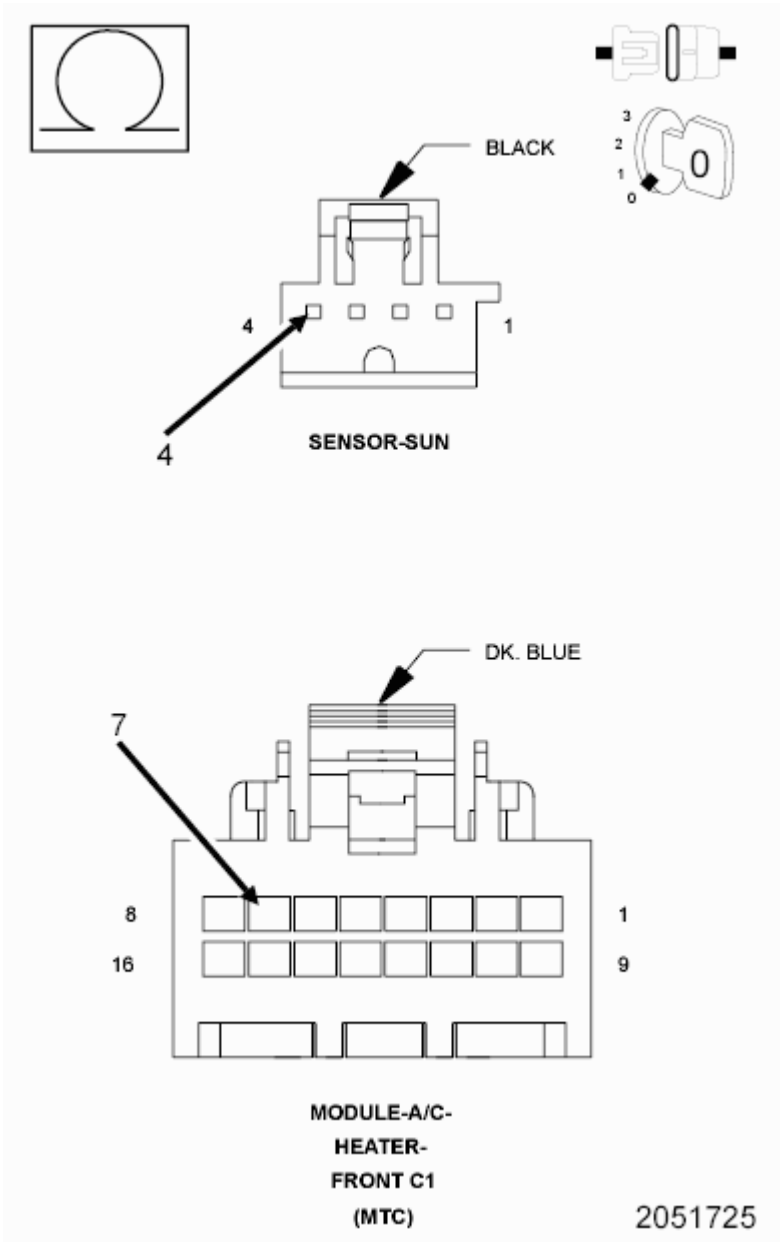

Fig. 117: Checking Sensor Ground Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (C121) Sensor Ground circuit between the A/C Heater Control C1 harness connector and the Sun Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go to step 5

No

- Repair the (C121) Sensor Ground circuit for an open.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

5. **CHECK THE SUN SENSOR AND A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information.
   2. Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   Did this DTC reset while performing the HVAC Verification Test?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B160F-92-TWILIGHT/AMBIENT LIGHT SENSOR INPUT - PERFORMANCE OR INCORRECT OPERATION

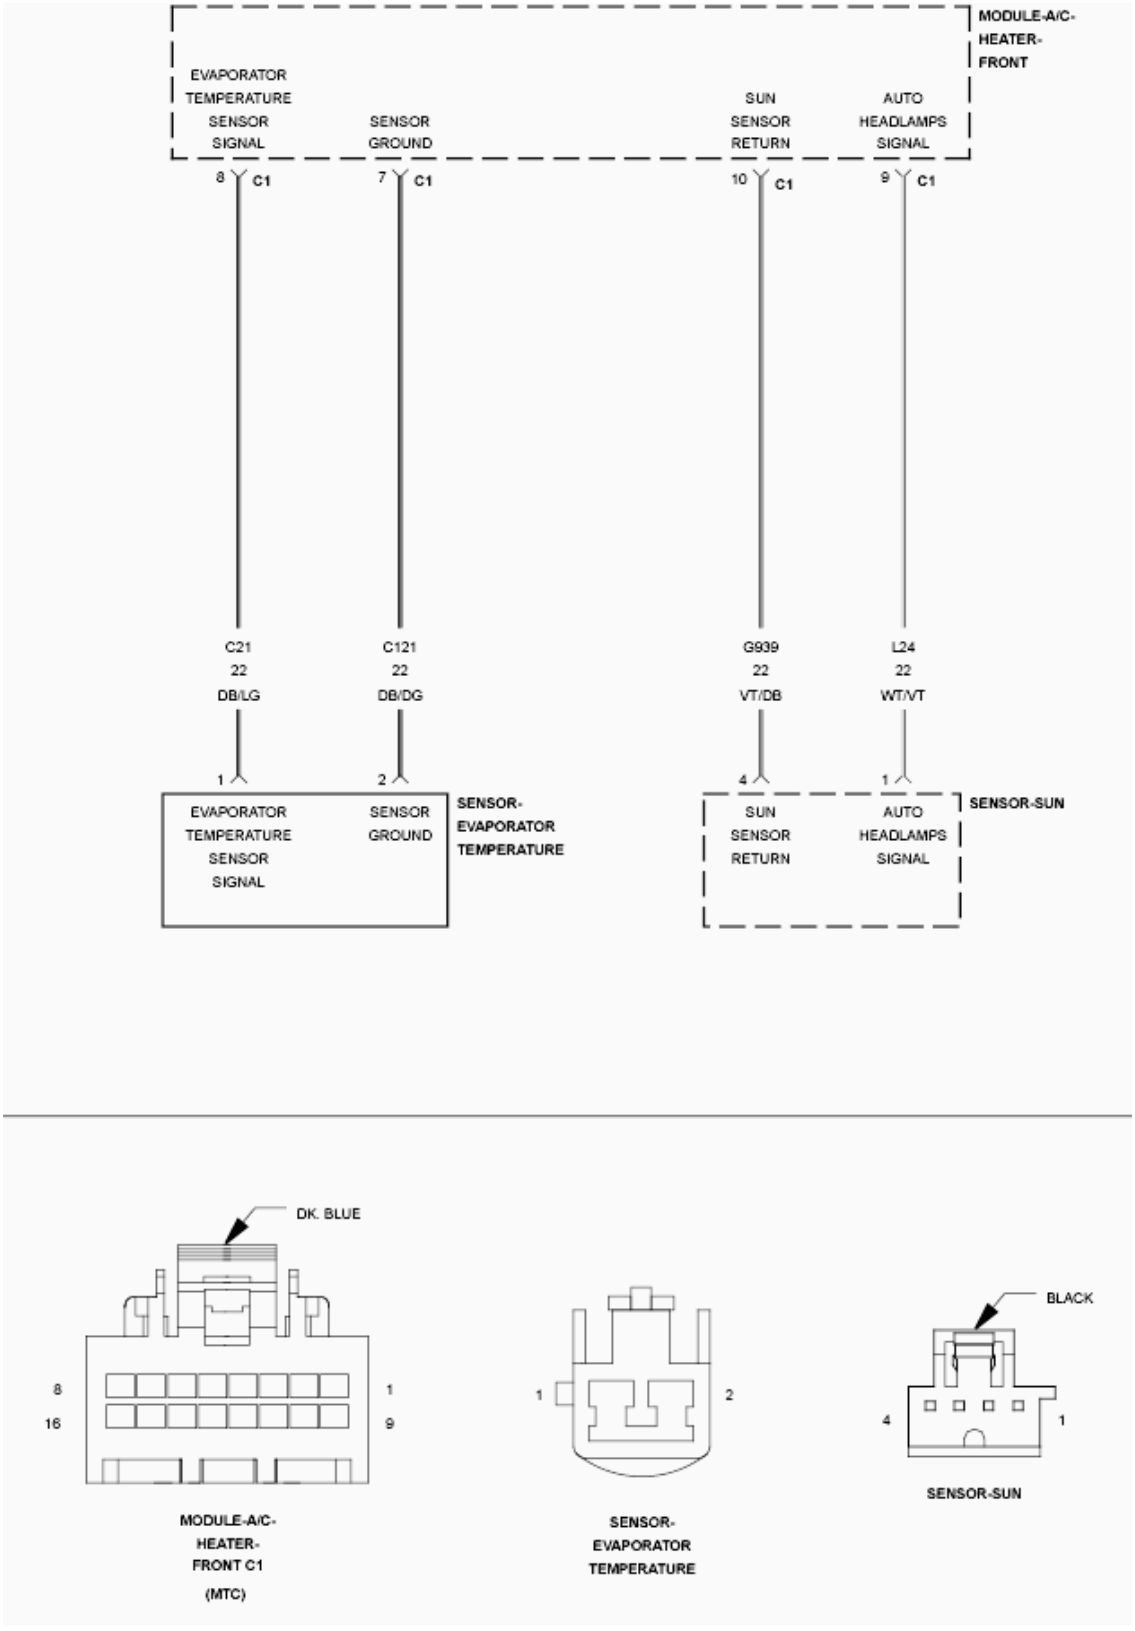

Fig. 118: Evaporator Temperature Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Control to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  Continuously with the ignition on.

- **Set Condition:**

  If the Auto Headlamps Signal input voltage is less than 4.3 volts and greater than 1.5 volts for period of 1.2 seconds. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORT TO GROUND
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Go to step 4
2. **CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

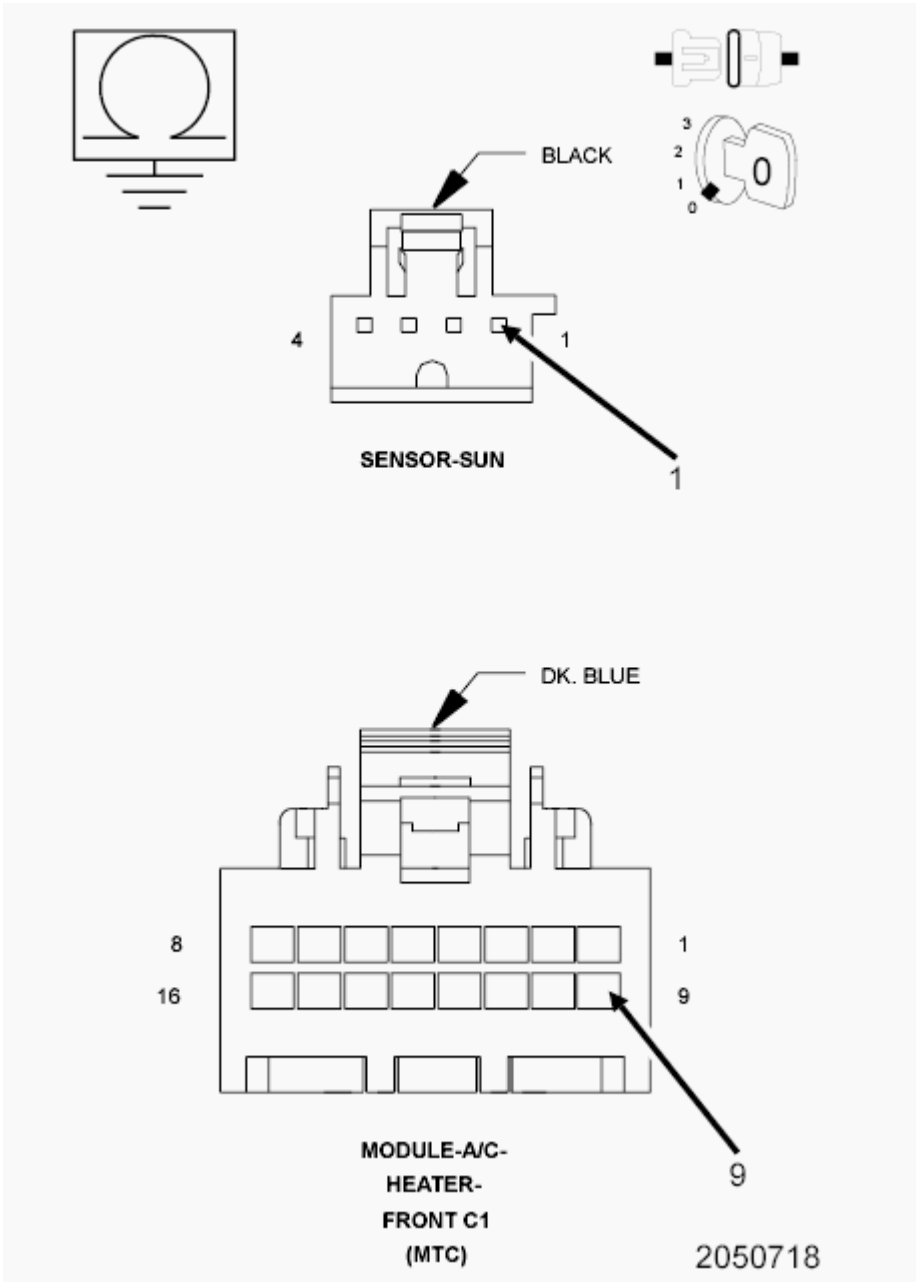

Fig. 119: Checking Auto Headlamps Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Sun Sensor harness connector.
4. Measure the resistance between ground and he (L24) Auto Headlamps Signal circuit.

   Is the resistance below 100k Ohms?

Yes

- Repair the (L24) Auto Headlamps Signal circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 3

3. **CHECK THE A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information.
   2. Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      Did this DTC reset while performing the HVAC Verification Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.
4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      No

      - Test complete.

B210A-84-SYSTEM VOLTAGE LOW - SIGNAL BELOW ALLOWABLE RANGE

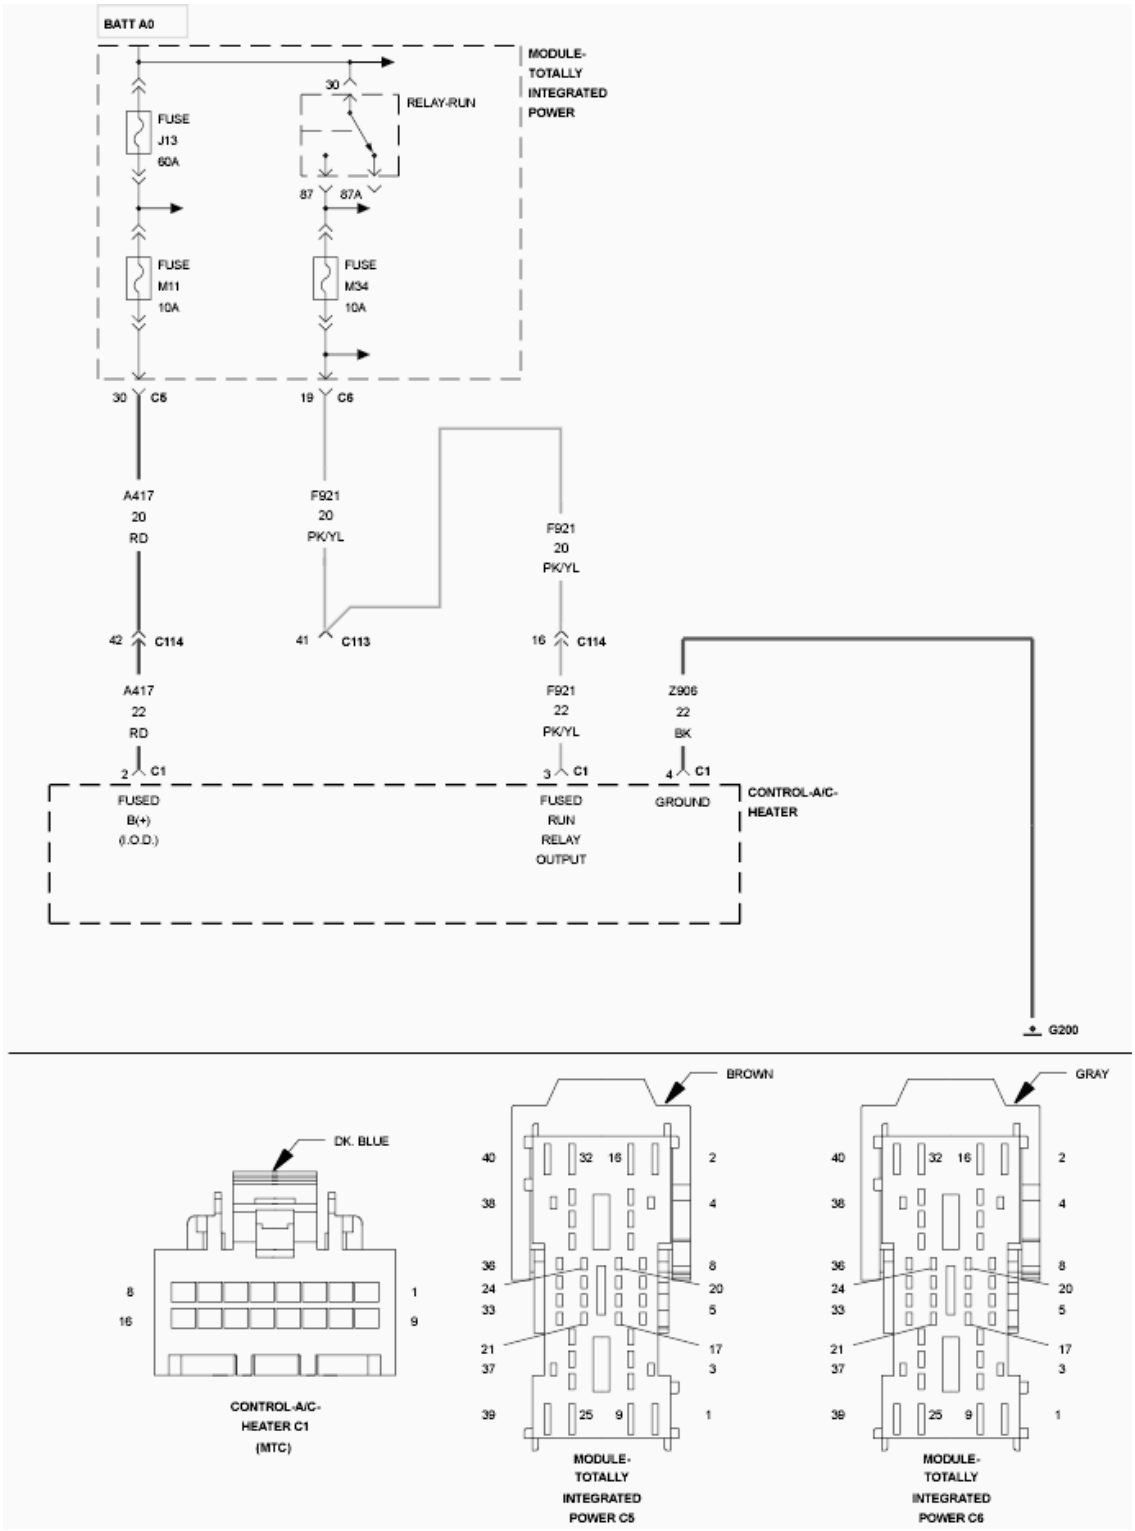

Fig. 120: Fused B+ Run Relay Output Ground Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Control constantly monitors battery and ignition voltage as well as battery voltage derived from BUS communication to ensure proper operation. If the voltage to the controller is out of range it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a DTC will set.

- **When Monitored:**

  Continuously with the ignition on.

- **Set Condition:**

  If the controller system voltage or ignition voltage broadcast over the BUS is lower than monitored controller voltage the for period of 60 seconds.

Possible Causes
RELATED TIPM DTCS PRESENT
RELATED CHARGING SYSTEM DTCS PRESENT
RELATED HVAC DTCS PRESENT
OTHER CONTROLLERS REPORTING UNDER VOLTAGE CONDITION
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR TIPM DTCS**
   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs.

      Are there any Totally Integrated Power Module (TIPM) DTCs present?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 2
2. **CHECK FOR POWERTRAIN CONTROL MODULE DTCS**

1. With the scan tool, read DTCs.

   Are there any Powertrain Control Module (PCM) charging system DTCs present?

   Yes

   - Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

   No

   - Go to step 3

3. **CHECK FOR HVAC DTCS**
   1. With the scan tool, read HVAC DTCs.

      Is the DTC B210D-84-Battery Voltage Low - Signal Below Allowable Range present also?

      Yes

      - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the diagnostic procedure for **B210D-84-BATTERY VOLTAGE LOW - SIGNAL BELOW ALLOWABLE RANGE**.

      No

      - Go to step 4

4. **CHECK IF THE DTC IS ACTIVE**
   1. With the scan tool, read HVAC DTCs.

      NOTE: It can take up to 60 seconds or more for this DTC to mature.

      Is this DTC active?

      Yes

      - Go to step 5

      No

      - Go to step 6

5. **CHECK IF OTHER CONTROLLERS ARE REPORTING AN OVER VOLTAGE CONDITION**
   1. With the scan tool, read DTCs.

      Are any other controllers reporting an over voltage condition?

Yes

- Go To DTC Based Diagnostics and perform the appropriate diagnostic procedure.

No

- Replace and program the A/C Heater Control in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B210B-85-SYSTEM VOLTAGE HIGH - SIGNAL ABOVE ALLOWABLE RANGE

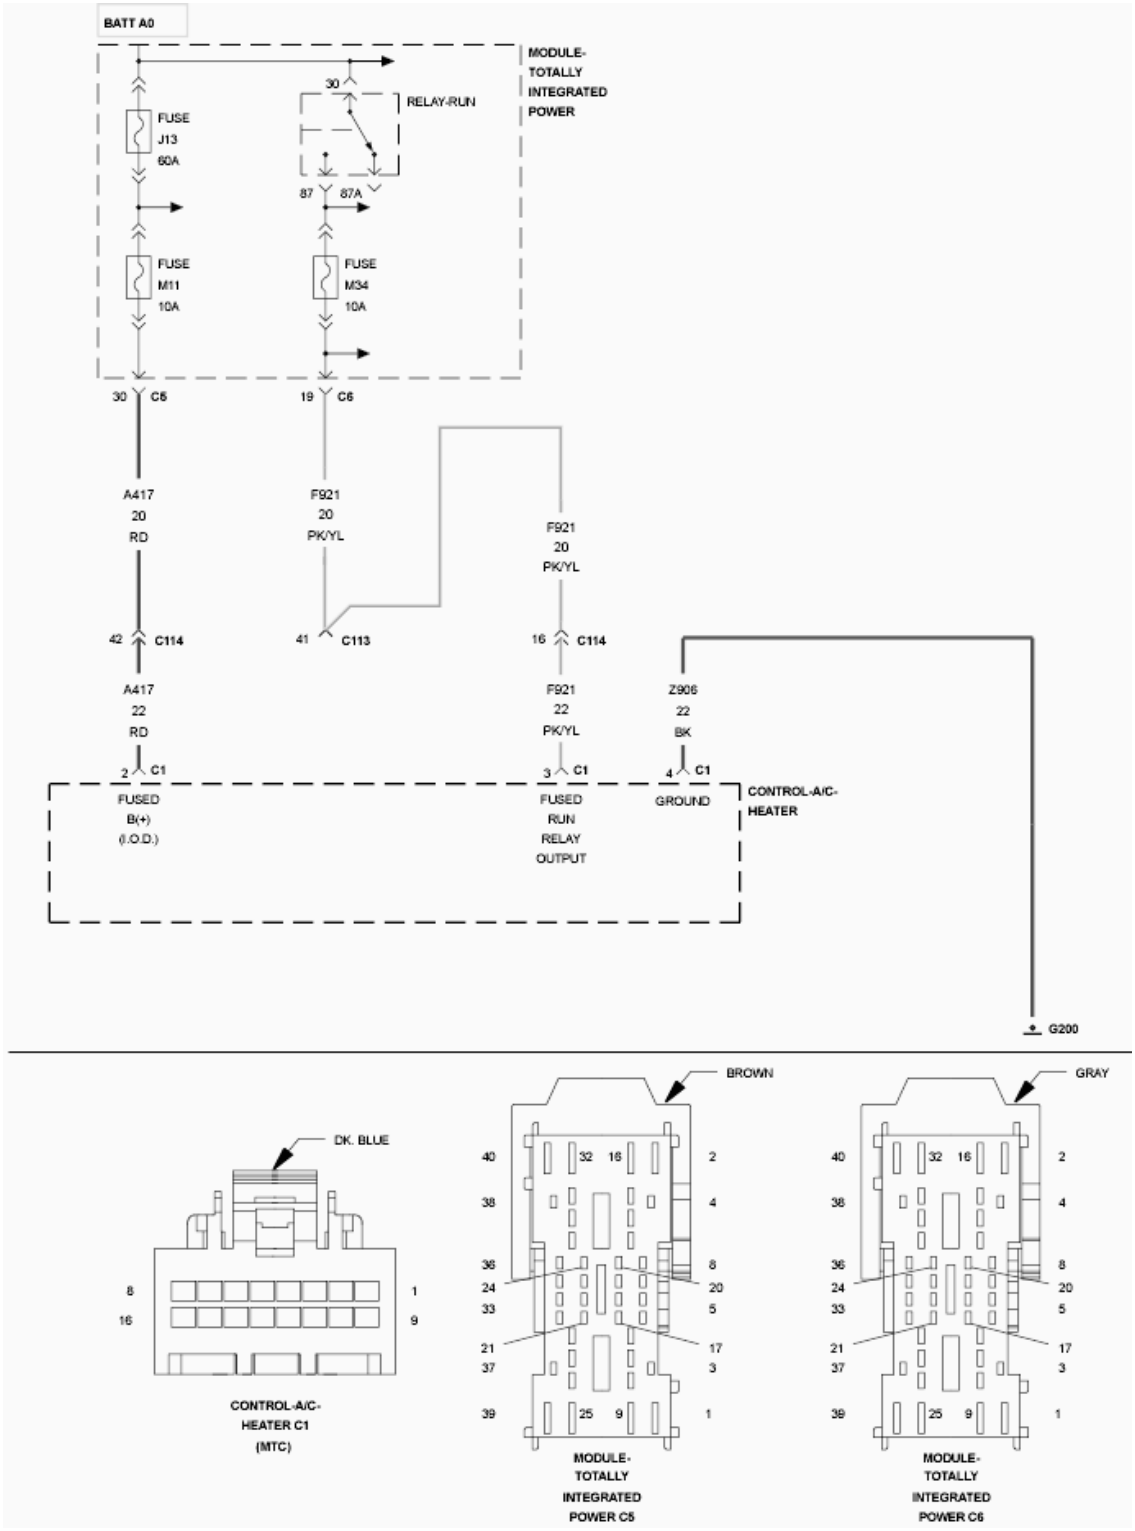

Fig. 121: Fused B+ Run Relay Output Ground Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Control constantly monitors battery and ignition voltage as well as battery voltage derived from BUS communication to ensure proper operation. If the voltage to the controller is out of range it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a DTC will set.

- **When Monitored:**

  Continuously with the ignition on.

- **Set Condition:**

  If the controller system voltage or ignition voltage broadcast over the BUS is higher than monitored controller voltage the for period of 60 seconds.

Possible Causes
RELATED TIPM DTCS PRESENT
RELATED CHARGING SYSTEM DTCS PRESENT
RELATED HVAC DTCS PRESENT
OTHER CONTROLLERS REPORTING OVER VOLTAGE CONDITION
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR TIPM DTCS**
   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs.

      Are there any Totally Integrated Power Module (TIPM) DTCs present?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 2
2. **CHECK FOR POWERTRAIN CONTROL MODULE DTCS**
   1. With the scan tool, read DTCs.

Are there any Powertrain Control Module (PCM) charging system DTCs present?

Yes

- Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 3

3. **CHECK FOR HVAC DTCS**
   1. With the scan tool, read HVAC DTCs.

      Is the DTC B210E-85-Battery Voltage High - Signal Above Allowable Range present also?

      Yes

      - See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the diagnostic procedure for **B210E-85-BATTERY VOLTAGE HIGH - SIGNAL ABOVE ALLOWABLE RANGE**.

      No

      - Go to step 4
4. **CHECK IF THE DTC IS ACTIVE**
   1. With the scan tool, read HVAC DTCs.

      NOTE: It can take up to 60 seconds or more for this DTC to mature.

      Is this DTC active?

      Yes

      - Go to step 5

      No

      - Go to step 6
5. **CHECK IF OTHER CONTROLLERS ARE REPORTING AN OVER VOLTAGE CONDITION**
   1. With the scan tool, read DTCs.

      Are any other controllers reporting an over voltage condition?

      Yes

- Go to DTC Based Diagnostics and perform the appropriate diagnostic procedure.

No

- Replace and program the A/C Heater Control in accordance with the Service Information.
- Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B210D-84-BATTERY VOLTAGE LOW - SIGNAL BELOW ALLOWABLE RANGE

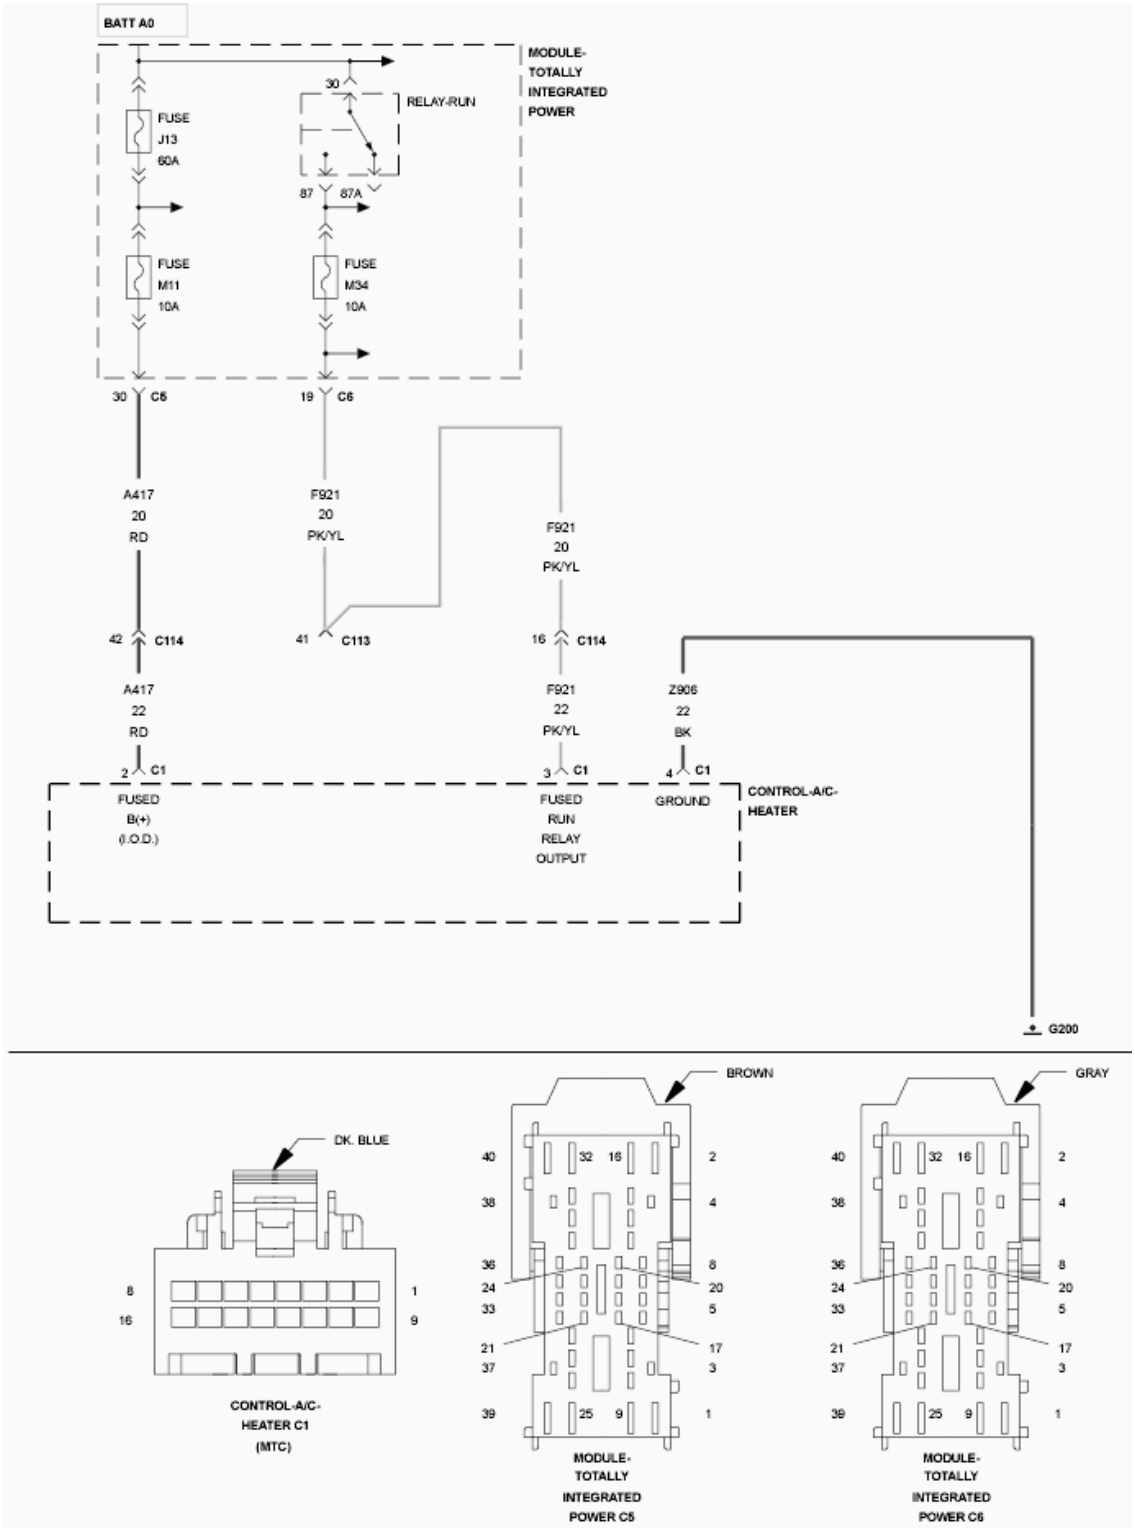

Fig. 122: Fused B+ Run Relay Output Ground Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Control constantly monitors battery and ignition voltage to ensure proper operation. If the voltage to the controller is out of range it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the controller battery voltage is less than or equal to 10.0 volts for period of 5.0 seconds.

Possible Causes
RELATED CHARGING SYSTEM DTCS PRESENT
(F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN
(A417) FUSED B(+) CIRCUIT OPEN
(Z906) GROUND CIRCUIT OPEN
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR CHARGING SYSTEM DTCS**
   1. Using the scan tool, read PCM DTCs.

      Are there any charging system DTCs present in the Powertrain Control Module (PCM)?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 2
2. **CHECK FOR TOTALLY INTEGRATED POWER MODULE DTCS**
   1. Using the scan tool, read TIPM DTCs.

      Are there any TIPM DTCS present?

Yes

- Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 3

3. **CHECK IF THE DTC IS ACTIVE**
   1. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 4

      No

      - Go to step 7
4. **CHECK THE (F921) FUSED RUN RELAY OUTPUT CIRCUIT FOR AN OPEN**

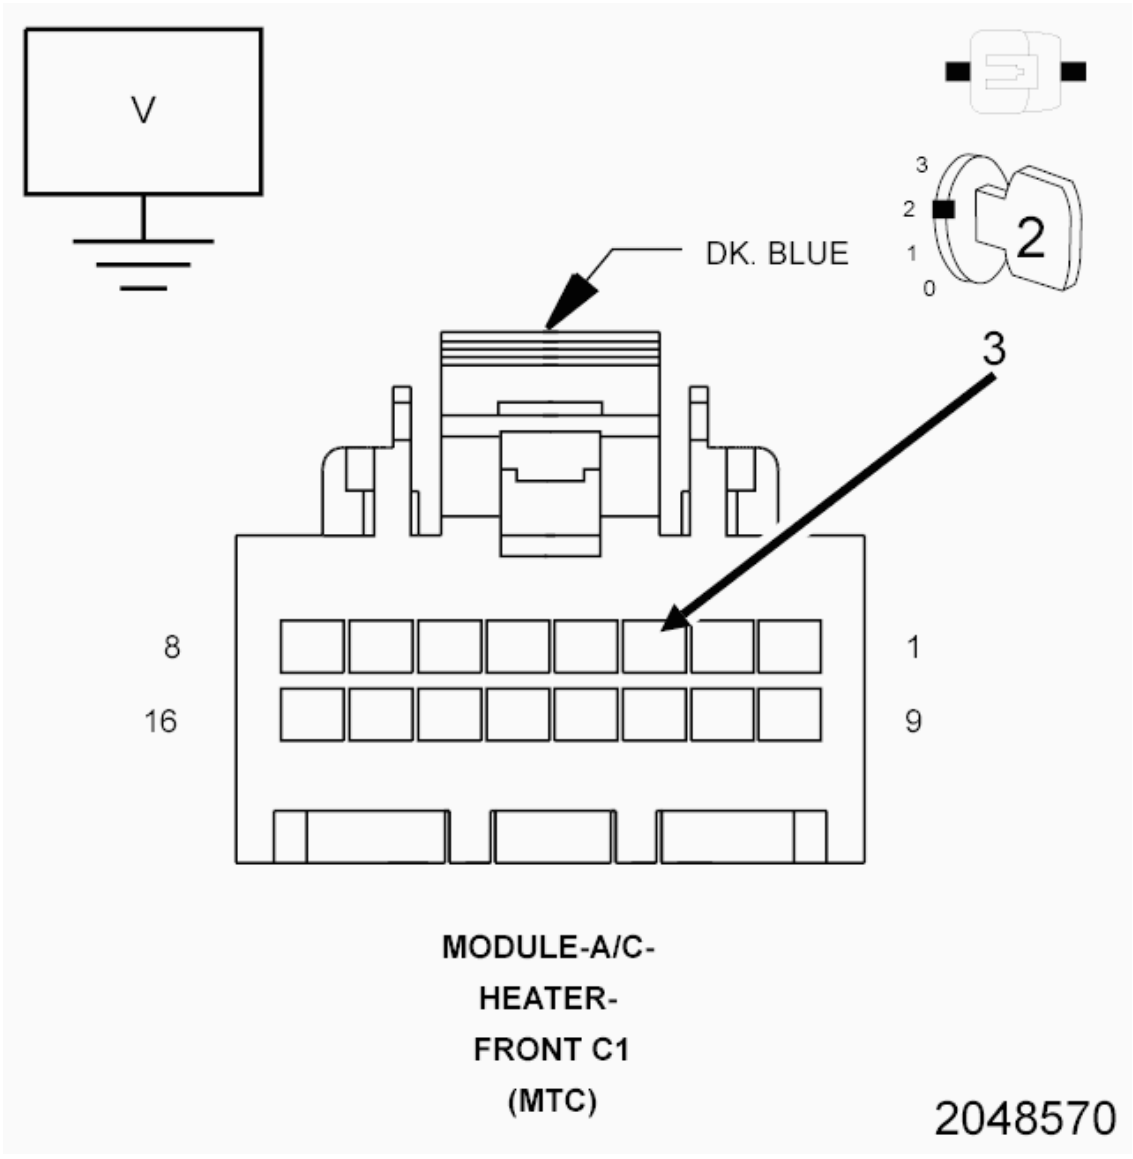

Fig. 123: Checking Fused Run Relay Output Circuit For An Open
Courtesy of CHRYSLER LLC

1. Ignition on, engine not running.
2. While back probing, measure the voltage of the (F921) Fused Run Relay Output circuit in the A/C Heater Control C1 harness connector.

   Is the voltage 10.0 volts or below?

   Yes

   - Repair the (F921) Fused Run Relay Output circuit for an open or high resistance.

     NOTE: If the fuse is open, make sure to check for a short to ground on

the (F921) Fused Run Relay Output circuit.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 5

5. **CHECK THE (A417) FUSED B(+) CIRCUIT FOR AN OPEN**

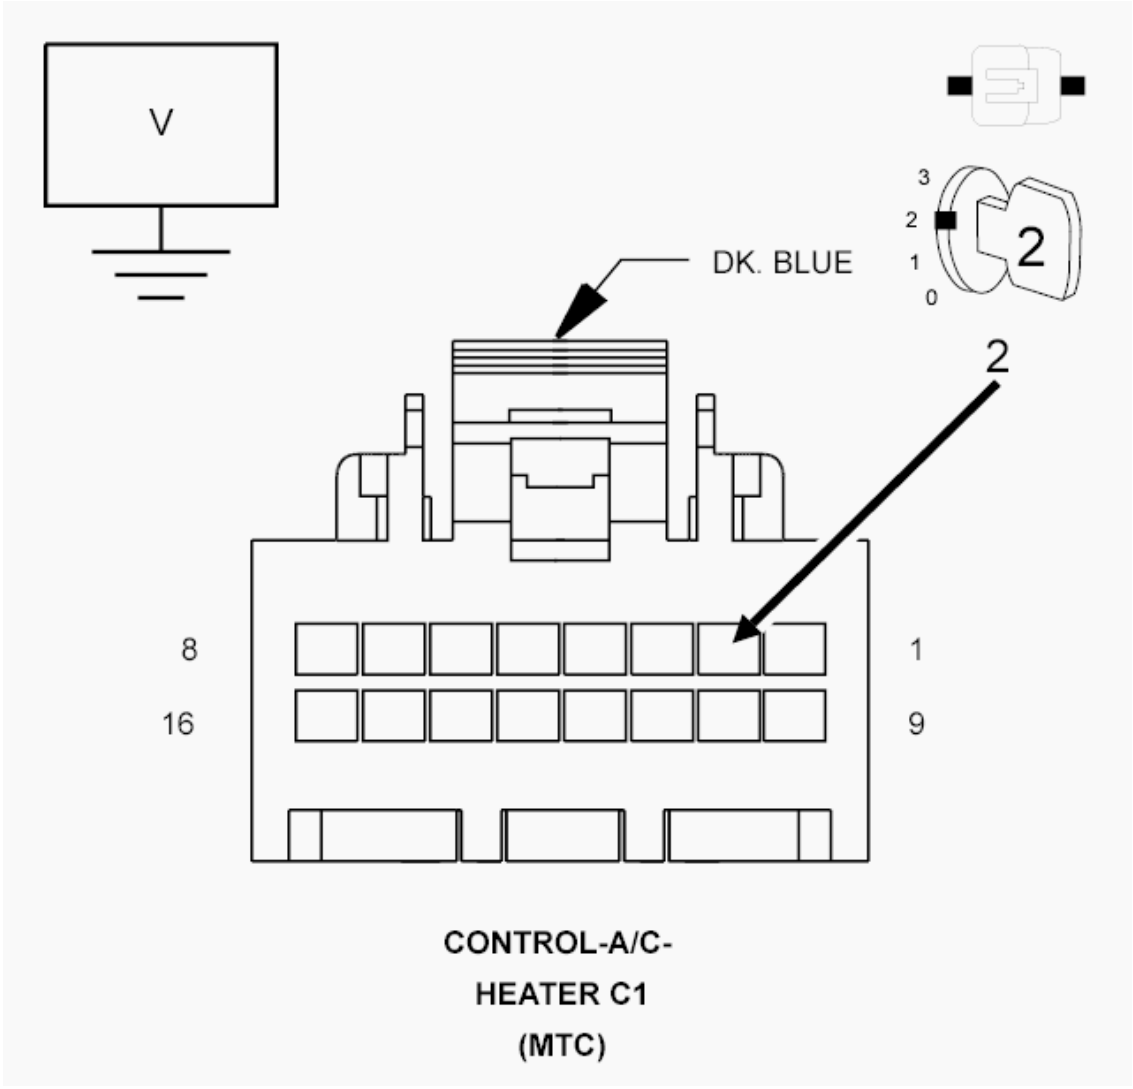

Fig. 124: Checking Fused B(+) Circuit For An Open
Courtesy of CHRYSLER LLC

1. Ignition on, engine not running.
2. While back probing, measure the voltage of the (A417) Fused B (+) circuit in the A/C Heater Control C1 harness connector.

Is the voltage 10.0 volts or below?

Yes

- Repair the (A417) Fused B (+) circuit for an open or high resistance.

  NOTE: Make sure to check if the IOD fuse is installed. If the fuse is open, make sure to check for a short to ground.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 6

6. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN**

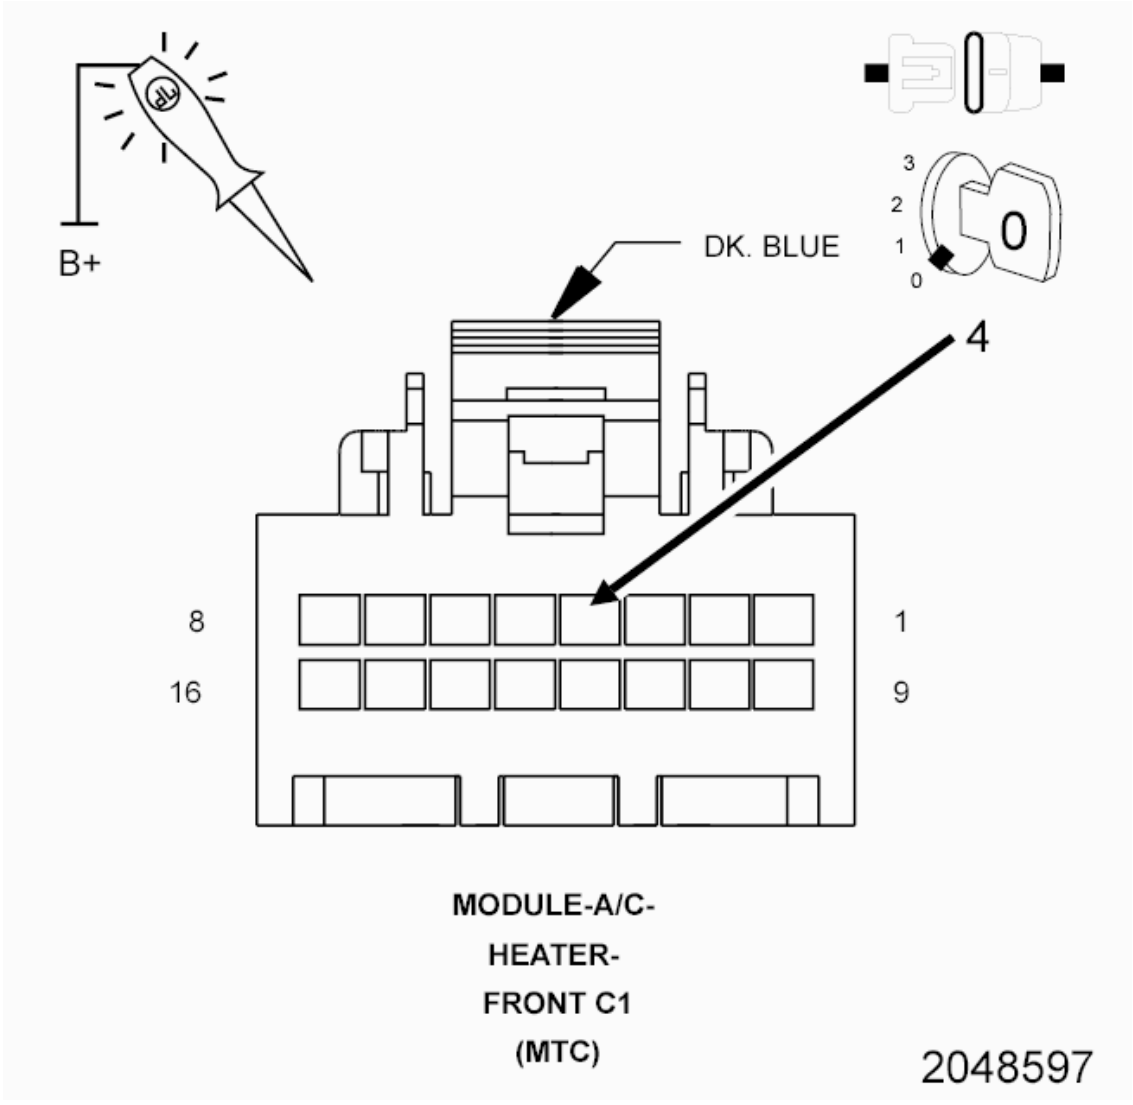

Fig. 125: Checking Ground Circuit For An Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information.

- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Repair the (Z906) Ground circuit for an open.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the **SYSTEM WIRING DIAGRAMS** as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

B210E-85-BATTERY VOLTAGE HIGH - SIGNAL ABOVE ALLOWABLE RANGE

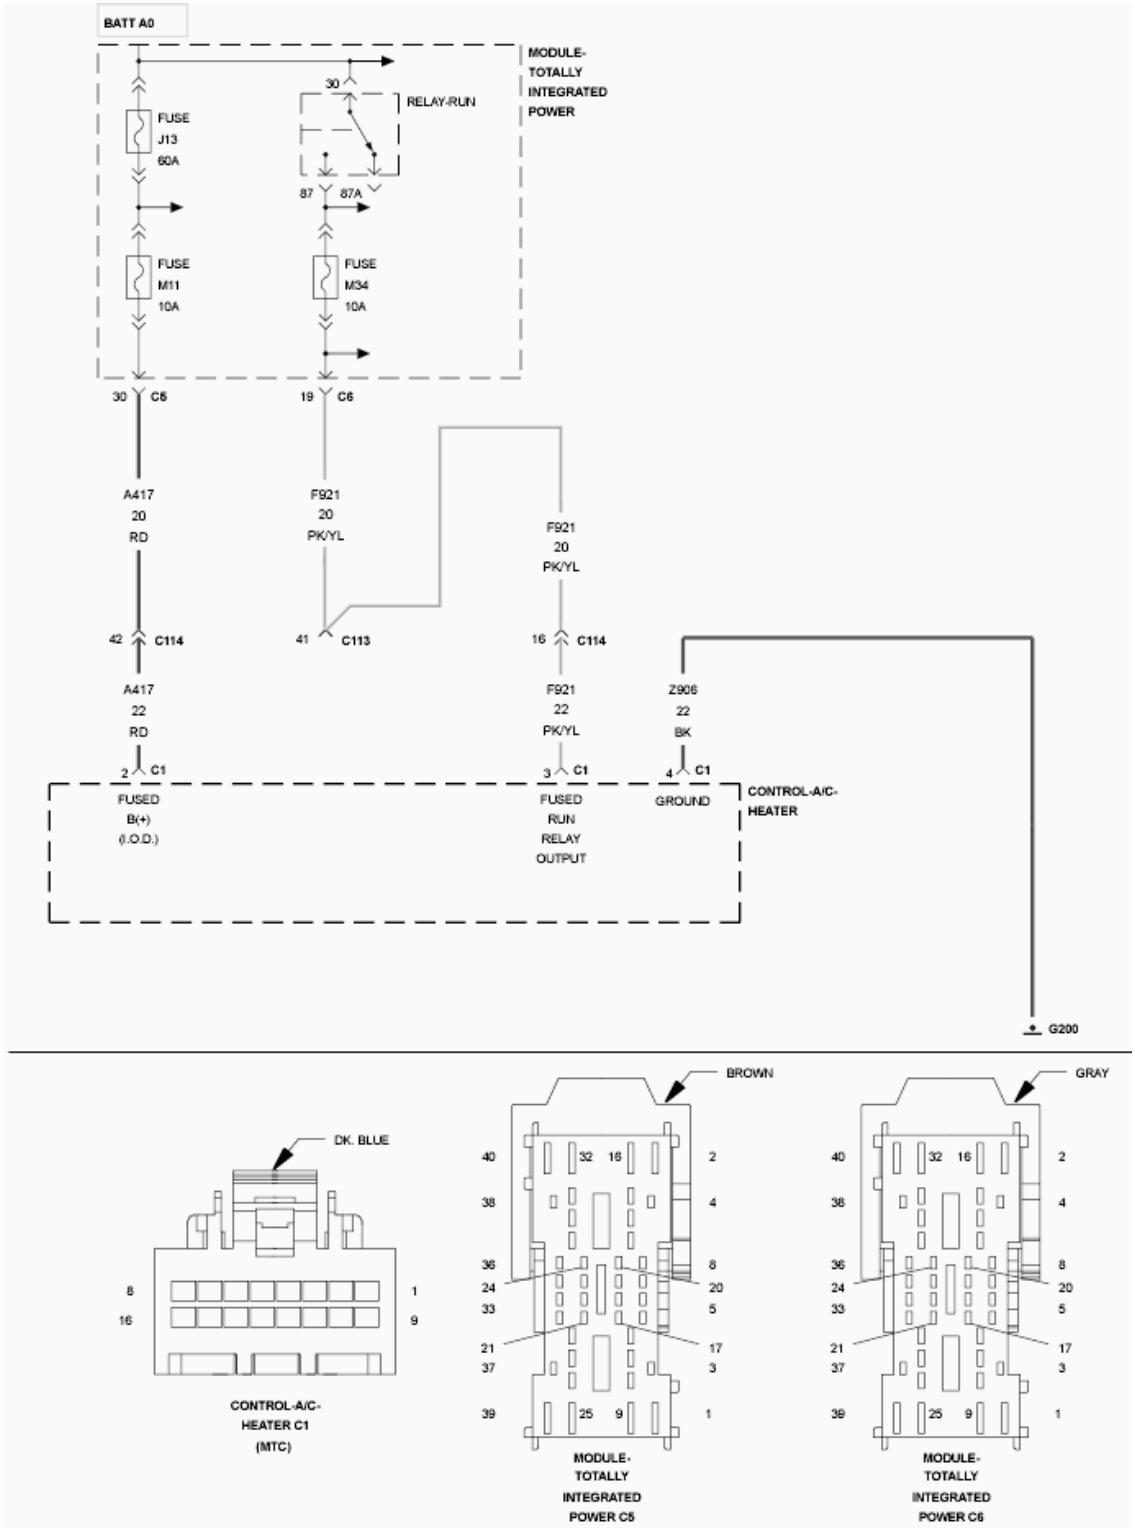

Fig. 126: Fused B+ Run Relay Output Ground Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Control constantly monitors battery and ignition voltage to ensure proper operation. If the voltage to the controller is out of range it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the controller battery voltage is higher than 16.0 Volts for period of 1.0 second.

Possible Causes
RELATED CHARGING SYSTEM DTCS PRESENT
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK FOR CHARGING SYSTEM DTCS**
   1. Using the scan tool, read PCM DTCs.

      Are there any charging system DTCs present in the Powertrain Control Module (PCM)?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 2
2. **CHECK FOR TOTALLY INTEGRATED POWER MODULE DTCS**
   1. Using the scan tool, read TIPM DTCs.

      Are there any TIPM DTCs present?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 3

3. **CHECK IF THE DTC IS ACTIVE**
   1. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go to step 4

      No

      - Go to step 5
4. **CHECK IF OTHER CONTROLLER ARE REPORTING AN OVER VOLTAGE CONDITION**
   1. Ignition on, engine not running.
   2. With the scan tool read DTCs.

      Are any other controllers reporting an over voltage condition?

      Yes

      - Go to DTC Based Diagnostics and perform the appropriate diagnostic procedure.

      No

      - Replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   4. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   5. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   6. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.

B2214-00-(HVAC) CLIMATE CONTROL INTERNAL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the A/C Heater Control has an internal fault. This Diagnostic Trouble Code (DTC) has a maturing time of five seconds and a de-maturing time of 10 seconds. If the DTCs status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK THE A/C HEATER CONTROL**

   Repair

   - Check for any controller software updates if applicable. If an update is available, reprogram the controller with the latest software. If no software updates are available, replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

B222A-00-VEHICLE LINE MISMATCH

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The A/C Heater Controller checks for vehicle configuration using communication over the BUS. If the stored configuration does not match the configuration stored in the controller this DTC will set.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the stored configuration does not match the configuration stored in the controller.

Possible Causes
VEHICLE CONFIGURATION NOT STORED IN THE TOTALLY INTEGRATED POWER MODULE (TIPM)
CONTROL MODULE INSTALLED IN INCORRECT VEHICLE
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK THE VEHICLE CONFIGURATION**

   NOTE: The DTC must be active and no BUS communication DTCs present before performing this test. If BUS communication DTCs are present, perform there respective test first. If the DTC is stored, erase the DTC and cycle the ignition. If the DTC resets and changes to active, then proceed.

   1. With the scan tool, check the vehicle configuration stored in the Totally Integrated Power Module (TIPM).
   2. With the scan tool, check the vehicle configuration stored in the A/C Heater Control (HVAC).

      Pick the answer that best describes your findings:

      TIPM has wrong or no vehicle configuration

      - With the scan tool, program the proper vehicle configuration in the TIPM.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

      HVAC has wrong vehicle configuration but TIPM has correct configuration.

      - Replace the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC -**

Standard Procedure.

HVAC and TIPM have proper calibration and the DTC is active in the HVAC.

- Check if other modules such as the Powertrain Control Module (PCM) have the wrong configuration stored in the controller and reprogram or replace as necessary. If all other modules show the proper configuration, replace the A/C Heater Control in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

U0010-00-CAN INTERIOR BUS

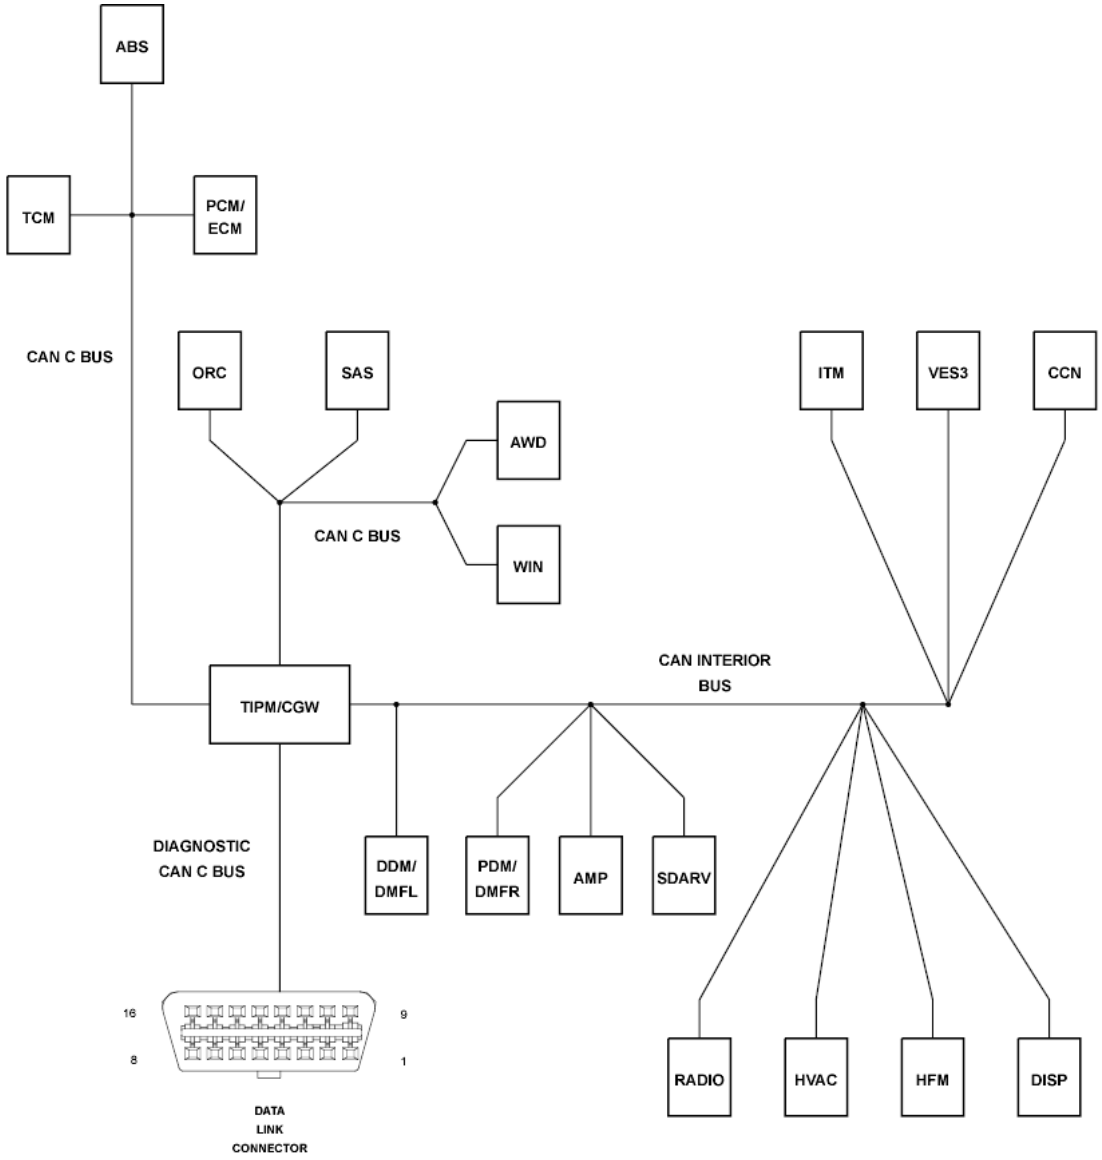

Fig. 127: CAN Interior Bus Circuit Schematic

Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously when the ignition is on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  The A/C Heater Control detects a short to ground or a short to voltage on the CAN Bus circuits.

Possible Causes
BUS CIRCUITS SHORTED TO GROUND OR VOLTAGE
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE (TIPM)
TIPM POWER AND GROUND
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the **U0010-CAN INTERIOR BUS** diagnostic procedure.

      No

- Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0141-00-LOST COMMUNICATION WITH IPM (FCM/TIPM)

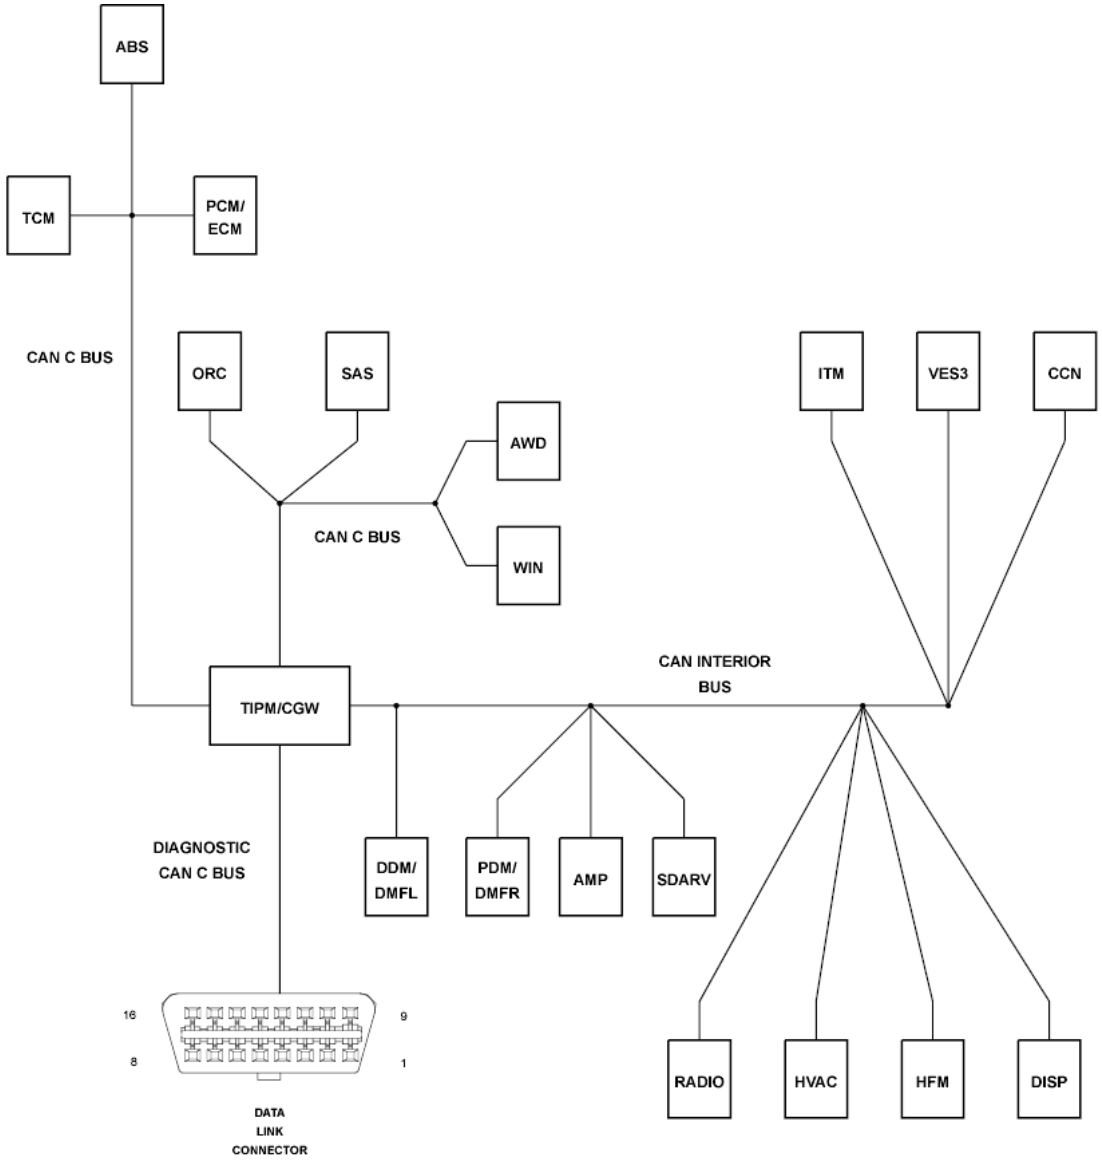

Fig. 128: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously when the ignition is on.

12-volt battery voltage between 10 and 16 Volts.

Ignition Off Draw (IOD) fuse installed.

Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Totally Integrated Power Module (TIPM) for three seconds.

Possible Causes
BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM/TIPM NOT CONFIGURED CORRECTLY
TIPM POWER AND GROUND
TOTALLY INTEGRATED POWER MODULE
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and 12-volt battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the diagnostic procedure for **U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)**.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTC diagnostic procedure.

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

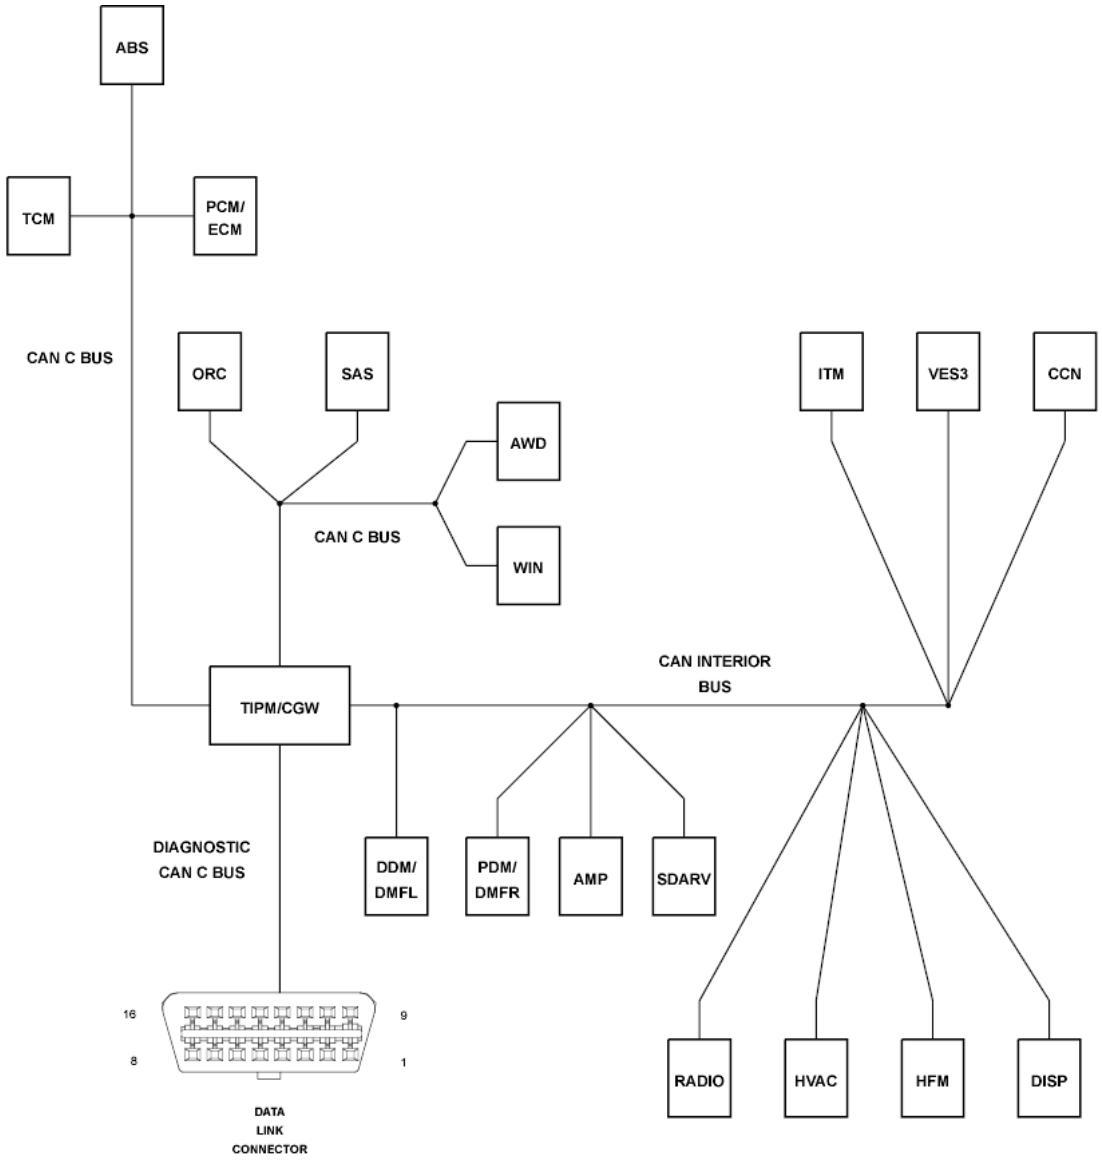

Fig. 129: CAN Interior Bus Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 Volts.

  Ignition Off Draw (IOD) fuse installed.

  Totally Integrated Power Module (TIPM) is configured correctly.

- **Set Condition:**

  Bus messages not received from the Cluster/CCN for approximately two to five seconds.

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
CLUSTER/CCN POWER AND GROUND
CLUSTER/CCN
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and 12-volt battery voltage is between 10 and 16 Volts before proceeding.

   1. Using the scan tool, read active HVAC DTCs.

      Is this DTC active?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the diagnostic procedure for **U0155-LOST COMMUNICATION WITH CLUSTER/CCN**.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTC diagnostic procedure.

STANDARD PROCEDURE

HVAC SYSTEM TEST

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC System Test provides a starting point in the diagnostic process by identifying the appropriate diagnostic procedure or system test to perform when diagnosing a given symptom, condition, or Diagnostic

Trouble Code (DTC). It also provides a means for testing the entire HVAC system by utilizing the A/C Heater Control's On-Board System Tests. The HVAC System Tests can also assist in diagnosing stored DTCs.

Diagnostic Test

1. **HVAC SYSTEM TEST**

   NOTE: Diagnose and repair all active DTCs before diagnosing and repairing stored DTCs. If active DTCs are present, see 28 - DTC-Based Diagnostics and perform the appropriate diagnostic procedure.

   Make a selection based on the symptom, condition, or DTC that you want to diagnose.

   scan tool Indicates HVAC Not Active On Bus

   - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the No Response from HVAC diagnostic procedure.

   Blower Motor Inoperative

   - Refer to **Heating and Air Conditioning/Distribution/MOTOR, Blower - Diagnosis and Testing** for Blower Motor diagnostic procedures.

   Actuator Calibration Test

   - Go to step 4

   A/C System Performance (Cool Down) Test

   - Go to step 2
2. **A/C COOL DOWN TEST**

   The following are prerequisites of the A/C Cool Down Test. Verify that the:

   - Refrigerant system has an adequate charge. Check and repair as necessary before proceeding in accordance with the Service Information. Refer to **Heating and Air Conditioning - Diagnosis and Testing** .
   - Blower motor operates correctly in all speeds. Diagnose and repair all blower related faults before proceeding.
   - Work area ambient temperature is above 16° C (60° F) before proceeding. Move the vehicle to a warmer work area if necessary.
   - Evaporator temperature is above 13° C (55° F) before proceeding.
   - A/C compressor is not running. If the compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding.

NOTE: Running the AC Cool Down test will cause the A/C status indicator to flash. One or more status messages will display on the scan tool after running the Cool Down Test. These messages will clear after paging back out of this test function. Therefore, it is important to note all messages before doing so.

1. Start the engine.
2. Turn the Blower control to the high speed position.
3. With the scan tool in HVAC, select System Tests and then select Cool Down test. Allow the test to run to completion.

   Does the scan tool display a status message that indicates a fault has occurred?

   Yes

   - See 28 - DTC-Based Diagnostics/HVAC and perform the appropriate diagnostic procedure based on vehicle HVAC system.

   No

   - Go to step 3

3. **MODE SWITCH AND DOOR ACTUATOR CIRCUIT TEST**

NOTE: If at anytime a DTC becomes active during this test, proceed to the conclusion question. If multiple DTCs are active, diagnose those that relate to a short circuit first.

1. Start the engine and turn the Blower control to the low speed position.
2. Set the Blend control (single-zone) or Driver and Passenger Blend control (dual-zone) to the full cold position.
3. Monitor the scan tool for active HVAC DTCs while performing the following test steps.

- If equipped, press the A/C mode switch on, wait 30 seconds, and then press it off.
- On Dual-Zone systems, press the Recirculation mode switch on, wait 30 seconds, and then press it off.
- If equipped, press the EBL mode switch on, wait 30 seconds, and then press it off.
- Move the Blend control (single-zone) or Driver Blend control (dual-zone) from full cold to full hot, wait 30 seconds, and then move it back to full cold.
- If equipped, move the Passenger Blend control from full cold to full hot, wait 30 seconds, and then moved it back to full cold.
- Turn the Mode select control to the defrost position, wait 30 seconds, and then turn it to the panel position (dual-zone) or panel / recirculation position (single-zone). Wait 30 seconds before proceeding.

4. **ACTUATOR CALIBRATION TEST**

1. Ignition on, engine not running.
2. Using the scan tool, select Actuator Calibration Test. When the test is complete, read HVAC DTCs.

   Does the scan tool display any DTCs?

   Yes

   - See 28 - DTC-Based Diagnostics/HVAC and perform the appropriate diagnostic procedure based on vehicle HVAC system.

   No

   - Test Complete.

HVAC PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Perform the following steps prior to any diagnostic procedure(s).

- Testing should only be performed with the battery fully charged to avoid false diagnosis.
- With the scan tool, read Powertrain Control Module (PCM) Diagnostic Trouble Codes (DTCs). If PCM DTCs are present. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure(s) before proceeding.
- Depending on the vehicle configuration, with the scan tool, read Totally Integrated Power Module (TIPM) DTCs. If TIPM DTCs are present. Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure(s) before proceeding.
- With the scan tool, read HVAC DTCs. Record all Stored, Active, and Pending DTC information.
- With the scan tool, read the Environmental Data. Use this data to help identify the conditions in which the DTC was set.
- Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, or operating under specific conditions.
- Using the **SYSTEM WIRING DIAGRAMS** as a guide, inspect the wiring and connectors related to this circuit and clean/repair as necessary.
- Check for controller software updates if applicable. Some conditions can be corrected by upgrading the controller software.

  NOTE: If the controller is updated with new software, with the scan tool, perform a HVAC Actuator Calibration Test.

- Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Did any of the above procedures repair the vehicle?

Yes

- Testing is complete.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

HVAC VERIFICATION TEST

Perform the following procedures to verify that the repair(s) are valid.

1. Make sure that all accessories are turned off.
2. Make sure that the battery is fully charged.
3. Turn the ignition off to the lock position.
4. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
5. With the scan tool, record and erase all Diagnostic Trouble Codes (DTCs) from ALL modules.
6. Turn the ignition off, remove the scan tool from the DLC (Data Link Connector). Open the door and close the door. Wait a minimum 30 seconds, then turn the ignition on. Reconnect the scan tool.

NOTE: Disconnecting the scan tool and opening and closing the door will allow the controller to enter into sleep mode.

7. With the scan tool perform the HVAC Actuator Calibration Test.
8. Start and run the engine for two minutes while operating all functions of the system that caused the original concern.
9. With the scan tool, check for DTCs in all modules.

Is the original condition still present or are there any other HVAC DTCs present?

Yes

- See **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Repair is complete.

2009 HVAC

Heating & Air Conditioning - Service Information - Journey

DESCRIPTION

DESCRIPTION

A manual temperature control (MTC) single zone heating-A/C system, automatic temperature controlled (ATC) dual zone heating-A/C system, MTC tri-zone heating-A/C system and an ATC tri-zone heating-A/C system is available on this vehicle.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to **COOLING** for more information before opening or attempting any service to the engine cooling system.

FRONT HEATING AND A/C SYSTEM

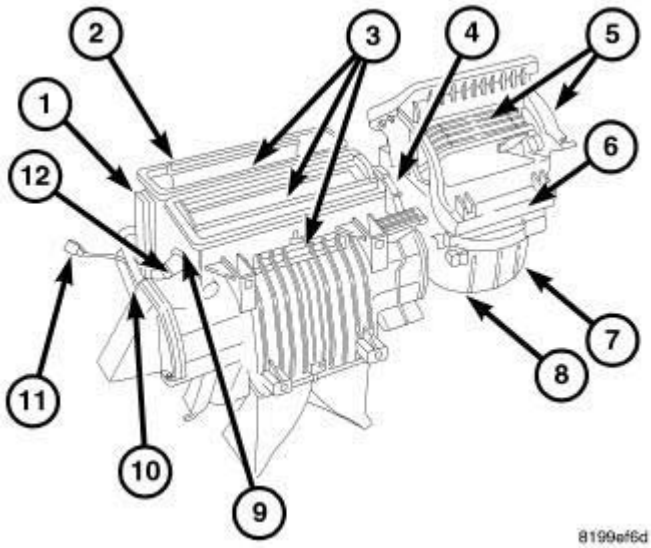

Fig. 1: HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: Single zone HVAC shown. Dual zone similar.

All vehicles are equipped with a common front heater, ventilation and air conditioning (HVAC) housing (1). The heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing mounted within the passenger compartment beneath the instrument panel. The HVAC housing includes:

- A/C evaporator (2)

- Mode-air doors (3)
- Mode door actuator (4)
- Recirculation-air door and actuator (5)
- Particulate air filter (when equipped) (6)
- Blower motor (7)
- Blower motor resistor or power module (depending on system application) (8)
- Blend door actuator(s) (9)
- Heater core (10)
- Evaporator temperature sensor (11)
- Blend-air door(s) (12)

NOTE: An electric positive temperature coefficient (PTC) heater is used on vehicles when equipped with the 2.0L diesel engine. The PTC heater unit compensates for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core. See Heating and Air Conditioning/Cabin Heater/UNIT, Heater - Description.

Based upon the system mode selected, conditioned air can exit the front HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the HVAC air distribution housing and the floor outlets are located on each side of the distribution housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the various outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlet** - Two defroster outlets are located in the center of the instrument panel, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each outboard end of the instrument panel, near the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located near the top of the instrument panel center bezel.
- **Front Floor Outlets** - There are two front floor outlets, one located on each side the floor panel center tunnel behind the instrument panel.
- **Rear Seat Floor Outlets** - There are two rear seat floor outlets, one located on each side of the floor panel near the front of each rear seat foot well.

REAR HEATING AND A/C SYSTEM

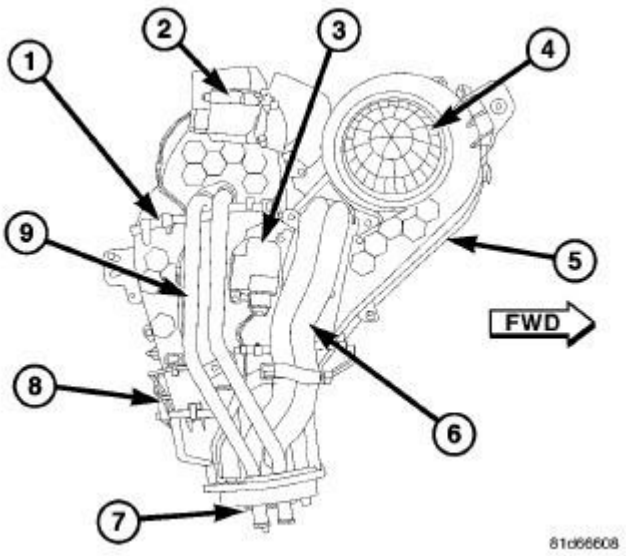

Fig. 2: Rear Heater AC Housing Description
Courtesy of CHRYSLER LLC

The tr-zone heating-A/C systems are equipped with a rear heater-A/C housing (1) that combines A/C and heating capabilities into a single unit mounted within the passenger compartment behind the right quarter interior trim panel. The rear heater-A/C housing includes:

- Mode door and actuator (2)
- Blend door and actuator (3)
- Blower motor (4)
- Blower motor resistor or power module (5) (depending on control system)
- A/C evaporator (6)
- A/C expansion valve (7)
- Wire harness (8)
- Heater core (9)

Based upon the rear temperature selected, conditioned air can exit the rear heater-A/C housing through one or a combination of the two rear housing outlets: ceiling or floor. The ceiling outlet is located at the top rear of the housing and the floor outlet is located at the top front of the rear housing. Once the conditioned air exits the rear heater-A/C housing, it is further directed through molded plastic ducts to the outlets at the rear of the passenger compartment. These outlets and their locations are as follows:

- **Ceiling Outlets** - There are four ceiling outlets in the headliner. One located at each outboard side of the intermediate seat position and one located in front of each rear seat position.
- **Floor Outlet** - There is one floor outlet in the right quarter interior trim panel located behind the right rear door area.

OPERATION

OPERATION

The standard front and available rear heating-A/C systems used in this vehicle are blend-air type systems. In a blend-air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around the heater core. In the available front dual zone system, separate blend-air doors are used to provide completely independent side-to-side temperature control of the discharge air. The temperature control(s) determines the discharge air temperature(s) by operating the blend door actuator(s), which move the blend-air door(s). This design allows almost immediate control of output air temperature(s).

FRONT SYSTEM

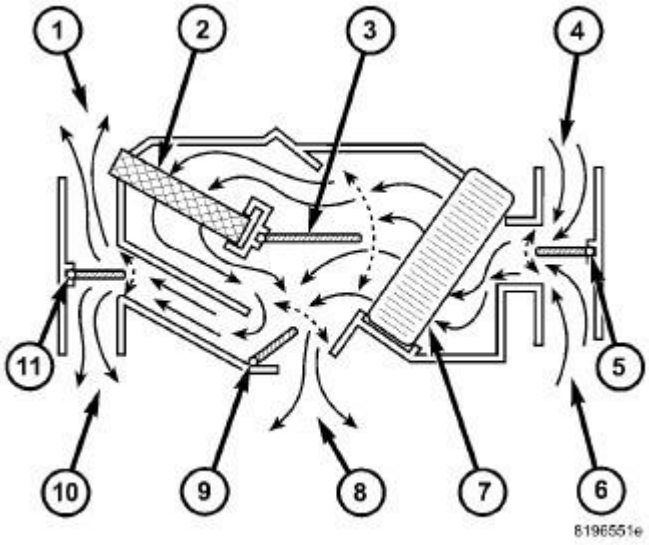

Fig. 3: Blend Air System Schematic
Courtesy of CHRYSLER LLC

NOTE: Typical blend-air type HVAC system shown.

The heating-A/C system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the base of the windshield and into the air inlet housing above the heating, ventilation and air conditioning (HVAC) housing and passes through the A/C evaporator (7). Air flow is then directed either through or around the heater core (2). This is done by adjusting the position of the blend-air door(s) (3) with the temperature control(s) located on the A/C-heater control in the instrument panel. Air flow is then directed out the floor outlet (8), instrument panel outlet (10) or the defroster outlet (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode control located on the A/C-heater control. The temperature and mode control use electrical actuators to operated the air doors.

The velocity of the air flow out of the outlets can be adjusted with the blower speed control located on the A/C-heater control.

The fresh air intake can be shut off by pressing the Recirculation button on the A/C-heater control. This will operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh

air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6).

The A/C compressor can be engaged by pressing the A/C (snowflake) button on the A/C-heater control. It will automatically engage when the mode control is set in any Mix to Defrost position. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control on the A/C-heater control is used to direct the conditioned air to the selected system outlets.

The defroster outlets receive airflow from the HVAC housing through the molded plastic defroster duct, which is secured to the top of the instrument panel. The airflow from the defroster outlets is directed by fixed vanes in the defroster outlet grille and cannot be adjusted.

The side window demister outlets receive airflow from the HVAC housing through the defroster duct and molded plastic demister ducts, which are secured to the instrument panel support. The airflow from the side window demister outlets is directed by fixed vanes and cannot be adjusted. The demisters operate when the mode control is set in any Floor to Defrost position.

The instrument panel outlets receive airflow from the HVAC housing through a molded plastic center panel duct and two end panel ducts. The two end panel ducts direct airflow to the left and right instrument panel outlets, while the center panel duct directs airflow to the two center panel outlets. Each of these outlets can be individually adjusted to direct or shut off the flow of air leaving the outlets.

The front and rear floor outlets receive airflow from the HVAC housing through the front and rear floor ducts which are secured to each side of the HVAC housing. The rear seat ducts direct airflow beneath the carpet to the outlets located near the front of each rear seat foot well. None of the floor outlets can be adjusted.

NOTE: It is important to keep the air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

The front A/C system is designed for use of non-CFC, R-134a refrigerant and uses an A/C expansion valve (TXV) to meter the flow of refrigerant to the A/C evaporator. To maintain minimum evaporator temperature and prevent evaporator freezing, an evaporator temperature sensor input is supplied to the A/C-heater control. In turn, the powertrain control module (PCM) cycles the A/C compressor clutch off and on as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

REAR SYSTEM

The rear heating-A/C system pulls interior air through the opening in the rear quarter interior trim panel and into the rear blower motor in the rear heater-A/C housing, then through the rear A/C evaporator. Air flow can be

directed either through or around the rear heater core by adjusting the blend-air door with either the front or the rear temperature control (depending on the front A/C-heater control setting). The air flow is then directed to the floor or ceiling outlets depending on the mode selected by the mode control. Air flow velocity can be adjusted with the blower speed control located on either the front A/C-heater control or the rear A/C-heater control (depending on the front A/C-heater control setting).

The headliner air outlets receive airflow from the rear heater-A/C housing through the molded plastic ceiling duct, which connects to the headliner duct and headliner air outlets. Airflow direction from the headliner air outlets can be adjusted to direct or shut off the flow of air leaving the outlets.

The rear floor outlet receives airflow from the rear heater-A/C housing through the molded plastic floor distribution duct, which connects to the rear floor outlet located in the rear quarter interior trim panel. The airflow from the rear floor outlet is directed by fixed vanes in the outlet and air flow direction cannot be adjusted. The rear floor outlet is integral to the rear quarter interior trim panel.

The rear A/C system is designed for use of non-CFC, R-134a refrigerant and uses an "H" valve-type thermal expansion valve (TXV) to meter the flow of refrigerant to the rear A/C evaporator.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test. Also the evaporator temperature sensor probe must be a minimum of 16° C (60° F) for this test as well.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

CAUTION: The use of an A/C recycling/charging station for purposes of determining the actual charge level of an A/C system is not recommend. Service recycling/charging stations do not reflect the correct amount of refrigerant charge in the A/C system after a single "reclaim" cycle. Tests have shown that it can take two or more "reclaim" cycles to remove all of the refrigerant charge, depending on the equipment being used. Use only the following procedure for determining the proper charge level.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Check for diagnostic trouble codes using a scan tool. If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM) or engine control module (ECM) (depending on engine application) or the totally integrated power module (TIPM), go to 2. If any DTCs are found, repair as required, then proceed to 2.
2. Connect a tachometer and a manifold gauge set.

NOTE: The ambient air temperature of the vehicle and the location where the vehicle will be tested must be a minimum of 21° C (70° F) before performing this test. Also the evaporator temperature sensor must be a minimum of 18° C (65° F) for this test as well. Place the vehicle in the testing area until the temperature within the vehicle reaches a minimum of 18° C (65° F).

3. Operate the heating-A/C system under the following conditions.
   - Engine at normal operating temperature
   - Engine at normal idle speed
   - Door and windows closed
   - Transaxle in Park
   - A/C-heater controls set to Recirculation mode, full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the A/C System Diagnosis table
   - All panel outlet vanes open and positioned straight rearward
4. Insert a thermometer in the driver side center panel air outlet and operate the A/C system until the thermometer temperature stabilizes or a minimum of 5 minutes.

NOTE: This procedure requires the technician to know what the temperature and

relative humidity is at the time of the test. The temperature must be combined with the relative humidity to calculate the apparent ambient temperature, when the temperatures are above 21° C (70° F). Use the current ambient temperature and the relative humidity in your location. This information can be obtained from multiple sources, such as the internet or local news media.

5. With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the compressor discharge pressure (high side) to the A/C Performance Temperature and Pressure chart.

A/C PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Air Temperature (Apparent)	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)
Air Temperature at Center Panel Outlet	9° C (48° F)	9° C (48° F)	12° C (54° F)	15° C (59° F)	24° C (75° F)
Air Temperature at Driver Side 2nd Row Headliner Outlet	10° C (50° F)	13° C (55° F)	15° C (59° F)	17° C (63° F)	24° C (75° F)
Suction Pressure at Service Port (Low Side)	138 to 310 kPa (20 to 45 psi)	138 to 345 kPa (20 to 50 psi)	207 to 365 kPa (30 to 55 psi)	207 to 414 kPa (30 to 60 psi)	241 to 448 kPa (35 to 65 psi)
Discharge Pressure at Service Port (High Side)	1034 to 1724 kPa (150 to 250 psi)	1379 to 2068 kPa (175 to 300 psi)	1551 to 2241 kPa (175 to 325 psi)	1724 to 2413 kPa (250 to 350 psi)	2068 to 2758 kPa (300 to 475 psi)

6. If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the compressor discharge pressure is high, refer to the **A/C SYSTEM DIAGNOSIS** table.

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C compressor clutch cycling with poor panel outlet temperatures (fixed displacement compressors only).	1. Low refrigerant system charge.	1. See **REFRIGERANT SYSTEM LEAKS**. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal low and high side pressures	1. No refrigerant in the refrigerant system.	1. See **REFRIGERANT SYSTEM LEAKS**. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Inoperative A/C compressor or clutch (depending on compressor application).	2. See **COMPRESSOR, A/C**. Test the compressor and/or clutch and replace, if required.
	3. Improperly installed or inoperative evaporator temperature sensor.	3. See **SENSOR, Evaporator Temperature**. Correctly install or test the sensor and replace, if required.
	4. Improperly installed or inoperative A/C pressure transducer.	4. See **TRANSDUCER, A/C Pressure**. Test the transducer and replace, if required.
	5. Inoperative A/C-heater control, totally integrated power module (TIPM) or PCM/ECM (depending on engine application).	5. See the appropriate Electrical Diagnostic Procedures for testing of the A/C-heater control, TIPM or PCM/ECM. Test the module and replace, if required.
Normal refrigerant pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See **REFRIGERANT OIL LEVEL**. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Blend door actuator(s) improperly installed or inoperative.	2. See **ACTUATOR, Blend Door, Front**. Inspect the actuator(s) for proper operation. Replace the actuator as required.
	3. Blend-air door(s) inoperative or sealing improperly.	3. See **HOUSING, HVAC**. Inspect the blend-air door(s) for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See **REFRIGERANT SYSTEM LEAKS**. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See **EVAPORATOR, A/C, Front**. Replace the restricted A/C evaporator, if required.

	3. Restricted refrigerant flow through the refrigerant lines.	3. See **Plumbing, Front**. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line if required.
	4. Inoperative A/C compressor.	4. See **COMPRESSOR, A/C**. Replace the compressor, if required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. Inoperative radiator cooling fan.	1. See **COOLING** . Test the radiator cooling fan and replace, if required.
	2. A/C condenser air flow restricted.	2. See **CONDENSER, A/C**. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins and missing or improperly installed air seals. Clean, repair or replace components as required.
	3. Refrigerant flow through the A/C receiver/drier is restricted.	3. See **DRIER, A/C Receiver**. Replace the restricted A/C receiver/drier, if required.
	4. Restricted refrigerant flow through the refrigerant lines.	4. See **Plumbing, Front**. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line if required.
	5. Refrigerant system overcharged.	5. See **REFRIGERANT SYSTEM CHARGE**. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.
	6. Air in the refrigerant system.	6. See **REFRIGERANT SYSTEM LEAKS**. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	7. Engine overheating.	7. See **COOLING** . Test the engine cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. See **COOLING** . Inspect the accessory drive belt condition and tension. Replace the accessory drive belt or tensioner, if required.
	2. Inoperative A/C expansion valve.	2. See **VALVE, A/C Expansion**. Replace the valve, if required.
	3. Inoperative A/C compressor.	3. See **COMPRESSOR, A/C**. Replace the compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See **LINE, A/C Liquid**, **LINE, A/C Suction** and **LINE, A/C Discharge**. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct

		the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See **VALVE, A/C Expansion**. Replace the valve, if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See **CONDENSER, A/C**. Replace the restricted condenser, if required.

HEATER PERFORMANCE

Before performing the following tests, see **COOLING** for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation.

WARNING: Do not remove radiator cap when engine is hot. Failure to follow this instruction may result in serious injury.

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to and from the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Temperature		Minimum Floor Outlet Temperature	
Celsius	**Fahrenheit**	**Celsius**	**Fahrenheit**
16°	60°	54°	130°
21°	70°	56°	132°
26°	80°	57°	134°
32°	90°	58°	136°

See **COOLING** if the heater outlet air temperature is below the minimum specification. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Low coolant level
- Inoperative water pump
- Inoperative thermostat
- Pinched or kinked heater hoses
- Improper heater hose routing
- Plugged heater hoses or supply and return ports at the cooling system connections
- Plugged heater core

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake
- Obstructed heater system outlets
- Inoperative engine thermostat
- Inoperative blower motor system
- Inoperative A/C-heater control
- Inoperative blend door actuator(s)
- Inoperative, obstructed or improperly installed blend-air door(s)

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Inoperative A/C-heater control
- Inoperative blend door actuator(s)
- Inoperative, obstructed or improperly installed blend-air door(s)
- Improper engine coolant temperature

SPECIFICATIONS

CONTROLS, FRONT

ACTUATOR, BLEND DOOR, FRONT

Description

DESCRIPTION

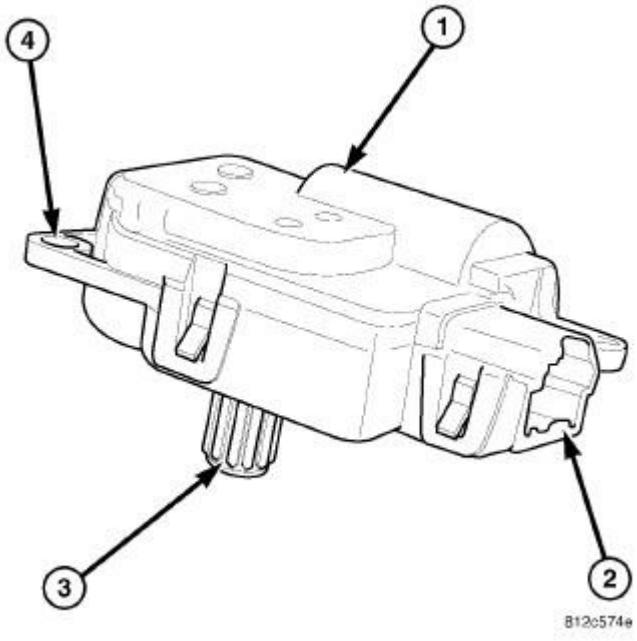

Fig. 7: Blend Door Actuators
Courtesy of CHRYSLER LLC

The blend door actuators (1) for the front heating-A/C system are reversible, 12-volt direct current (DC) servo motors. Models with the front single zone heating-A/C system have a single blend-air door, which is controlled by a single blend door actuator. Models with the front dual zone heating-A/C system have dual blend-air doors, which are controlled by two blend door actuators.

The blend door actuator for the single zone heating-A/Csystem is located on the driver side front HVAC air distribution housing. For the dual zone heating-A/C system, the same blend door actuator used for the single zone system becomes the driver side blend door actuator, which is mechanically connected to only the driver side blend-air door. A second separate blend door actuator is also located on the passenger side of the front air distribution housing which is mechanically connected to only the passenger side blend-air door.

The blend door actuators are contained within a black molded plastic housing with an integral wire connector receptacle (2). An output shaft with splines (3) connect the blend door actuators to the blend door linkage. Three integral mounting tabs (4) allow the actuators to be secured to the air distribution housing. The blend door actuators do not require mechanical indexing to the blend door linkage, as they are electronically calibrated by the A/C-heater control.

The A/C-heater control must be recalibrated each time an actuator motor is replaced. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The blend door actuators are interchangeable with the actuators for the recirculation and mode-air doors.

Operation

OPERATION

The blend door actuators are connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector. The blend door actuator(s) can move the blend-air door(s) in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the blend-air door stops and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuator(s) and the blend-air door(s). The A/C-heater control learns the blend-air door stop positions during the calibration procedure and will store a diagnostic trouble code(DTC) for any problems it detects in the blend door actuator circuits.

The blend door actuators are diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The blend door actuators cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The single zone heating-A/C system is equipped with a single blend door actuator. The dual zone system has two blend door actuators, one for the driver side blend-air door and one for the passenger side blend-air door.

NOTE: LHD model shown in illustrations. RHD model similar.

SINGLE ZONE/DUAL ZONE LEFT SIDE

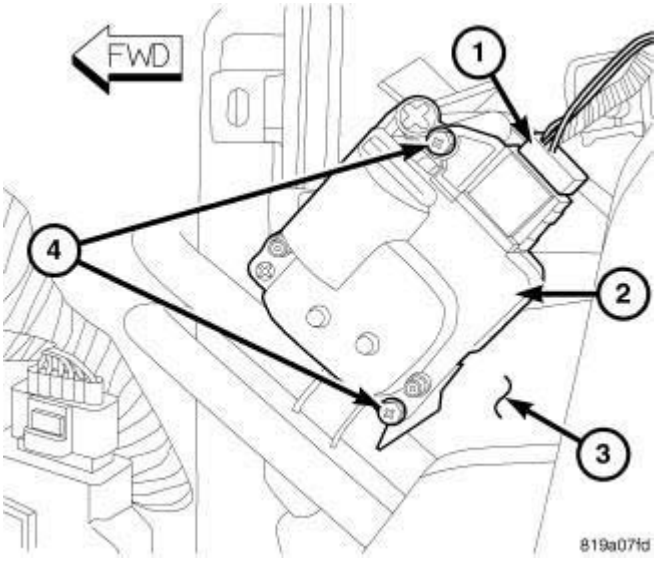

Fig. 8: Blend Door Actuator Removal/Installation
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. On RHD models, if equipped, remove the silencer from underneath the passenger side of the instrument panel.
3. On RHD models, remove the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
4. Disconnect the wire harness connector (1) from the blend door actuator (2) located on the left side of the HVAC air distribution housing (3).
5. Remove the two screws (4) that secure the blend door actuator to the air distribution housing and remove the actuator.

DUAL ZONE RIGHT SIDE

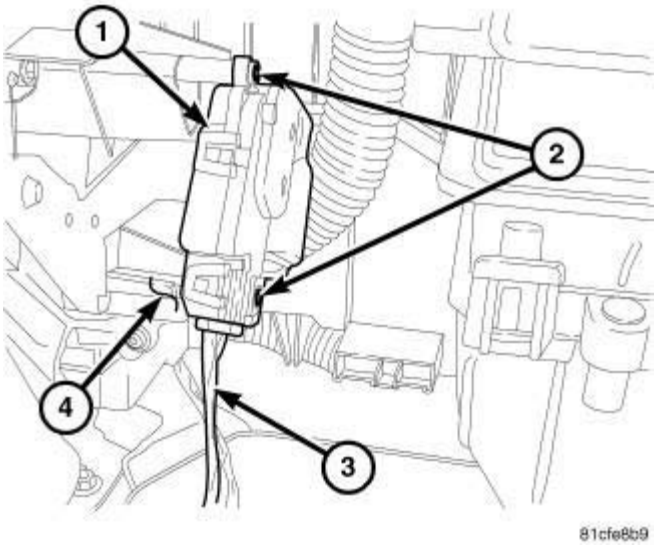

Fig. 9: Blend Door Actuator Dual Zone Passenger
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. On LHD models, if equipped, remove the silencer from underneath the passenger side of the instrument panel.
3. On LHD models, remove the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
4. Remove the front floor distribution duct from the right side of the air distribution housing. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Installation**.
5. Remove the screws (2) that secure the blend door actuator (1) to the right side of the air distribution housing (4) and remove the actuator from the housing.
6. Disconnect the wire harness connector (3) from the blend door actuator and remove the actuator from the vehicle.

Installation

INSTALLATION

NOTE: The single zone heating-A/C system is equipped with a single blend door actuator. The dual zone system has two blend door actuators, one for the driver side blend-air door and one for the passenger side blend-air door.

NOTE: LHD model shown in illustrations. RHD model similar.

SINGLE ZONE/DUAL ZONE LEFT SIDE

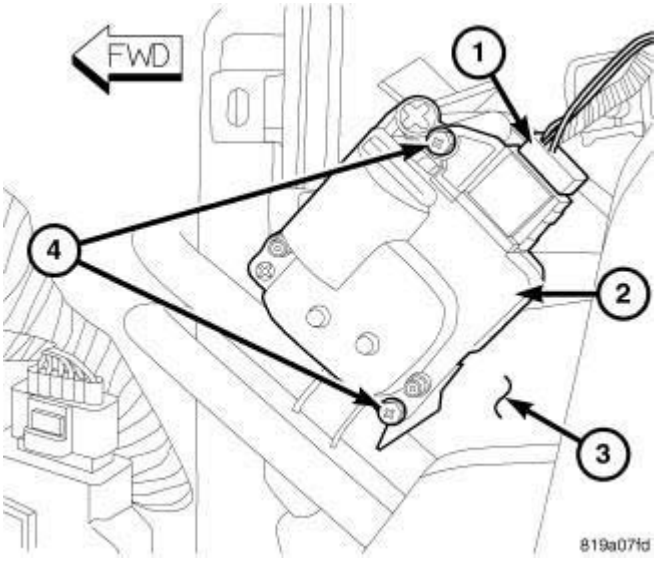

Fig. 10: Blend Door Actuator Removal/Installation
Courtesy of CHRYSLER LLC

1. Position the blend door actuator (2) onto the left side of the HVAC air distribution housing (3). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the blend air door linkage.
2. Install the two screws (4) that secure the blend door actuator to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
3. Connect the wire harness connector (1) to the blend door actuator.
4. On RHD models, install the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
5. On RHD models, if equipped, install the silencer underneath the instrument panel.
6. Reconnect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

DUAL ZONE RIGHT SIDE

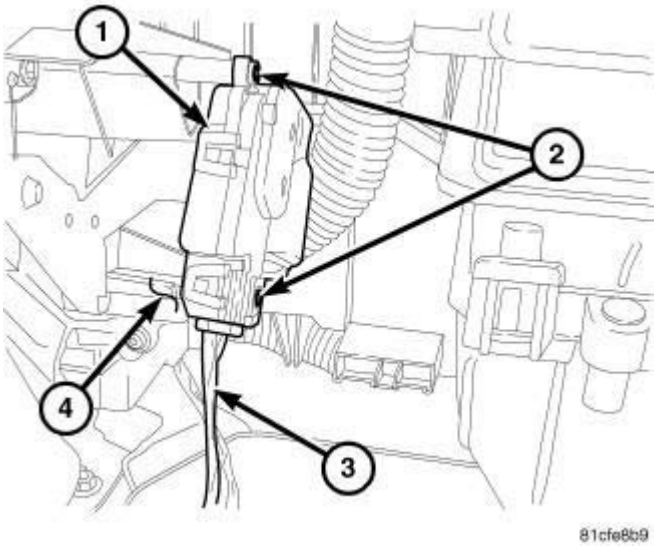

Fig. 11: Blend Door Actuator Dual Zone Passenger
Courtesy of CHRYSLER LLC

1. Position the blend door actuator (1) to the right side of the HVAC air distribution housing (4) and connect the wire harness connector (3) to the actuator.
2. Install the blend door actuator onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator with the blend door linkage.
3. Install the two screws (2) that secure the blend door actuator to the air distribution housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
4. Install the right front floor distribution duct onto the air distribution housing. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Installation**.
5. On LHD models, install the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
6. On LHD models, if equipped, install the silencer underneath the instrument panel.
7. Reconnect the negative battery cable.
8. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

ACTUATOR, MODE DOOR, FRONT

Description

DESCRIPTION

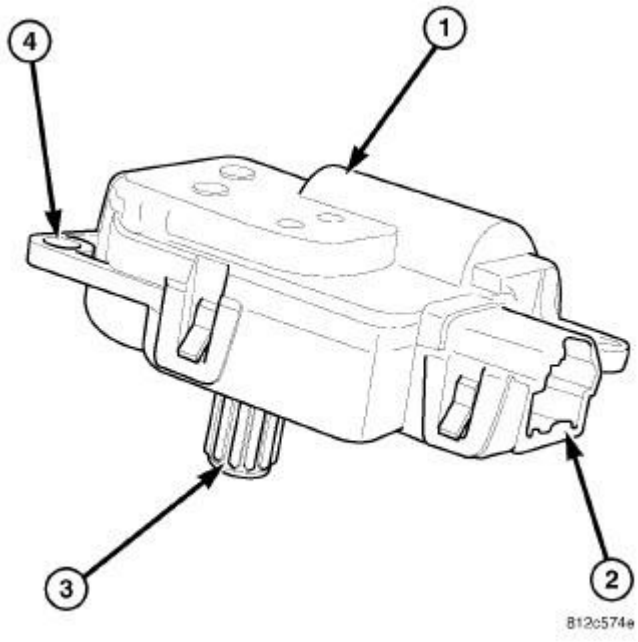

Fig. 12: Blend Door Actuators
Courtesy of CHRYSLER LLC

The mode door actuator (1) for the heating-A/C system is a reversible, 12-volt Direct Current (DC) servo motor, which is mechanically connected to the mode-air doors. The mode door actuator is located on the right side of the HVAC air distribution housing.

The mode door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2). An output shaft with splines (3) connect it to mode door linkage and integral mounting tabs (4) allow the actuator to be secured to the air distribution housing. The mode door actuator does not require mechanical indexing to the mode-air doors, as it is electronically calibrated by the A/C-heater control.

The A/C-heater control must be recalibrated each time an actuator motor is replaced. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The mode door actuator is interchangeable with the actuators for the recirculation and blend-air doors.

Operation

OPERATION

The mode door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the instrument panel wire harness. The mode door actuator can move the mode-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the mode-air door moves in the opposite direction. Once the A/C-heater control makes the voltage to both connections high or both connections low, the mode-air door stops and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the mode door actuator and the mode-air door. The A/C-heater control learns the mode-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode door actuator circuits. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The mode door actuator cannot be adjusted or repaired and it must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
3. Remove the screws (1) that secure the mode door actuator (4) to the bracket (5) located on the right side of the HVAC air distribution housing (2).
4. Disconnect the wire harness connector (3) from the mode door actuator and remove the actuator.

Installation

INSTALLATION

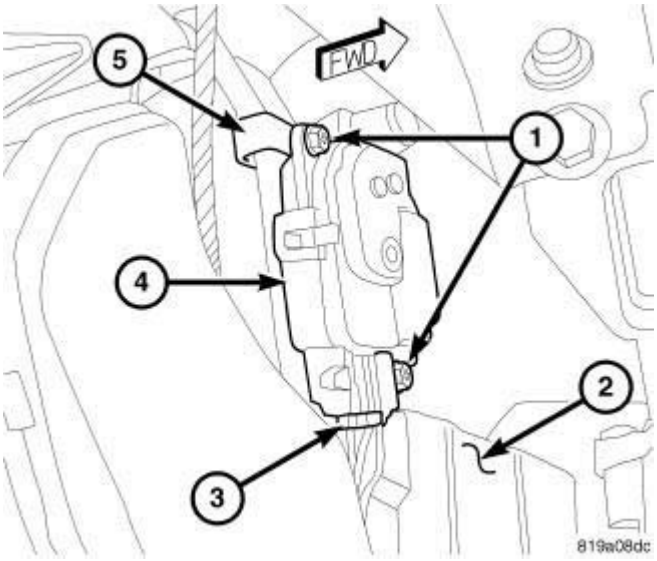

Fig. 14: Mode Door Actuator Removal/Installation
Courtesy of CHRYSLER LLC

1. Position the mode door actuator (4) onto the bracket (5) located on the right side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the mode air door linkage.
2. Install the screws (1) that secure the mode door actuator to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
3. Connect the wire harness connector (3) to the mode door actuator.
4. Install the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
5. Reconnect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

ACTUATOR, RECIRCULATION DOOR

Description

DESCRIPTION

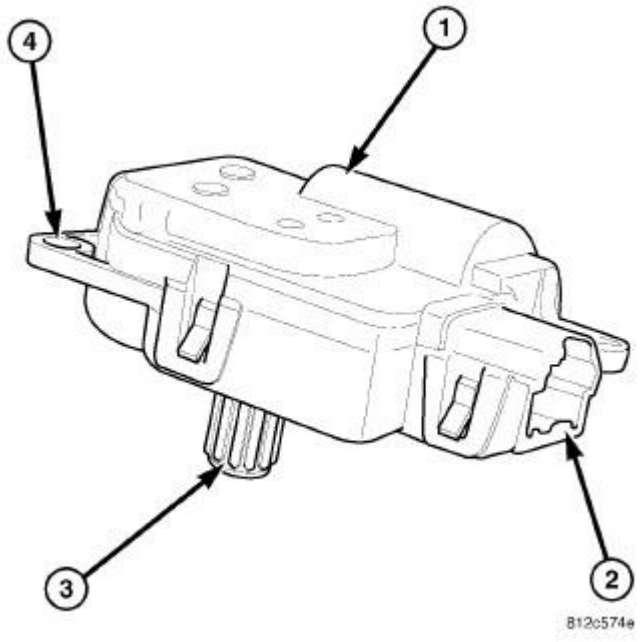

Fig. 15: Blend Door Actuators
Courtesy of CHRYSLER LLC

The recirculation door actuator (1) is a reversible, 12 volt direct current (DC) servo motor, which is connected directly to the pivot shaft lever of the recirculation-air door. The recirculation door actuator is located on the right side of the HVAC air inlet housing.

The recirculation door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2), an output shaft with splines (3) connect it to the recirculation door and three integral mounting tabs (4) allow the actuator to be secured to the air inlet housing. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.

The A/C-heater control must be recalibrated each time an actuator motor is replaced. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The recirculation door actuator is interchangeable with the actuators for the blend and mode-air doors.

Operation

OPERATION

The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the instrument panel wire harness. The recirculation door actuator can move the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction. Once the A/C-heater control makes the voltage to both connections high or both

connections low, the recirculation-air door stops and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The A/C-heater control learns the recirculation-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the recirculation door actuator circuits. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The recirculation door actuator cannot be adjusted or repaired and it must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

5. Install the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
6. Reconnect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

CONTROL, A/C AND HEATER, FRONT

Description

MANUAL TEMPERATURE CONTROL (MTC) SINGLE ZONE

The A/C-heater control for the front Manual Temperature Control (MTC) single zone system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The heating-A/C system uses a dedicated miroprocessor to drive the electrically operated door actuators. This control provides the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle.

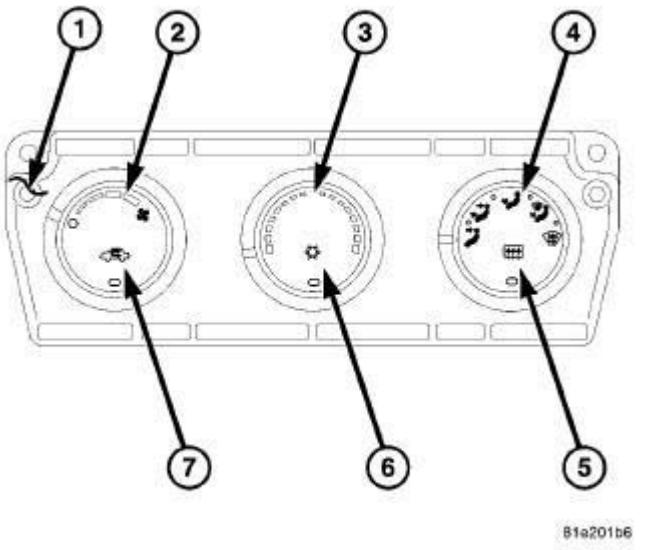

Fig. 19: Front Manual Temperature Control AC Heater Control
Courtesy of CHRYSLER LLC

The A/C-heater control (1) is located in the instrument panel and contains:

- a rotary control for blower motor speed selection, and to turn the blower motor off (2).
- a rotary control for temperature control of the discharged air (3).
- a rotary control for mode control of the discharged air (4).
- a push-button control with an indicator lamp to turn the rear window defogger system on and off (5).
- a push-button control with an indicator lamp to turn the A/C system on and off (6).
- a push-button control with an indicator lamp for recirculation control of the discharged air (7).

The A/C-heater control for the MTC heating and A/C system and is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

Prior to replacing an A/C-heater control, check for any Diagnostic Trouble Codes (DTCs) related to the heating-A/C system, and run the calibration procedure to verify that the concern is not an air-door calibration issue. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The A/C-heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

AUTOMATIC TEMPERATURE CONTROL (ATC) DUAL ZONE

The A/C-heater control for the Automatic Temperature Control (ATC) dual zone front heating-A/C system allows both the driver and the front seat passenger the ability to individually regulate air temperature for their side of the vehicle. An infrared sensor located in the overhead console detects thermal radiation emitted by the front seat occupants and their surroundings. Based on the sensor input, the system automatically adjusts the air temperature, airflow volume, airflow distribution and amount of inside air recirculation to maintain front seat occupant comfort, even under changing outside weather conditions. All controls are identified by ISO graphic

symbols.

The ATC dual zone heating-A/C system uses a dedicated miroprocessor to automatically drive the electrically operated door actuators. The ATC A/C-heater control obtains vehicle speed, engine speed, engine coolant temperature, ambient temperature and refrigerant system pressure. The ATC A/C-heater control communicates with other electrical modules in the vehicle over the Controller Area Network (CAN) IHC bus.

This ATC system provides the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle and offers several manual override features such as fan speed, airflow distribution, defrost mode and when the outside air contains smoke, odors or high humidity, the interior air can be manually recirculated.

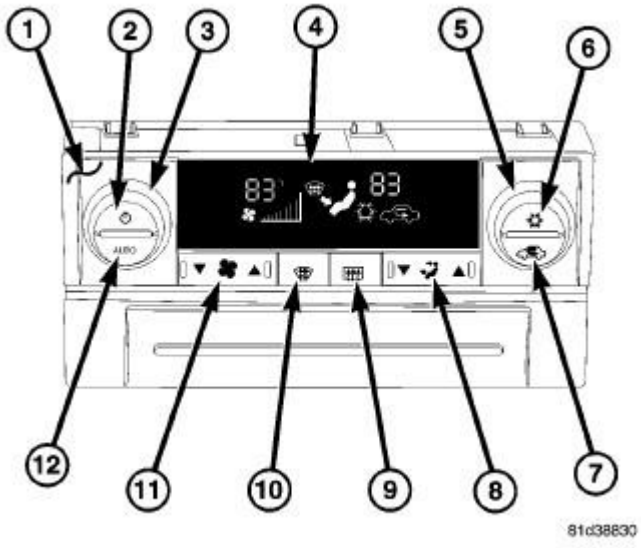

Fig. 20: Dual Zone Front ATC Control
Courtesy of CHRYSLER LLC

The ATC dual zone A/C-heater control (1) is located in the instrument panel and contains:

- a push button on/off control which allows the heating-A/C system to be completely turned off (2). The Vacuum-Flourescent (VF) digital display (4) is blank when the heater-A/C system is off.
- two rotary temperature controls to select both driver and front seat passenger comfort temperatures from 15° to 29° C (60° to 85° F) (3 and 5). Comfort temperatures for each zone are shown in the VF digital display. If the set temperatures are 15° C (60° F) and is adjusted lower, the A/C-heater control will attempt to achieve the lowest temperature possible, but the display will show LO. If the set temperatures are 29° C (85° F) and is adjusted up, the A/C-heater control will attempt to achieve the highest temperature possible, but the display will show HIGH. Temperatures can be displayed in either Metric or Fahrenheit.
- a push button A/C on/off control (6). An ISO Snowflake symbol appears in the VF digital display when the A/C system is in operation, whether under manual or Auto mode.
- a push button air recirculation control to set the heating-A/C system to Recirculation mode (7). An ISO Recirculation symbol appears in the VF digital display when Recirculation mode is selected and when the

system exceeds 80 percent circulated air under Auto mode (due to high A/C demand).

- a rocker switch mode control that can override the Auto mode (8). An ISO mode symbol appears in the VF digital display to indicate the current mode setting when selected manually or by Auto mode.
- a push button rear window defogger on/off control (9). An indicator lamp illuminates in the control when selected. The indicator lamp illuminates in the control even with the heating-A/C system turned off.
- a push button front window defogger control (10). An indicator lamp illuminates in the control when selected manually and an ISO symbol appears in the VF digital display when selected by auto mode.
- a rocker switch fan speed control that can override the auto mode (11). A bar graph is shown in the VF digital display to indicate the selected or determined front fan speed (depending on manual or auto mode).
- a push button automatic mode control to set the heating-A/C system to auto mode (12). AUTO appears in the VF digital display when the system is in auto mode.
- illumination lamps for backlighting of the control.
- computer logic that remembers the settings of the controls when the ignition is turned off and retains those settings after a restart. If the heating-A/C system is off when the ignition is turned off, the system will be off when the engine is restarted.
- computer logic that provides variable air recirculation under high temperature and humidity conditions. Because recirculation is generally accompanied by increased fan noise, the proportion of recirculated to outside air, gradually approaches full recirculation over a broad temperature range.

The front A/C-heater control utilizes integrated circuitry and information carried on the CAN IHS bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C-heater control allows it to control the electronic functions and features of the ATC heating-A/C system.

The inputs received by the A/C-heater control of the ATC heating-A/C system are as follows:

- Refrigerant Pressure
- Evaporator Temperature
- Engine Coolant Temperature
- Ambient Air Temperature
- Infrared Temperature Sensor
- Vehicle Speed

The messages broadcasted by the A/C-heater control of the ATC heating-A/C system are as follows:

- A/C Request
- A/C Select
- Rear Window Defogger (EBL) Request

The A/C-heater control for the ATC heating and A/C system is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

Prior to replacing an A/C-heater control, check for any Diagnostic Trouble Codes (DTCs) related to the heating-

A/C system, and run the calibration procedure to verify that the concern is not an air-door calibration issue. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The A/C-heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged. The illumination lamps for the A/C-heater control can be serviced separately.

MANUAL TEMPERATURE CONTROL (MTC) TRI ZONE

The A/C-heater controls for the Manual Temperature Control (MTC) tri-zone heating-A/C system allows the driver, front seat passenger and the intermediate seat passengers, the ability to individually regulate air temperature as well as fan speed for their portion of the vehicle. Primary controls for the rear heating-A/C system are located on the front A/C-heater control panel. All controls are identified by ISOgraphic symbols.

FRONT CONTROL PANEL

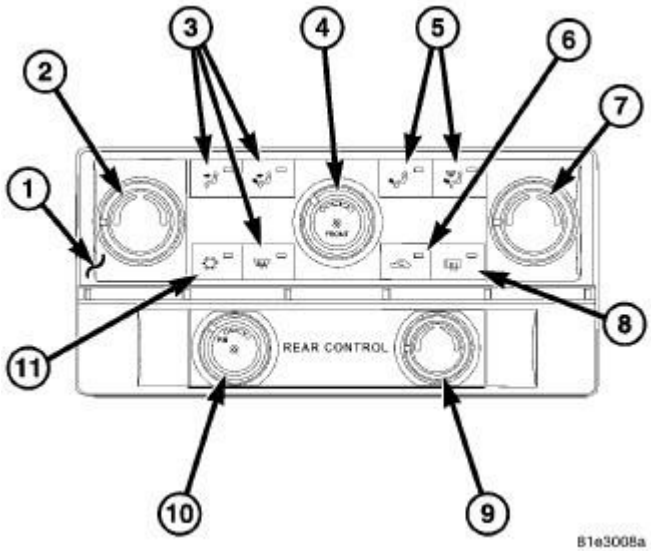

Fig. 21: Manual Temperature Control Tri Zone Front Control
Courtesy of CHRYSLER LLC

The front MTC dual zone A/C-heater control and integral computer (1) is located in the instrument panel and contains:

- three rotary temperature controls (2, 7 and 9) to select the separate temperatures for both of the front comfort zones and the rear comfort zone
- five push button mode controls (3 and 5) to select the position of the discharged air for the driver and front passenger comfort zones. An indicator lamp illuminates in each of the controls when selected.
- a rotary control knob for front fan speed selection and turning the heater-A/C system off (4).
- a push button air recirculation control (6). An indicator lamp illuminates in the control when selected.
- a push button rear window defogger on/off control (8). An indicator lamp illuminates in the control when selected. The rear window defogger system operates and the indicator lamp illuminates in the control even when the heating-A/C system is turned off.

- a rotary control knob for rear fan speed selection and turning the rear heater-A/C system off (10). This control has a position for locking out the rear heater-A/C controls, allowing only the driver and front seat passenger control of the rear heating-A/C system.
- a push button A/C on/off control (11). An indicator lamp illuminates in the control when the A/C system is in operation.
- computer logic that remembers the settings of the A/C-heater control when the ignition is turned off, and retains those settings after a restart. If the heating-A/C system is off when the ignition is turned off, the system will be off when the engine is restarted.

The front A/C-heater control utilizes integrated circuitry and information carried on the Controller Area Network (CAN) IHS bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C-heater control allows it to control the electronic functions and features of the MTC heating-A/C system.

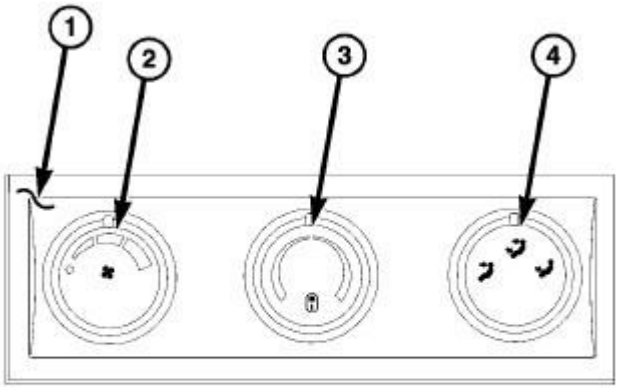
The front A/C-heater control is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

Prior to replacing an A/C-heater control, check for any Diagnostic Trouble Ccodes(DTCs) related to the heating-A/C system, and run the calibration procedure to verify that the concern is not an air-door calibration issue. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The front A/C-heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REAR CONTROL PANEL

The rear MTC A/C-heater control is located in the headliner and allows intermediate seat passengers to adjust rear air distribution, temperature and blower motor speed when the rear heating-A/C system primary on/off control in the front A/C-heater control in the instrument panel is set to the on position and the rear heater-A/C controls are NOT locked out by the driver or front seat passenger.



81e30089

Fig. 22: Manual Temperature Control Tri Zone Rear Control
Courtesy of CHRYSLER LLC

The rear A/C-heater control (1) contains:

- a rotary control knob for fan speed selection and turning the rear heating-A/C system on and off (2).
- a rotary control knob for temperature control of the rear discharged air (3). An indicator lamp illuminates in the control when the rear heater-A/C controls are locked out by the driver or front seat passenger.
- a rotary control knob for mode control of the rear discharged air (4).

The rear A/C-heater control is a slave potentiometer to the front A/C-heater control and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

AUTOMATIC TEMPERATURE CONTROL (ATC) TRI ZONE

The A/C-heater controls for the Automatic Temperature Control (ATC) tri-zone heating-A/C system allows the driver, font seat passenger and the intermediate seat passengers the ability to individually regulate the air temperature for their portion of the vehicle automatically. Primary controls for the rear are located on the front A/C-heater control panel. All controls are identified by ISO graphic symbols.

FRONT CONTROL PANEL

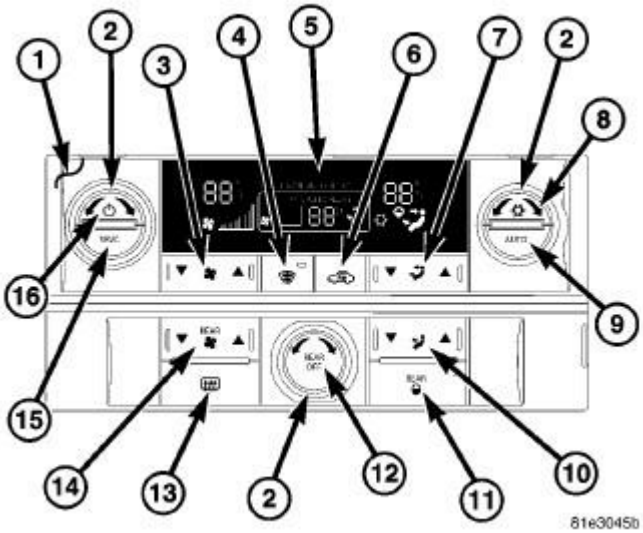


Fig. 23: ATC Tri Zone Front Control
Courtesy of CHRYSLER LLC

The front A/C-heater control (1) and integral computer is located in the instrument panel and contains:

- three rotary temperature controls (2) to select both of the front and the rear comfort temperatures from 15° to 29° C (60° to 85° F). Comfort temperatures for each zone are shown in the Vacuum-Flourescent (VF) digital display (5). If the set temperatures are 15° C (60° F) and is adjusted lower, the A/C-heater

control will attempt to achieve the lowest temperature possible, but the display will show LO. If the set temperatures are 29° C (85° F) and is adjusted up, the A/C-heater control will attempt to achieve the highest temperature possible, but the display will show HIGH. Temperatures can be displayed in either Metric or Fahrenheit, which is selected from the overhead console.

- a rocker switch front fan speed control (3) that can override the Auto mode. A bar graph is shown in the VF digital display to indicate the selected or determined front fan speed (depending on manual or Auto mode).
- a push button front window defogger control (4). An indicator lamp illuminates in the control when selected manually and an ISO symbol appears in the VF digital display when selected by Auto mode.
- a push button air recirculation control (6). An indicator lamp illuminates in the control when selected manually and an ISO Recirculation symbol appears in the VF digital display when the system exceeds 80 percent circulated air under Auto mode due to high A/C demand.
- a rocker switch front mode control (7) that can override the Auto mode. An ISO mode symbol appears in the VF digital display to indicate the current mode setting when selected manually or by Auto mode.
- a push button A/C on/off control (8). An ISO Snowflake symbol appears in the VF digital display when the A/C system is in operation, whether under manual or Auto mode.
- a push button automatic mode control (9) to set the heating-A/C system to Auto mode. FRONT AUTO appears in the VF digital display when the system is in Auto mode.
- a rocker switch rear mode control (10) that can override the rear A/C-heater control and the Auto mode. An ISO mode symbol appears in the center portion of the VF display to show the current mode setting when selected manually or by Auto mode.
- a push button control that locks out the rear heater-A/C controls (11), allowing only the driver and front seat passenger control of the rear heating-A/C system. An indicator lamp illuminates in the control when selected.
- a push button on/off control (12) that turns the rear heating-A/C system completely off. The center portion of the VF display is blank when the rear heating-A/C system is off.
- a push button rear window defogger on/off control (13). An indicator lamp illuminates in the control when selected. The indicator lamp illuminates in the control even with the heating-A/C system turned off.
- a rocker switch rear fan speed control (14) that can override the rear A/C-heater control and the Auto mode. A bar graph is shown in the center portion of the VF digital display to indicate the selected or determined rear fan speed (depending on manual or Auto mode).
- a push button synchronize control (15) that synchronizes the temperature of all three of the comfort zones to the drivers selected temperature. SYNC appears in the VF digital display when the system is synchronized, whether under manual or Auto mode.
- a push button on/off control (16) which allows the heating-A/C system to be completely turned off. The display is blank when the heater-A/C system is off.
- illumination lamps for backlighting of the control.
- computer logic that remembers the settings of the controls when the ignition is turned off and retains those settings after a restart. If the system is off when the ignition is turned off it will be off when the engine is restarted, etc.
- computer logic that provides variable air recirculation under high temperature and humidity conditions. Because recirculation is generally accompanied by increased fan noise, the proportion of recirculated to outside air gradually approaches full recirculation over a broad temperature range.

The front A/C-heater control utilizes integrated circuitry and information carried on the Controller Area Network (CAN) IHS bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C-heater control allows it to control the electronic functions and features of the ATC heating-A/C system.

The inputs received by the A/C-heater control of the ATC heating-A/C system are as follows:

- Refrigerant Pressure
- Evaporator Temperature
- Engine Coolant Temperature
- Ambient Air Temperature
- Infrared Temperature Sensor
- Vehicle Speed

The messages broadcast by the A/C-heater control of the ATC heating-A/C system are as follows:

- A/C Request
- A/C Select
- Rear Window Defogger (EBL) Request
- Heated Front Seat Requests

The front A/C-heater control is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

Prior to replacing an A/C-heater control, check for any Diagnostic Trouble Codes (DTCs) related to the heating-A/C systems and run the calibration procedure to verify that the concern is not an system calibration issue. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The front A/C-heater control cannot be repaired and must be replaced if inoperative or damaged.

REAR CONTROL PANEL

The rear A/C-heater control is located in the rear overhead console and allows intermediate seat passengers to adjust rear air distribution, temperature and blower motor speed when the rear heating-A/C system primary on/off control in the front A/C-heater control in the instrument panel is set to the on position and the rear heater-A/C controls are NOT locked out by the driver and front seat passenger.

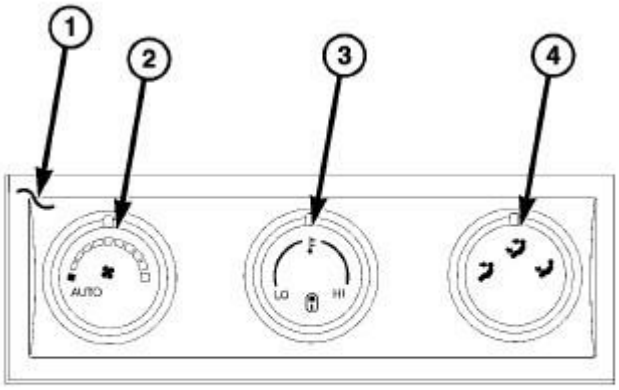

Fig. 24: ATC Tri Zone Rear Control
Courtesy of CHRYSLER LLC

The rear A/C-heater control (1) contains:

- a rotary control knob for fan speed selection and turning the rear heating-A/C system off or to Auto mode (2).
- a rotary control knob for temperature control of the rear discharged air (3). An indicator lamp illuminates in the control when the rear heater-A/C controls are locked out by the driver or front seat passenger.
- a rotary control knob for mode control of the rear discharged air (4).

The rear A/C-heater control is a slave potentiometer to the front A/C-heater control and cannot be repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the front face of the instrument panel center bezel from cosmetic damage during this service procedure.

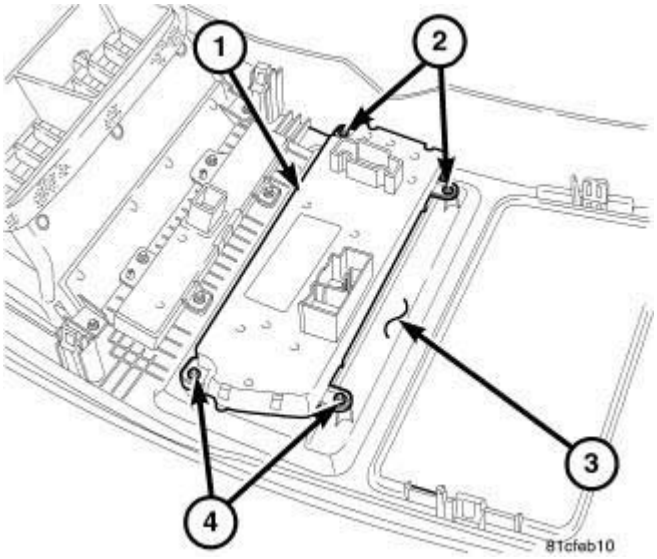

Fig. 25: AC Heater Control Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: MTC single zone A/C-heater control shown. Other A/C-heater controls similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (3) and place it on a workbench. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal** .
3. Remove the screws (2 and 4) that secure the A/C-heater control (1) to the back of the center bezel and remove the control.

Installation

INSTALLATION

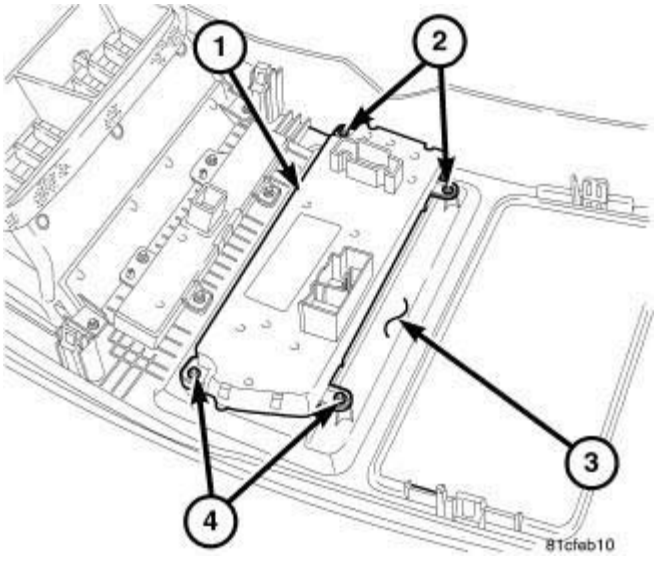

Fig. 26: AC Heater Control Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: MTC single zone A/C-heater control shown. Other A/C-heater controls similar.

1. Position the A/C-heater control (1) onto the back of the center bezel (3).
2. Install the screws (2 and 4) that secure the A/C-heater control to the center bezel. Tighten the screws to 2 N.m (17 in. lbs.).
3. Install the center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** .
4. Reconnect the negative battery cable.

NOTE: The A/C-heater control will automatically perform the Actuator Calibration function when the ignition is initially turned on when installing a new control or when reinstalling the original control. However, the Actuator Calibration function must be manually initiated using a scan tool if the A/C-heater control has been previously installed in another vehicle.

5. If required, initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

MODULE, POWER, FRONT BLOWER MOTOR

Description

DESCRIPTION

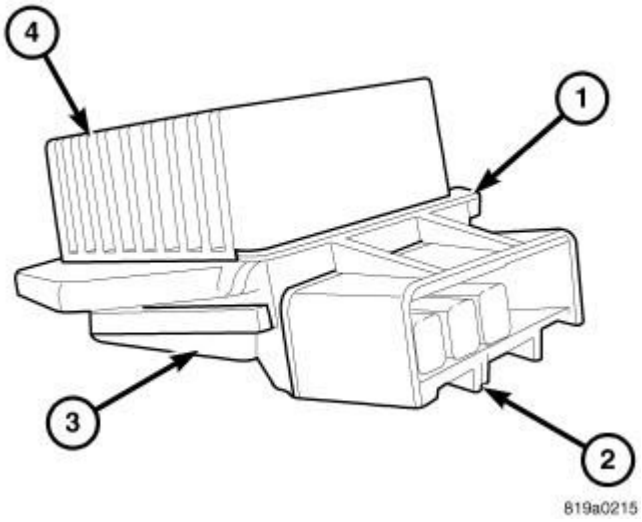

Fig. 27: Blower Mtr Pwr Module
Courtesy of CHRYSLER LLC

A blower motor power module is used on this model when equipped with the automatic temperature control

(ATC) heating-A/C system. Models equipped with the manual temperature control (MTC) heating-A/C system use a blower motor resistor, instead of the blower motor power module. See **Heating and Air Conditioning/Controls/RESISTOR, Blower Motor - Description**.

The blower motor power module is mounted to the bottom of the HVAC housing, on the passenger side of the vehicle. The blower motor power module consists of a molded plastic mounting plate (1) with an integral connector receptacle (2). Concealed behind the mounting plate is the power module electronic circuitry (3) and a finned aluminum heat sink (4). The blower motor power module is accessed for service from under the instrument panel.

Operation

OPERATION

The blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector of the instrument panel wire harness. A second lead and connector of the instrument panel wire harness is connected to the blower motor. The blower motor power module allows the microprocessor-based automatic temperature control(ATC) A/C-heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a pulse width modulated (PWM) circuit strategy.

The PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The blower motor power module cannot be adjusted or repaired must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: The heat sink for the blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor power module, wait five minutes to allow the heat sink to cool before performing diagnosis or service. Failure to take this precaution may result in possible serious injury.

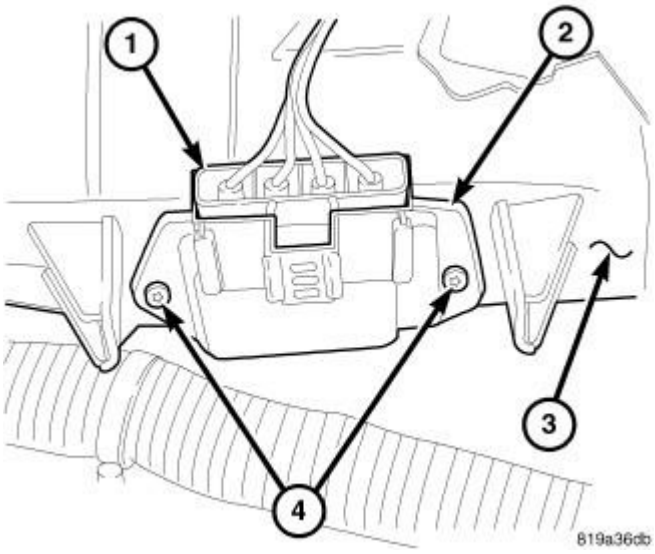

Fig. 28: Blower Motor Power Module
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the blower motor power module (2) located at the bottom of the HVAC housing (3) on the passenger side of the vehicle.
3. Remove the two screws (4) that secure the blower motor power module to the HVAC housing and remove the power module.

Installation

INSTALLATION

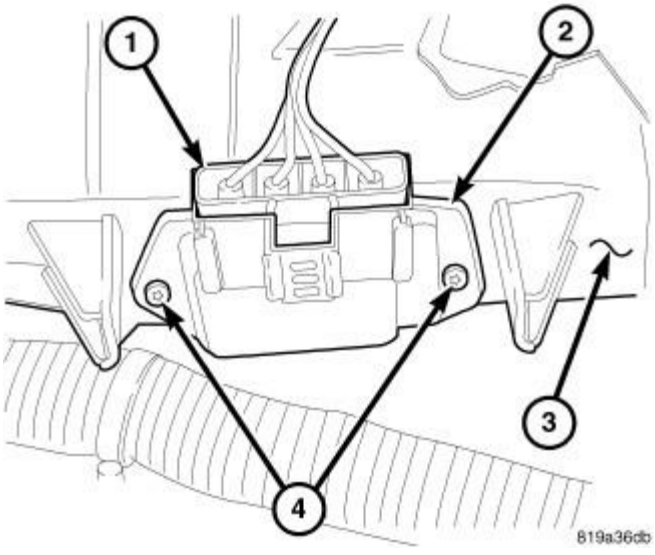

Fig. 29: Blower Motor Power Module
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Position the blower motor power module (2) into the bottom of the HVAC housing (3).
2. Install the two screws (4) that secure the blower motor power module to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor power module.
4. Reconnect the negative battery cable.

RESISTOR, BLOWER MOTOR, FRONT

Description

DESCRIPTION

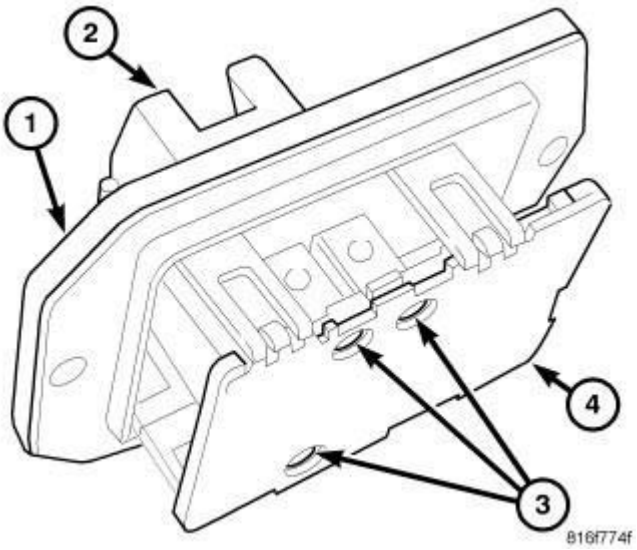

Fig. 30: Blower Motor Resistor - Description
Courtesy of CHRYSLER LLC

A blower motor resistor is used on vehicles equipped with the manual temperature control (MTC) heating-A/C system. Vehicles equipped with the automatic temperature control (ATC) heating-A/C system use a blower motor power module, instead of the blower motor resistor. See **Heating and Air Conditioning/Controls/MODULE, Power - Description**.

The blower motor resistor is mounted to the bottom of the HVAC housing, on the passenger side of the vehicle. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate are resistors (3) located between a two-piece stamped steel base (4). The blower motor resistor is accessed for service from under the instrument panel.

Operation

OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. The blower motor resistor has three resistors, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor control for the heating-A/C system directs the ground path for the blower motor through the correct resistor to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistors. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistors, increasing the blower motor speed. When the blower motor control is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be adjusted or repaired and it must be replaced if inoperative or damaged.

Diagnosis and Testing

BLOWER MOTOR RESISTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: See SYSTEM WIRING DIAGRAMS for circuit descriptions and diagrams. Wiring Information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor. See **Heating and Air Conditioning/Controls/RESISTOR, Blower Motor - Removal**.
3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor speed control and the blower motor resistor or blower motor as required. If not OK, replace the inoperative blower motor resistor.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering

column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution may result in possible injury.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

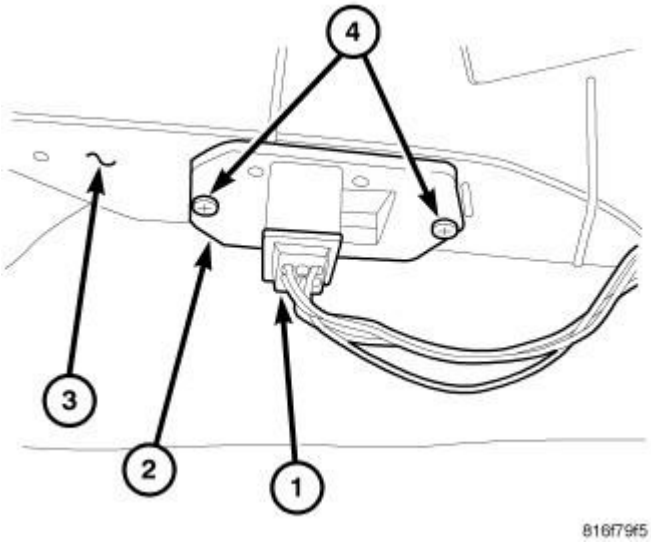

Fig. 31: Blower Motor Resistor
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the blower motor resistor (2) located at the bottom of the HVAC housing (3) on the passenger side of the vehicle.
3. Remove the two screws (4) that secure the blower motor resistor to the HVAC housing and remove the resistor.

Installation

INSTALLATION

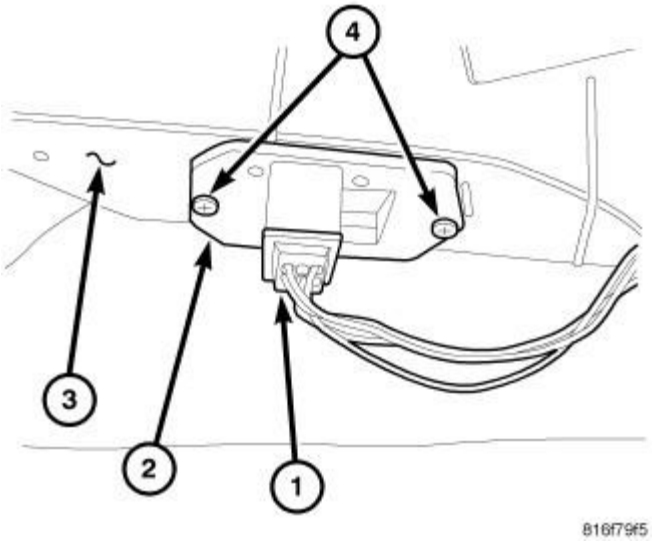

Fig. 32: Blower Motor Resistor
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Position the blower motor resistor (2) onto the bottom of the HVAC housing (3).
2. Install the two screws (4) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor resistor.
4. Reconnect the negative battery cable.

SENSOR, AMBIENT TEMPERATURE

Description

DESCRIPTION

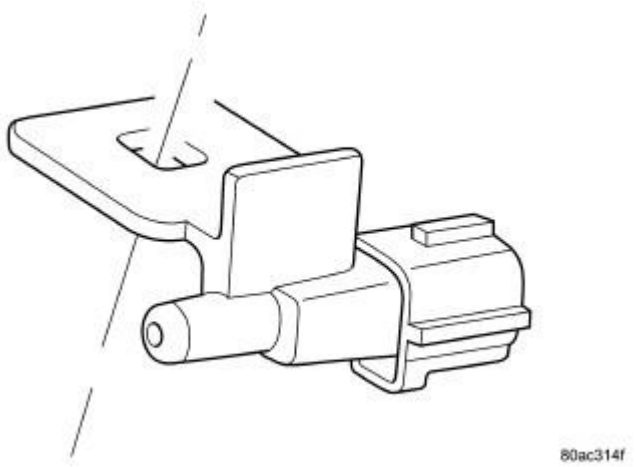

Fig. 33: Identifying Ambient Air Temperature Sensor
Courtesy of CHRYSLER LLC

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The ATC system uses the sensor data to maintain optimum cabin temperature levels. The ambient air temperature sensor is mounted inside the front fascia.

Operation

OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5-volt reference signal sent by the Totally Integrated Power Module (TIPM). The ambient air temperature sensor is connected to the TIPM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the TIPM. The TIPM converts and broadcasts the sensor data over the Controller Area Network (CAN) IHS bus, where it is read by the ATC A/C-heater control, Powertrain Control Module (PCM) and other vehicle control modules.

The ambient air temperature sensor is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** .

The ambient air temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

SENSOR, EVAPORATOR TEMPERATURE

Description

DESCRIPTION

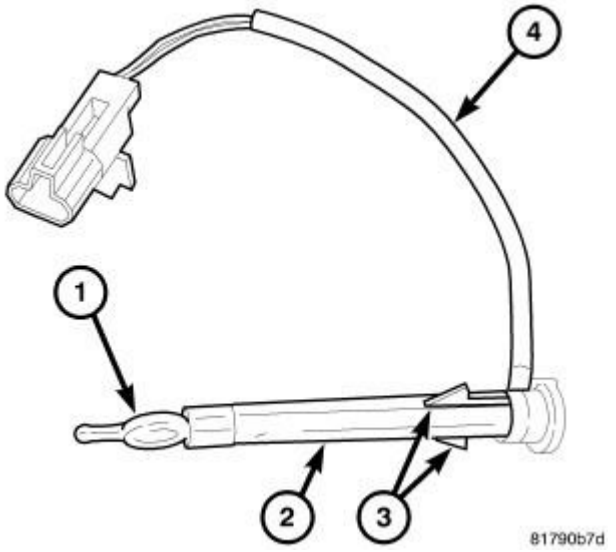

Fig. 34: Evaporator Temperature Sensor-Description
Courtesy of CHRYSLER LLC

The evaporator temperature sensor measures the temperature of the conditioned air downstream of the A/C evaporator. The evaporator temperature sensor is an electrical thermistor (1) mounted on the end of a molded plastic housing (2) that is inserted into the driver side of the HVAC housing near the coldest point of the A/C evaporator. The evaporator temperature sensor is retained in the HVAC housing by two integral retaining tabs (3) and is connected to the vehicle electrical system by use of a wire lead and connector (4) with two terminals.

Operation

OPERATION

The evaporator temperature sensor monitors the surface temperature of A/C evaporator and supplies an input signal to the A/C-heater control. The A/C-heater control uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C-heater control through sensor ground circuit and a 5-volt reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C-heater control uses the monitored voltage reading as an indication of evaporator temperature. The A/C-heater control is programmed to respond to this input by requesting the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) to adjust the compressor swash plate angle as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Operation**.

The evaporator temperature sensor is diagnosed using a scan tool.

The evaporator temperature sensor cannot be adjusted or repaired and it must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

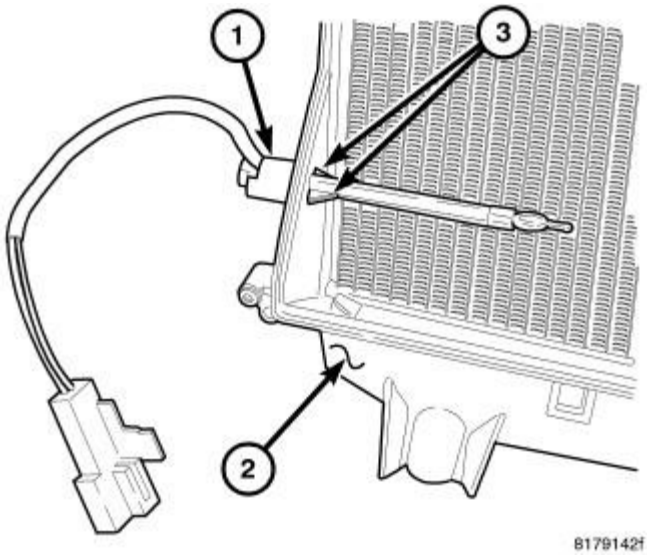

Fig. 35: Evaporator Temperature Sensor-Install
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with air distribution housing removed for clarity.

NOTE: It is not necessary to remove and disassemble the HVAC housing to service the evaporator temperature sensor. The evaporator temperature sensor can be removed for service from underneath the instrument panel.

1. Disconnect and isolate the negative battery cable.
2. Reach up under the driver side of the instrument panel and disconnect the electrical connector for the evaporator temperature sensor (1) from the instrument panel wire harness.
3. Using needle nose pliers, disengage the two retaining tabs (3) that secure the evaporator temperature sensor to the HVAC housing (2) by carefully pulling the sensor straight out of the side of the HVAC housing.
4. Route the electrical connector and wire lead of the evaporator temperature sensor out from under the heater core tubes and remove the sensor from the vehicle.

Installation

INSTALLATION

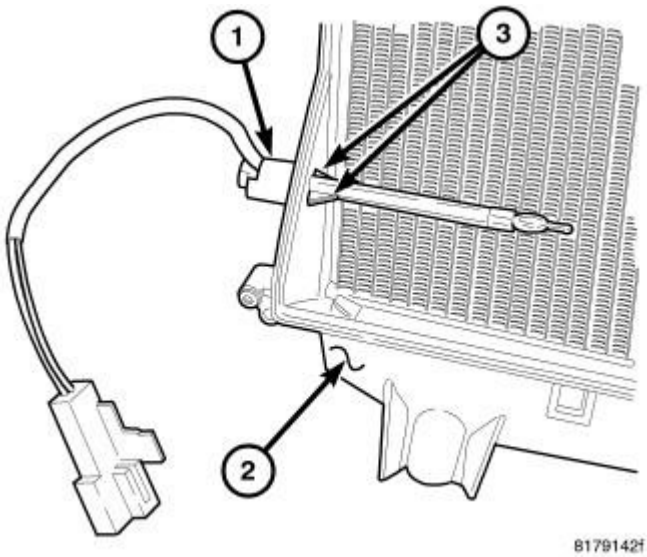

Fig. 36: Evaporator Temperature Sensor-Install
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with air distribution housing removed for clarity.

1. Route the electrical connector and wire lead of the evaporator temperature sensor (1) under the heater core tubes located on the driver side of the HVAC housing (2).
2. Install the evaporator temperature sensor into the driver side of the HVAC housing. Make sure the retaining tabs (3) are fully engaged to the housing.
3. Connect the electrical connector for the evaporator temperature sensor to the instrument panel wire harness.
4. Reconnect the negative battery cable.

SENSOR, INFRARED TEMPERATURE

Description

DESCRIPTION

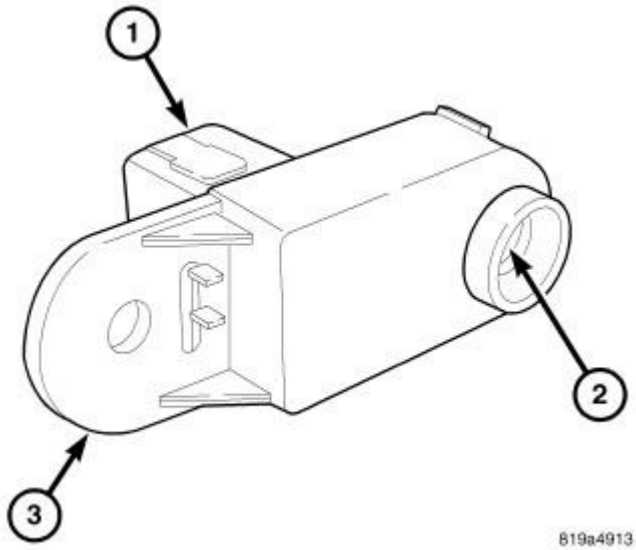

Fig. 37: Infrared Sensor
Courtesy of CHRYSLER LLC

The infrared temperature sensor is located in the overhead console and consists of an infrared transducer concealed behind a clear lens (2) in a molded plastic housing with an integral wire connector receptacle (1) and mounting tab (3).

The infrared sensor is used only on models equipped with the automatic temperature control (ATC) heating-A/C system.

Operation

OPERATION

The infrared sensor detects thermal radiation emitted by the driver and front passenger seat occupants and surroundings and converts its data into a linear Pulse Width Modulated (PWM) output signal which is read by the Automatic Temperature Control (ATC) A/C-heater control. The ATC A/C-heater control uses the infrared sensor data as one of the inputs necessary to automatically control the interior cabin temperature levels. By using thermal radiation (surface temperature) measurement, rather than an air temperature measurement, the ATC heating-A/C system is able to adjust itself to the comfort level as perceived by the occupants. This allows the ATC system to compensate for other ambient conditions affecting comfort levels, such as solar heat gain or evaporative heat loss.

The ATC system logic responds to the infrared sensor message by calculating and adjusting the air flow temperature and air flow rate needed to properly obtain and maintain the selected comfort level temperature of the occupants. The A/C-heater control continually monitors the infrared sensor circuits, and will store Diagnostic Touble Codes (DTCs) for any problem it detects.

The infrared sensor is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The infrared sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

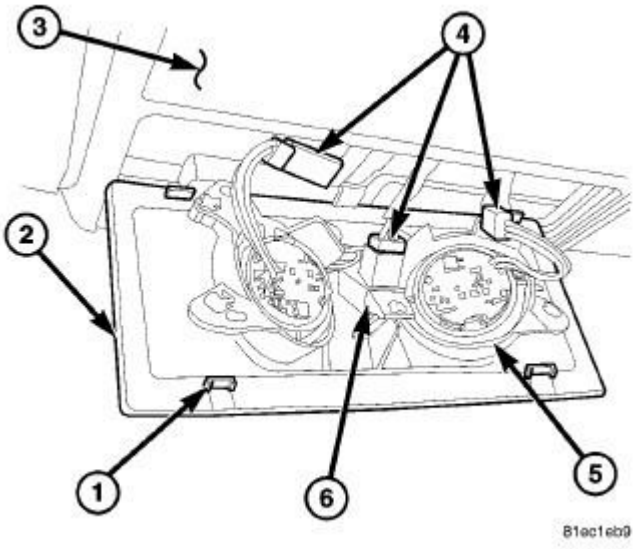

Fig. 38: Infrared Sensor
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Using Trim Stick C-4755 or equivalent, carefully disengage the four retaining tabs (1) that secure the infrared sensor and overhead map/courtesy lamp bezel (2) to the overhead console (3).
3. Disconnect the wire harness connectors (4) from the two overhead map/courtesy lamps (5) and the infrared sensor (6) and remove the sensor, lamp and bezel assembly from the vehicle

Installation

INSTALLATION

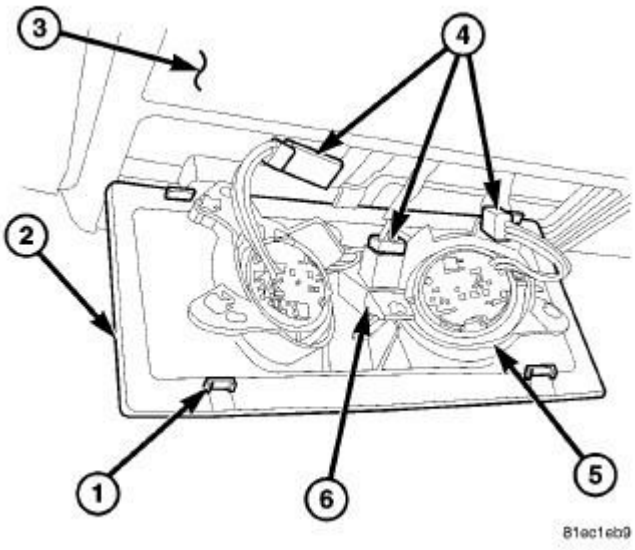

Fig. 39: Infrared Sensor
Courtesy of CHRYSLER LLC

1. Position the infrared sensor and overhead map/courtesy lamp bezel (2) to the overhead console (3).
2. Connect the wire harness connectors (4) to the two overhead map/courtesy lamps (5) and the infrared sensor (6).
3. Engage the four retaining tabs (1) that secure the infrared sensor and overhead map/courtesy lamp bezel to the overhead console. Make sure the retaining tabs are fully engaged.
4. Reconnect the negative battery cable.

SENSOR, SUN

Description

DESCRIPTION

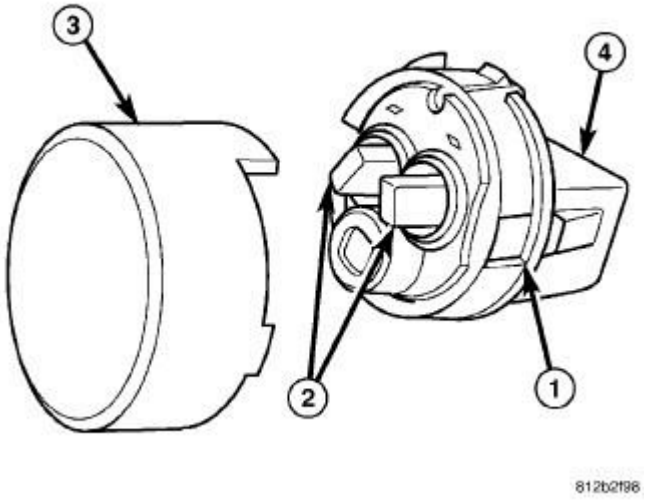

Fig. 40: Sensor-Sun
Courtesy of CHRYSLER LLC

NOTE: Typical sun sensor assembly shown.

The automatic temperature control (ATC) heating-A/C system uses a sun sensor assembly (1) to measure sun light intensity. The sun sensor assembly incorporates two sun sensors (2) within a molded plastic case which is mounted to the instrument panel and a clear lens (3) that protrudes through the defroster grille. The wire harness receptacle (4) connects the sun sensors to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

Operation

OPERATION

The ATC dual-zone heating-A/C system uses two sun sensors to balance the system in response to side-to-side variations in sun light intensity. Passengers in sun and shadow require different functional settings because they experience very different temperatures. The sun sensor assembly provides data to the A/C heater control to help determine proper mode and blend-air door positions and blower motor speeds. The sun sensors are not thermistor type sensors, but rather photo diodes. For this reason the sun sensors responds to sun light intensity rather than temperature. The sun sensor assembly is also used to sense day and night conditions for automatic headlight control, if equipped.

The sun sensor is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The sun sensor assembly cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Diagnosis and Testing

SUN SENSOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in an accidental airbag deployment and possible serious or fatal injury.

The sun sensor assembly is located so that the sun rays will hit the sensors in the same way that it will hit the driver and the passenger. It is important that the area in front of the sun sensor assembly be unobstructed. Check for the following:

- Windshield wipers are properly adjusted.
- Defroster grille or sun sensor is properly installed. The sun sensor lens should protrude above the defroster grille.
- Any stickers on the windshield are not directly in front of the sun sensor.
- Any items laying on top of the instrument panel are not covering the sun sensor.

If the vehicle exhibits a lack of passenger comfort in sunny weather such as in the early afternoon, inspect the position of the sun sensor assembly. The sun sensor lens should protrude above the defroster grille to insure proper operation. If the sun sensor is not properly positioned, perform the following procedure:

1. Confirm that the defroster grille is properly installed. If not, repair as required.
2. Remove the defroster grille and verify that the sun sensor is properly installed to the instrument panel. See **Heating and Air Conditioning/Controls/SENSOR, Sun - Installation**.
3. Reinstall the defroster grille.

The A/C-heater control continually monitors the sun sensor circuits and will store diagnostic trouble codes (DTCs) for any problem it detects. The sun sensor can be tested in the vehicle with a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

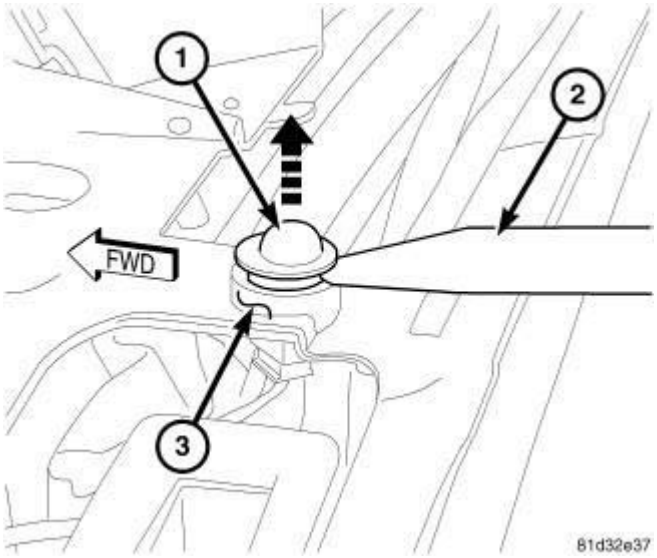

Fig. 41: Sun Sensor Remove
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the defroster grille. Refer to **Body/Instrument Panel/GRILLE, Defroster - Removal** .
3. Using Trim Stick C-4755 or equivalent (2), gently pry between both sides of the sun sensor assembly (1) and the instrument panel (3) to release the snap retainers that secure the sun sensor.

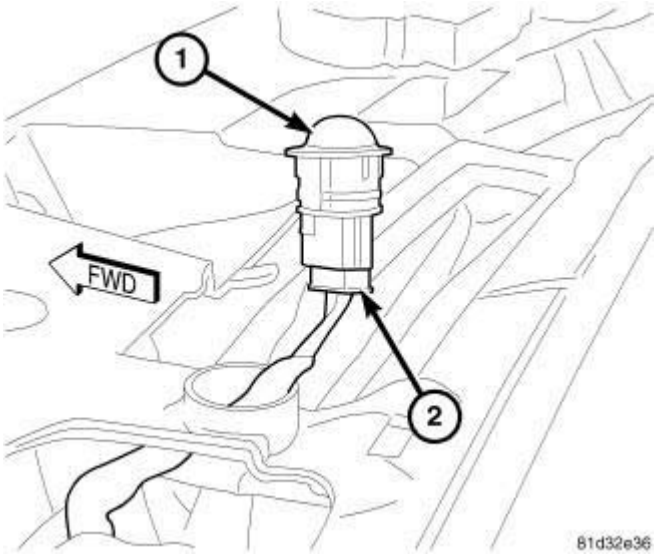

Fig. 42: Sun Sensor Wire Connector
Courtesy of CHRYSLER LLC

4. Disconnect the wire harness connector (2) from the sun sensor assembly (1) and remove the sensor.

Installation

INSTALLATION

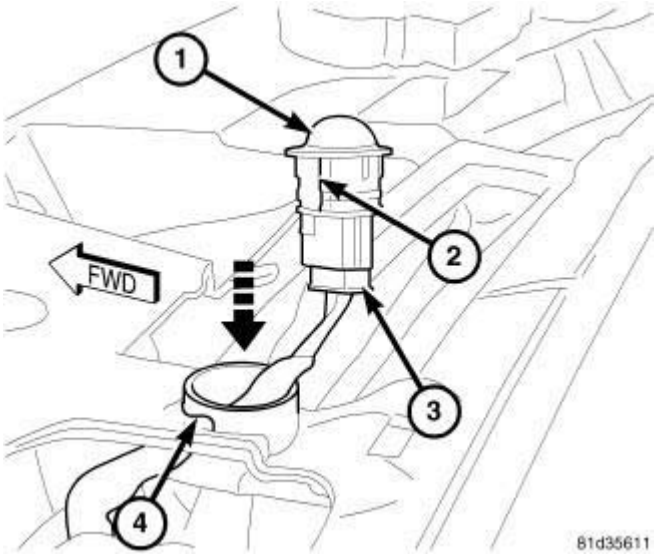

Fig. 43: Sun Sensor Install
Courtesy of CHRYSLER LLC

1. Position the sun sensor assembly (1) to the top of the instrument panel (4) and connect the wire harness connector (3).
2. Align the tab (2) on the sun sensor assembly with the opening in the instrument panel.
3. Gently push the sun sensor assembly into the instrument panel until the sensor snap retainers are securely engaged.
4. Install the defroster grille. Refer to **Body/Instrument Panel/GRILLE, Defroster - Installation** .
5. Reconnect the negative battery cable.

TRANSDUCER, A/C PRESSURE

Description

DESCRIPTION

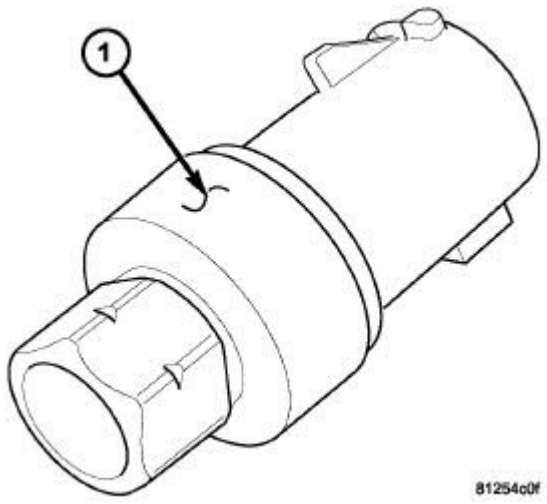

Fig. 44: A/C Pressure Transducer
Courtesy of CHRYSLER LLC

1 - A/C PRESSURE TRANSDUCER

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C liquid line at the right front corner of the engine compartment. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader-type fitting. A rubber O-ring seals the connection between the A/C pressure transducer and the A/C liquid line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

Operation

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C discharge line. The internal resistance of the A/C pressure transducer changes in response to the pressures it monitors.

The Totally Integrated Power Module (TIPM) provides a five volt reference signal and a sensor ground to the A/C pressure transducer. The TIPM then monitors the output voltage of the transducer on a sensor return circuit to determine refrigerant pressure and sends a message to the Powertrain Control Module (PCM) or the Engine Control Module (ECM) (depending on engine application) over the CAN C BUS.

With 2.7L/3.5L 5-Passenger and all 7-Passenger models, the PCM is programmed to respond to this and other sensor inputs by controlling the operation of the swash plate within the A/C compressor and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM adjusts the swash plate to nearly a zero degree angle (low compressor displacement) when high side pressure rises above 3130 kPa (454 psi) and readjusts the swash plate to a greater angle (higher compressor displacement) when high side pressure drops below 1999 kPa (290 psi). The A/C pressure transducer also

reduces the swash plate angle if the high side pressure drops below 200 kPa (29 psi) and will increase the swash plate angle when the high side pressure rises above 234 - 262 kPa (34 - 38 psi). When the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan.

With 2.0L/2.4L 5-Passenger models, A/C compressor clutch engagement is controlled by the PCM or ECM, depending on engine application. When the A/C-heater control is set to any A/C position, it sends a request signal on the CAN-IHS bus to the TIPM, which then transfers the request on the CAN-C Bus to the PCM/ECM, which determines if operating conditions are correct for A/C clutch engagement. When all operating conditions have been met, the PCM/ECM sends a signal on a dedicated hard-wired circuit back to the TIPM to energize the internal A/C clutch high side driver. When energized, the A/C clutch high side driver provides battery current to the A/C clutch field coil.

A Schrader-type valve in the A/C discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The A/C pressure transducer is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** .

The A/C pressure transducer cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

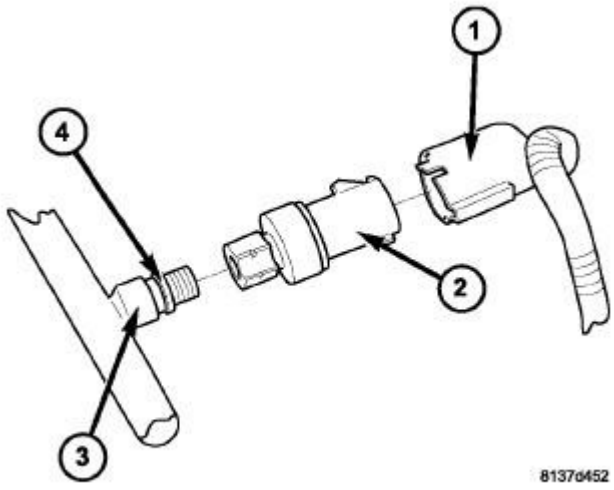

Fig. 45: Transducer-A/C pressure Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: Typical A/C pressure transducer shown.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2) located on the A/C liquid line (3) at the right front corner of the engine compartment.
3. Remove the A/C pressure transducer from the A/C liquid line and remove and discard the O-ring seal (4).

Installation

INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

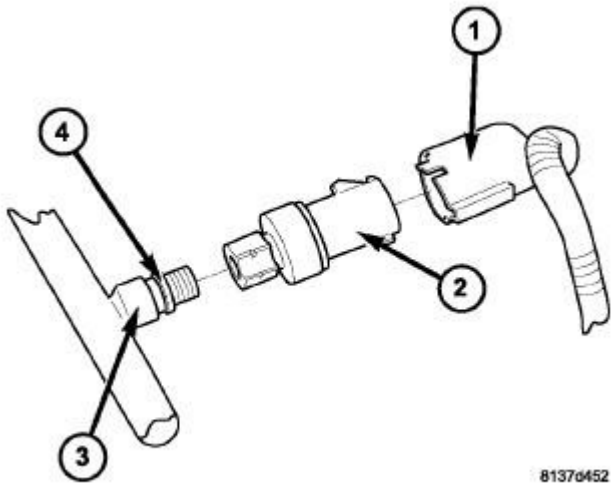

Fig. 46: Transducer-A/C pressure Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: Typical A/C pressure transducer shown.

1. Lubricate a new rubber O-ring seal (4) with clean refrigerant oil and install it onto the A/C liquid line (3).
2. Install the A/C pressure transducer (2) onto the A/C liquid line. Tighten the A/C pressure transducer to 5.6 N.m (50 in. lbs.).
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

CONTROLS, REAR

ACTUATOR, BLEND DOOR, REAR

Description

DESCRIPTION

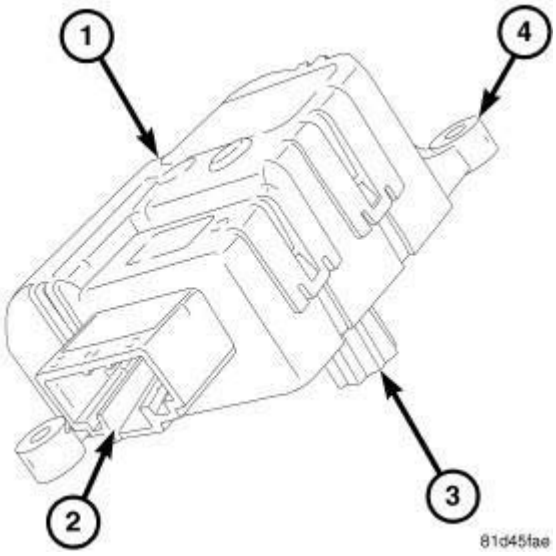

Fig. 47: Rear Actuator Description
Courtesy of CHRYSLER LLC

The blend door actuator (1) for the rear heating-A/C system is a reversible, 12 volt direct current (DC), servo motor. The rear blend door actuator is located on the outboard side of the rear heater-A/C housing.

The rear blend door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2), an output shaft with splines (3) connect it to the rear blend-air door and three integral mounting tabs (4) allow the actuator to be secured to the rear heater-A/C housing. The blend door actuator does not require mechanical indexing to the blend door linkage, as it is electronically calibrated by the A/C-heater control.

The A/C-heater control must be recalibrated each time an actuator motor is replaced. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The rear blend door actuator is interchangeable with the actuator for the rear mode-air door.

Operation

OPERATION

The rear blend door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the rear heater-A/C wire harness. The rear blend door actuator can move the rear blend-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the rear blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the rear blend-air door moves in the opposite direction. When the front A/C-heater control makes the voltage to both connections high or both connections low, the rear blend-air door stops and will not move.

The front A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the rear blend door actuator and the rear blend-air door. The front A/C-heater control learns the rear blend-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for

any problems it detects in the rear blend door actuator circuits.

The rear blend door actuator is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The rear blend door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

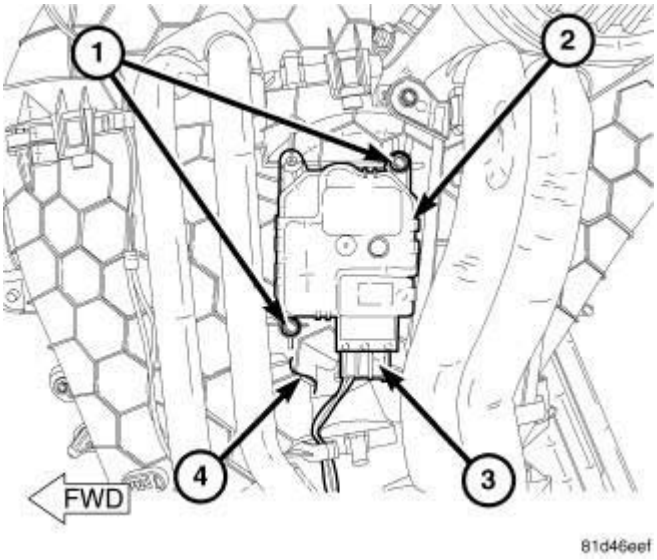

Fig. 48: Rear Blend Door Actuator Removal/Installation

Courtesy of CHRYSLER LLC

1. Position the rear blend door actuator (1) onto the rear heater-A/C housing (3). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the rear blend-air door pivot shaft (2).

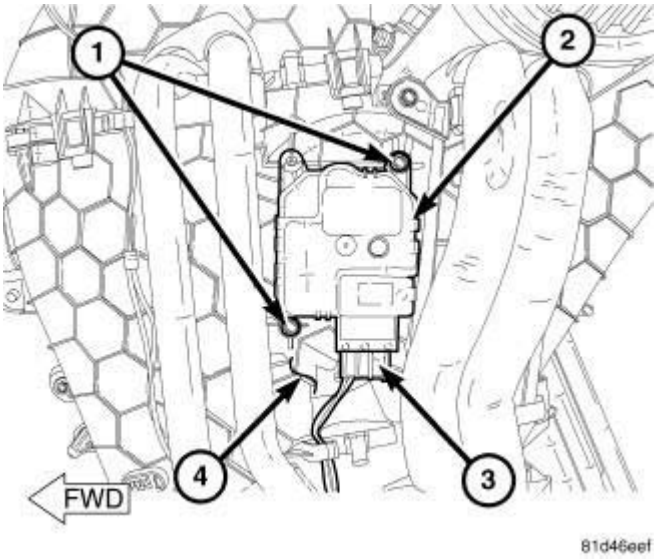

Fig. 50: Rear Blend Door Actuator Removal/Installation
Courtesy of CHRYSLER LLC

2. Install the two screws (1) that secure the rear blend door actuator (2) to the rear heater-A/C housing (4). Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector (3) to the rear blend door actuator.
4. Install the rear heater-A/C housing. See **Heating and Air Conditioning/Distribution/HOUSING, A/C and Heater - Installation**.

5. Initiate the Actuator Calibrationfunction using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

ACTUATOR, MODE DOOR, REAR

Description

DESCRIPTION

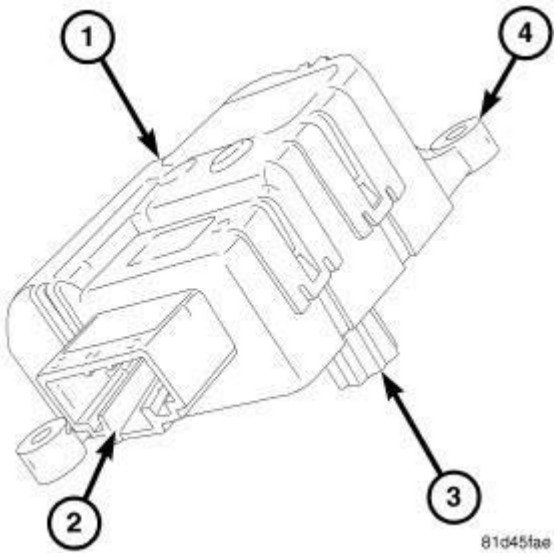

Fig. 51: Rear Actuator Description
Courtesy of CHRYSLER LLC

The mode door actuator (1) for the rear heater-A/C system is a reversible, 12 volt direct current (DC), servo motor. The rear mode door actuator is located on the outboard side of the rear heater-A/C housing.

The rear mode door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2), an output shaft with splines (3) connect it to the rear mode-air door and three integral mounting tabs (4) allow the actuator to be secured to the rear heater-A/C housing. The mode door actuator does not require mechanical indexing to the mode door linkage, as it is electronically calibrated by the A/C-heater control.

The A/C-heater control must be recalibrated each time an actuator motor is replaced. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The rear mode door actuator is interchangeable with the actuator for the rear blend-air door.

Operation

OPERATION

The rear mode door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the rear heater-A/C wire harness. The rear mode door actuator can

move the rear mode-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the rear mode-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the rear mode-air door moves in the opposite direction. When the front A/C-heater control makes the voltage to both connections high or both connections low, the rear mode-air door stops and will not move.

The front A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the rear mode door actuator and the rear mode-air door. The front A/C-heater control learns the rear mode-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the rear mode door actuator circuits.

The rear mode door actuator is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The rear mode door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

3. Connect the wire harness connector (4) to the rear mode door actuator.
4. Install the rear heater-A/C housing. See **Heating and Air Conditioning/Distribution/HOUSING, A/C and Heater - Installation**.
5. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

CONTROL, A/C AND HEATER, REAR

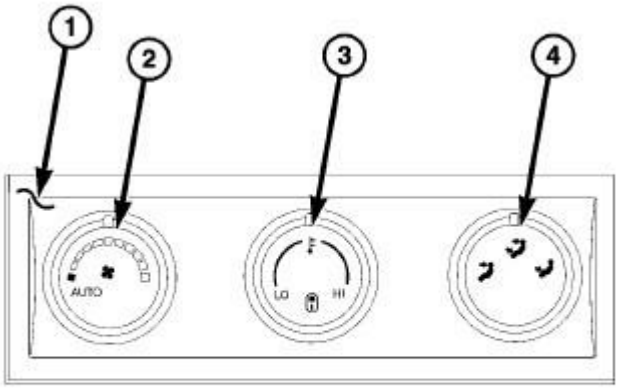
Description

DESCRIPTION

The A/C-heater controls allows the driver and front seat passenger and the intermediate seat passengers the ability to regulate air temperature as well as fan speed for the rear heating-A/C system and provides a floor outlet near the right rear door and upper air outlets at the ceiling. All controls are identified by ISO graphic symbols.

The primary controls for the rear heating-A/C system are located in the instrument panel. See **Heating and Air Conditioning/Controls/CONTROL, A/C and Heater - Description**.

The rear A/C-heater control is located in the headliner and allows intermediate seat passengers to adjust rear air distribution, temperature and blower motor speed when the rear heating-A/C system primary on/off control in the instrument panel is set to the on position and the rear heater-A/C controls are NOT locked out by the driver and front seat passenger.



81e3045a

Fig. 55: ATC Tri Zone Rear Control
Courtesy of CHRYSLER LLC

The rear automatic temperature control (ATC) A/C-heater control (1) contains:

- a rotary control knob for fan speed selection and turning the rear heating-A/C system off or to Auto mode (2).
- a rotary control knob for temperature control of the rear discharged air (3). An indicator lamp illuminates in the control when the rear heater-A/C controls are locked out by the driver or front seat passenger.
- a rotary control knob for mode control of the rear discharged air (4).

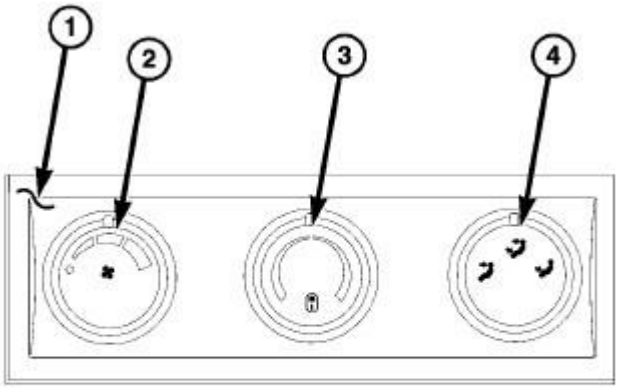


Fig. 56: Manual Temperature Control Tri Zone Rear Control
Courtesy of CHRYSLER LLC

The rear manual temperature control (MTC) A/C-heater control (1) contains:

- a rotary control knob for fan speed selection and turning the rear heating-A/C system on and off (2).
- a rotary control knob for temperature control of the rear discharged air (3). An indicator lamp illuminates in the control when the rear heater-A/C controls are locked out by the driver or front seat passenger.
- a rotary control knob for mode control of the rear discharged air (4).

The rear A/C-heater control is a slave potentiometer to the front A/C-heater control and is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING (ATC) - ELECTRICAL DIAGNOSTICS** or **HEATING & AIR CONDITIONING (MTC) - ELECTRICAL DIAGNOSTICS**).

Prior to replacing an A/C-heater control, check for any diagnostic trouble codes (DTCs) related to the heating-A/C systems and run the calibration procedure to verify that the concern is not a system issue. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The rear A/C-heater control cannot be repaired must be replaced if inoperative or damaged. The illumination lamps are available for service replacement.

Removal

REMOVAL

NOTE: Take the proper precautions to protect the face of the rear A/C-heater control bezel from cosmetic damage during this service procedure.

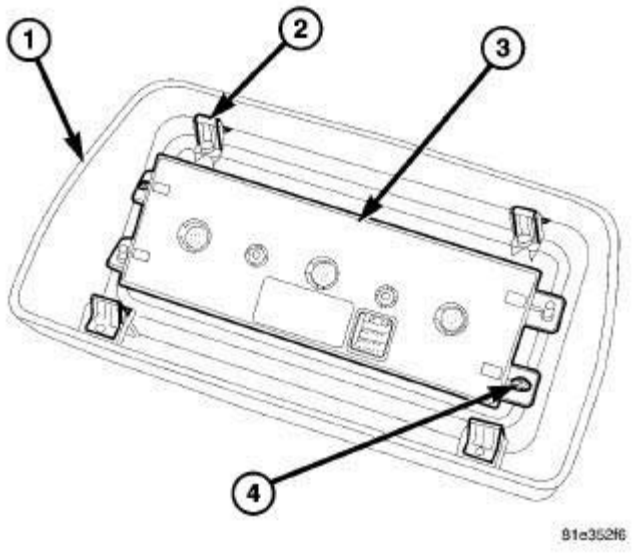

Fig. 57: Rear AC Heater Control Removal/Installation
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the rear A/C-heater control (3) and bezel (1) as an assembly from the headliner by releasing the four metal retaining tabs (2) using Trim Stick C-4755 or equivalent.
3. Disconnect the wire harness connector from the back of the rear A/C-heater control and place the control and bezel assembly on a workbench.
4. Remove the two screws (4) that secure the rear A/C-heater control to the rear control bezel and remove the control from the bezel.

Installation

INSTALLATION

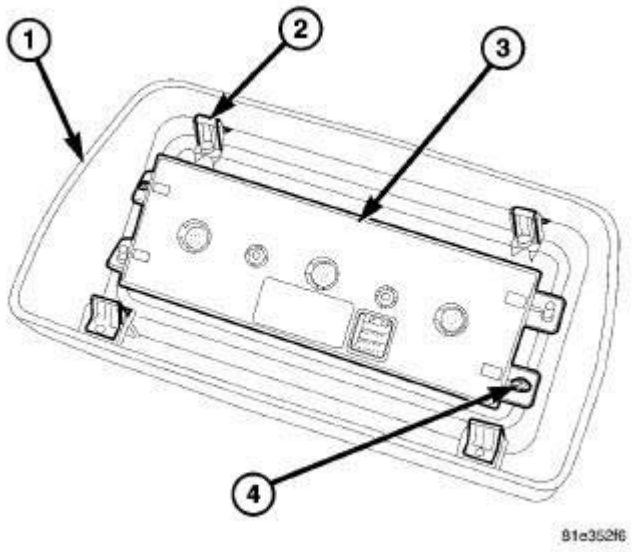

Fig. 58: Rear AC Heater Control Removal/Installation
Courtesy of CHRYSLER LLC

1. Position the rear A/C-heater control (3) to the rear control bezel (1) and align the control to the two plastic guide posts on the back of the bezel.
2. Install the two screws (4) that secure the rear A/C-heater control to the rear control bezel. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector to the back of the rear A/C-heater control and install the bezel and control as an assembly to the headliner. Make sure the four metal retaining tabs (2) are fully engaged.
4. Reconnect the negative battery cable.
5. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

MODULE, POWER, REAR BLOWER MOTOR

Description

DESCRIPTION

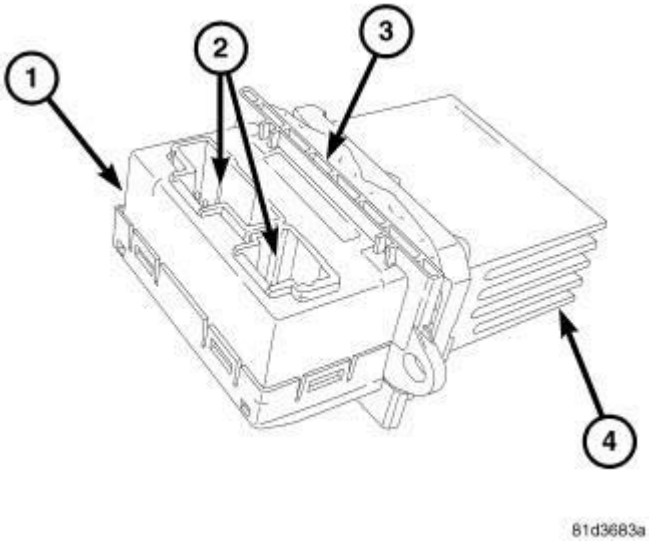

Fig. 59: Rear Blower Power Module Description
Courtesy of CHRYSLER LLC

A blower motor power module is used on this model when equipped with the automatic temperature control (ATC) rear heating-A/C system. Models equipped with the manual temperature control (MTC) rear heating-A/C system use a blower motor resistor, instead of the blower motor power module. See **Heating and Air Conditioning/Controls/RESISTOR, Blower Motor - Description**.

The rear blower motor power module (1) is mounted to the inboard side of the rear heating-A/C housing, located on the right side of the vehicle. The rear blower motor power module consists of a molded plastic housing with two integral wire connector receptacles (2) for the power module electronic circuitry, a mounting plate (3) with a gasket and a finned aluminum heat sink (4).

The rear blower motor power module can be accessed for service without removing the rear heater-A/C housing.

Operation

OPERATION

The rear blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector of the rear body wire harness. A second lead and connector of the wire harness is connected to the rear blower motor. The rear blower motor power module allows the microprocessor-based automatic temperature contro (ATC) A/C-heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a pulse width modulated (PWM) circuit strategy.

The PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the rear blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The rear blower motor power module is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC**

- Diagnosis and Testing .

The rear blower motor power module cannot be adjusted or repaired must be replaced if inoperative or damaged.

Removal

REMOVAL

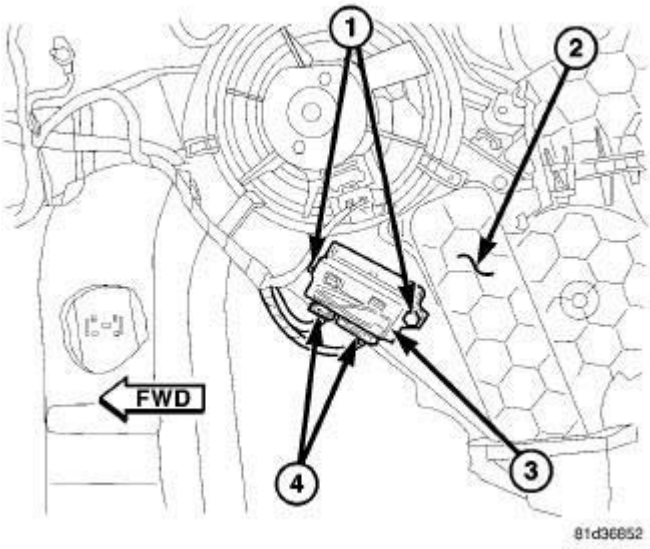

Fig. 60: Rear Blower Power Module Removal/Installation
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove right rear quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
3. Disconnect the two wire harness connectors (4) from the rear blower motor power module (3).
4. Remove the two screws (1) that secure the rear blower motor power module to the rear heater-A/C housing (2) and remove the module.

Installation

INSTALLATION

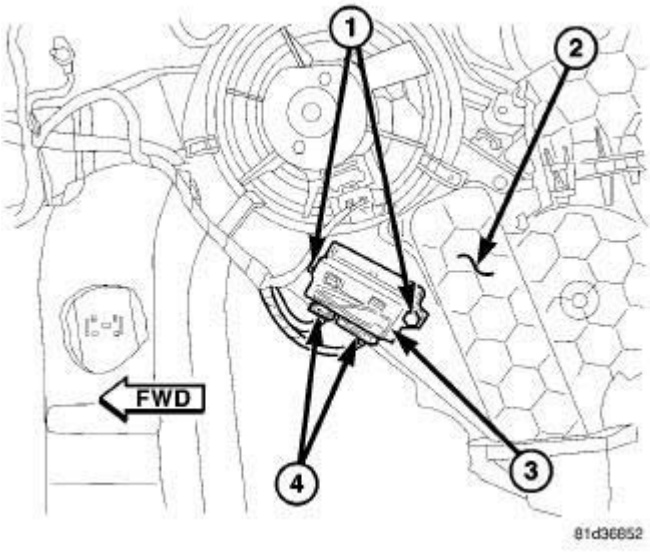

Fig. 61: Rear Blower Power Module Removal/Installation
Courtesy of CHRYSLER LLC

1. Position the rear blower motor power module (3) onto the rear heater-A/C housing (2).
2. Install the two screws (1) that secure the rear blower motor power module to the rear heater-A/C housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the two wire harness connectors (4) to the rear blower motor power module.
4. Install the right rear quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .
5. Reconnect the negative battery cable.

RESISTOR, BLOWER MOTOR, REAR

Description

DESCRIPTION

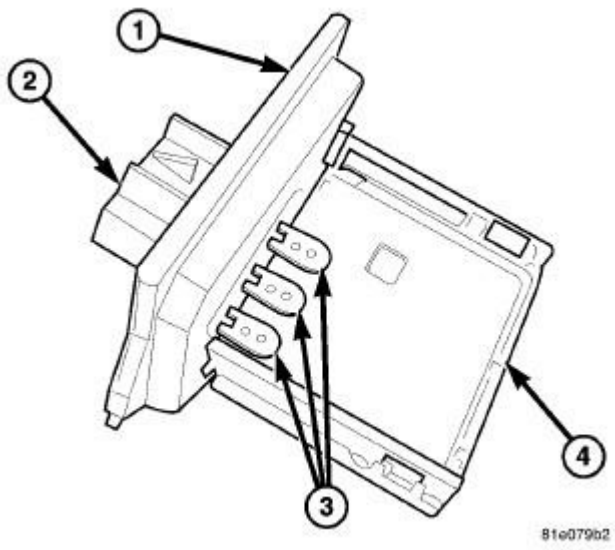

Fig. 62: Rear Blower Resistor
Courtesy of CHRYSLER LLC

A blower motor resistor is used on this model when equipped with the manual temperature control (MTC) rear heating-A/C system. Models equipped with the automatic temperature control (ATC) rear heating-A/C system use a blower motor power module, instead of the blower motor resistor. See **Heating and Air Conditioning/Controls/MODULE, Power - Description**.

The rear blower motor resistor is mounted to the inboard side of the rear heating-A/C housing, located on the right side of the vehicle. The rear blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate are resistors (3) located between a two-piece stamped steel heat sink (4).

The rear blower motor resistor can be accessed for service without removing the rear heater-A/C housing.

Operation

OPERATION

The blower motor resistor for the rear heating-A/C system is connected to the vehicle electrical system through a dedicated wire lead and connector of the rear heater-A/C wire harness. The rear blower motor resistor has an electrical circuit board with three resistors, each of which will reduce the current flow through the rear blower motor to change the blower motor speed.

The blower motor switch for the MTC rear heater-A/C system directs the ground path for the rear blower motor through the correct resistor to obtain the selected speed. With the rear blower motor control in the lowest speed position, the ground path for the rear blower motor is applied through all of the resistors. Each higher speed selected with the rear blower motor control applies the blower motor ground path through fewer of the resistors, increasing the rear blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistors are bypassed and the blower motor receives a direct path to ground through the rear blower motor switch.

The rear blower motor resistor cannot be adjusted or repaired and it must be replaced if inoperative or damaged.

Diagnosis and Testing

REAR BLOWER MOTOR RESISTOR

NOTE: See SYSTEM WIRING DIAGRAMS for circuit descriptions and diagrams. Wiring Information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor. See **Heating and Air Conditioning/Controls/RESISTOR, Blower Motor - Removal**.
3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or the blower motor as required. If not OK, replace the inoperative blower motor resistor.

Removal

REMOVAL

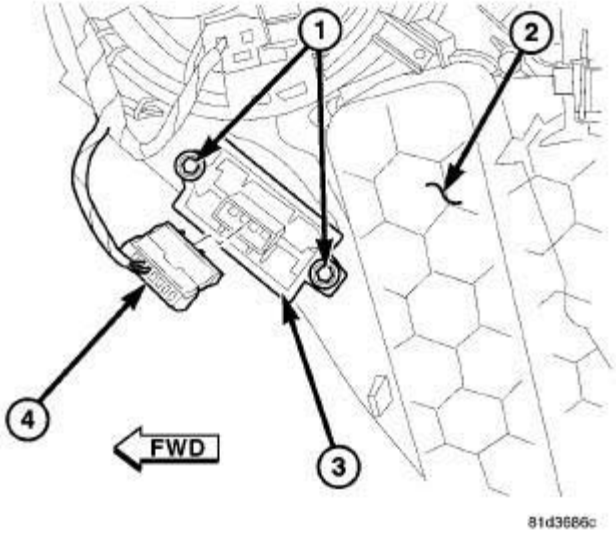

Fig. 63: Rear Blower Resistor Removal/Installation
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove right rear quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .

3. Disconnect the wire harness connector (4) from the rear blower motor resistor (3).
4. Remove the two screws (1) that secure the rear blower motor resistor to the rear heater-A/C housing (2) and remove the resistor.

Installation

INSTALLATION

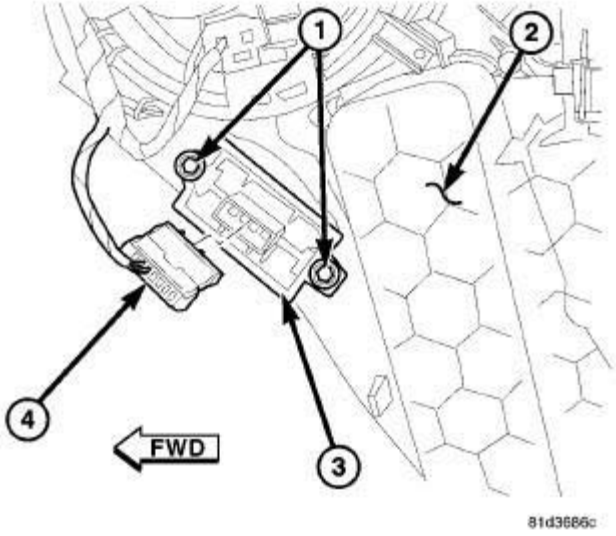

Fig. 64: Rear Blower Resistor Removal/Installation
Courtesy of CHRYSLER LLC

1. Position the rear blower motor resistor (3) onto the rear heater-A/C housing (2).
2. Install the two screws (1) that secure the rear blower motor resistor to the rear heater-A/C housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector (4) to the rear blower motor resistor.
4. Install the right rear quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .
5. Reconnect the negative battery cable.

DISTRIBUTION, FRONT

DUCT, DEFROSTER

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect

and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage while performing this procedure.

NOTE: LHD model shown. RHD model similar.

7. Install the instrument panel. Refer to **Body/Instrument Panel/PANEL, Instrument - Installation** .

FILTER, PARTICULATE AIR

Description

DESCRIPTION

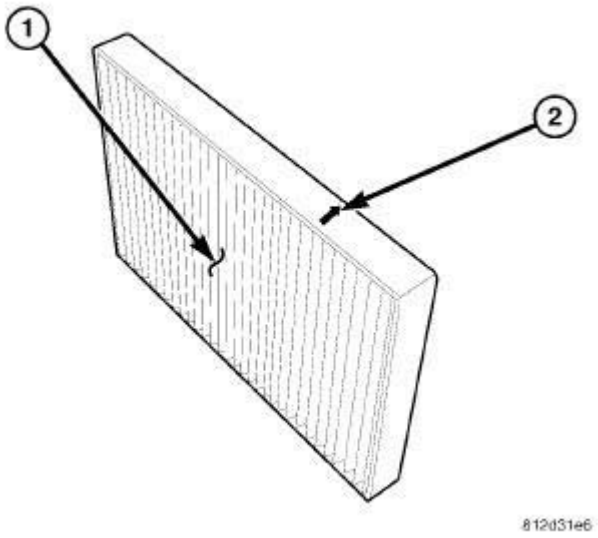

Fig. 85: Filter-Particulate Air Description
Courtesy of CHRYSLER LLC

Some models are equipped with a particulate air filter (1) that helps purify the outside air entering the HVAC housing. The filter is mounted in the passenger compartment, behind the glove box bin.

The filter should be replaced at least once a year or every 24,000 km (15,000 miles) and checked if heating-A/C system performance seems lower than expected. The particulate air filter is labeled with an arrow (2) to indicate the direction of air flow through the filter.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Always make sure the A/C-heater system is turned off and that the ignition switch is in the OFF position prior to servicing the particulate air filter. Never place fingers or other objects into the filter opening of the HVAC housing. Failure to follow this warning may result in serious injury.

NOTE: LHD model shown in illustrations. RHD model similar.

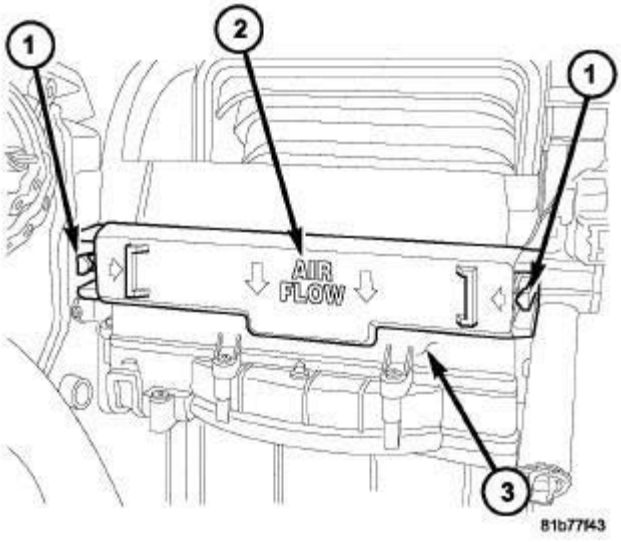

Fig. 86: Particulate Filter Cover Removal/Installation S1
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with instrument panel removed for clarity.

1. Remove the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
2. Disengage the two retaining tabs (1) that secure the particulate air filter cover (2) to the passenger side of the HVAC housing (3) and remove the cover.

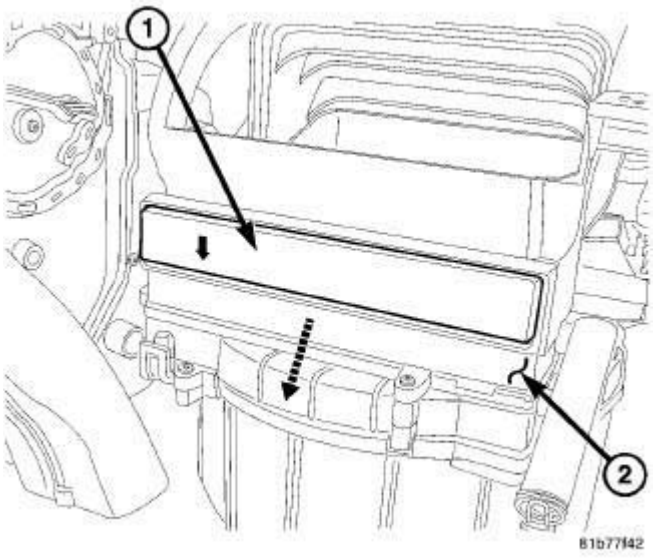

Fig. 87: Particulate Filter Removal S1
Courtesy of CHRYSLER LLC

3. Remove the particulate air filter (1) from the HVAC housing (2) by pulling the filter element straight out of the housing.

Installation

INSTALLATION

NOTE: The particulate air filter is labeled with an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

NOTE: LHD model shown in illustrations. RHD model similar.

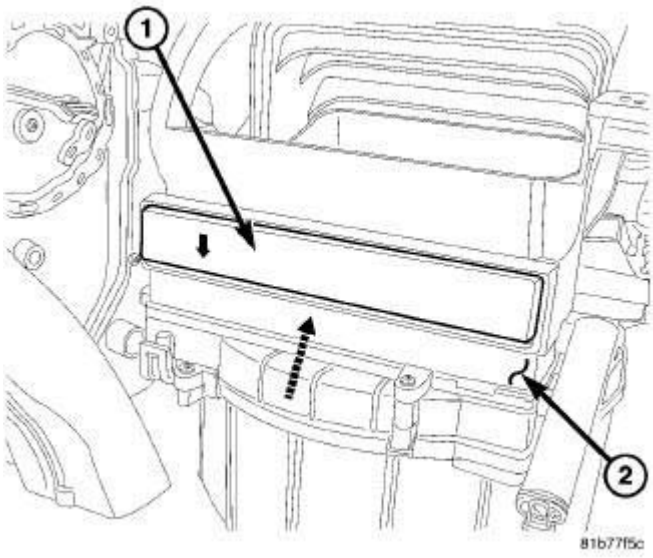

Fig. 88: Particulate Filter Install S1
Courtesy of CHRYSLER LLC

1. Install the particulate air filter (1) into the filter opening in the HVAC housing (2). Insert the particulate air filter directly into the housing with the arrow on the filter pointing to the floor.

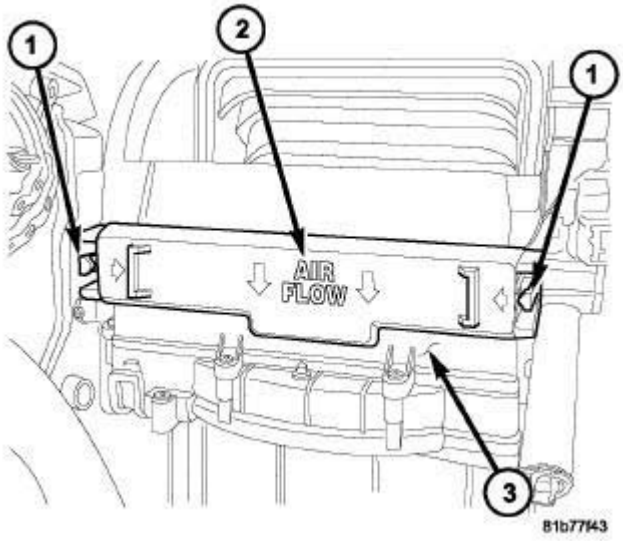

Fig. 89: Particulate Filter Cover Removal/Installation S1
Courtesy of CHRYSLER LLC

2. Position the particulate air filter cover (2) to the HVAC housing (3) and engage the two retaining tabs (1) that secure the cover to the housing. Make sure the retaining tabs are fully engaged.
3. Install the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .

HOUSING, HVAC

Description

DESCRIPTION

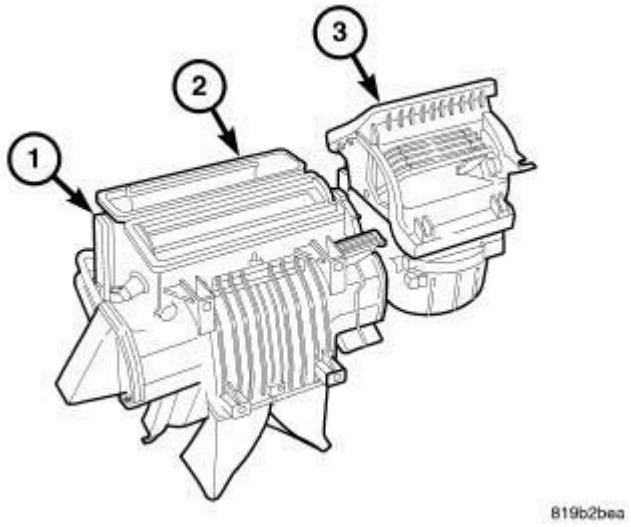

Fig. 90: HVAC housing assembly
Courtesy of CHRYSLER LLC

NOTE: LHD model shown RHD model similar.

All models are equipped with a common HVAC housing assembly that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The HVAC housing assembly consists of three separate housings:

- **HVAC housing** - The HVAC housing (1) is mounted to the dash panel behind the instrument panel and contains the A/C evaporator. The HVAC housing consists of an upper and a lower housing that are attached together and has mounting provisions for the air inlet housing, blower motor and the air distribution housing.
- **Air distribution housing** - The air distribution housing (2) is mounted to the rear of the HVAC housing and contains the heater core, blend-air and mode-air doors and door linkage.
- **Air inlet housing** - The air inlet housing (3) is mounted to the passenger side end of the HVAC housing and contains the recirculation-air door and actuator.

The heating-A/C system is a blend-air type system. The blend-air door controls the amount of conditioned air that is allowed to flow through, or around the heater core.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the electric blend door actuator, which moves the blend-air door. This allows an almost immediate control of the output air temperature of the system. The electric mode door actuator

operates the mode-air door. The electric recirculation door actuator operates the recirculation-air door which closes off the fresh air intake into the HVAC housing and recirculates the air already inside the vehicle. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housing at the selected speed by use of the blower motor resistor or power module (depending on application), which is located on the bottom of the HVAC housing. The actuators, resistor or power module and the blower motor are connected to the vehicle electrical system by the instrument panel wire harness.

The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors. The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door. The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

Removal

HOUSING-AIR DISTRIBUTION

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors.

NOTE: LHD model shown in illustrations. RHD model similar.

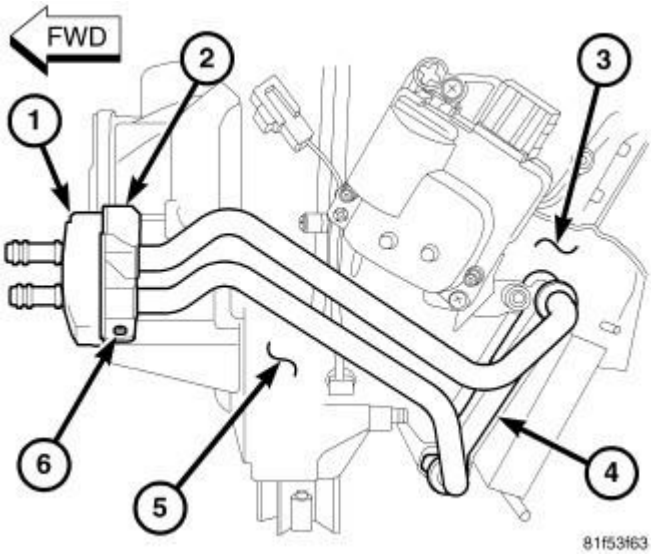

Fig. 91: Heater Core Removal/Installation
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
2. Remove the floor distribution ducts from the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Removal**.

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

3. Remove the foam seal (1) from the flange (2) located on the front of the HVAC housing (5).
4. Remove the screw (6) that secures the flange to the HVAC housing and remove the flange.
5. On RHD models, remove the air distribution housing (3) from the HVAC housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**
6. Carefully pull the heater core (4) out of the air distribution housing.

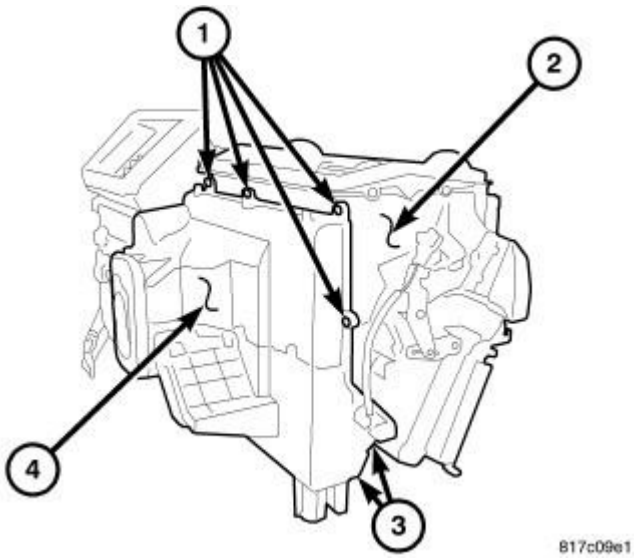

Fig. 92: Air Distribution Housing-Removal/Installation
Courtesy of CHRYSLER LLC

7. Remove the two metal retaining clips (3) that secure the bottom of air distribution housing (2) to the HVAC housing (4).
8. Remove the seven screws (1) that secure the air distribution housing to the rear of the HVAC housing.
9. Remove the air distribution housing from the rear of the HVAC housing.
10. If required, disassemble the air distribution housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Disassembly**.

HOUSING-AIR INLET

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

NOTE: LHD model shown. RHD model similar.

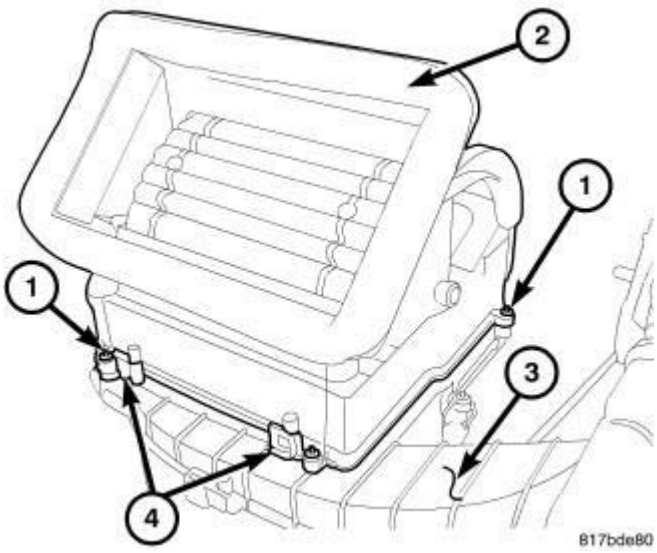

Fig. 93: Air Inlet Housing-Removal/Installation
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
2. If equipped, remove the particulate air filter. See **Heating and Air Conditioning/Distribution/FILTER, Particulate Air - Removal**.
3. Remove the four screws (1) that secure the air inlet housing (2) to the top of the HVAC housing (3).
4. Disengage the two plastic retaining tabs (4) that secure the air inlet housing to the HVAC housing and remove the inlet housing from the HVAC housing.
5. If required, disassemble the air inlet housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Disassembly**.

SCREEN-AIR INLET

NOTE: LHD model shown. RHD model similar.

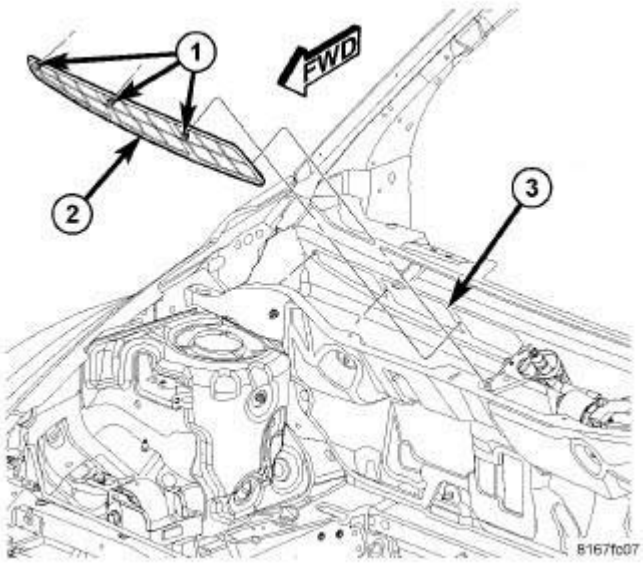

Fig. 94: Screen-HVAC Housing Air Inlet
Courtesy of CHRYSLER LLC

1. Remove the cowl grille screen. Refer to **Body/Exterior/COVER, Cowl Panel - Removal** .
2. Disengage the three push-in retainers (1) that secure the HVAC housing air inlet screen (2) to the cowl panel (3) and remove the screen.

HOUSING-HVAC

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the heater core, A/C evaporator, air intake housing and the mode-air and blend-air doors.

NOTE: LHD model shown in illustrations. RHD model similar.

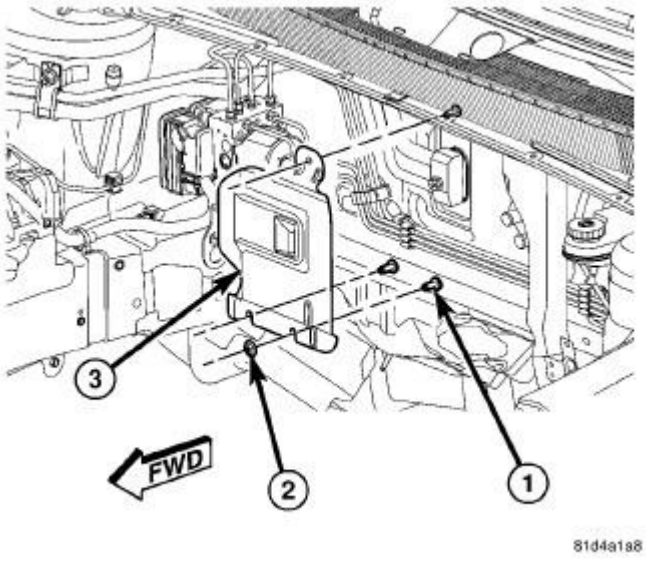

Fig. 95: Heat Shield - Unified Line
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Partially drain the engine cooling system. Refer to **Cooling - Standard Procedure** .
4. If equipped with heat shield (3), remove the top nut (2) that secures the heat shield to the stud (1) located on the dash panel.

   NOTE: Two slots are provided at the bottom of the heat shield to aid in heat shield removal, if equipped. Complete removal of the two bottom heat shield retaining nuts is not required.

5. If equipped, reach behind the engine and remove the two bottom nuts the that secure the heat shield to the studs located on the dash panel and remove the heat shield. Rotate and tilt the heat shield as required.

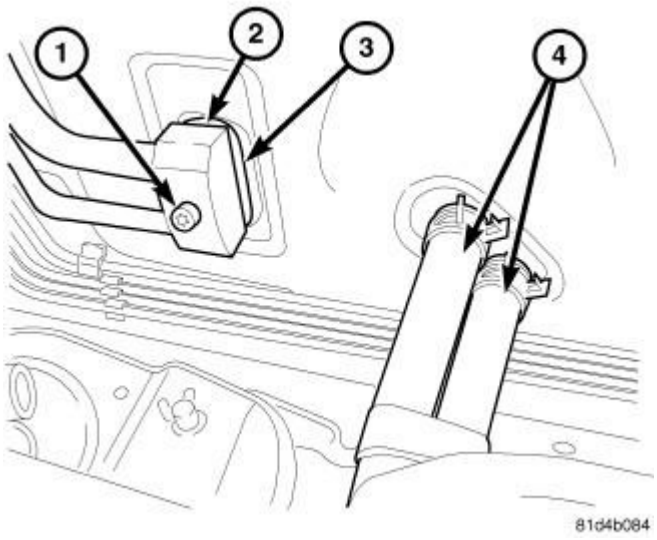

Fig. 96: Unified Liquid & Suction Line to Evaporator
Courtesy of CHRYSLER LLC

6. Remove the nut (1) that secures the A/C liquid and suction line assembly (2) to the A/C expansion valve (3).
7. Disconnect the A/C liquid and suction line assembly from the A/C evaporator and remove and discard the dual-plane seals.
8. Install plugs in, or tape over the opened refrigerant line fittings and the evaporator ports.
9. Disconnect the heater hoses (4) from the heater core tubes. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during housing removal.

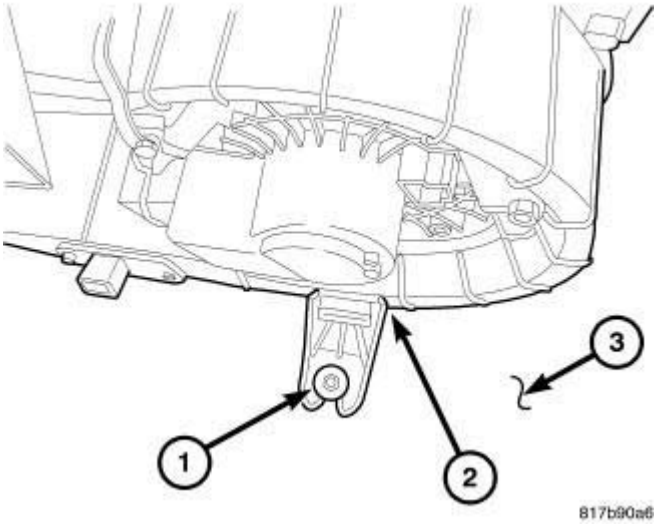

Fig. 97: HVAC Housing to Dash Panel Nut
Courtesy of CHRYSLER LLC

NOTE: Make sure to remove the five bolts that secure the HVAC housing to the

instrument panel support prior to removing the instrument panel from the vehicle.

10. Remove the instrument panel. Refer to **Body/Instrument Panel/PANEL, Instrument - Removal** .
11. Remove the rear floor ducts. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Removal**.
12. Remove the condensation drain tube.
13. Remove the nut (1) that secures the passenger side of the HVAC housing (2) to the dash panel (3).

NOTE: Use care to ensure that the interior is covered in case of loss of residual fluids from the heater and evaporator cores.

14. Pull the HVAC housing rearward and remove the HVAC housing assembly from the passenger compartment.

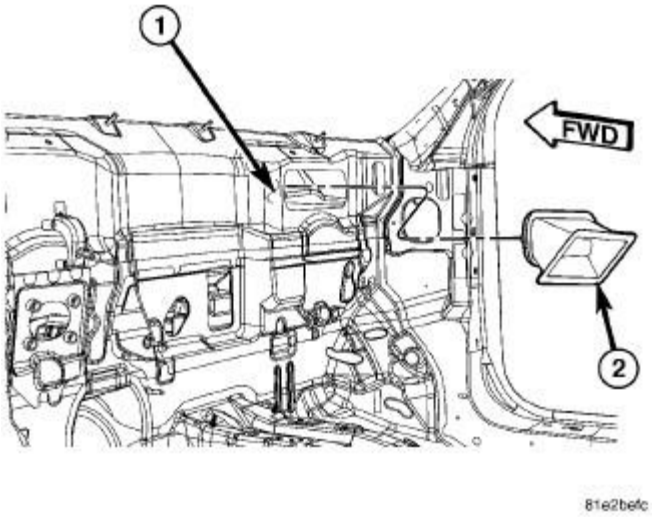

Fig. 98: Air Inlet Duct
Courtesy of CHRYSLER LLC

15. If required, remove the HVAC housing air inlet duct (2) from the passenger compartment side of the dash panel (1).

Disassembly

HOUSING-AIR DISTRIBUTION

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

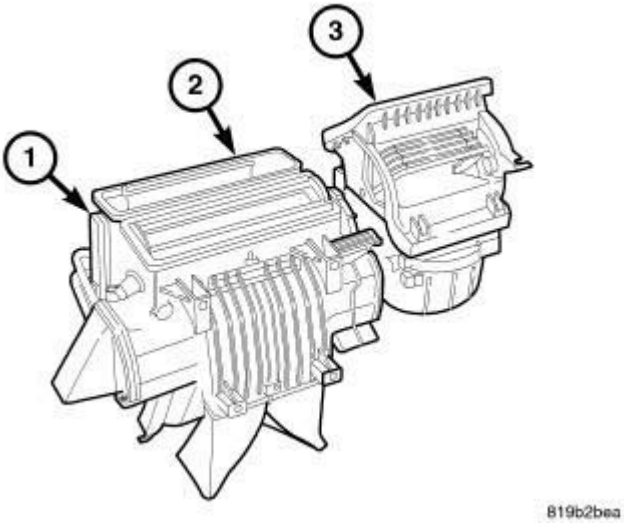

Fig. 99: HVAC housing assembly
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
2. Remove the air distribution housing (2) from the HVAC housing (1). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
3. If equipped with the 2.0L diesel engine, remove the electric positive temperature coefficient (PTC) heater unit from the air distribution housing. See **Heating and Air Conditioning/Cabin Heater/UNIT, Heater - Removal**.
4. Remove the heater core from the air distribution housing. See **Heating and Air Conditioning/Plumbing/CORE, Heater - Removal**.

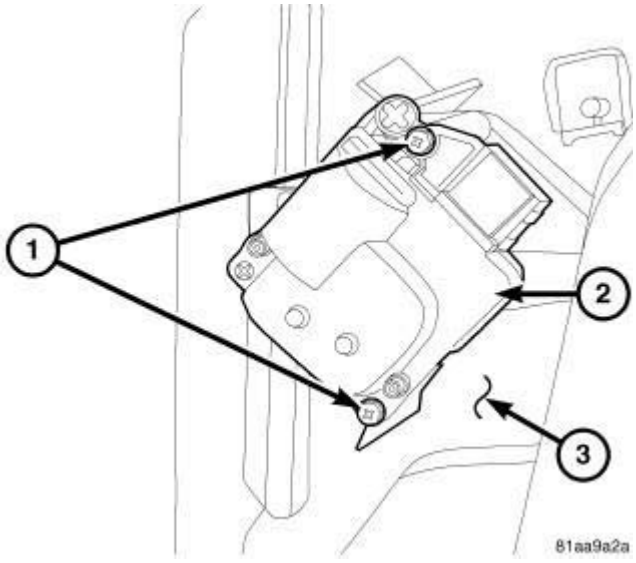

Fig. 100: Blend Door Actuator
Courtesy of CHRYSLER LLC

5. Remove the screws (1) that secure the blend door actuator (2) to the left side of the air distribution housing (3) and remove the actuator.
6. If equipped with dual zone system, remove the screws that secure the other blend door actuator to the right side of the air distribution housing and remove the actuator. See **Heating and Air Conditioning/Controls/ACTUATOR, Blend Door - Removal**.

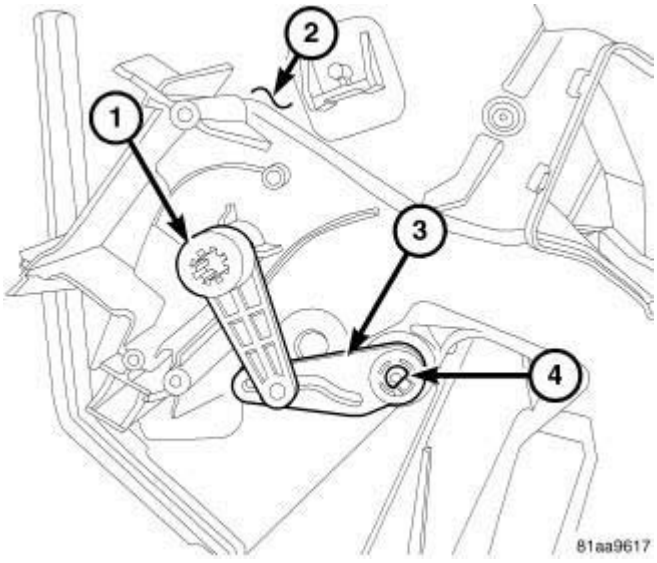

Fig. 101: Blend Door Levers
Courtesy of CHRYSLER LLC

7. Remove the blend door lever (1) from the left side of the air distribution housing (2).

NOTE: To remove the blend door pivot lever, disengage the retaining tab on the lever and pull the lever straight off the pivot shaft.

8. Remove the blend door pivot lever (3) from the end of the blend door pivot shaft (4).

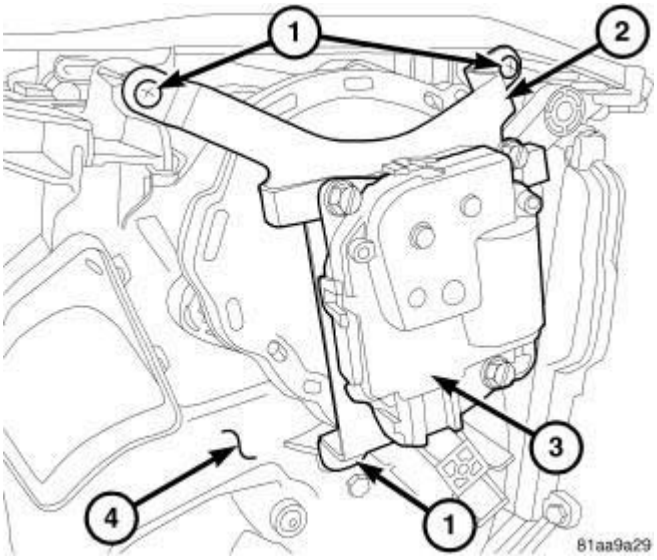

Fig. 102: Mode Door Actuator & Bracket
Courtesy of CHRYSLER LLC

NOTE: It is not necessary to remove the mode door actuator from the bracket when servicing the air distribution housing.

9. Remove the three screws (1) that secure the mode door actuator (2) and bracket (3) to the right side of the air distribution housing (4) and remove the actuator and bracket as an assembly.

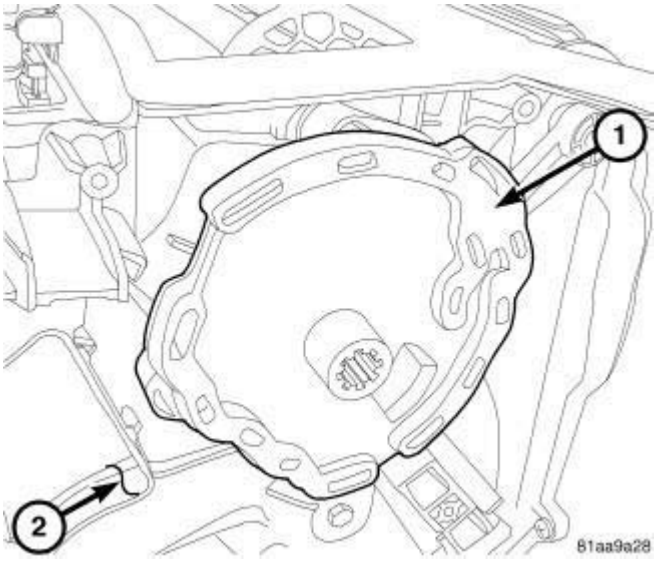

Fig. 103: Mode Door Cam
Courtesy of CHRYSLER LLC

10. Remove the mode door cam (1) from the right side of the air distribution housing (2).

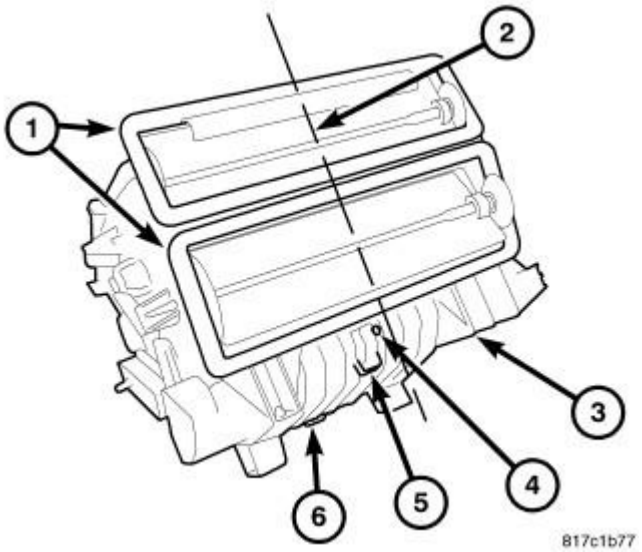

Fig. 104: Parting Line & Retainers
Courtesy of CHRYSLER LLC

NOTE: If any foam seal on the air distribution housing outlets is deformed or damaged, the seal must be replaced.

11. Carefully cut the two foam seals (1) along the parting line (2) of the two halves of the air distribution housing (3). If either seal is deformed or damaged, it must be replaced.
12. Remove the five screws (4) and one metal clip (5) that secure the two halves of the air distribution housing together.
13. Disengage the three plastic retaining tabs (6) that secure the two halves of the air distribution housing together and carefully separate the housing.

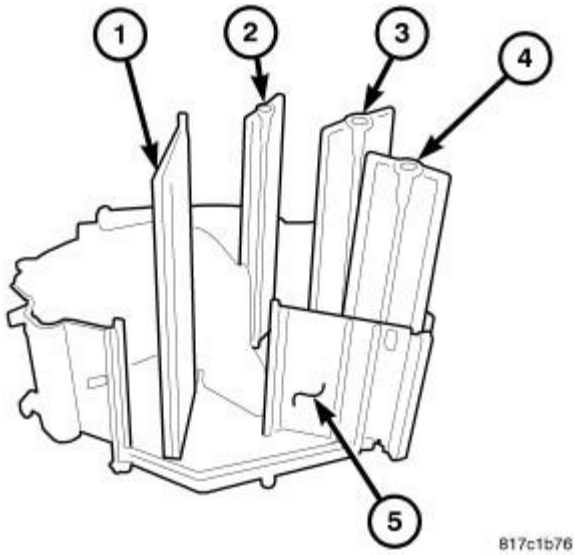

Fig. 105: Air Doors-Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: If a seal on an air door is deformed or damaged, the air door must be replaced.

NOTE: If equipped with dual zone heating/A/C system, there are two blend-air doors that mate together at the centerline of the housing.

14. Disengage the air doors (1, 2, 3 and 4) from the door levers and remove the air doors from the air distribution housing (5).

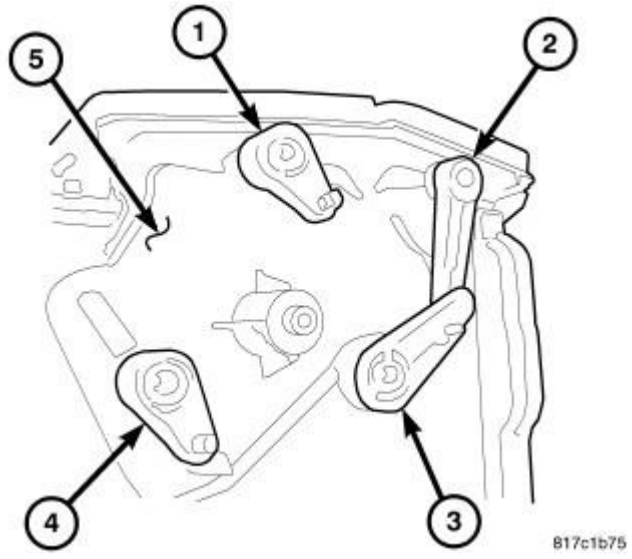

Fig. 106: Mode Door Levers-Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: To remove the door levers, disengage the retaining tabs on the inside of the air distribution housing and pull the levers straight out of the housing.

15. If required, remove the door levers (1, 2, 3 and 4) from the right side of the air distribution housing (5).

HOUSING-AIR INLET

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

NOTE: LHD model shown in illustrations. RHD model similar.

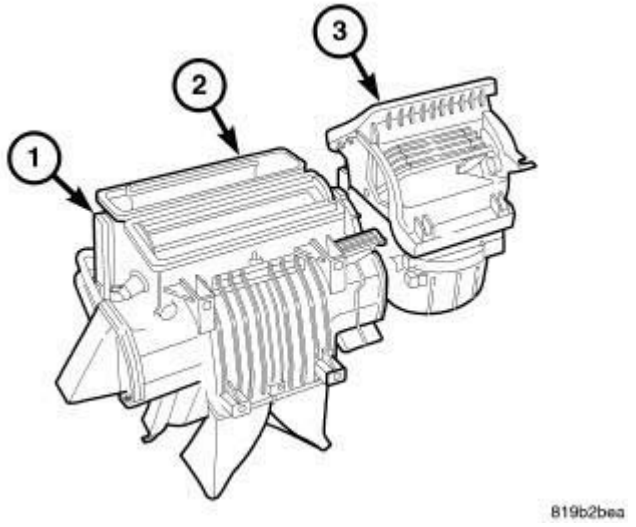

Fig. 107: HVAC housing assembly
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
2. Remove the air inlet housing (3) from the HVAC housing (1). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.

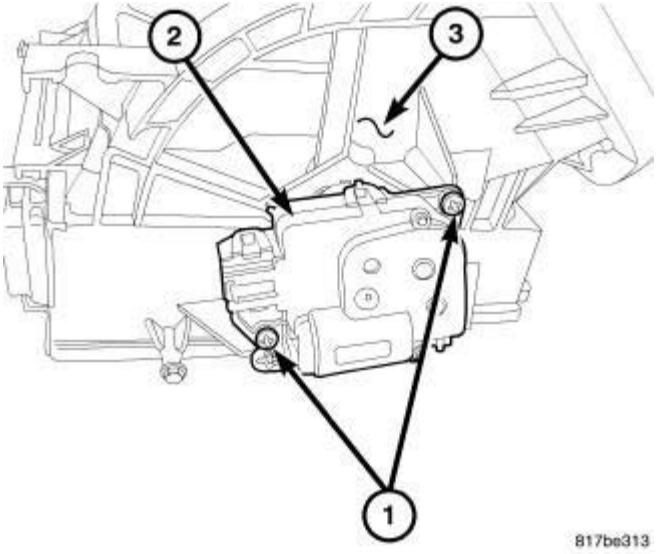

Fig. 108: Recirculation Door Actuator-Removal/Installation
Courtesy of CHRYSLER LLC

3. Remove the two screws (1) that secure the recirculation door actuator (2) to the right side of the air inlet housing (3) and remove the actuator.

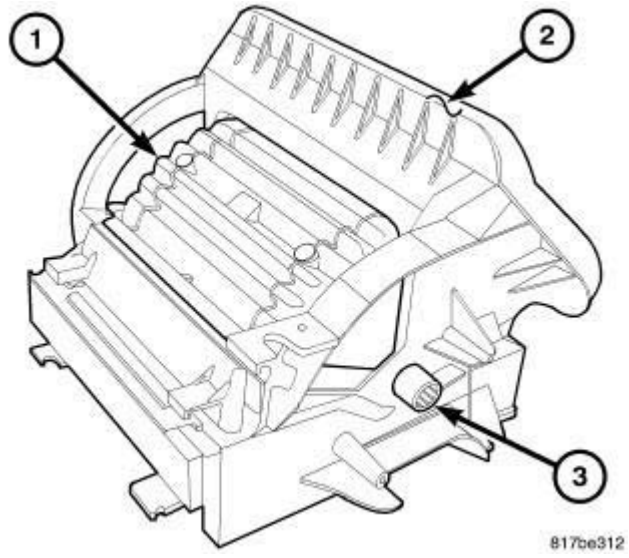

Fig. 109: Recirculation Air-Door & Pivot Shaft
Courtesy of CHRYSLER LLC

4. To remove the recirculation door pivot shaft adapter from the right end of the recirculation-air door, first carefully push down on the tab of the door lever pivot shaft adapter located inside of the air inlet housing, then pull the pivot shaft adapter straight out of the end of the recirculation-air door pivot shaft.

NOTE: If the foam seal on the air inlet housing is deformed or damaged, the seal must be replaced.

NOTE: If a rubber seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

5. Carefully pinch the two ends of the recirculation air-door together and remove the air-door from the air inlet housing. If the seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

HOUSING-HVAC

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model shown in illustrations. RHD model similar.

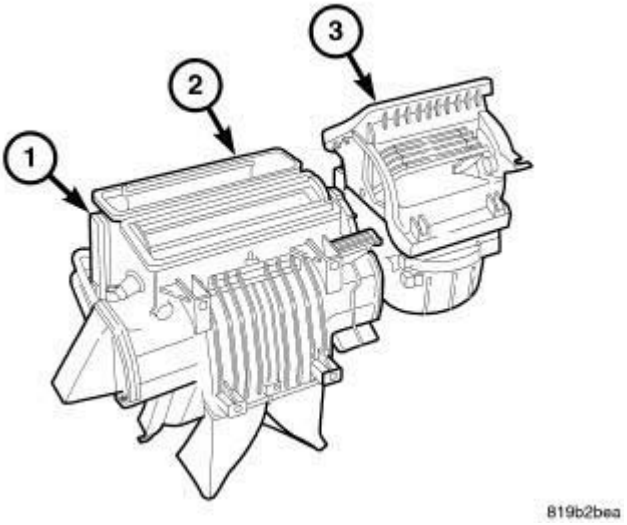

Fig. 110: HVAC housing assembly
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
2. Remove the air distribution housing (2) from the HVAC housing (1). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
3. Remove the air inlet housing (3) from the HVAC housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.

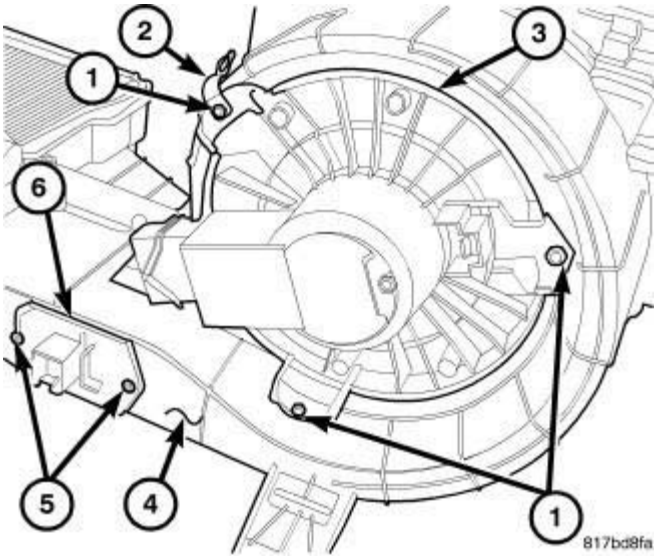

Fig. 111: Blower Motor & Resistor
Courtesy of CHRYSLER LLC

NOTE: Manual temperature system shown. Automatic system similar.

4. Remove the three screws (1) that secure the wire lead bracket (2) and the blower motor (3) to the bottom of the HVAC housing (4) and remove the blower motor and wire lead bracket.
5. Remove the two screws (5) that secure the blower motor resistor or power module (6) to the bottom of the HVAC housing and remove the resistor or power module.

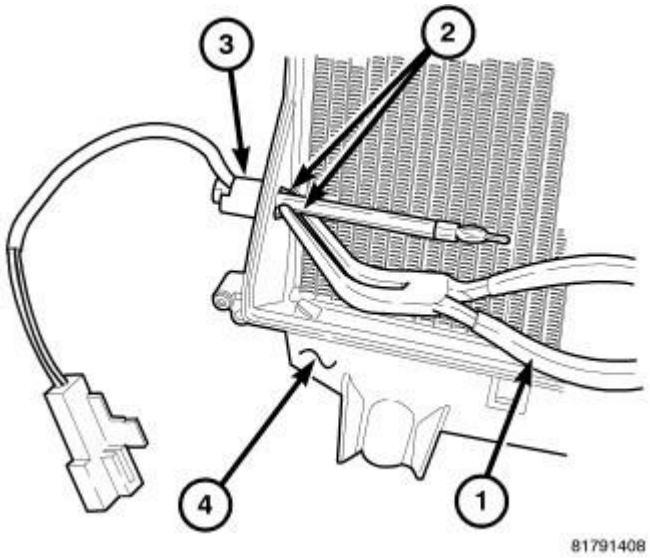

Fig. 112: Evaporator Temperature Sensor-Removal
Courtesy of CHRYSLER LLC

6. Using needle nose pliers (1), disengage the two retaining tabs (2) that secure the evaporator temperature sensor (3) to the driver side of the HVAC housing (4) and remove the sensor.

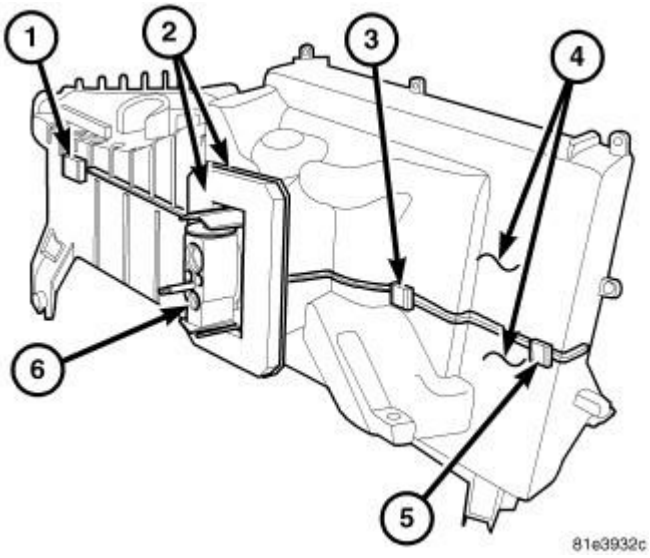

Fig. 113: HVAC Housing-Separate
Courtesy of CHRYSLER LLC

NOTE: If the foam seal or plastic flange is deformed or damaged, it must be

replaced.

7. Remove the two bolts that secure the A/C expansion valve (6 to the A/C evaporator and remove the valve. See **Heating and Air Conditioning/Plumbing/VALVE, A/C Expansion - Removal**.
8. Remove and discard the O-ring seals and install plugs in, or tape over the opened expansion valve and evaporator tube ports.
9. Remove the foam seal and plastic flange (2) from the front of the two halves of the HVAC housing (4). Carefully release the four retaining tabs located at the back of the flange and pull the flange off of the evaporator tubes. If the seal or flange is deformed or damaged, it must be replaced.
10. Remove the nine screws (3) and three metal clips (5) that secure the two halves of the HVAC housing together.
11. Disengage the nine plastic retaining tabs (1) that secure the two halves of the HVAC housing together and separate the housing.

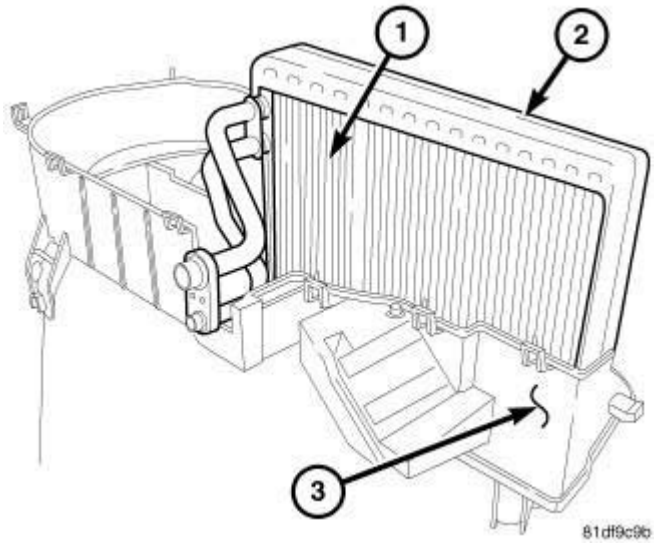

Fig. 114: Evaporator Removal/Installation
Courtesy of CHRYSLER LLC

12. Carefully lift the A/C evaporator (1) and the foam insulator (2) out of the lower half of the HVAC housing (3).

Assembly

HOUSING-AIR DISTRIBUTION

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

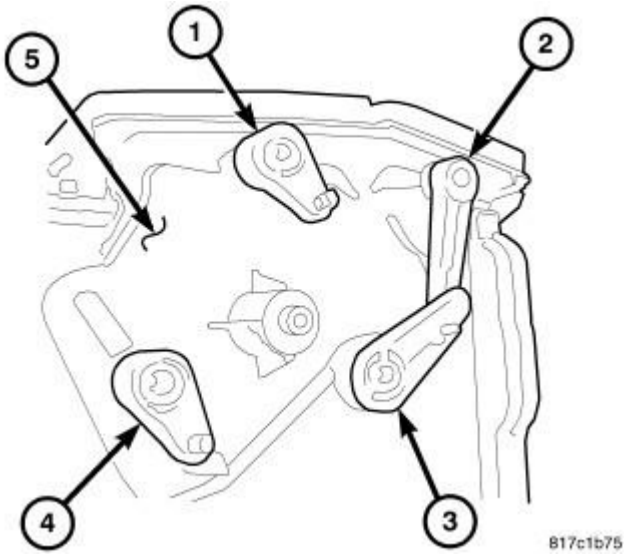

Fig. 115: Mode Door Levers-Removal/Installation
Courtesy of CHRYSLER LLC

1. If removed, install the four door levers (1, 2, 3 and 4) onto the right side of the air distribution housing (5) Make sure the lever retaining tabs are fully engaged to the housing.

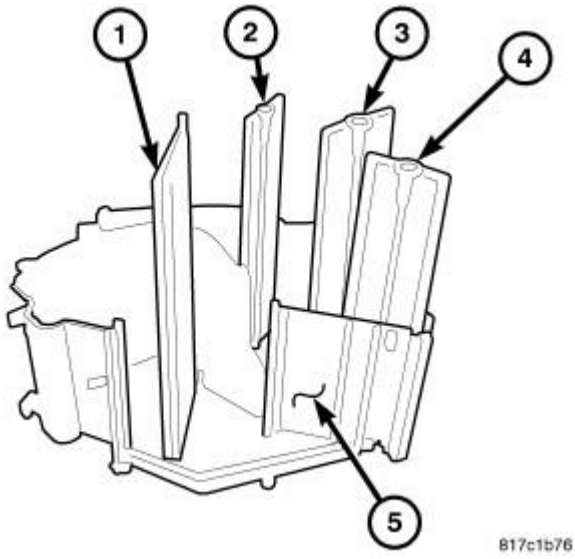

Fig. 116: Air Doors-Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: If a seal on an air door is deformed or damaged, the air door must be replaced.

NOTE: Properly position the air doors within the air distribution housing by first aligning the four door levers to the scribe lines located on the right outer side of the air distribution housing. Then, install the air doors onto the

door levers with the UP mark on each air door facing toward the top of the housing.

NOTE: If equipped with dual zone heating/A/C system, there are two blend-air doors that mate together at the centerline of the housing.

2. Align the four door levers to the scribe lines on the right outer side of the air distribution housing (5) and install the air door(s) (1, 2, 3 and 4) onto the door levers with the UP mark on each air door facing toward the top of the housing.

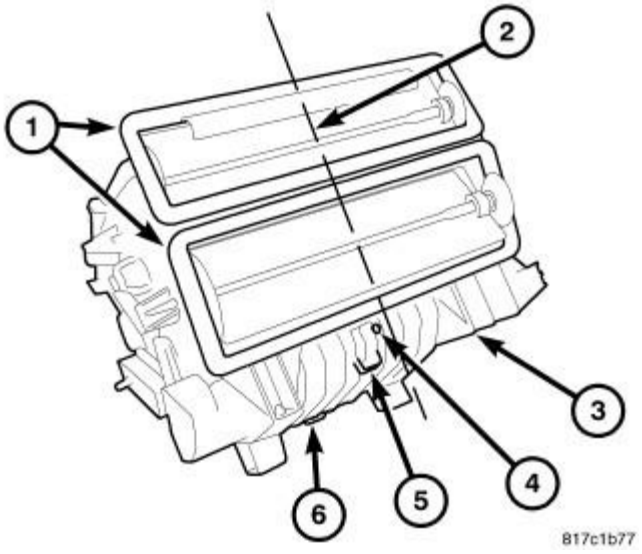

Fig. 117: Parting Line & Retainers
Courtesy of CHRYSLER LLC

3. Align the air door(s) with the pivot shaft hole(s) in the air distribution housing (3) and install the two halves of the housing together. Make sure the three plastic retaining tabs (6) are fully engaged.
4. Install the five screws (4) and one metal clip (5) that secure the two halves of the air distribution housing together. Tighten the screws to 2.2 N.m (20 in lbs.). Make sure the metal clip is fully engaged to the housing halves.

NOTE: If any foam seal on the air distribution housing outlets is deformed or damaged, the seal must be replaced.

5. Inspect the foam seals (1), especially at the parting line (2). If a foam seal is deformed or damaged, it must be replaced.

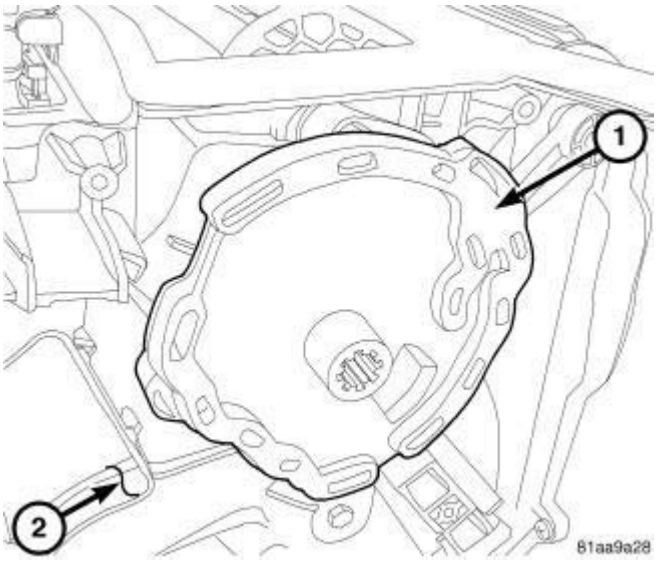

Fig. 118: Mode Door Cam
Courtesy of CHRYSLER LLC

NOTE: Align the pins on the mode door levers with the grooves in the back of the mode door cam prior to installation of the cam.

6. Align the mode door levers on the right side of the air distribution housing (2) to the mode door cam (1) and install the cam onto the housing. Make sure the levers are correctly engaged to the cam.

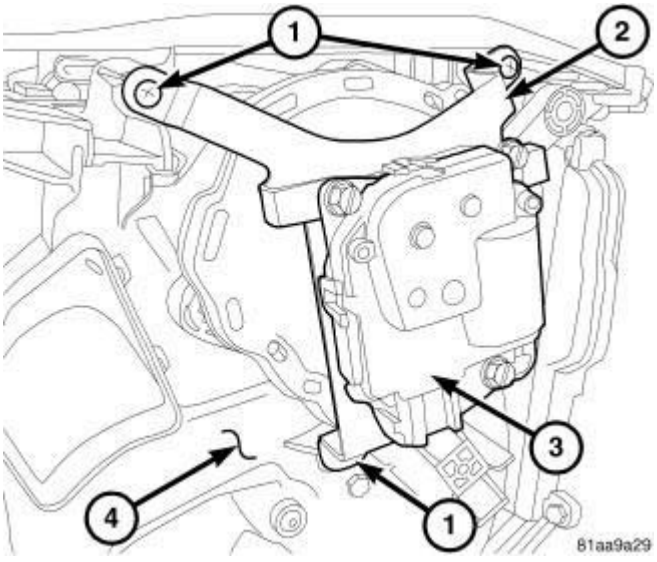

Fig. 119: Mode Door Actuator & Bracket
Courtesy of CHRYSLER LLC

7. Position the mode door actuator (2) and bracket (3) onto the right side of the HVAC air distribution housing (4). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the mode door cam.

8. Install the screws (1) that secure the mode door actuator bracket to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).

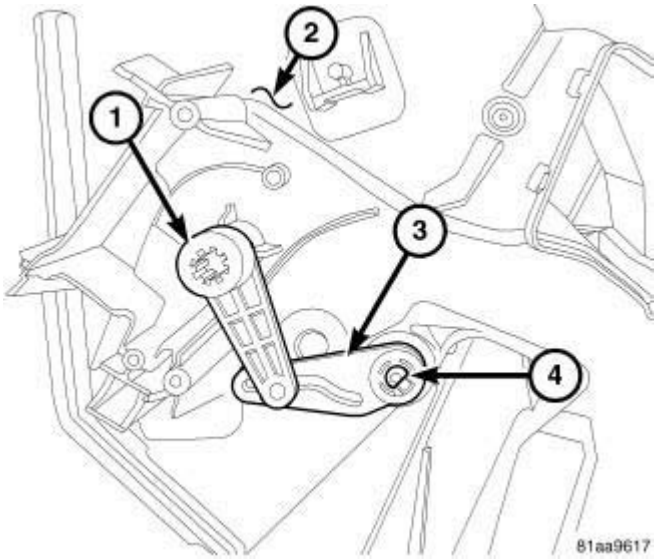

Fig. 120: Blend Door Levers
Courtesy of CHRYSLER LLC

9. Install the blend door pivot lever (3) onto the end of the blend door pivot shaft (4) located on the left side of the air distribution housing (2). Make sure the lever retaining tab is fully engaged to the pivot shaft.

NOTE: Align the pin on the blend door lever with the groove in the pivot lever prior to installation of the blend door lever.

10. Install the blend door lever (1) onto the air distribution housing. Make sure the levers are correctly aligned to each other.

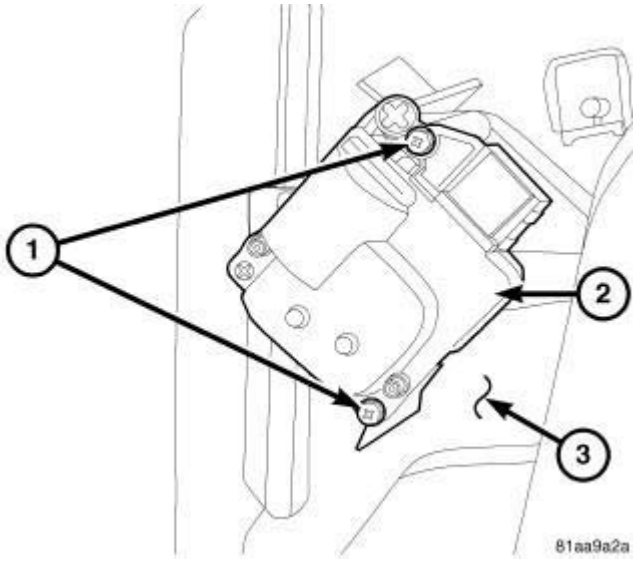

Fig. 121: Blend Door Actuator
Courtesy of CHRYSLER LLC

11. Position the blend door actuator (2) onto the left side of the air distribution housing (3). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the blend door lever.
12. Install the screws (1) that secure the blend door actuator to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
13. If equipped with dual zone system, position the blend door actuator onto the right side of the air distribution housing and install the retaining screws. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the blend door. Tighten the screws to 2 N.m (17 in. lbs.).

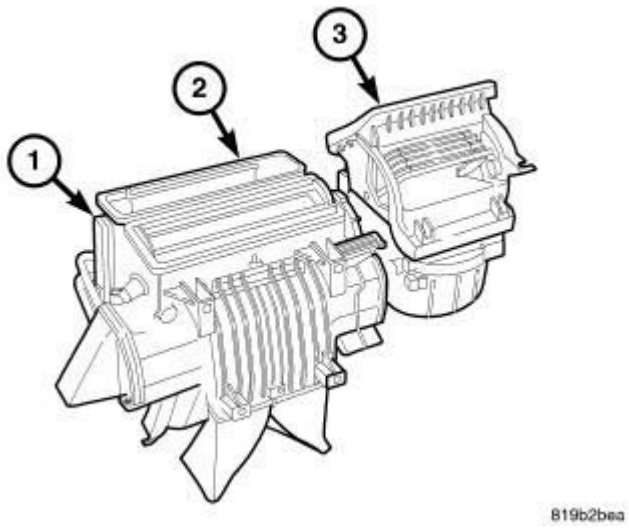

Fig. 122: HVAC housing assembly
Courtesy of CHRYSLER LLC

14. If equipped with the 2.0L diesel engine, install the electric positive temperature coefficient (PTC) heater unit into the air distribution housing (2). See **Heating and Air Conditioning/Cabin Heater/UNIT, Heater - Installation**.
15. Install the heater core into the air distribution housing. See **Heating and Air Conditioning/Plumbing/CORE, Heater - Installation**.
16. Install the air distribution housing onto the HVAC housing (1). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
17. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.

HOUSING-AIR INLET

NOTE: LHD model shown in illustrations. RHD model similar.

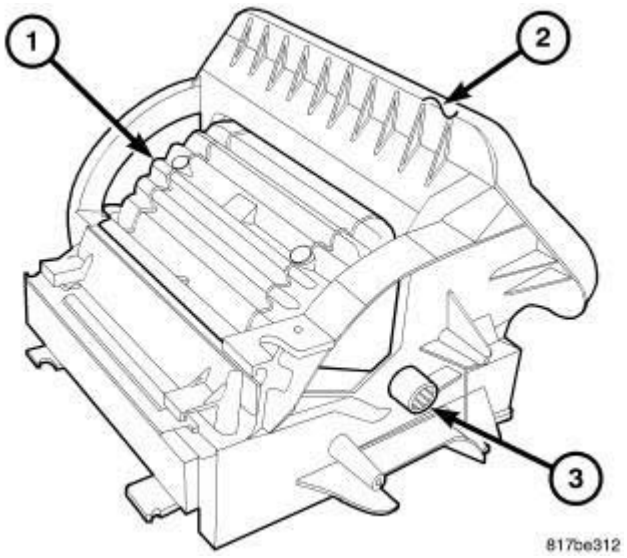

Fig. 123: Recirculation Air-Door & Pivot Shaft
Courtesy of CHRYSLER LLC

1. Carefully install the recirculation-air door (1) into the air inlet housing (2) by pinching the two ends of the air-door together and aligning the pivot shafts of the air-door to the pivot shaft holes in the air inlet housing.

NOTE: Install the recirculation door pivot shaft adapter by carefully pushing it straight into the end of the recirculation door pivot shaft.

2. Install the recirculation door pivot shaft adapter (3) into the right side pivot shaft of the recirculation air-door. Make sure the adapter is fully engaged to the pivot shaft.

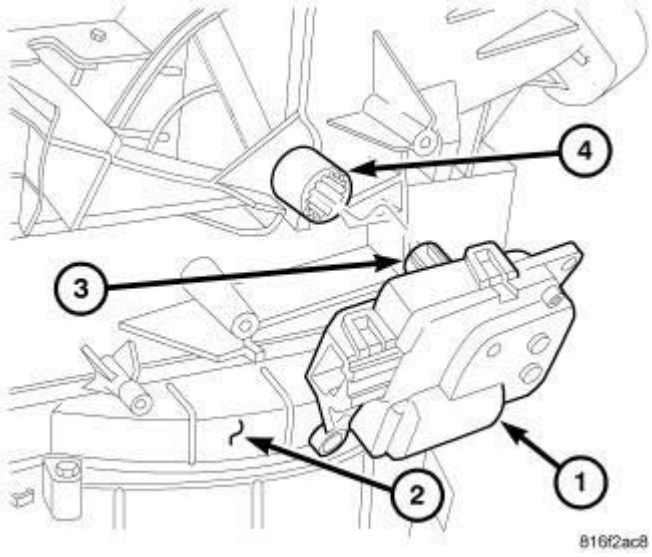

Fig. 124: Recirculation Door Actuator-Align
Courtesy of CHRYSLER LLC

3. Install the recirculation door actuator (1) onto the right side of the air inlet housing (2). If necessary, rotate the actuator slightly to align the splines of the actuator output shaft (3) with those on the recirculation door pivot shaft adapter (4).

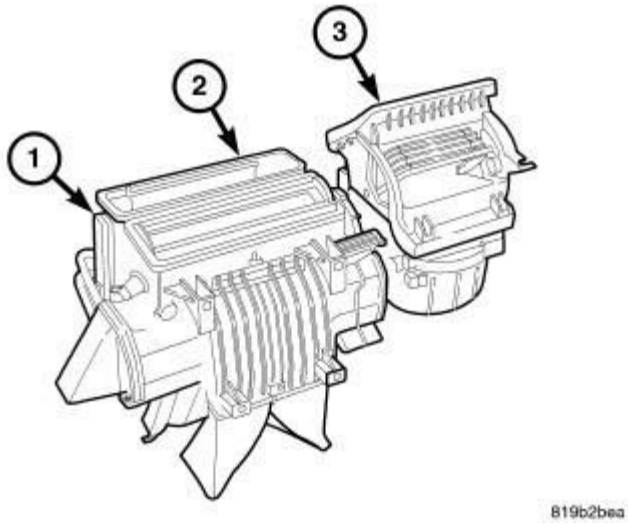

Fig. 125: HVAC housing assembly
Courtesy of CHRYSLER LLC

4. Install the air inlet housing (3) onto the HVAC housing (1). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
5. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.

HOUSING-HVAC

NOTE: LHD model shown in illustrations. RHD model similar.

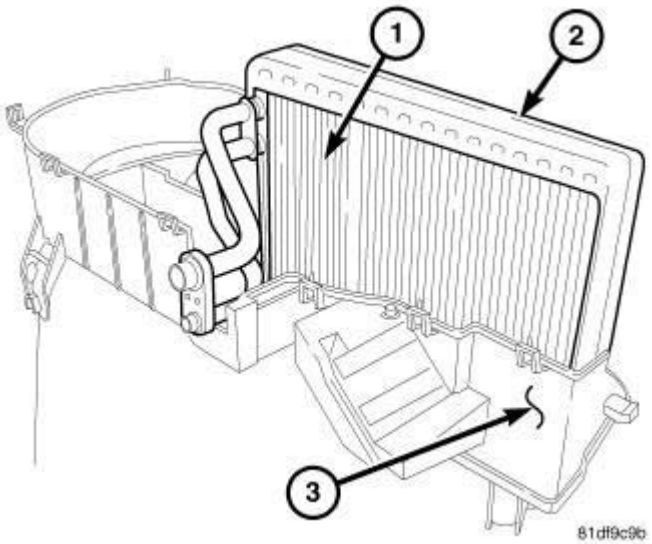

Fig. 126: Evaporator Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: Make sure that the foam insulator is properly positioned around the A/C evaporator and in the HVAC housing.

1. Carefully install the A/C evaporator (1) and foam insulator (2) into the lower half of the HVAC housing (3).

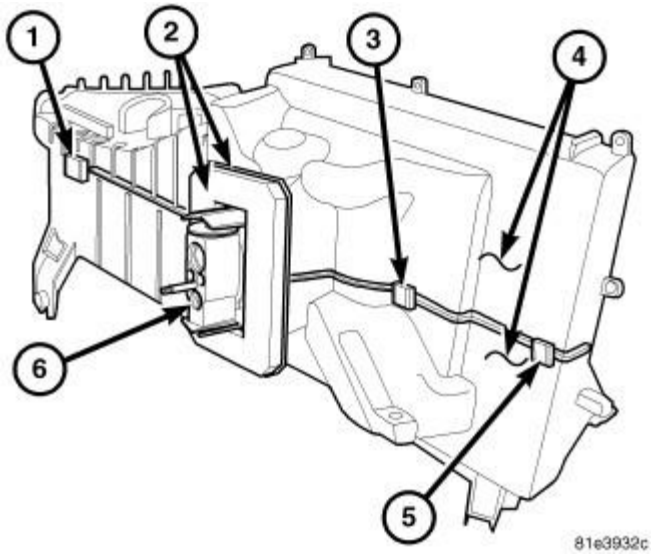

Fig. 127: HVAC Housing-Separate
Courtesy of CHRYSLER LLC

2. Install the two halves of the HVAC housing (4) together and engage the nine plastic retaining tabs (1). Make sure the retaining tabs are fully engaged.
3. Install the nine screws (3) and three metal clips (5) that secure the two halves of the HVAC housing

together. Tighten the screws to 1.2 N.m (10 in lbs.). Make sure the metal clips are fully engaged to the housing halves.

NOTE: If the foam seal or plastic flange is deformed or damaged, it must be replaced.

4. Install the plastic flange and foam seal (2) over the evaporator tubes and onto the front of the HVAC housing. Make sure the four flange retaining tabs are fully engaged to the housing.
5. Remove the tape or plugs from the expansion valve and evaporator ports.
6. Lubricate new O-ring seals with clean refrigerant oil and install them onto the evaporator tube fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the A/C expansion valve (6) and the two retaining bolts. Tighten the bolts to 11 N.m (97 in. lbs.). See **Heating and Air Conditioning/Plumbing/VALVE, A/C Expansion - Installation**.

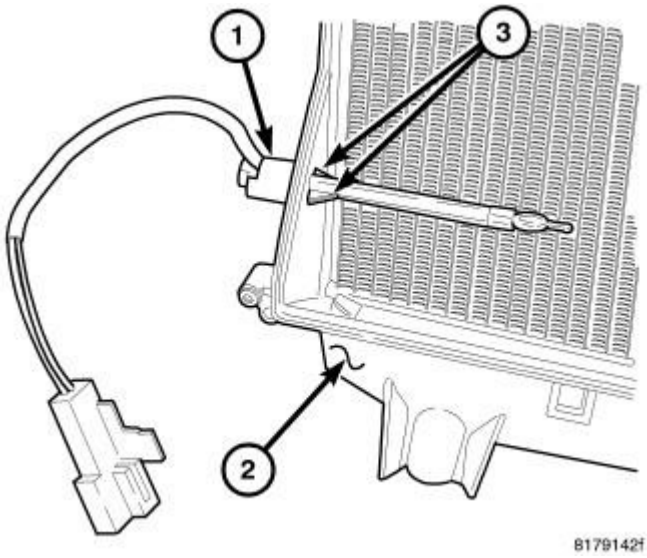

Fig. 128: Evaporator Temperature Sensor-Install
Courtesy of CHRYSLER LLC

8. Install the evaporator temperature sensor (1) into the driver side of the HVAC housing (2). Make sure the retaining tabs (3) are fully engaged to the housing.

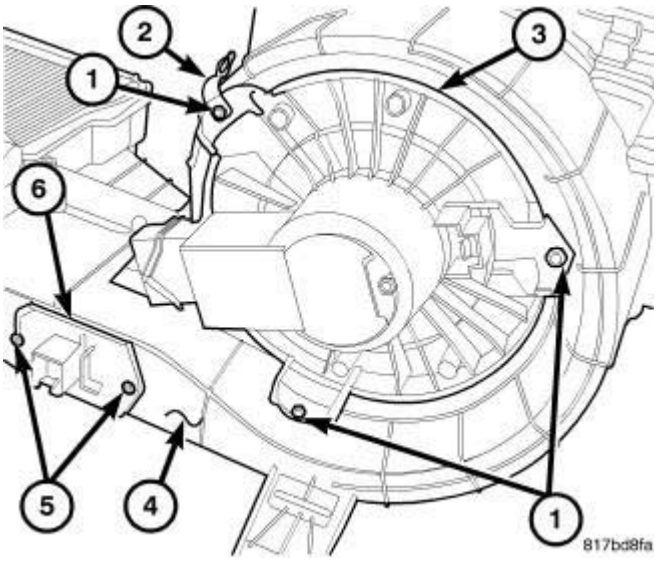

Fig. 129: Blower Motor & Resistor
Courtesy of CHRYSLER LLC

NOTE: Manual temperature system shown. Automatic system similar.

9. Position the blower motor (3) into the bottom of the HVAC housing (4).
10. Install the wire lead bracket (2) and the three screws (1) that secure the blower motor to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
11. Position the blower motor resistor or power module (6) into the HVAC housing.
12. Install the two screws (5) that secure the resistor or power module to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).

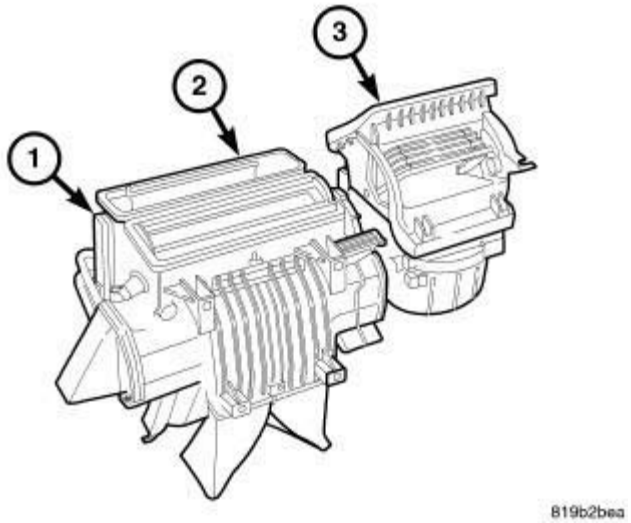

Fig. 130: HVAC housing assembly
Courtesy of CHRYSLER LLC

13. Install the air inlet housing (3) onto the HVAC housing (1). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
14. Install the air distribution housing (2) onto the HVAC housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.

NOTE: If the heater core is being replaced, flush the cooling system. Refer to Cooling - Standard Procedure .

15. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.

Installation

HOUSING-AIR DISTRIBUTION

NOTE: LHD model shown in illustrations. RHD model similar.

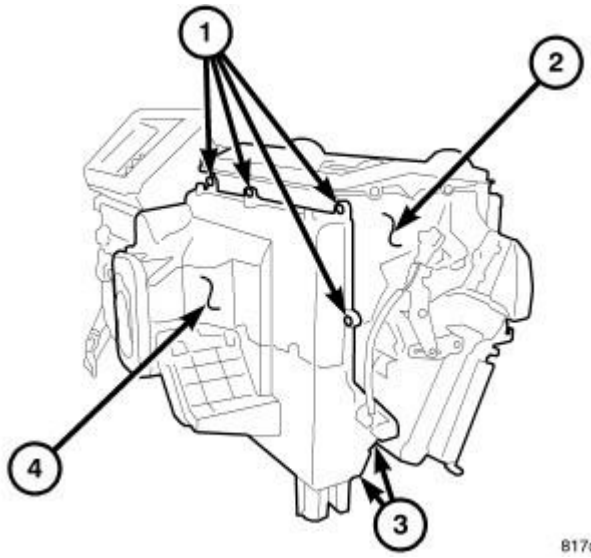

Fig. 131: Air Distribution Housing-Removal/Installation
Courtesy of CHRYSLER LLC

1. Position the air distribution housing (2) onto the rear of the HVAC housing (4).
2. Install the two metal retaining clips (3) that secure the bottom of the air distribution housing to the HVAC housing.
3. Install the seven screws (1) that secure the air distribution housing to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).

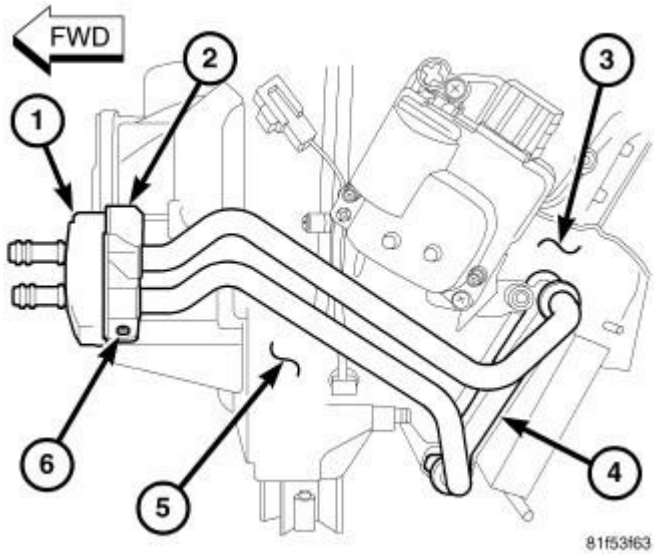

Fig. 132: Heater Core Removal/Installation
Courtesy of CHRYSLER LLC

4. Carefully install the heater core (4) into the side of the air distribution housing (3).
5. On RHD models, install the air distribution housing onto the HVAC housing (5). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
6. Install the flange (2) that secures the heater core tubes to the front of the HVAC housing.
7. Install the screw (6) that secures the flange to the HVAC housing. Tighten the screw to 1.2 N.m (10 in. lbs.).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

8. Install the foam seal (1) onto the flange.
9. Install all of the floor distribution ducts onto the air distribution housing. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Installation**.

NOTE: If the heater core is being replaced, flush the cooling system. Refer to Cooling - Standard Procedure .

10. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.

HOUSING-AIR INLET

NOTE: LHD model shown. RHD model similar.

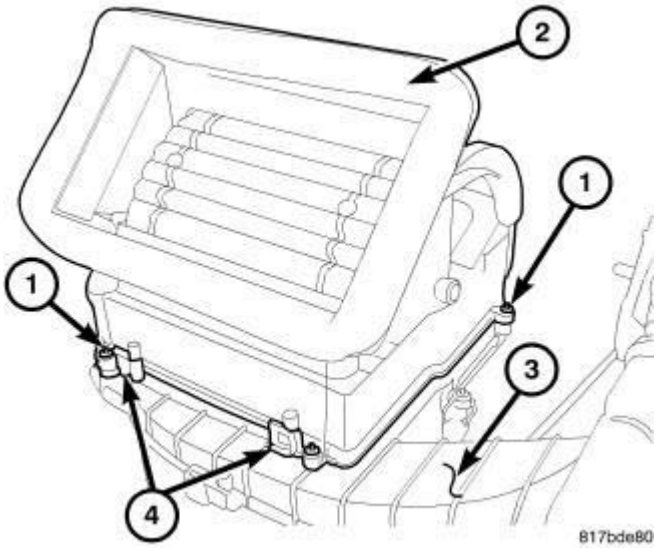

Fig. 133: Air Inlet Housing-Removal/Installation
Courtesy of CHRYSLER LLC

1. Install the air inlet housing (2) onto the top of the HVAC housing (3) and engage the two plastic retaining tabs (4). Make sure the retaining tabs are fully engaged.
2. Install the four screws (1) that secure the air inlet housing to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. If equipped, install the particulate air filter. See **Heating and Air Conditioning/Distribution/FILTER, Particulate Air - Installation**.
4. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.

SCREEN-AIR INLET

NOTE: LHD model shown. RHD model similar.

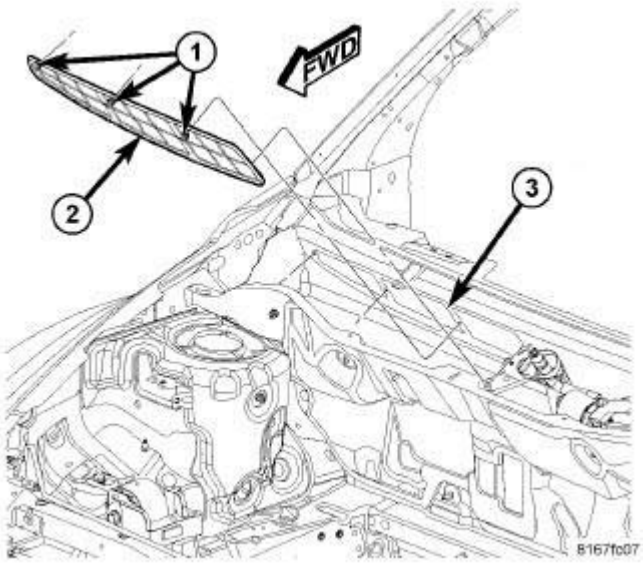

Fig. 134: Screen-HVAC Housing Air Inlet
Courtesy of CHRYSLER LLC

1. Position the HVAC housing air inlet screen (2) to the cowl panel (3) and fully engage the three push-in retainers (1) that secure the screen to the panel.
2. Install the cowl grille screen. Refer to **Body/Exterior/COVER, Cowl Panel - Installation** .

HOUSING-HVAC

NOTE: LHD model shown in illustrations. RHD model similar.

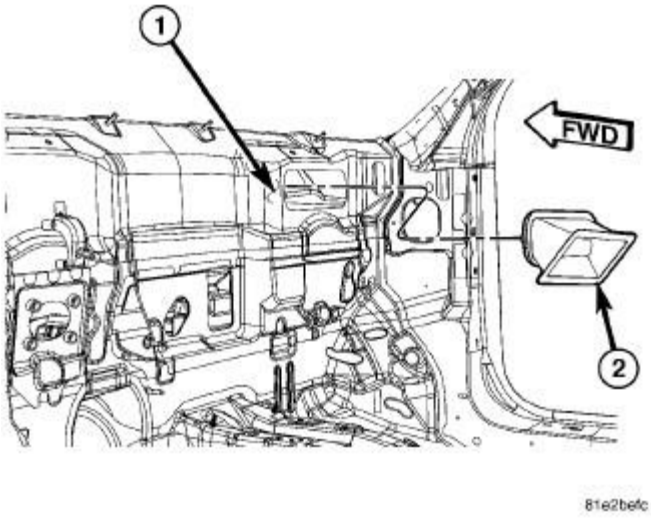

Fig. 135: Air Inlet Duct
Courtesy of CHRYSLER LLC

1. If removed, install the HVAC housing air inlet duct (2) onto the passenger compartment side of the dash panel (1). Make sure the foam seal is not missing or damaged and that the retaining tabs are fully engage to the dash panel.

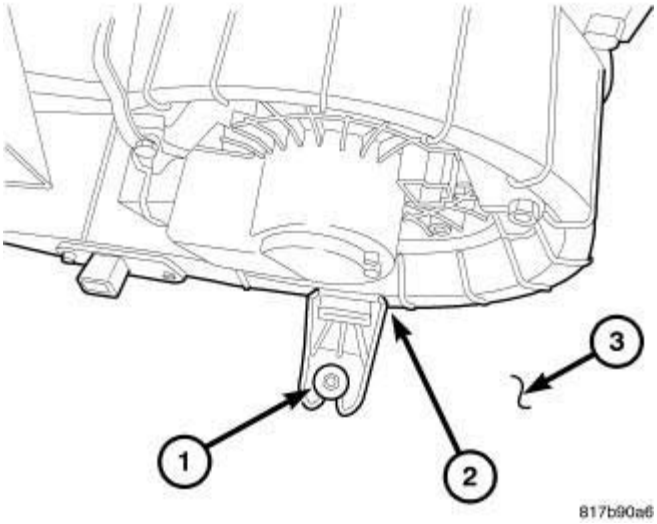

Fig. 136: HVAC Housing to Dash Panel Nut
Courtesy of CHRYSLER LLC

2. Position the HVAC housing assembly (2) to the dash panel (3). Be certain that the passenger side of the HVAC housing is correctly located over the dash panel mounting stud.
3. Install the nut (1) that secures the HVAC housing to the passenger compartment side of dash panel. Tighten the nut to 4.5 N.m (40 in. lbs.).
4. Install the condensation drain tube.
5. Install the rear floor ducts. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Installation**.
6. Install the instrument panel. Refer to **Body/Instrument Panel/PANEL, Instrument - Installation** .

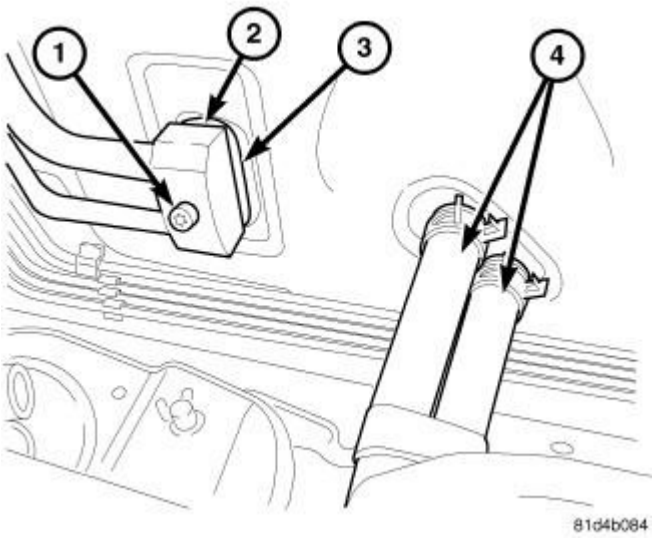

Fig. 137: Unified Liquid & Suction Line to Evaporator
Courtesy of CHRYSLER LLC

7. Remove the previously installed plugs or caps and connect the heater hoses (4) to the heater core tubes.
8. Remove the tape or plugs from the refrigerant line fittings and the expansion valve ports.
9. Lubricate the rubber O-ring seals with clean refrigerant oil and install them onto the liquid and suction line fittings. Use only the specified O-ring seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Connect the A/C liquid and suction line assembly (2) to the A/C expansion valve (3).
11. Install the nut (1) that secures the A/C liquid and suction line assembly to the A/C expansion valve. Tighten the nut to 20 N.m (15 ft. lbs.).

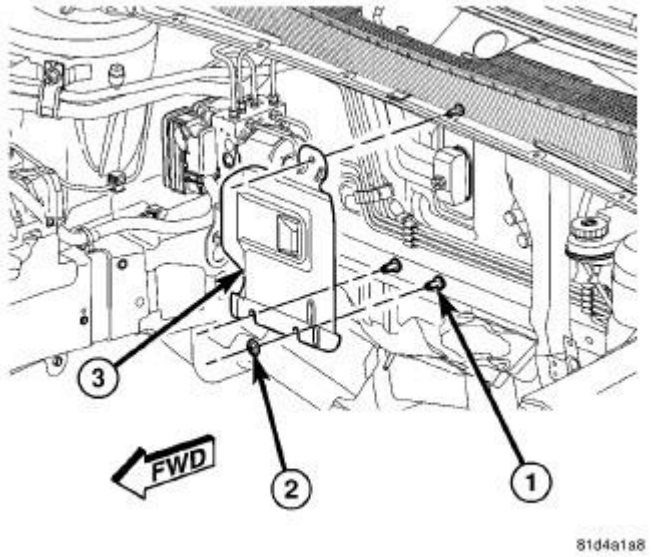

Fig. 138: Heat Shield - Unified Line
Courtesy of CHRYSLER LLC

12. If equipped, position the heat shield (3) onto the studs (1) located on the dash panel in the engine compartment and install the retaining nuts (2). Tighten the nuts to 1 N.m (10 in. lbs.).
13. Reconnect the negative battery cable.
14. If the heater core is being replaced, flush the cooling system. Refer to **Cooling - Standard Procedure** .
15. Refill the engine cooling system. Refer to **Cooling - Standard Procedure** .

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

16. Evacuate and charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
17. Initiate the Actuator Calibration function using a scan tool. See **Heating and Air Conditioning - Diagnosis and Testing**.

MOTOR, BLOWER, FRONT

Description

DESCRIPTION

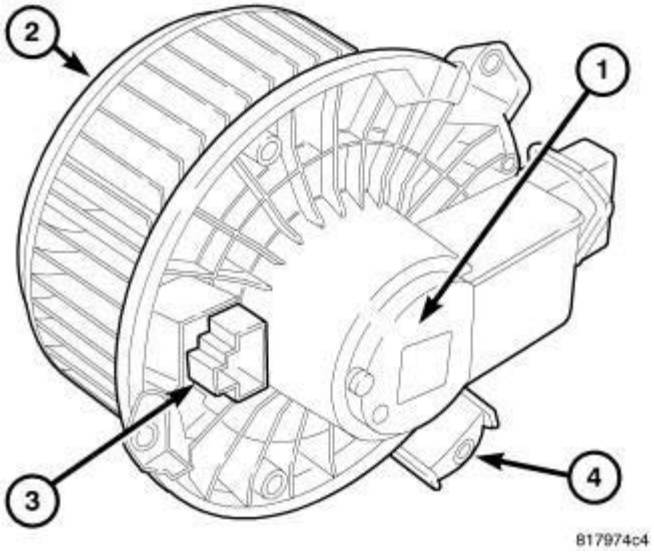

Fig. 139: Blower Motor-PM
Courtesy of CHRYSLER LLC

The blower motor (1) is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel (2) within the HVAC air inlet housing at the selected speed.

The blower motor is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral wire harness connector (3) and three mounting tabs (4). The squirrel cage-type blower wheel is secured to the blower

motor shaft and is positioned within the air inlet housing on the passenger side of the HVAC housing.

Operation

OPERATION

The blower motor controls the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

On the Manual Temperature Control (MTC) heating-A/C system, blower motor speed is controlled by regulating the path to ground through the blower control switch and the blower motor resistor. With the Automatic Temperature Control (ATC) heating-A/C system, blower motor speed is controlled by an electronic blower motor power module, that uses a Pulse Width Modulated (PWM) input from the A/C-heater control and a feedback signal from the blower motor to regulate the blower motor ground path. On both systems, the blower motor receives battery current through the Totally Integrated Power Module (TIPM) whenever the ignition switch is in the Run position, and the blower motor control is in any position except Off.

The blower motor can be accessed for service from underneath the instrument panel.

NOTE: The blower motor is supplied with a 12 volt feed from the TIPM whenever the ignition switch is in the Run position. Due to an open circuit condition within the blower motor control switch, the TIPM is unable to detect an open circuit for the blower motor.

The blower motor control system is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The blower motor and blower motor wheel are factory balanced as an assembly and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Diagnosis and Testing

BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The blower motor is supplied with a 12V feed from the TIPM whenever the ignition switch is in RUN. Due to an open circuit condition within the blower motor control switch the TIPM is UNABLE to detect an OPEN circuit for the blower motor.

To determine if an open condition exists within the blower motor circuit wiring, it is necessary to disconnect the

negative battery cable and check for continuity within the blower motor circuits using an ohmmeter. See **SYSTEM WIRING DIAGRAMS** for circuit descriptions and diagrams.

OPERATION

Possible causes of an inoperative blower motor include:

- Open fuse
- Inoperative blower motor resistor
- Inoperative blower motor switch
- Inoperative blower motor
- Inoperative blower motor circuit wiring or wire harness connectors

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material on fresh air inlet screen
- Foreign material in blower wheel
- Foreign material in HVAC housing
- Improper blower motor mounting
- Deformed or damaged blower wheel
- Worn blower motor bearings or brushes

VIBRATION

Possible causes of a blower motor vibration include:

- Improper blower motor mounting
- Foreign material in blower wheel
- Deformed or damaged blower wheel
- Worn blower motor bearings

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag

system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The blower motor is located on the bottom of the passenger side of the HVAC housing. The blower motor can be removed from the vehicle without having to remove the HVAC housing.

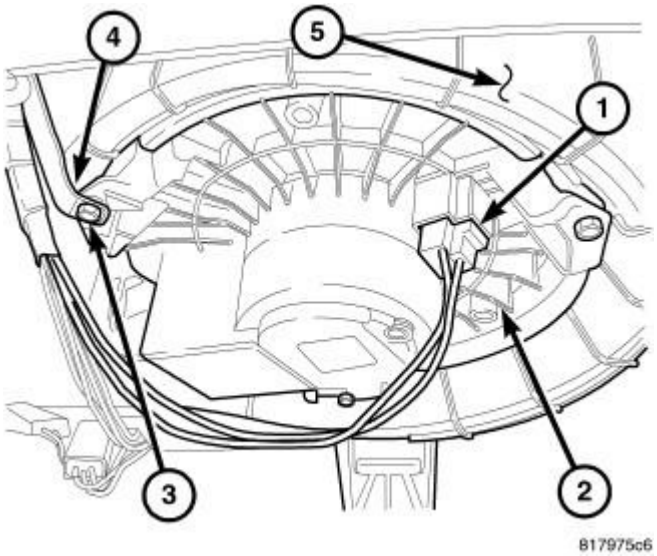

Fig. 140: Blower Motor-Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the silencer from below the passenger side of the instrument panel.
3. From underneath the instrument panel, disengage the connector lock and disconnect the instrument panel wire harness connector (1) from the blower motor (2).
4. Remove the three screws (3) that secure the blower motor and the wire lead bracket (4) (if equipped) to the bottom of the HVAC housing (5) and remove the blower motor.

Installation

INSTALLATION

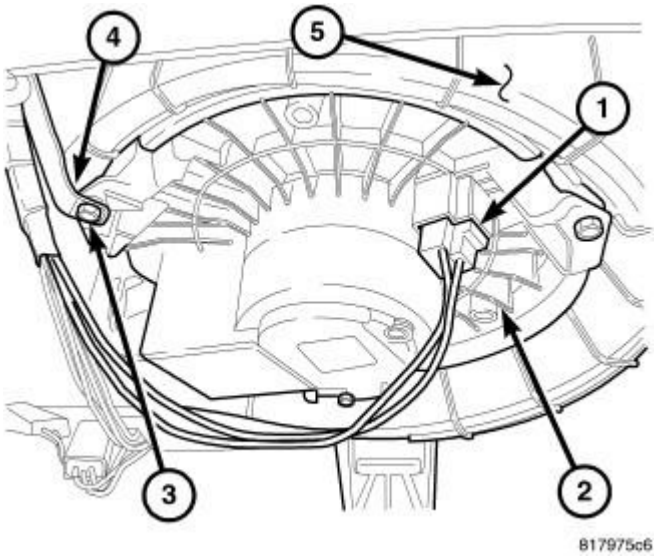

Fig. 141: Blower Motor-Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Position the blower motor (2) into the bottom of the HVAC housing (5).
2. Install the three screws (3) that secure the blower motor and the wire lead bracket (4) (if equipped) to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the instrument panel wire harness connector (1) to the blower motor and engage the connector lock.
4. If equipped, install the silencer below the passenger side of the instrument panel.
5. Reconnect the negative battery cable.

OUTLET, AIR, FRONT

Description

DESCRIPTION

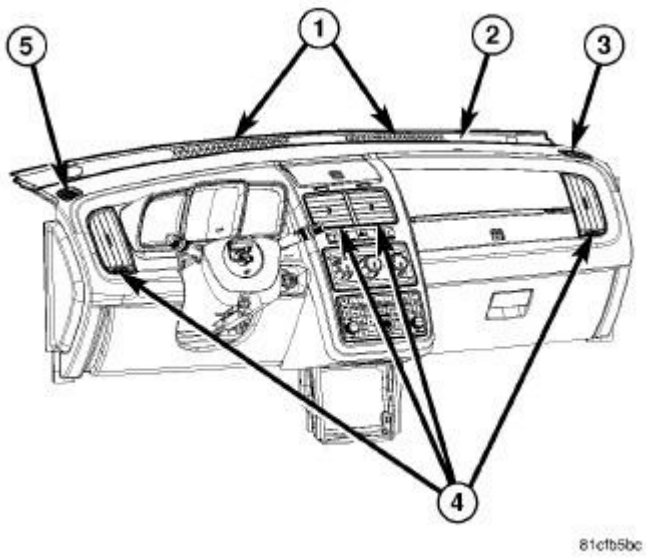

Fig. 142: Instrument Panel Outlets
Courtesy of CHRYSLER LLC

There are two defroster air outlets (1) in the defroster grille (2) located at the top of the instrument panel. The airflow from the defroster outlets are directed by fixed vanes in the grille and cannot be adjusted. The defroster air outlets are not serviceable from the defroster grille.

There are two side window demister air outlets (3 and 5). One located on each end of the instrument panel. The airflow from the side window demister air outlets is directed by fixed vanes and cannot be adjusted. The side window demister air outlets can be serviced separately from the instrument panel.

There are four instrument panel air outlets (4). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and two air outlets are located at the top of the instrument panel center bezel. Each of the instrument panel air outlets contain movable vanes that can direct or shut off the flow of the conditioned air leaving the outlets. The instrument panel air outlets can be serviced separately from the instrument panel.

Some models with A/C are equipped with a cooled beverage storage bin located in the instrument panel. Vehicles so equipped have an outlet, which, when opened with the A/C on, allows cooled air to flow into the bin.

Removal

BEVERAGE COOLER

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag

system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: LHD model shown in illustrations. RHD model similar.

OUTLET

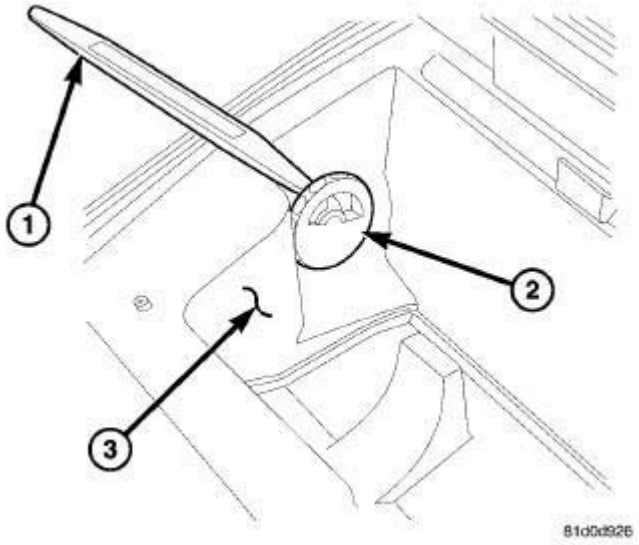

Fig. 143: Beverage Cooler Outlet
Courtesy of CHRYSLER LLC

1. Using Trim Stick C-4755 or equivalent (1), disengage the three retaining tabs that secure the beverage cooler outlet (2) to side of the glove box bin (3).

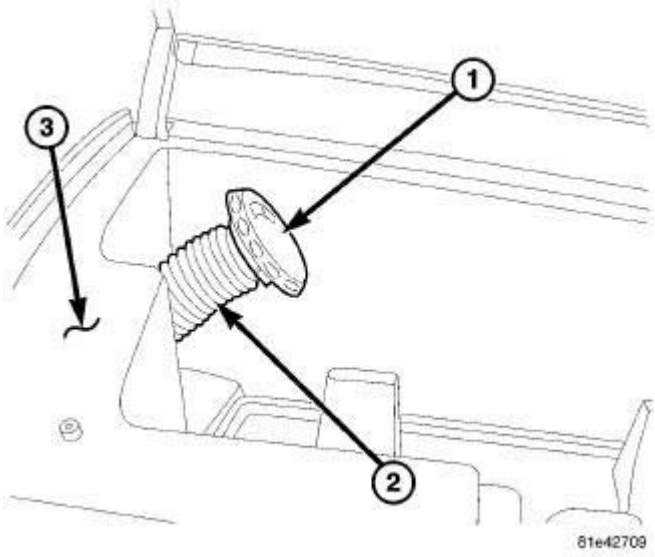

Fig. 144: Beverage Cooler Outlet & Hose
Courtesy of CHRYSLER LLC

NOTE: If the beverage cooler cold air supply hose becomes disconnected from the air beverage cooler outlet and falls back into the instrument panel during outlet removal, the beverage cooler bin may need to be removed from the instrument panel for outlet installation. Refer to Body/Instrument Panel/BIN, Instrument Panel - Removal .

2. Carefully pull the beverage cooler outlet (1) away from side of the beverage cooler bin (3) and disconnect the cold air supply hose (2) from the outlet. Make sure the end of the cold air supply hose remains in the bin and does not fall back into the instrument panel.

COLD AIR SUPPLY HOSE

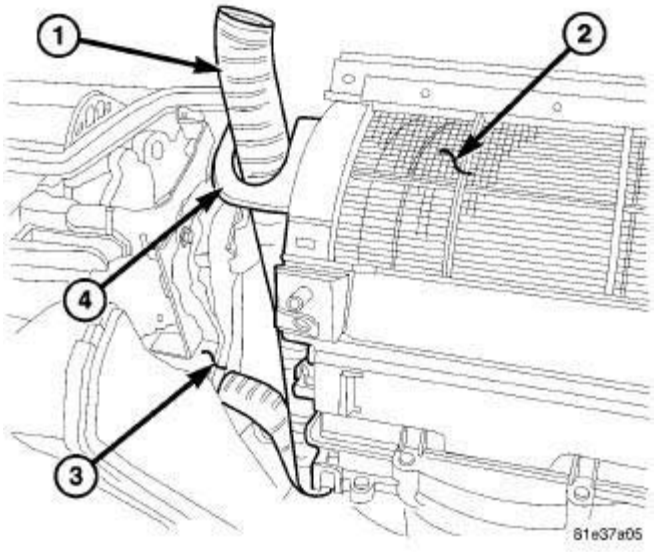

Fig. 145: Beverage Cooler Supply Hose
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with instrument panel removed for clarity.

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal** .
3. Remove the outer passenger side instrument panel air outlet. See **Heating and Air Conditioning/Distribution/OUTLET, Air - Removal**.
4. Remove the beverage cooler outlet. Refer to **OUTLET**.
5. Remove the beverage cooler bin. Refer to **Body/Instrument Panel/BIN, Instrument Panel - Removal** .
6. If equipped, remove the silencer trim panel out from underneath the passenger side of the instrument

panel. Refer to **Body/Instrument Panel/PANEL, Silencer - Removal** .

7. Remove the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
8. Reach up underneath the instrument panel and disconnect the cold air supply hose (1) from the passenger side of the air distribution housing (3).
9. Working through the beverage cooler bin opening in the instrument panel, disengage the cold air supply hose from the bracket (4) located on the air inlet housing (2) and remove the hose. Note the routing of the hose and the instrument panel wiring for aid in reinstallation.

DEMISTER OUTLETS

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Right side air outlet shown. Left side outlet similar.

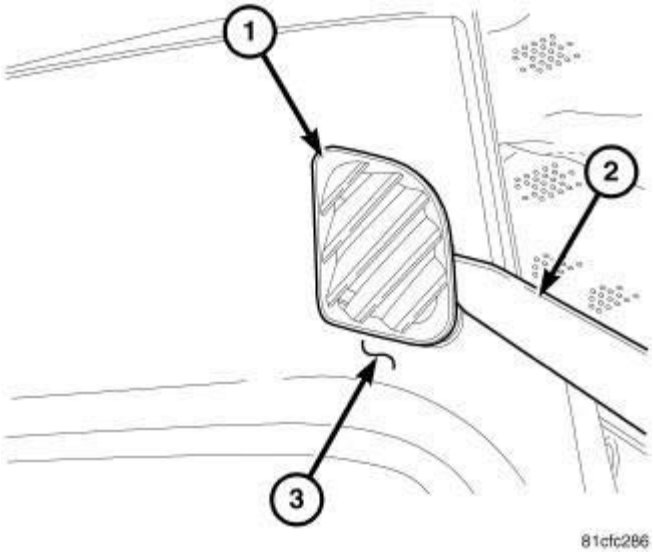

Fig. 146: Demister Outlet
Courtesy of CHRYSLER LLC

1. Using Trim Stick C-4755 or equivalent (2), carefully disengage the three retaining tabs that secure each demister air outlet (1) to the instrument panel cover (3) and remove the outlet.

AIR OUTLETS

WARNING: Disable the airbag system before attempting any steering wheel, steering

column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

OUTBOARD OUTLETS

NOTE: Right side air outlet shown. Left side outlet similar.

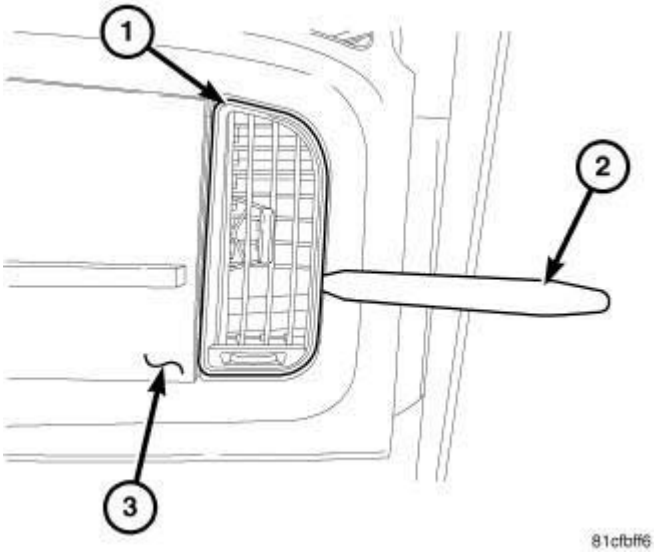

Fig. 147: Outboard Instrumental Panel Outlets
Courtesy of CHRYSLER LLC

1. Using trim stick C-4755 or equivalent (2), carefully disengage the four retaining tabs (two tabs on each side) that secure each air outlet (1) to the instrument panel cover (3) and remove the outlet.

CENTER OUTLETS

NOTE: Take the proper precautions to protect the front face of the center bezel from cosmetic damage while performing this procedure.

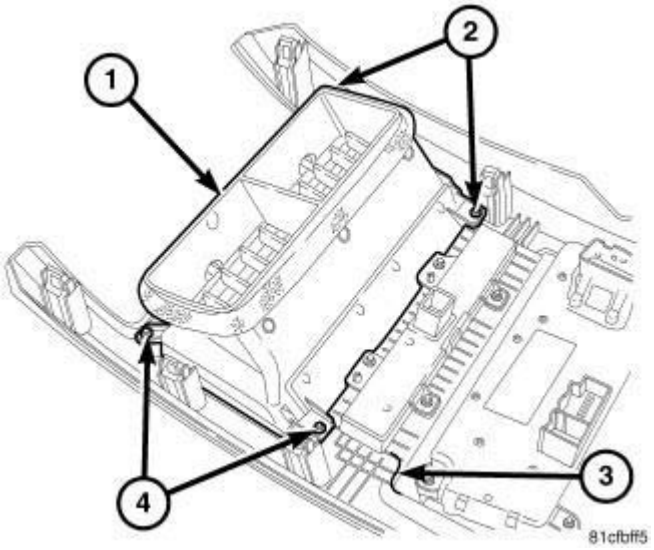

Fig. 148: Center Instrumental Panel Outlets
Courtesy of CHRYSLER LLC

1. Remove the center bezel (3) from the instrument panel and place it on a workbench. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal** .
2. Remove the four screws (2 and 4) that secure the center instrument panel air outlets (1) to the center bezel and remove the outlets.

Installation

BEVERAGE COOLER

NOTE: LHD model shown in illustrations. RHD model similar.

OUTLET

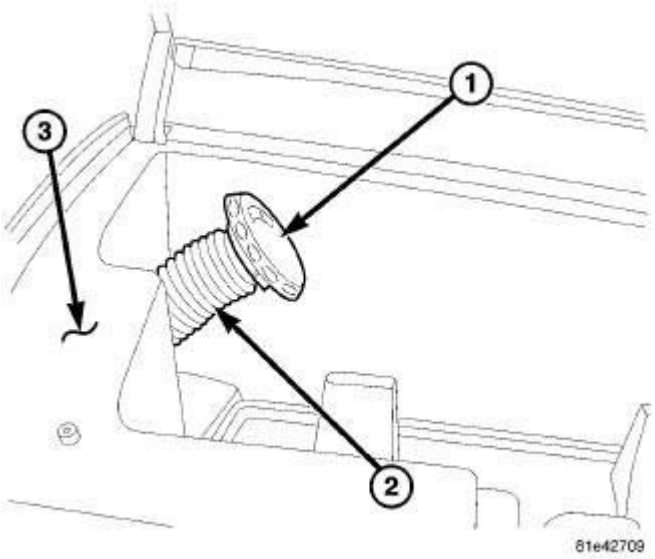

Fig. 149: Beverage Cooler Outlet & Hose
Courtesy of CHRYSLER LLC

NOTE: If the beverage cooler cold air supply hose falls back into the instrument panel during outlet installation, the beverage cooler bin may need to be removed from the instrument panel and the hose rerouted through the opening in the bin. Refer to Body/Instrument Panel/BIN, Instrument Panel - Removal .

1. Position the beverage cooler outlet (1) to the beverage cooler bin (3) and connect the cold air supply hose (2) to the outlet.

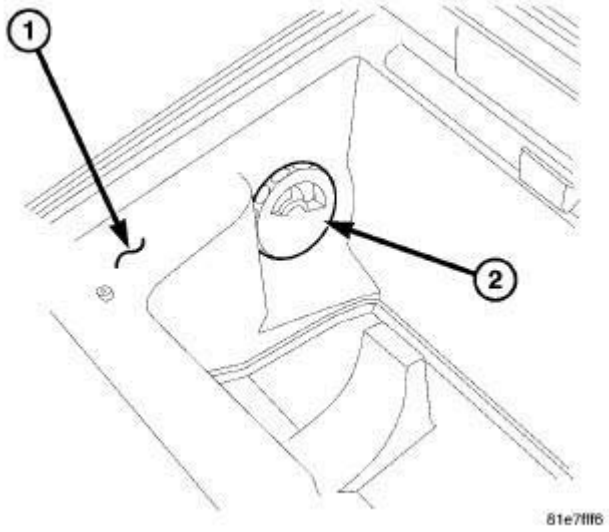

Fig. 150: Beverage Cooler Outlet Install
Courtesy of CHRYSLER LLC

2. Feed the cold air supply hose through the opening in the side of the beverage cooler bin (1) and align and install the beverage cooler outlet (2) onto the bin. Make sure the three retaining tabs on the outlet are fully engaged to the bin.

COLD AIR SUPPLY HOSE

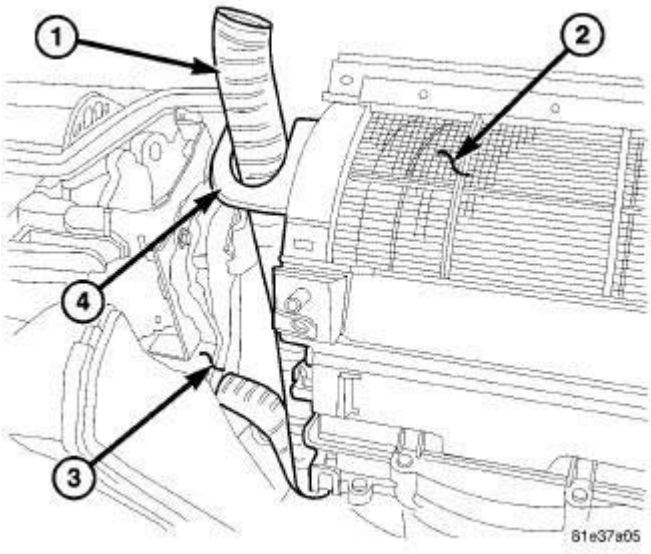

Fig. 151: Beverage Cooler Supply Hose
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with instrument panel removed for clarity.

1. Working through the beverage cooler bin opening in the instrument panel, feed the cold air supply hose (1) into the instrument panel. Note the routing of the hose and the instrument panel wiring.
2. Reach up underneath the instrument panel and connect the cold air supply hose to the passenger side of the air distribution housing (3).
3. Working through the beverage cooler bin opening in the instrument panel, engage the cold air supply hose to the bracket (4) located on the air inlet housing (2).
4. Position the beverage cooler bin to the instrument panel and route the cold air supply hose through the beverage cooler outlet opening.
5. Install the beverage cooler bin. Refer to **Body/Instrument Panel/BIN, Instrument Panel - Installation** .
6. Install the beverage cooler outlet. Refer to **OUTLET**.
7. Install the instrument panel center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** .
8. Install the outer passenger side instrument panel air outlet. See **Heating and Air Conditioning/Distribution/OUTLET, Air - Installation**.
9. Install the glove box bin. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .

10. If equipped, install the silencer trim panel underneath the passenger side of the instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .
11. Reconnect the negative battery cable.

DEMISTER OUTLETS

NOTE: Right side demister outlet shown. Left side outlet similar.

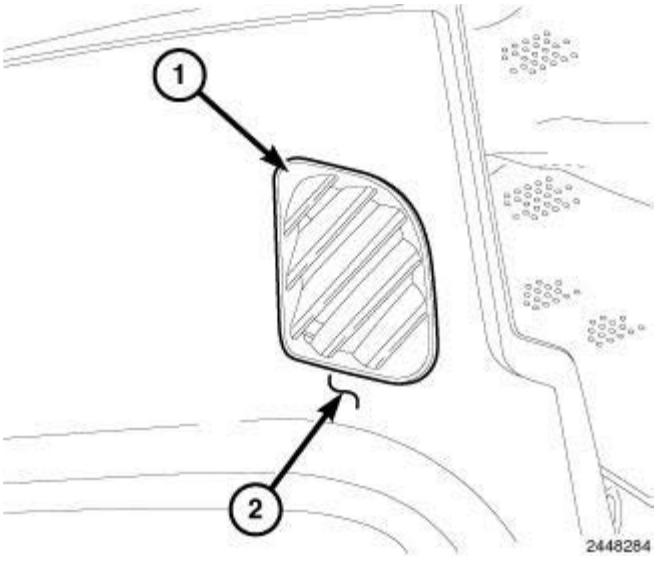

Fig. 152: Demister Outlet
Courtesy of CHRYSLER LLC

1. Position the demister air outlet (1) to the opening in the instrument panel cover (2) and engage the three retaining tabs. Make sure the retaining tabs are fully engaged.

AIR OUTLETS

OUTBOARD OUTLETS

NOTE: Right side air outlet shown. Left side outlet similar.

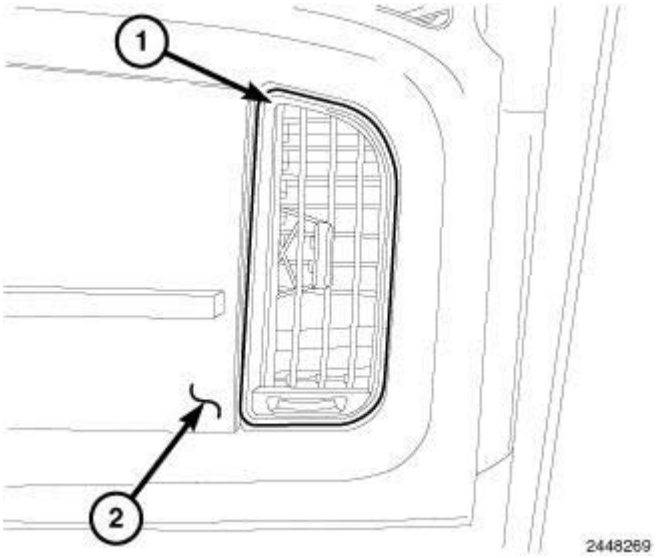

Fig. 153: Outboard Instrumental Panel Outlets
Courtesy of CHRYSLER LLC

1. Position the air outlet (1) to the opening in the instrument panel cover (2) and align the outlet to the instrument panel duct.

NOTE: Make sure that the air outlet(s) are properly aligned to the instrument panel duct(s).

2. Engage the four retaining tabs that secure each instrument panel outlet to the instrument panel cover. Make sure the retaining tabs are fully engaged.

CENTER OUTLETS

NOTE: Take the proper precautions to protect the front face of the center bezel from cosmetic damage while performing this procedure.

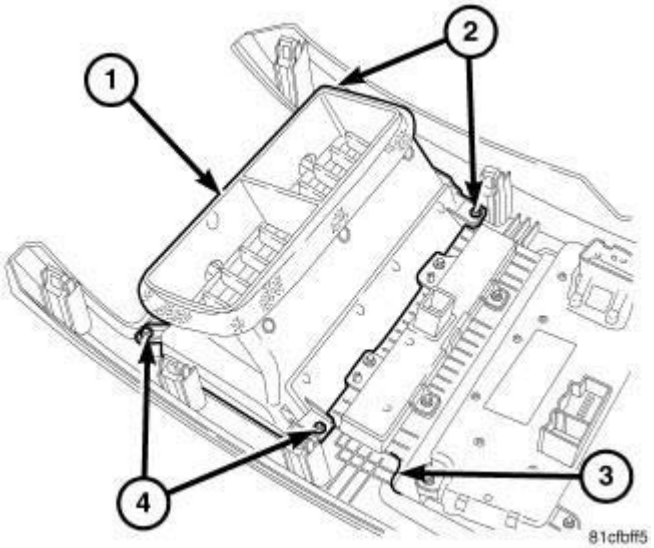

Fig. 154: Center Instrumental Panel Outlets
Courtesy of CHRYSLER LLC

1. Position the air outlets (1) to the back of the center bezel (3) and install the four retaining screws (2 and 4). Tighten the screws to 1.2 N.m (10 in. lbs.).

   NOTE: Make sure that the air outlets are properly aligned to the instrument panel center duct.

2. Install the center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** .

DISTRIBUTION, REAR

DUCT, CEILING DISTRIBUTION

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

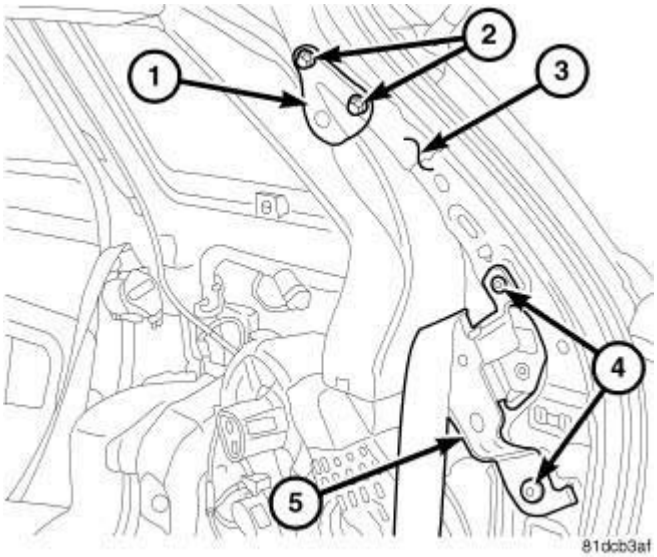

Fig. 155: D-Pillar Seat Belt Bracket
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the right D-pillar trim panel. Refer to **Body/Interior/PANEL, D-Pillar Trim - Removal** .
3. Remove right quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
4. Remove the two bolts (2) that secure the upper seat belt bracket (1) to the right D-pillar (3) and remove the bracket.
5. Remove the two bolts (4) that secure the right seat belt retractor (5) to the right D-pillar and remove the retractor.

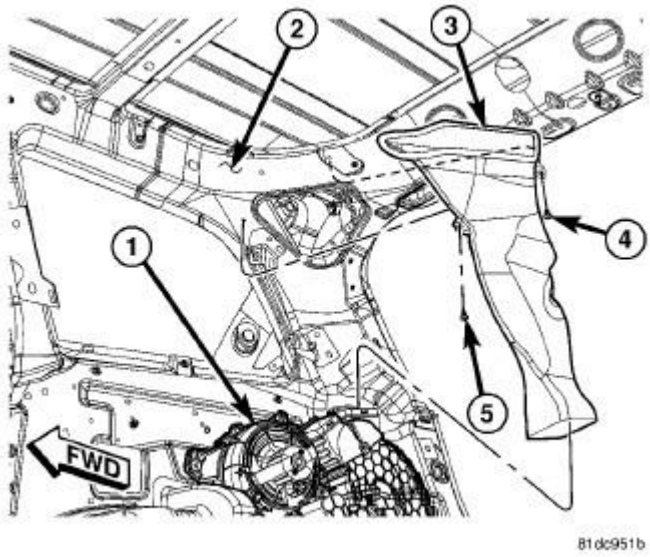

Fig. 156: Rear Ceiling Duct
Courtesy of CHRYSLER LLC

6. Remove the two retainers (4 and 5) that secure the rear ceiling distribution duct (3) to the right D-pillar (2).
7. Lift the rear ceiling distribution duct upward and disengage it from the rear heater-A/C housing (1).

CAUTION: Use care when removing the rear ceiling distribution duct from the heater-A/C housing to prevent damage to the molded plastic support brace located on the top of the housing outlet. Failure to follow this caution could result in part of, or all of the support brace falling into the rear housing, which may interfere with rear mode door operation.

8. Pull the bottom end of the rear ceiling distribution duct away from the rear heater-A/C housing and remove the duct.

Installation

INSTALLATION

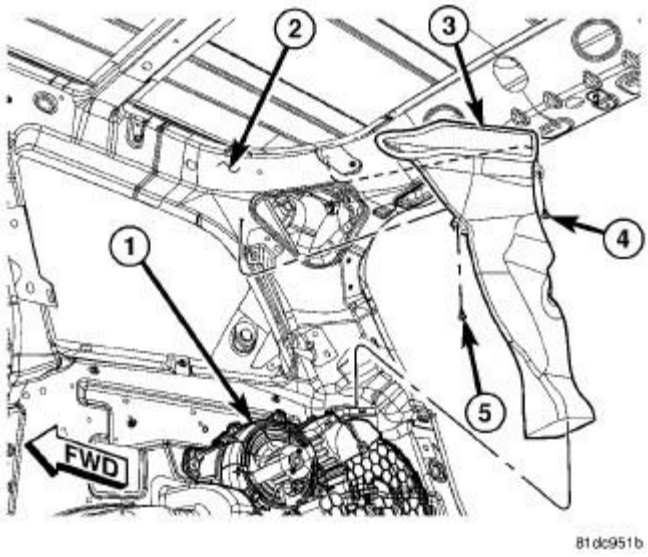

Fig. 157: Rear Ceiling Duct
Courtesy of CHRYSLER LLC

1. Position the rear ceiling distribution duct (3) to the right D-pillar (2).

CAUTION: Use care when installing the rear ceiling distribution duct onto the heater-A/C housing to prevent damage to the molded plastic support brace located on the top of the housing outlet. Failure to follow this caution could result in part of, or all of the support brace falling into the rear housing, which may interfere with rear mode door operation.

2. Install the rear ceiling distribution duct onto the top of the rear heater-A/C housing (1). Make sure the

duct is fully engaged to the housing.

3. Install the two retainers (4 and 5) that secure the rear ceiling distribution duct to the right D-pillar.

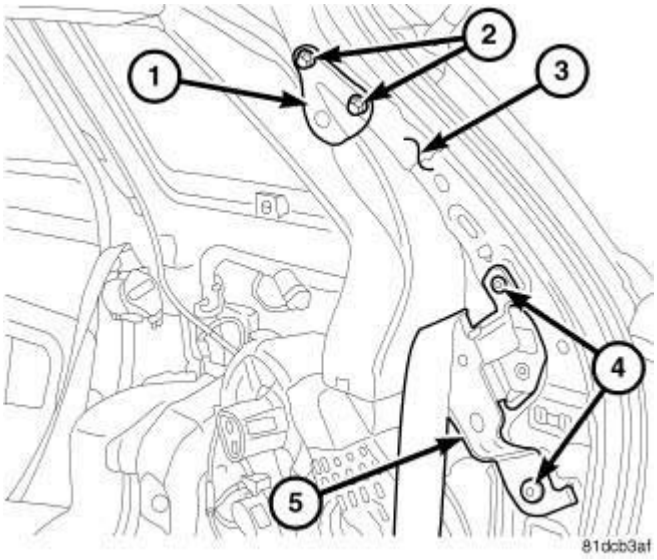

Fig. 158: D-Pillar Seat Belt Bracket
Courtesy of CHRYSLER LLC

4. Position the upper seat belt bracket (2) onto the D-pillar (3) and install the two retaining bolts (1). Tighten the bolts to 52 N.m (38.5 ft. lbs.).
5. Install the right seat belt retractor (5) and retaining bolts (4) onto the D-pillar. Tighten the bolts to 52 N.m (38.5 ft. lbs.).
6. Install the right quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .
7. Install the right D-pillar trim panel. Refer to **INSTALLATION** .
8. Reconnect the negative battery cable.

DUCT, FLOOR DISTRIBUTION, REAR

Removal

REMOVAL

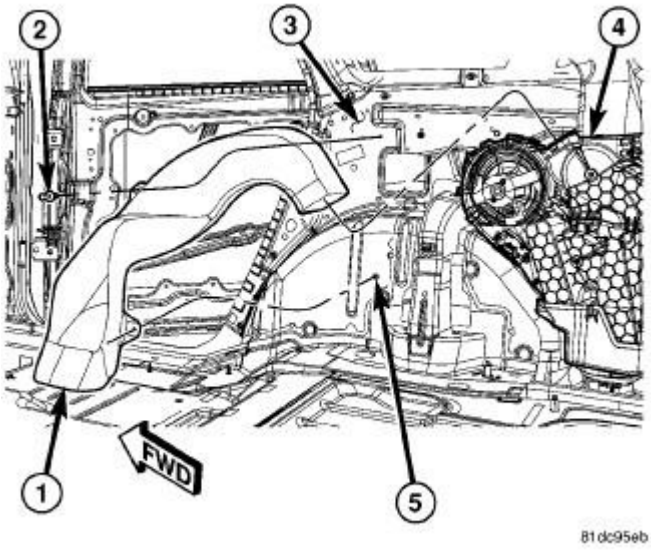

Fig. 159: Rear Floor Distribution Duct
Courtesy of CHRYSLER LLC

1. Remove right quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
2. Remove the push-pin retainer (2) that secures the rear floor distribution duct (1) to the right inner quarter panel (3).
3. Disengage the rear floor distribution duct from the stud (5) located on the right inner quarter panel.
4. Disengage the rear floor distribution duct from the rear heater-A/C housing (4) and remove the duct.

Installation

INSTALLATION

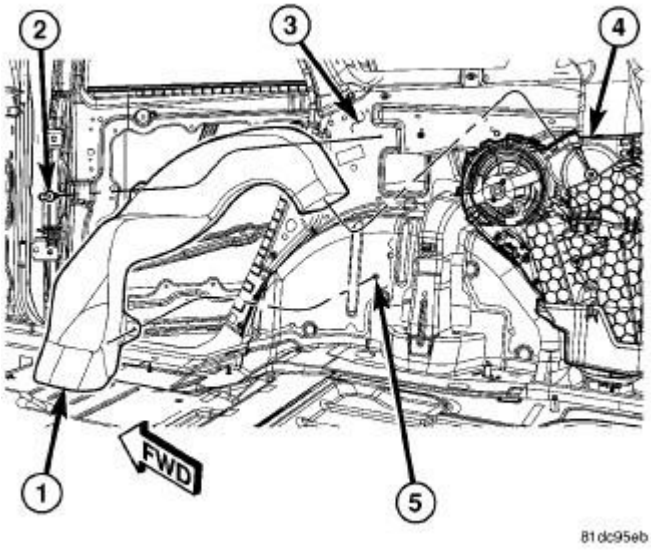

Fig. 160: Rear Floor Distribution Duct
Courtesy of CHRYSLER LLC

1. Install the rear floor distribution duct (1) onto rear heater-A/C housing (4). Make sure the duct is fully engaged to the housing.
2. Engage the rear floor distribution duct to the stud (5) located on the right inner quarter panel (3).
3. Install the push-pin retainer (2) that secures the rear floor distribution duct to the right inner quarter panel.
4. Install the right quarter panel trim. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .

HOUSING, A/C AND HEATER

Description

DESCRIPTION

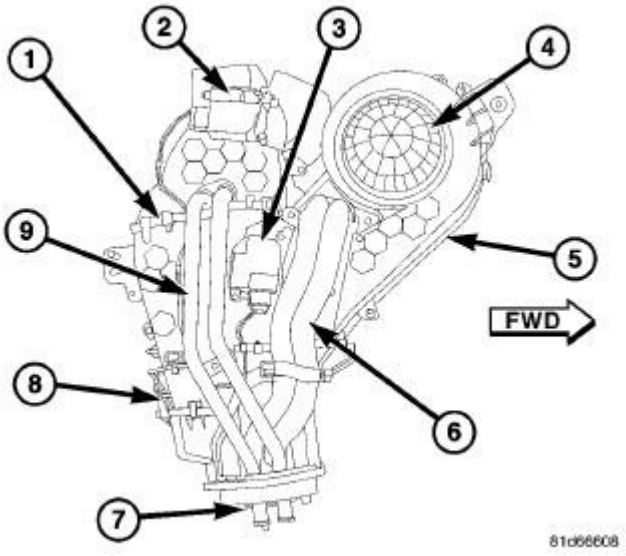

Fig. 161: Rear Heater AC Housing Description
Courtesy of CHRYSLER LLC

Models with the rear heating-A/C system use a rear heater-A/C housing (1) that combines A/C and heating capabilities into a single unit mounted within the rear passenger compartment. The rear heating-A/C system is a blend-air type system. A blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core (9). The rear A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C expansion valve (7) and A/C evaporator (6) to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the blend door actuator (3), which moves the blend-air door. This allows an almost immediate control of the output air temperature of the rear system. The mode control operates the mode door actuator (2) that positions the mode-air door to direct the flow of the conditioned air out the upper or lower air outlets, depending on the position selected. Both electric door actuators are connected to the vehicle electrical system by the rear heater-A/C wire harness (8). The rear blower motor (4) controls the velocity of air flowing through the rear heater-A/C housing by spinning the blower wheel within the rear housing at the selected speed by use of the rear blower

motor resistor or power module (5) (depending on manual or automatic control).

The rear heater-A/C housing must be removed from the vehicle for service of the mode door actuator and blend door actuator and it must be disassembled for service of the A/C evaporator and the heater core.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

NOTE: The rear heater-A/C housing must be removed from the vehicle for service of the mode door actuator and blend door actuator and it must be disassembled for service of the A/C evaporator and the heater core.

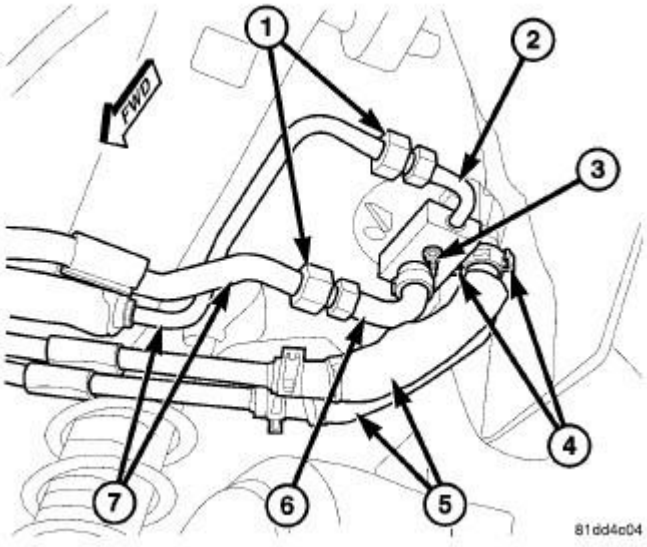

Fig. 162: Underbody Lines to Rear Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Drain the engine cooling system. Refer to **Cooling - Standard Procedure** .
4. Raise and support the vehicle.

CAUTION: DO NOT apply excessive force on underbody heater lines or rear

heater tubes when disconnecting the connections. Excessive force may damage or deform the tubes and or lines, causing an engine coolant leak.

NOTE: Replacement of the rubber heater hose ends will be required if the rubber hoses are cut for removal.

5. Release the spring type hose clamps (4) and disconnect the underbody heater lines (5) from the rear heater core tubes located behind the right rear wheel housing.
6. Lower the underbody heater lines and drain any residual coolant from the lines into a suitable container.
7. Loosen the fitting nuts (1) that secure the underbody refrigerant lines (7) to the underbody refrigerant extension lines and sealing plate (2 and 6).
8. Disconnect the underbody refrigerant lines from underbody refrigerant extension lines and remove and discard the O-ring seals.
9. Remove the nut (3) that secures the underbody refrigerant extension lines and sealing plate to the rear A/C expansion valve.
10. Disconnect the extension lines and sealing plate from the rear A/C expansion valve and remove and discard the O-ring seals.
11. Install plugs in, or tape over the opened underbody refrigerant line fittings and rear expansion valve ports.

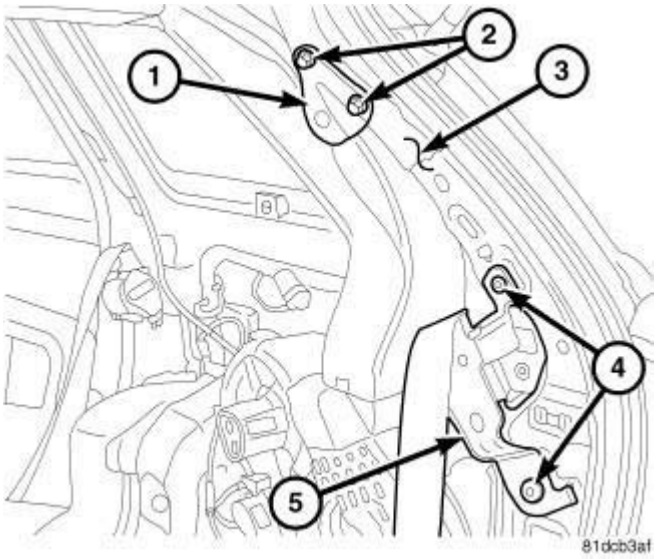

Fig. 163: D-Pillar Seat Belt Bracket
Courtesy of CHRYSLER LLC

12. Lower the vehicle.
13. Remove the right D-pillar trim panel. Refer to **Body/Interior/PANEL, D-Pillar Trim - Removal** .
14. Remove right quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
15. Remove the two bolts (2) that secure the upper seat belt bracket (1) to the right D-pillar (3) and remove the bracket.

16. Remove the two bolts (4) that secure the right seat belt retractor (5) to the right D-pillar and remove the retractor.

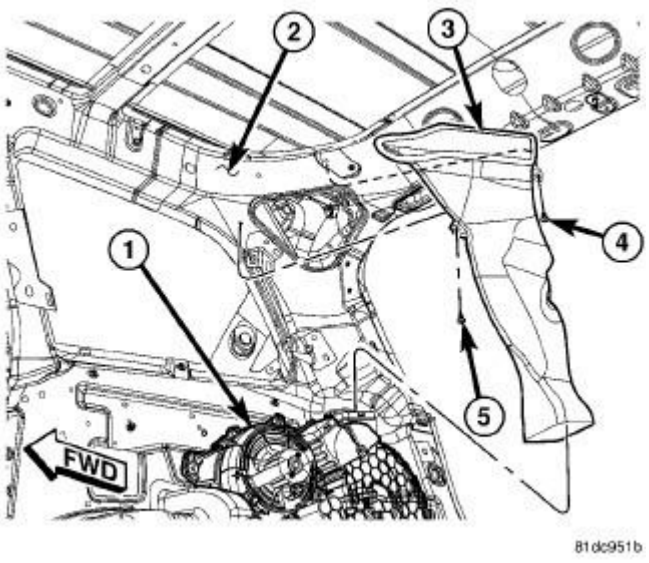

Fig. 164: Rear Ceiling Duct
Courtesy of CHRYSLER LLC

17. Remove the two retainers (4 and 5) that secure the rear ceiling distribution duct (3) to the right D-pillar (2).
18. Lift the rear ceiling distribution duct upward and disengage it from the rear heater-A/C housing (1).

CAUTION: Use care when removing the rear ceiling distribution duct from the heater-A/C housing to prevent damage to the molded plastic support brace located on the top of the housing outlet. Failure to follow this caution could result in part of, or all of the support brace falling into the rear housing, which may interfere with rear mode door operation.

19. Pull the bottom end of the rear ceiling distribution duct away from the rear heater-A/C housing and remove the duct.

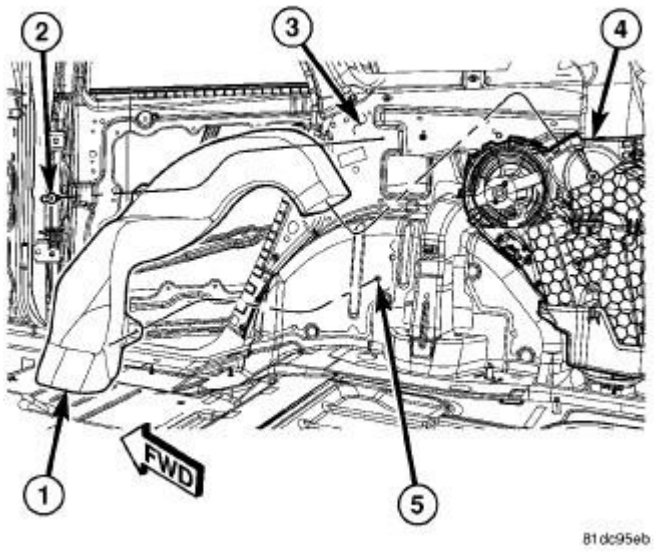

Fig. 165: Rear Floor Distribution Duct
Courtesy of CHRYSLER LLC

20. Remove the push-pin retainer (2) that secures the rear floor distribution duct (1) to the right inner quarter panel (3).
21. Disengage the rear floor distribution duct from the stud (5) located on the right inner quarter panel.
22. Disengage the rear floor distribution duct from the rear heater-A/C housing (4) and remove the duct.

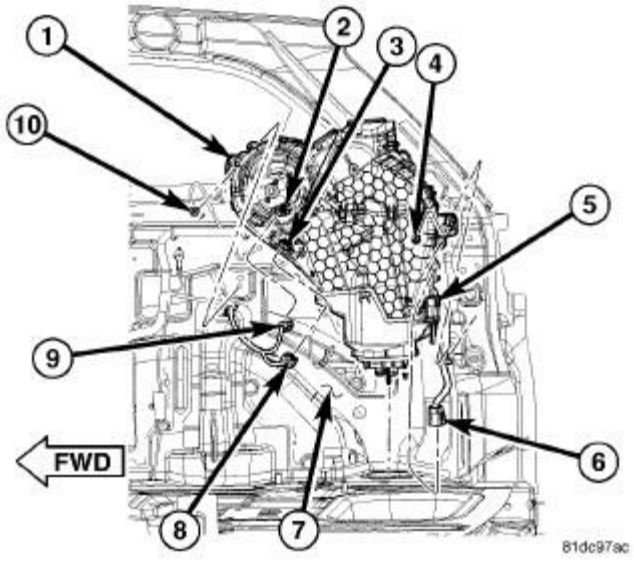

Fig. 166: Rear Heater AC Housing Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: MTC rear heater-A/C system shown. ATC system similar.

23. Disconnect the body wire harness connectors (8 and 9) from the rear blower motor (2) and the rear blower motor resistor or power module (3) (depending on control system).
24. Disconnect the body wire harness connector (6) from the rear heater-A/C wire harness connector (5).
25. Remove the two bolts (4 and 10) that secure the rear heater-A/C housing (1) to the right inner quarter panel (7) and remove the housing.

Disassembly

DISASSEMBLY

NOTE: The rear heater-A/C housing must be removed from the vehicle for service of the mode door actuator and blend door actuator and it must be disassembled for service of the A/C evaporator and the heater core. The blend-air door and mode-air door are only serviced with the respective housing.

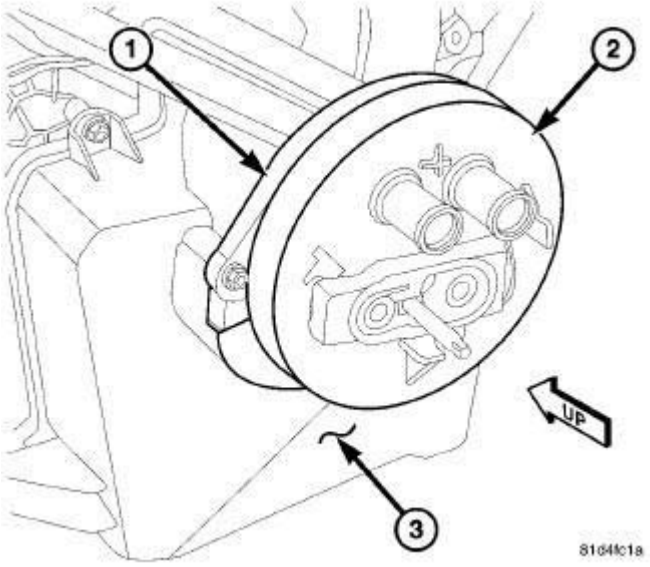

Fig. 167: Rear Housing Flange Seal 09
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the rear heater-A/C housing and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, A/C and Heater - Removal**.
3. Remove the rear blower motor resistor or power module (depending on application). See **Heating and Air Conditioning/Controls/RESISTOR, Blower Motor - Removal** or. See **Heating and Air Conditioning/Controls/MODULE, Power - Removal**.
4. Remove the rear blower motor. See **Heating and Air Conditioning/Distribution/MOTOR, Blower - Removal**.
5. Remove the foam seal (2) from the flange (1) located at the bottom of the rear heater-A/C housing (3). If the foam seal is deformed or damaged, it must be replaced.

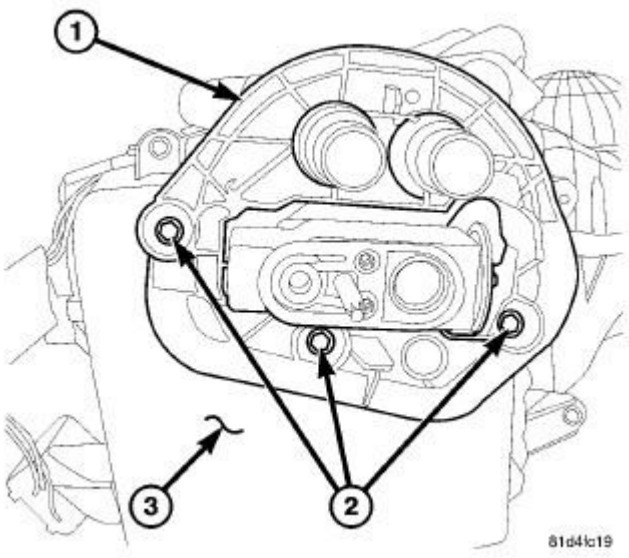

Fig. 168: Rear Housing Flange
Courtesy of CHRYSLER LLC

6. Remove the three screws (2) that secure the flange (1) to the bottom of the rear heater-A/C housing (3) and remove the flange.

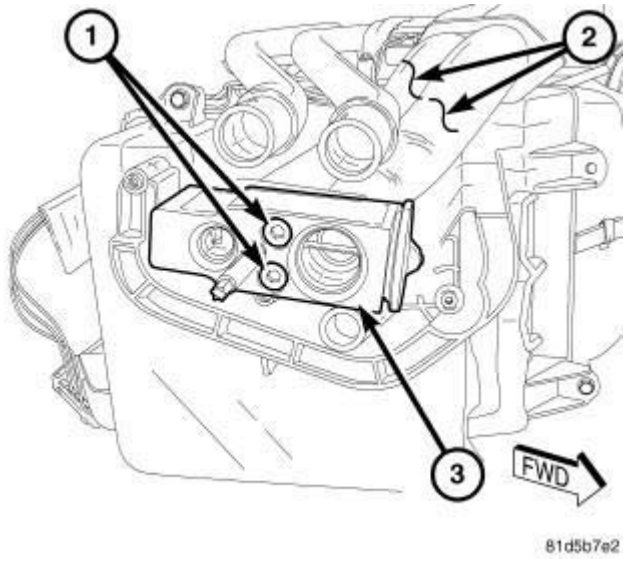

Fig. 169: Rear Expansion Valve Removal/Installation Bench
Courtesy of CHRYSLER LLC

7. Remove the two screws (1) that secure the rear expansion valve (3) to the tapping plate located on the end of the rear evaporator tubes (2) and remove the valve.
8. Remove and discard the O-ring seals and install plugs in, or tape over the opened evaporator tubes and expansion valve ports.

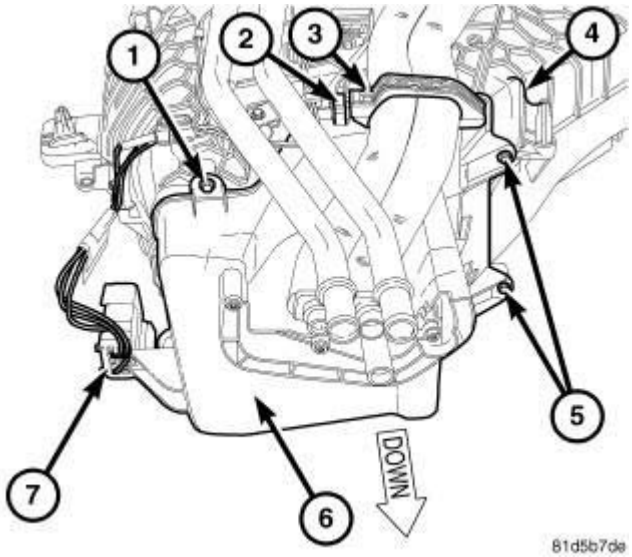

Fig. 170: Lower Rear Housing Removal/Installation
Courtesy of CHRYSLER LLC

9. Remove the wire harness connector (7) from the lower rear heater-A/C housing (6).
10. Open the evaporator tube retaining bracket (3) located on the outboard side of the lower housing.
11. Remove the metal retaining clip (2) that secures the lower housing to the rear heater-A/C housing (4).
12. Remove the five screws (1 and 5) that secure the lower housing the rear heater-A/C housing and carefully remove the lower housing. Rotate and tilt the lower housing as necessary for removal.

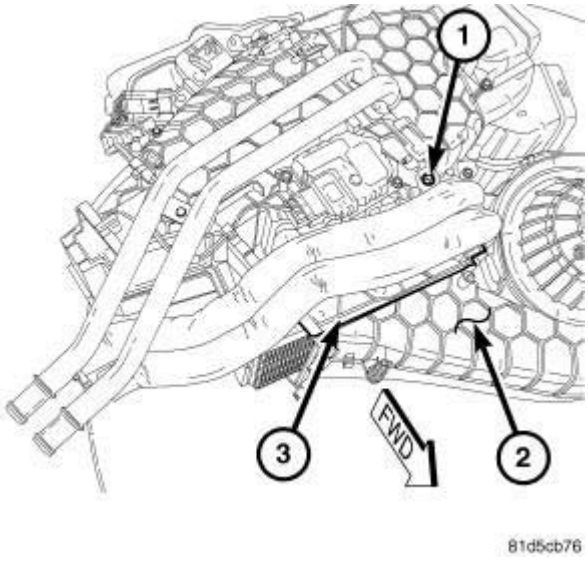

Fig. 171: Rear Evaporator Cover Removal/Installation
Courtesy of CHRYSLER LLC

13. Remove the screw (1) that secures the rear evaporator cover (3) to the outboard side of the rear heater-A/C housing (2) and remove the cover of the housing.

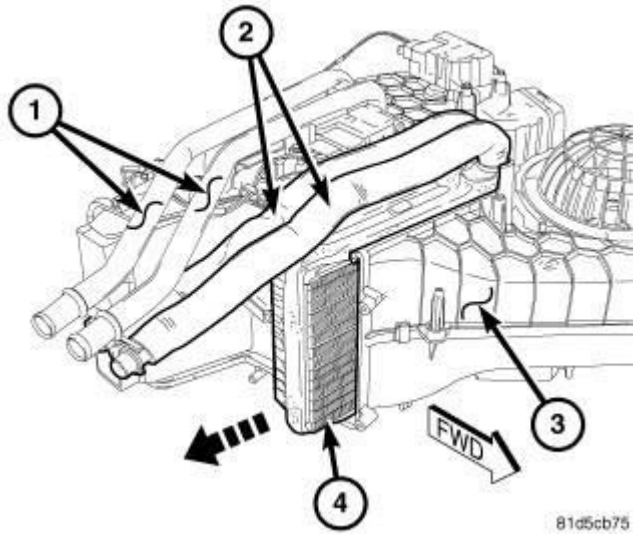

Fig. 172: Rear Evaporator Removal
Courtesy of CHRYSLER LLC

14. Carefully pull the rear A/C evaporator (4) out the bottom of the rear heater-A/C housing (3). Guide the evaporator tubes (2) past the heater core tubes (1). If the foam seals on the A/C evaporator are deformed or damaged, they must be replaced.

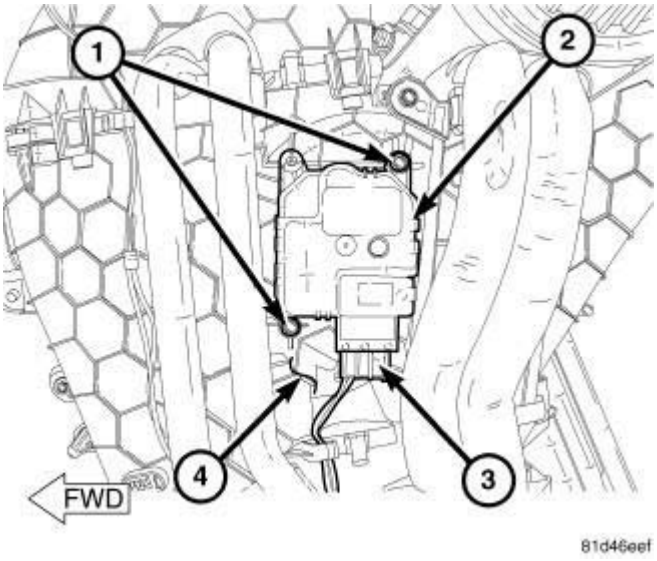

Fig. 173: Rear Blend Door Actuator Removal/Installation
Courtesy of CHRYSLER LLC

15. Disconnect the wire harness connector (3) from the rear blend door actuator (2) located on the outboard side of the rear heater-A/C housing (4).
16. Remove the two screws (1) that secure the rear blend door actuator to the rear heater-A/C housing and remove the actuator.

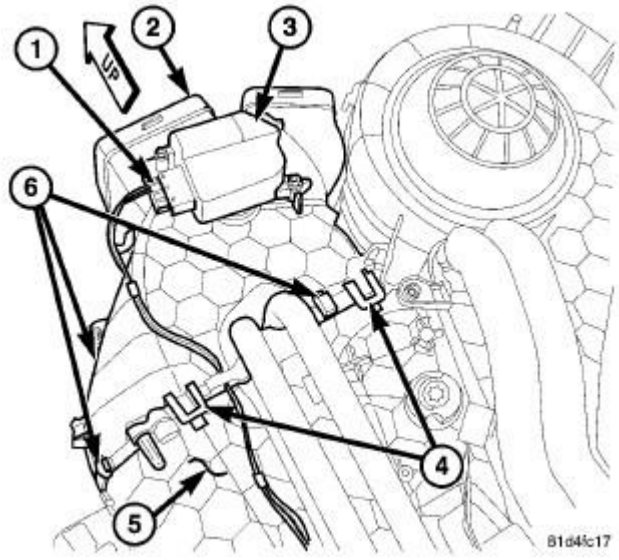

Fig. 174: Rear Distribution Housing Removal/Installation 09
Courtesy of CHRYSLER LLC

17. Disconnect the rear heater-A/C wire harness connector (1) from the rear mode door actuator (3) located on the outboard side of the rear heater-A/C distribution housing (2) and remove the wire harness from the rear heater-A/C housing (5).
18. Remove the three metal retaining clips (4) that secure the rear distribution housing to the rear heater-A/C housing.
19. Release the five plastic retaining tabs (4) that secure the rear distribution housing and rear heater-A/C housing together and separate the housings.
20. If required, remove the rear mode door actuator from the rear distribution housing. See **Heating and Air Conditioning/Controls/ACTUATOR, Mode Door - Removal**.

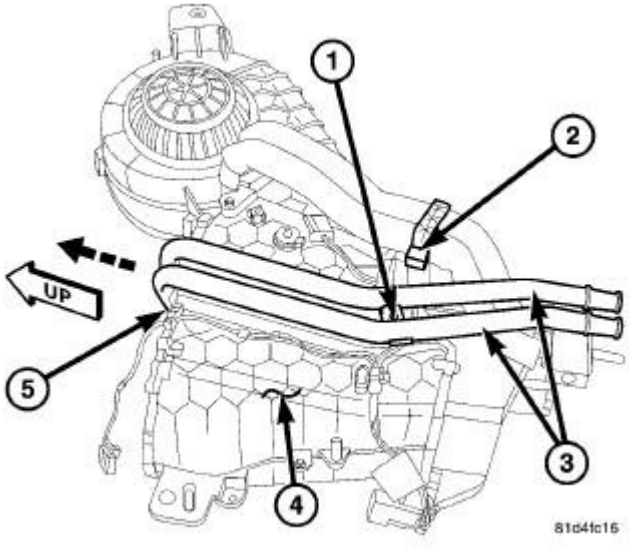

Fig. 175: Rear Heater Core Remove
Courtesy of CHRYSLER LLC

21. Remove the screw (1) that secures the rear heater core tubes (3) to the outboard side of the rear heater-A/C housing (4).
22. Pull the rear heater core (5) out of the top of the rear heater-A/C housing. If the foam seals on the heater core are deformed or damaged, they must be replaced.

Assembly

ASSEMBLY

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: If only the rear A/C evaporator is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.

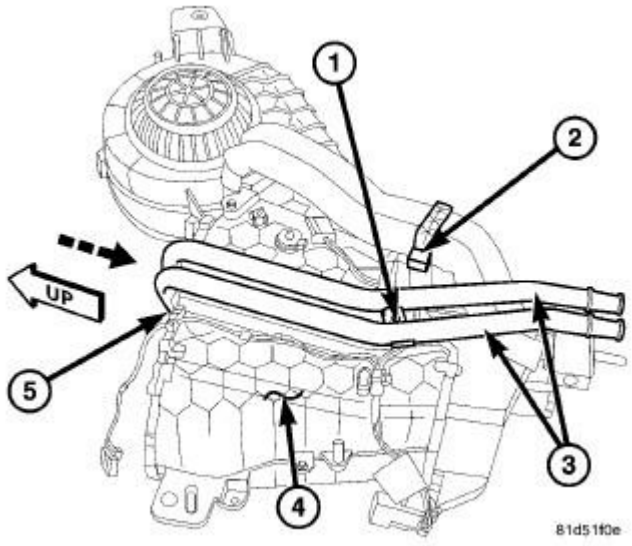

Fig. 176: Rear Heater Core Install
Courtesy of CHRYSLER LLC

1. Install the rear heater core (5) into the rear heater-A/C housing (4). Make sure that the foam seals are properly installed.
2. Install the screw (1) that secures the rear heater core tubes (3) to the outboard side of the rear heater-A/C housing. Tighten the screw to 1.2 N.m (10 in. lbs.).

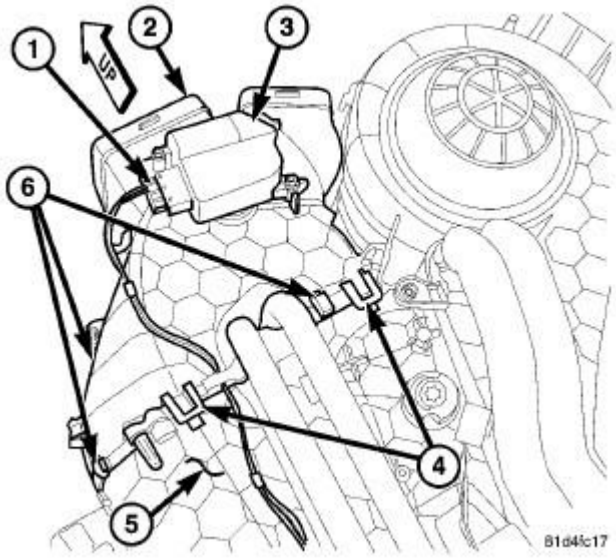

Fig. 177: Rear Distribution Housing Removal/Installation
Courtesy of CHRYSLER LLC

3. If removed, install the rear mode door actuator (3) to the rear heater-A/C distribution housing (2). See **Heating and Air Conditioning/Controls/ACTUATOR, Mode Door - Installation**.

4. Position the rear heater-A/C distribution housing to the rear heater-A/C housing (5) and engage the five plastic retaining tabs (4). Make sure the retaining tabs are fully engaged.
5. Install the three metal retaining clips (6) that secure the rear distribution housing to the rear heater-A/C housing.
6. Position the rear heater-A/C wire harness (1) to the rear heater-A/C distribution housing and connect it to the rear mode door actuator (3).

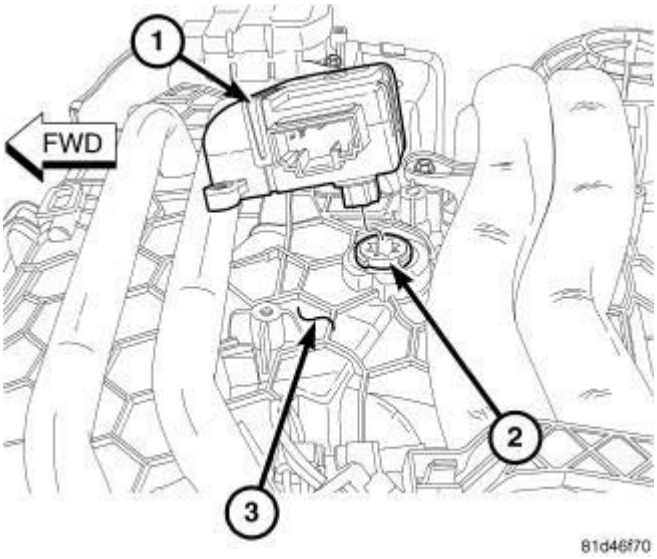

Fig. 178: Rear Blend Door Actuator Align
Courtesy of CHRYSLER LLC

7. Position the rear blend door actuator (1) onto the rear heater-A/C housing (3). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the rear blend-air door pivot shaft (2).

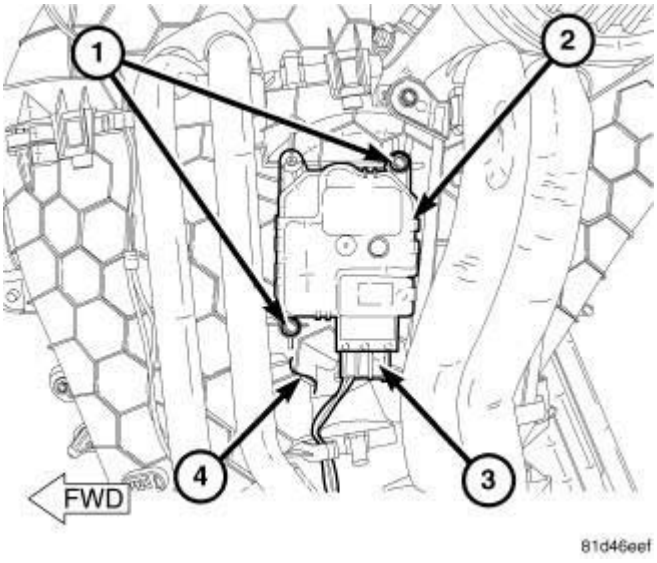

Fig. 179: Rear Blend Door Actuator Removal/Installation

Courtesy of CHRYSLER LLC

8. Install the two screws (1) that secure the rear blend door actuator (2) to the rear heater-A/C housing (4). Tighten the screws to 1.2 N.m (10 in. lbs.).
9. Connect the wire harness connector (3) to the rear blend door actuator.

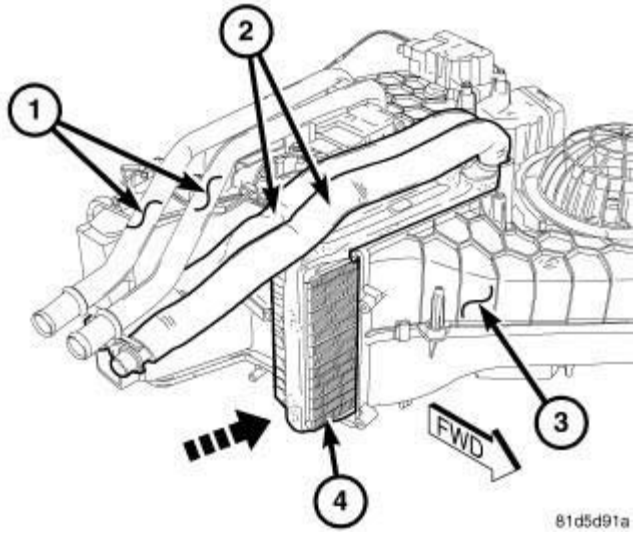

Fig. 180: Rear Evaporator Install
Courtesy of CHRYSLER LLC

10. Install the rear A/C evaporator (4) into the rear heater-A/C housing (3). Guide the evaporator tubes (2) past the rear heater core tubes (1). Make sure that the foam seals are properly installed on the evaporator.

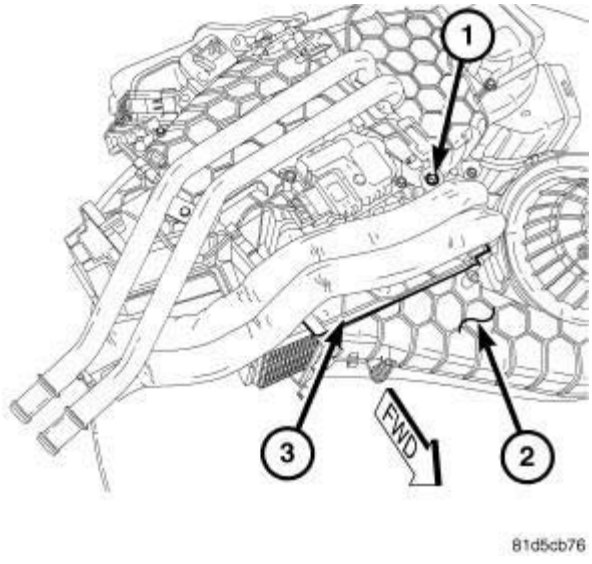

Fig. 181: Rear Evaporator Cover Removal/Installation
Courtesy of CHRYSLER LLC

11. Install the evaporator cover (3) onto the outboard side of the rear heater-A/C housing (2) and install the

retaining screw (1). Tighten the screw to 1.2 N.m (10 in. lbs.).

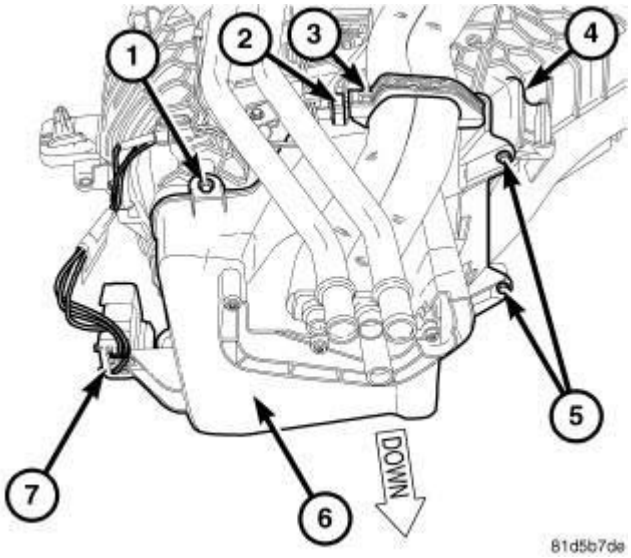

Fig. 182: Lower Rear Housing Removal/Installation
Courtesy of CHRYSLER LLC

12. Install the lower rear heater-A/C housing (6) onto the rear heater-A/C housing (4). Rotate and tilt the lower housing as necessary for installation.
13. Install the five screws (1 and 5) that secure the lower housing to the rear heater-A/C housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
14. Install the metal retaining clip (2) that secures the lower housing to the rear heater-A/C housing.
15. Close the evaporator tube retaining bracket (3). Make sure the bracket retainers are fully engaged.
16. Install the wire harness connector (7) onto the lower rear heater-A/C housing.

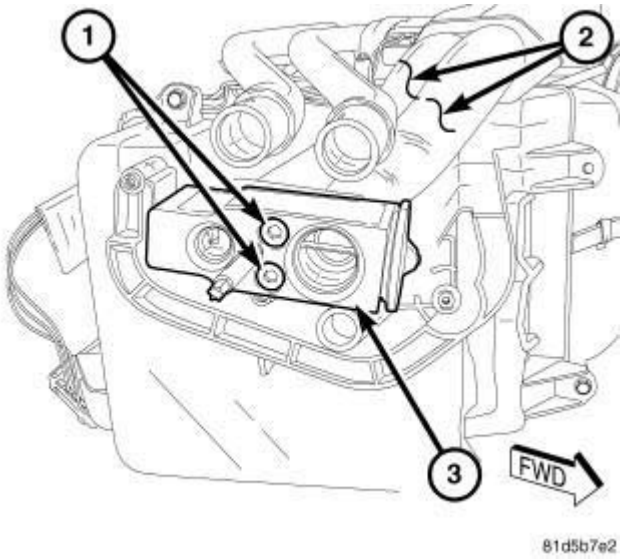

Fig. 183: Rear Expansion Valve Removal/Installation Bench
Courtesy of CHRYSLER LLC

17. Remove the tape or plugs from the rear evaporator tubes and expansion valve ports.
18. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the rear evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
19. Install the rear A/C expansion valve (3) onto the tapping plate located on the end of the rear evaporator tubes (2)
20. Install two bolts (1) that secure the rear A/C expansion valve to the taping plate. Tighten the bolts to 11 N.m (97 in. lbs.).

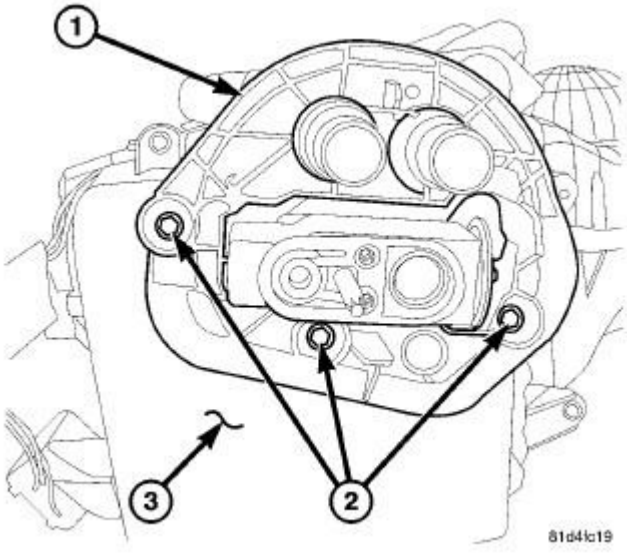

Fig. 184: Rear Housing Flange
Courtesy of CHRYSLER LLC

21. Position the flange (1) to the bottom of the rear heater-A/C housing (3) and install the three retaining screws (2). Tighten the screws to 1.2 N.m (10 in. lbs.).

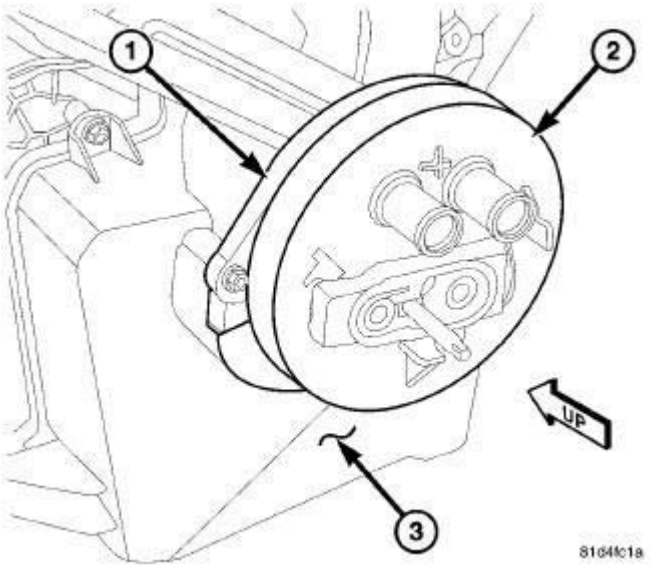

Fig. 185: Rear Housing Flange Seal
Courtesy of CHRYSLER LLC

22. Install the foam seal (2) onto the flange (1) at the bottom of the rear heater-A/C housing (3). Make sure that the foam seal is properly installed.
23. Install the rear blower motor. See **Heating and Air Conditioning/Distribution/MOTOR, Blower - Installation**.
24. Install the rear blower motor resistor or power module (depending on application). See **Heating and Air Conditioning/Controls/RESISTOR, Blower Motor - Installation** or. See **Heating and Air Conditioning/Controls/MODULE, Power - Installation**.
25. Install the rear heater-A/C housing. See **Heating and Air Conditioning/Distribution/HOUSING, A/C and Heater - Installation**.
26. Reconnect the negative battery cable.
27. If the rear heater core is being replaced, flush the cooling system. Refer to **Cooling - Standard Procedure** .
28. If the rear A/C evaporator is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

Installation

INSTALLATION

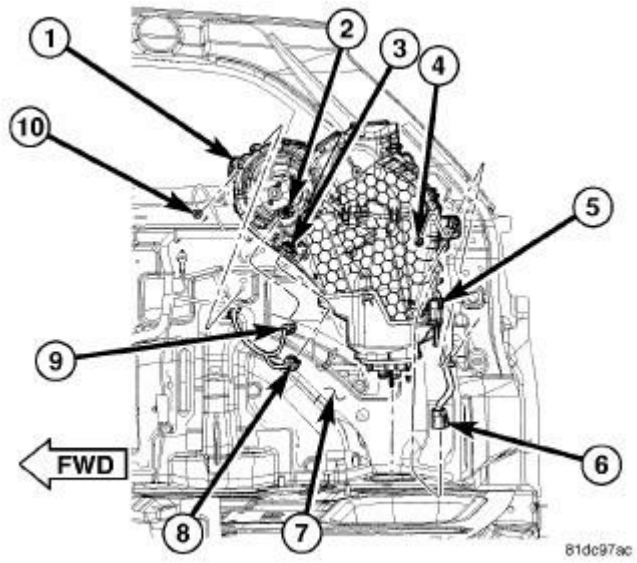

Fig. 186: Rear Heater AC Housing Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: MTC rear heater-A/C system shown. ATC system similar.

1. Position the rear heater-A/C housing (1) into the vehicle and align the guide pins on the housing to the holes in the right inner quarter panel (7).
2. Install the two bolts (4 and 10) that secure the rear heater-A/C housing to the right inner quarter panel. Tighten the bolts to 3 N.m (27 in. lbs.).
3. Connect the body wire harness connector (6) to the rear heater-A/C wire harness connector (5).
4. Connect the body wire harness connectors (8 and 9) to the rear blower motor (2) and the rear blower motor resistor or power module (3) (depending on control system).

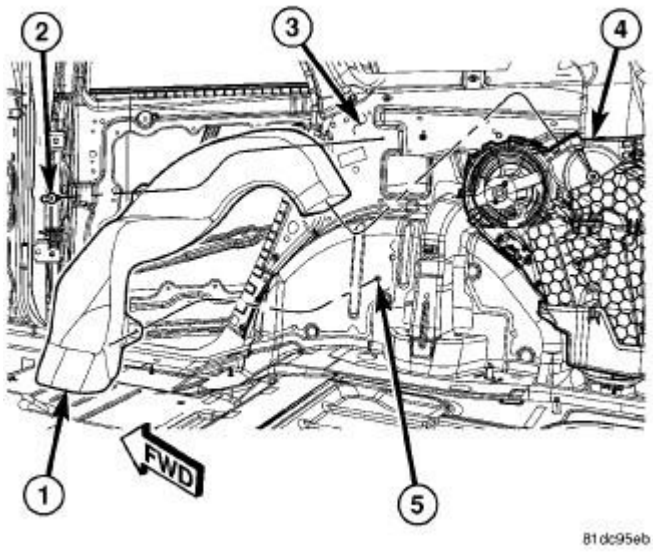

Fig. 187: Rear Floor Distribution Duct
Courtesy of CHRYSLER LLC

5. Install the rear floor distribution duct (1) onto rear heater-A/C housing (4). Make sure the duct is fully engaged to the housing.
6. Engage the rear floor distribution duct to the stud (5) located on the right inner quarter panel (3).
7. Install the push-pin retainer (2) that secures the rear floor distribution duct to the right inner quarter panel.

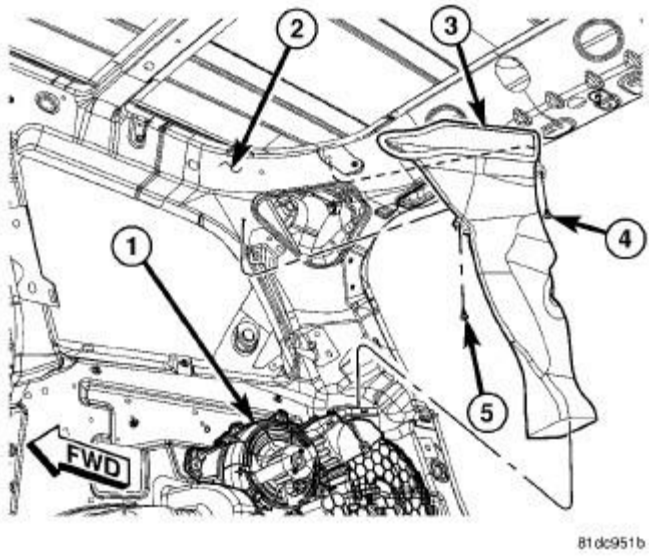

Fig. 188: Rear Ceiling Duct
Courtesy of CHRYSLER LLC

8. Position the rear ceiling distribution duct (3) to the right D-pillar (2).

CAUTION: Use care when installing the rear ceiling distribution duct onto the heater-A/C housing to prevent damage to the molded plastic support brace located on the top of the housing outlet. Failure to follow this caution could result in part of, or all of the support brace falling into the rear housing, which may interfere with rear mode door operation.

9. Install the rear ceiling distribution duct onto the top of the rear heater-A/C housing (1). Make sure the duct is fully engaged to the housing.
10. Install the two retainers (4 and 5) that secure the rear ceiling distribution duct to the right D-pillar.

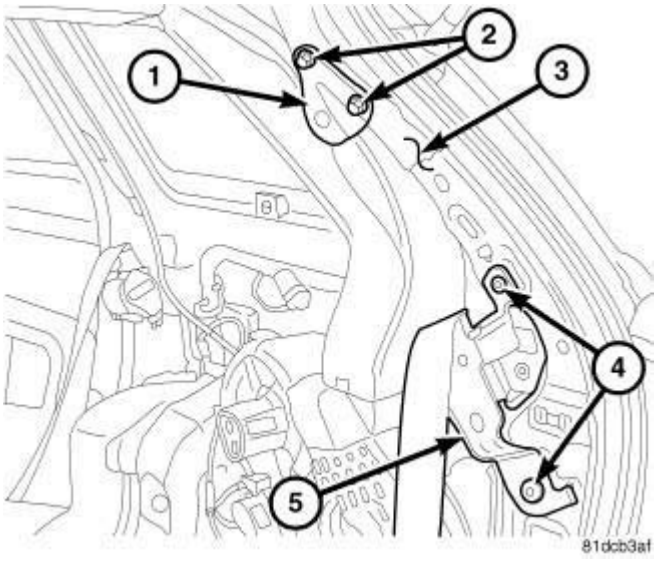

Fig. 189: D-Pillar Seat Belt Bracket
Courtesy of CHRYSLER LLC

11. Position the upper seat belt bracket (2) onto the D-pillar (3) and install the two retaining bolts (1). Tighten the bolts to 52 N.m (38.5 ft. lbs.).
12. Install the right seat belt retractor (5) and retaining bolts (4) onto the D-pillar. Tighten the bolts to 52 N.m (38.5 ft. lbs.).
13. Install the right quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .
14. Install the right D-pillar trim panel. Refer to **Body/Interior/PANEL, D-Pillar Trim - Installation** .

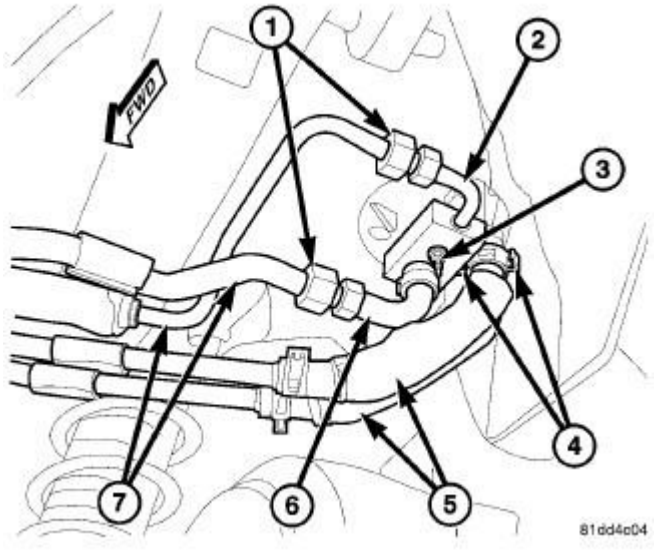

Fig. 190: Underbody Lines to Rear Housing
Courtesy of CHRYSLER LLC

15. Raise and support the vehicle.

CAUTION: DO NOT apply excessive force on underbody heater lines or rear heater tubes fittings when connecting the connections. Excessive force may damage or deform the tubes and or lines, causing an engine coolant leak.

NOTE: Replacement of the rubber heater hose ends will be required if the rubber hoses were cut for removal.

16. Remove the tape or plugs from all the opened refrigerant line fittings and the rear expansion valve ports.
17. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the underbody refrigerant extension line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
18. Connect the underbody refrigerant extension lines and sealing plate (2 and 6) to the rear A/C expansion valve.
19. Loosely install the nut (3) that secures the extension lines and sealing plate to the rear A/C expansion valve.
20. Connect the underbody refrigerant lines (7) to the underbody refrigerant extension lines and tighten the fitting nuts (1) to 23 N.m (17 ft. lbs.).
21. Tighten the nut that secures the extension lines and sealing plate to the rear A/C expansion valve to 11 N.m (97 in. lbs.).
22. Connect the underbody heater lines (5) to the rear heater core tubes located behind the right rear wheel housing and engage the spring type hose clamps (4).

23. Lower the vehicle.
24. Reconnect the negative battery cable.
25. If the heater core is being replaced, flush the cooling system. Refer to **Cooling - Standard Procedure** .
26. Fill the engine cooling system. Refer to **Cooling - Standard Procedure** .

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

27. Evacuate and charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
28. Calibrate the A/C-heater control. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

MOTOR, BLOWER, REAR

Description

DESCRIPTION

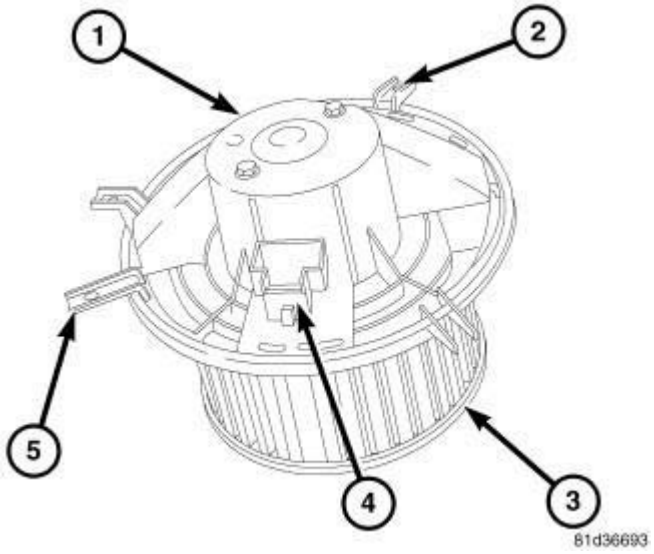

Fig. 191: Rear Blower
Courtesy of CHRYSLER LLC

The rear blower motor (1) is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral wire connector (4) and a squirrel cage-type blower wheel (3) that is secured to the blower motor shaft. Three integral mounting tabs (2) and a lock tab (5) secure the blower motor to the inboard side of the rear heater-A/C housing.

The rear blower motor can be accessed for service without removing the rear heater-A/C housing.

Operation

OPERATION

The rear blower motor is used to control the velocity of air moving through the rear heater-A/C housing by spinning the blower wheel within the heater-A/C housing at the selected speed.

The rear blower motor will only operate when the ignition switch is in ON and the rear blower motor switch located in the front accessory switch panel is ON. The rear blower motor receives a battery feed through the totally integrated power module (TIPM), whenever the ignition switch is in ON. See **Heating and Air Conditioning/Distribution/MOTOR, Blower - Diagnosis and Testing**.

The rear blower motor and blower wheel are factory balanced and cannot be adjusted or repaired and must be replaced as an assembly if inoperative or damaged.

Removal

REMOVAL

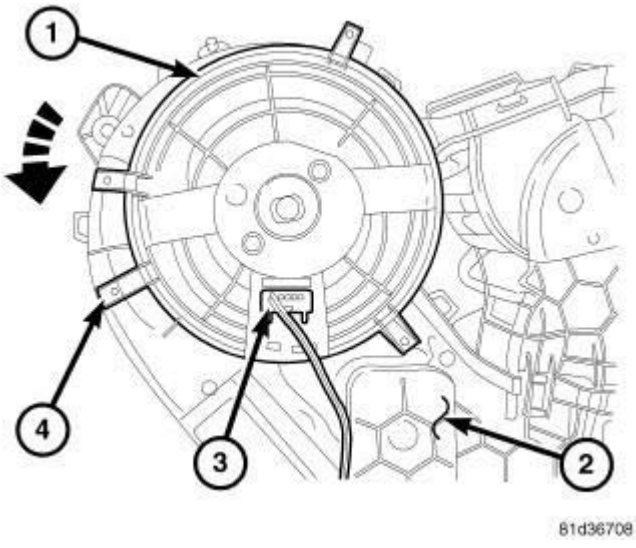

Fig. 192: Rear Blower Motor Remove
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove right rear quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
3. Disconnect the wire harness connector (3) from the rear blower motor (1).
4. Disengage the locking tab (4) and remove the rear blower motor from the rear heater-A/C housing (2) by turning the blower motor counterclockwise.

Installation

INSTALLATION

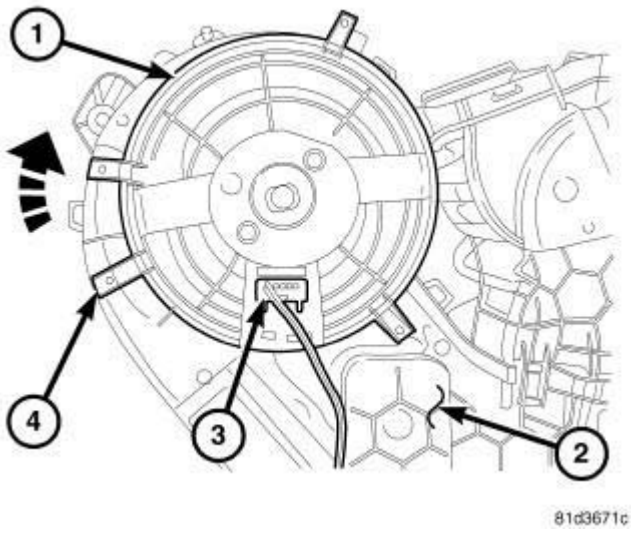

Fig. 193: Rear Blower Motor Install
Courtesy of CHRYSLER LLC

1. Position the rear blower motor (1) into the rear heater-A/C housing (2) and rotate the blower motor clockwise until the blower motor is fully engaged to the housing and the retaining tab (4) is in the locked position.
2. Connect the wire harness connector (3) to the rear blower motor.
3. Install the right rear quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .
4. Reconnect the negative battery cable.

OUTLET, AIR, REAR

Removal

REMOVAL

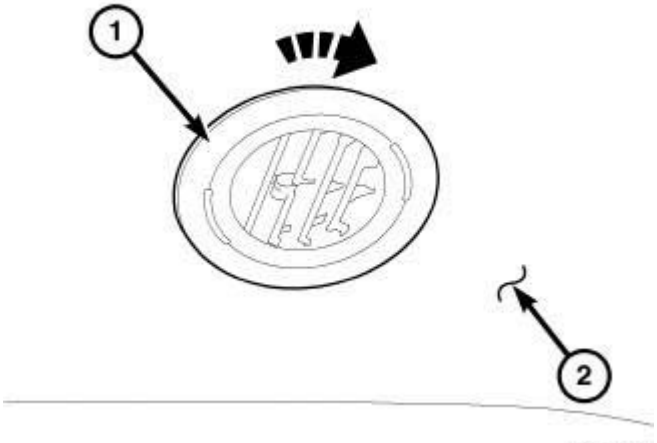

Fig. 194: Ceiling Air Outlet Removal RT
Courtesy of CHRYSLER LLC

1. Rotate the air outlet (1) being serviced clockwise until the retaining tabs on the back of the outlet disengage from the headliner (2).
2. Remove the air outlet from the headliner.

Installation

INSTALLATION

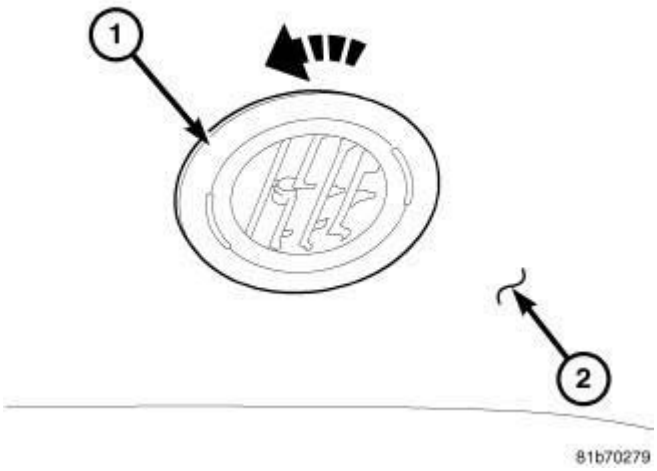

Fig. 195: Ceiling Air Outlet Install RT
Courtesy of CHRYSLER LLC

1. Position the air outlet (1) being serviced to the opening in the headliner (2).
2. Rotate the air outlet counterclockwise until the retaining tabs on the back of the outlet are fully engaged to the headliner.

PLUMBING, FRONT

DESCRIPTION

DESCRIPTION

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a A/C system consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a small molecular structure. The ends of the refrigerant lines are made from lightweight aluminum and brazed fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and

can reduce the flow of refrigerant within the system.

OPERATION

OPERATION

High pressures are produced in a refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

Depending on vehicle, model and market application, refrigerant lines are connected to each other or other A/C system components with block-type or quick-connect type fittings. To ensure the integrity of the refrigerant system, O-rings and/or gaskets may be used to seal the refrigerant system connections.

The refrigerant lines and hoses cannot be repaired and must be replaced if leaking or damaged.

WARNING

WARNING

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage and serious or fatal injury.

WARNING: The engine cooling system is designed to develop internal pressures up to 145 kPa (21 psi). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. Chrysler LLC recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very

small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

REFRIGERANT SYSTEM LEAKS

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage and possible serious or fatal injury.

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge an R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

NOTE: If the A/C system refrigerant charge is empty or low, a leak in the A/C system is likely. Visually inspect all A/C lines, fittings and components for an oily residue. Oil residue can be an indicator of an A/C system leak location.

NOTE: The only way to correctly determine if the A/C system is fully charged with refrigerant to perform the A/C PERFORMANCE TEST. See Heating and Air Conditioning - Diagnosis and Testing.

Connect a suitable manifold gauge set and determine if the static A/C system pressure is above or below 345

kPa (50 psi). See **Heating and Air Conditioning/Plumbing - Standard Procedure**. If less than 345 kPa (50 psi), proceed to **SYSTEM EMPTY**. If greater than 345 kPa (50 psi), go to **SYSTEM LOW**.

SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately -88 kPa (-26 in. Hg) or greater vacuum). See **Heating and Air Conditioning/Plumbing - Standard Procedure**. Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed to 2.
2. Prepare and dispense 0.284 kilograms (10 ounces) of R-134a refrigerant into the evacuated refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure** and proceed to 1 of the System Low procedure.

SYSTEM LOW

1. Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
2. Operate the heating-A/C system with the engine at idle under the following conditions for at least 5 minutes.
   - Doors or windows open
   - Transaxle in Park or Neutral with the parking brake set (depending on application)
   - A/C-heater controls set to outside air, full cool, panel mode, high blower and with A/C compressor engaged

CAUTION: A leak detector only designed for R-12 refrigerant will not detect leaks in an R-134a refrigerant system.

3. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the drain tube opening or an air outlet. A dye for R-134a is available to aid in leak detection. Use only Chrysler LLC approved refrigerant dye.

STANDARD PROCEDURE

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

WARNING: Eye protection must be worn when servicing an air conditioning refrigerant system. Turn off (rotate clockwise) all valves on the equipment being used, before connecting to or disconnecting from the refrigerant

system. Failure to observe these warnings may result in serious or fatal injury.

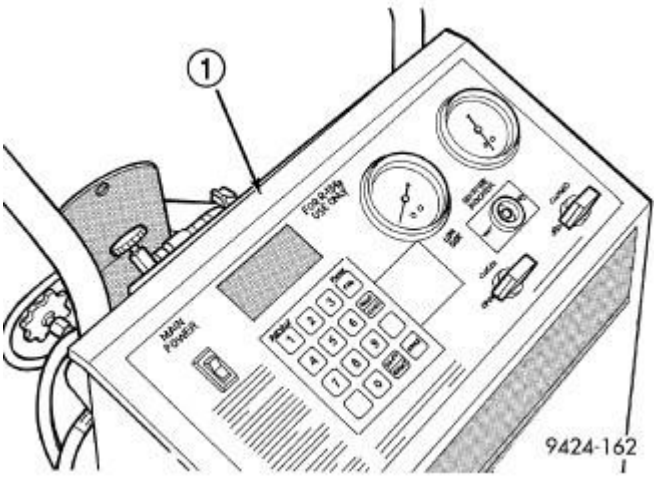

Fig. 196: Refrigerant Recovery/Recycling Station - Typical
Courtesy of CHRYSLER LLC

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 must be used (1). Per SAE standard J2788, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1 degrees C (70 degrees F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). When charging, the refrigerant recovery station must charge the system to an accuracy of 14 grams (0.5 oz.). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

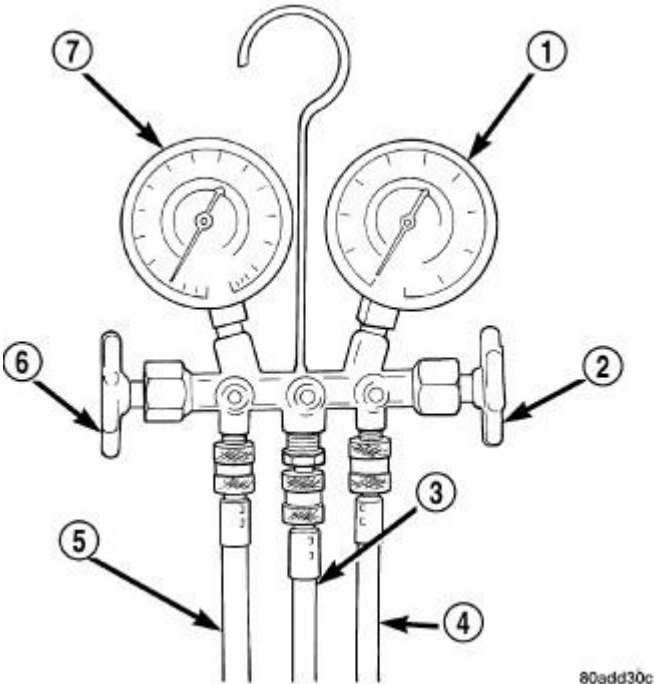

Fig. 197: Manifold Gauge Set - Typical
Courtesy of CHRYSLER LLC

A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and A/C system damage will result.

- **LOW PRESSURE GAUGE HOSE** - The low pressure hose (Blue with Black stripe) attaches to the low side service port. This port is located on the A/C suction line near the dash panel.
- **HIGH PRESSURE GAUGE HOSE** - The high pressure hose (Red with Black stripe) attaches to the high side service port. This port is located on the A/C liquid line near the right front strut tower.
- **RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE** - The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

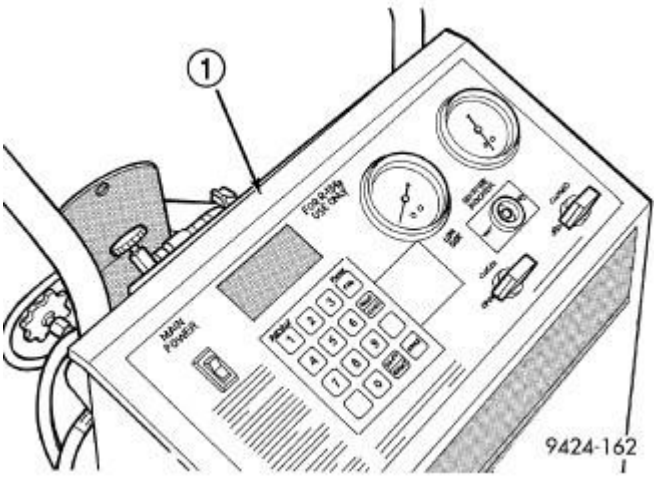

Fig. 198: Identifying R-134A Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER LLC

NOTE: If equipped with the rear heating-A/C system, use a heat gun to heat the underbody lines to help remove any trapped refrigerant from the rear A/C system.

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 must be used (1). Per SAE standard J2788, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1 degrees C (70 degrees F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

REFRIGERANT SYSTEM EVACUATE

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
2. With the engine OFF, connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment. See **Heating and Air Conditioning/Plumbing - Standard Procedure**. Do not operate the engine with a vacuum on the A/C system.
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.

4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

REFRIGERANT SYSTEM CHARGE

WARNING: Review safety precautions and warnings in this part before performing this procedure. See Heating and Air Conditioning/Plumbing - Warning and. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

NOTE: The Underhood HVAC Specification Label contains the refrigerant fill specification of the vehicle being serviced.

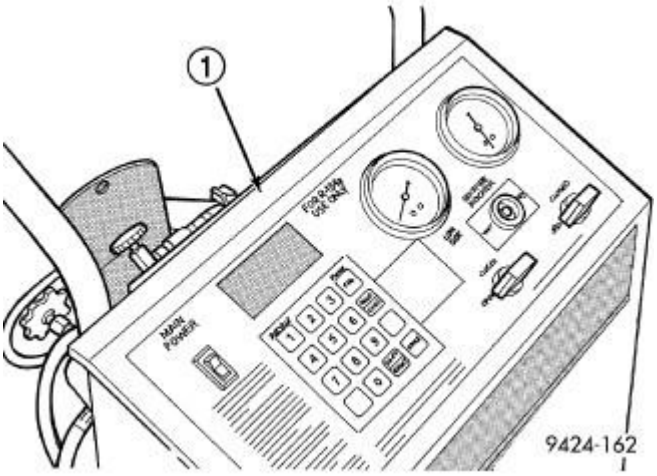

Fig. 199: Identifying R-134A Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER LLC

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. See **Heating and Air Conditioning/Plumbing/REFRIGERANT - Specifications**.

When charging the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 must be used (1). Per SAE standard J2788, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
2. Connect a manifold gauge set or R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
4. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
5. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
6. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the A/C compressor does not engage, test the compressor clutch control circuit and repair as required.
7. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning could result in possible serious or fatal injury.

8. Disconnect the charging station and manifold gauge set from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

COMPRESSOR, A/C

Description

FIXED DISPLACEMENT A/C COMPRESSOR

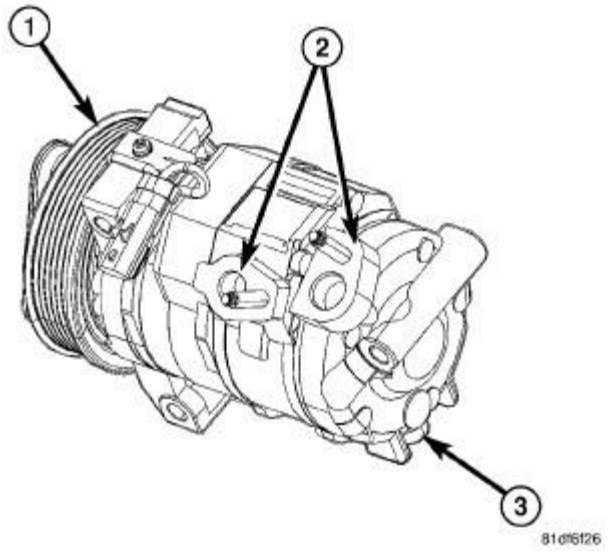

Fig. 200: Denso 10SR17 Compressor

Courtesy of CHRYSLER LLC

NOTE: Denso 10SR17 shown. Denso 10SR15 similar.

2.7L and 3.5L 5-Passenger models are equipped with the Denso 10SR15 A/C compressor. All 7-Passenger models are equipped with the Denso 10SR17 A/C compressor. Both A/C compressors are a fixed displacement, five double-acting piston, reciprocating swash plate-type compressor (1). Both compressors are clutch operated with suction and discharge ports (2) and have an integral high pressure relief valve (3) located near the rear of the compressor. The A/C compressor is secured to the engine with three bolts.

A label identifying the use of R-134a refrigerant and ND-8 PAG oil is located on each A/C compressor.

VARIABLE DISPLACEMENT A/C COMPRESSOR

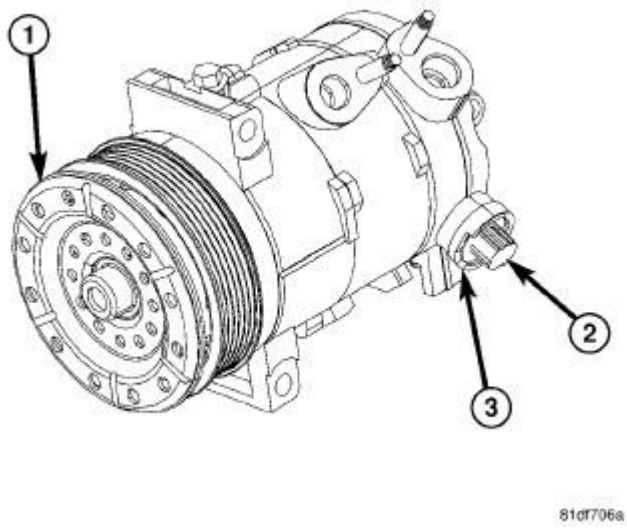

Fig. 201: Denso 6SEU16 Compressor
Courtesy of CHRYSLER LLC

2.0L and 2.4L 5-passenger models use a Denso 6SEU16 clutchless, variable displacement swashplate type A/C compressor (1). This A/C compressor has a total displacement of 160 cubic centimeters (9.7 cubic inches) and a control valve (2) and a high pressure relief valve (3) located on the back cover. The A/C compressor is secured to the engine with three bolts.

A label identifying the use of R-134a refrigerant and ND-8 PAG oil is located on the A/C compressor.

CLUTCH - FIXED DISPLACEMENT A/C COMPRESSOR

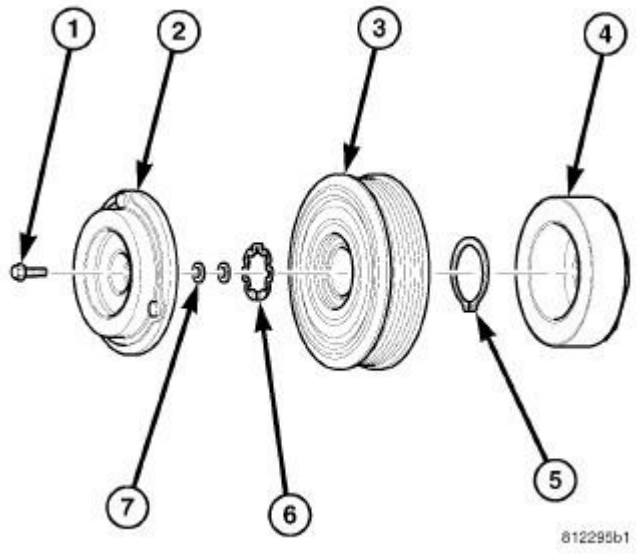

Fig. 202: A/C Compressor Clutch Components
Courtesy of CHRYSLER LLC

NOTE: Typical A/C clutch assembly shown.

The clutch assembly for the Denso 10SR15 and 10SR17 fixed displacement A/C compressors consists of a stationary electromagnetic A/C clutch field coil (4), pulley bearing and pulley assembly (3), clutch plate (2) and shims (7). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil and the pulley bearing and pulley assembly are both retained on the nose of the A/C compressor with snap rings (5 and 6). The clutch plate is splined to the compressor shaft and secured with a bolt (1).

HUB AND PULLEY - VARIABLE DISPLACEMENT A/C COMPRESSOR

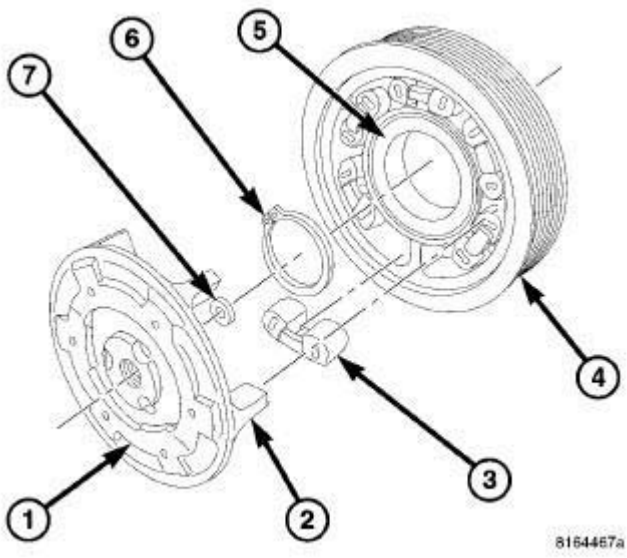

Fig. 203: A/C Compressor Hub & Pulley Assembly
Courtesy of CHRYSLER LLC

NOTE: Typical clutchless A/C compressor pulley and drive hub shown.

The non-servicable hub and pulley assembly for the Denso 6SEU16 variable displacement A/C compressor provides the means to drive the A/C compressor using the engine accessory drive belt. The hub and pulley assembly consists of an aluminum drive hub (1) with composite tabs (2) that are positioned between rubber dampeners (3), which are located inside of a composite pulley (4).

The A/C pulley has a bearing (5) which is retained to the nose of the A/C compressor with a snap ring (6). The drive hub and shim (7) are retained to the compressor shaft by use of left handed threads.

HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head at the rear of each A/C compressor. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Description**. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components caused by condenser air flow restriction or an overcharge of refrigerant.

Operation

FIXED DISPLACEMENT A/C COMPRESSOR

The Denso 10SR15 and 10SR17 fixed displacement A/C compressors are driven by the engine through an electric clutch, drive pulley and belt arrangement. These A/C compressors are lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The A/C compressors draw in low-pressure refrigerant vapor from the A/C evaporator through the suction port, then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is pumped to the

A/C condenser through the compressor discharge port.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

The Denso 10SR15 and 10SR17 fixed displacement A/C compressors cannot be repaired and must be replaced if inoperative or damaged. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service if inoperative or damaged. If an internal failure of the A/C compressor has occurred, the A/C receiver/drier must also be replaced. See **Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Removal**.

VARIABLE DISPLACEMENT A/C COMPRESSOR

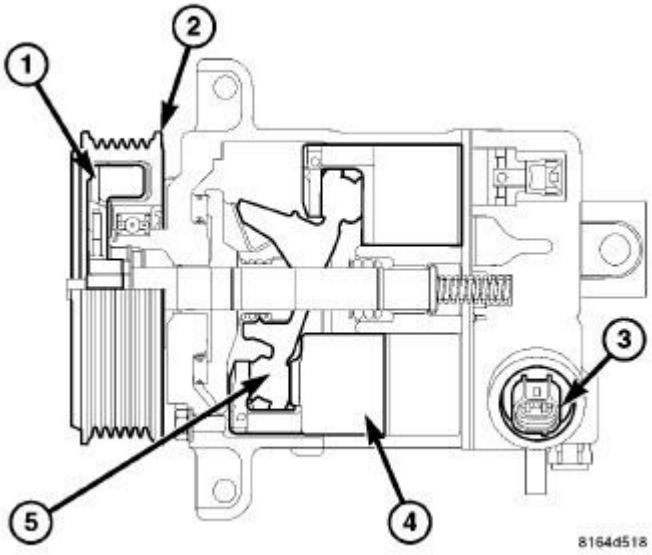

Fig. 204: 5SE12C Compressor-Operation
Courtesy of CHRYSLER LLC

NOTE: Typical variable displacement A/C compressor shown.

The Denso 6SEU16 A/C compressor is a variable displacement compressor (VDC) which is driven by the engine through a drive hub (1) and pulley (2). This A/C compressor does not require the use of an electromagnetic clutch, as the compressor uses an integral control solenoid (3) to reduce or increase the stroke of the five pistons (4) within the compressor by automatically adjusting the angle of the swashplate (5).

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant. See **Heating and Air**

Conditioning/Plumbing/OIL, Refrigerant - Description.

The A/C compressor is controlled by the powertrain control module (PCM) or engine control module (ECM), depending on engine application. The PCM/ECM calculates compressor displacement required by A/C system load and demand by monitoring vehicle speed, A/C high side pressure, engine speed, evaporator temperature, accelerator pedal position, ambient temperature and A/C-heater request signals. The PCM/ECM then sends a pulse width modulated (PWM) signal to the A/C compressor control solenoid to increase or decrease refrigerant flow through an orifice located within the compressor housing. The amount of refrigerant allowed to pass through the orifice in the compressor determines the head pressure which controls the angle of the swashplate, which in turn, determines the amount of compressor displacement. When there is no demand for A/C, the swashplate is adjusted to nearly a zero degree angle, which removes compressor torque drag from the engine.

This A/C compressor will reduce the displacement of the compressor based on ambient air temperature. For example; as the outside temperature falls from 27° C (80° F) to 19° C (66° F), the amount of refrigerant flow required through the A/C orifice valve to keep the A/C evaporator cool becomes less, and the swashplate is adjusted to a lower angle, which reduces compressor displacement. However, due to the lower outside air temperature, panel air outlet temperature will not noticeably change.

The A/C compressor control system is diagnosed using a scan tool. See **Heating and Air Conditioning - Diagnosis and Testing**.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with a variable displacement A/C compressor. Failure to follow this caution will result in serious A/C compressor damage.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: The compressor drive hub and the pulley and bearing assembly can not be serviced separately from the A/C compressor. In the event of drive hub or pulley and bearing assembly damage or failure, the A/C compressor, drive hub and pulley and bearing must be replaced as an assembly.

The A/C compressor cannot be adjusted or repaired and must be replaced if inoperative or damaged. If an internal failure of the A/C compressor has occurred, the A/C receiver/drier must also be replaced. See **Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Description**.

CLUTCH - FIXED DISPLACEMENT A/C COMPRESSOR

The clutch components for the Denso 10SR15 and 10SR17 fixed displacement A/C compressor provide the means to engage and disengage the compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and

drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C compressor clutch engagement is controlled by the powertrain control module (PCM) or the engine control module (ECM), depending on engine application. When the A/C-heater control is set to any A/C position, it sends a request signal on the CAN-IHS bus to the totally integrated power module (TIPM), which then transfers the request on the CAN-C Bus to the PCM/ECM, which determines if operating conditions are correct for A/C clutch engagement. When all operating conditions have been met, the PCM/ECM sends a signal on a dedicated hard-wired circuit back to the totally integrated power module (TIPM) to energize the internal A/C clutch high side driver. When energized, the A/C clutch high side driver provides battery current to the A/C clutch field coil.

The A/C clutch control system is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** .

The A/C compressor clutch components cannot be adjusted or repaired and must be replaced if inoperative or damaged.

HUB AND PULLEY - VARIABLE DISPLACEMENT A/C COMPRESSOR

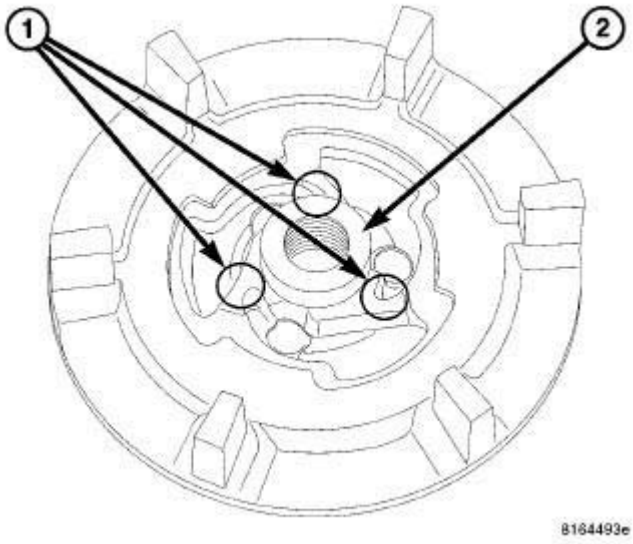

Fig. 205: A/C Compressor Hub
Courtesy of CHRYSLER LLC

NOTE: Typical clutchless compressor pulley drive hub shown.

The design of the Denso 6SEU16 variable displacement A/C compressor does not require the use of an electromagnetic clutch, as the compressor is controlled by an integral control valve that allows refrigerant to bypass within the compressor. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Description**.

The three bridges (1) located on compressor drive hub (2) are designed to break away in the event of compressor seizure. This action prevents damage to the serpentine accessory drive belt. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Inspection**.

NOTE: The compressor drive hub and the pulley and bearing assembly can not be serviced separately from the A/C compressor. In the event of drive hub or pulley and bearing assembly damage or failure, the A/C compressor, drive hub and pulley and bearing must be replaced as an assembly.

The compressor drive hub and the pulley and bearing assembly can not be serviced separately from the A/C compressor. The A/C compressor must be replaced if the drive hub or pulley and bearing assembly is worn or damaged.

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve should not open when the A/C system is operating correctly. If the high pressure relief valve vents refrigerant, there is most likely a problem within the A/C refrigerant system. The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. If the high pressure relief valve vents refrigerant, see the A/C System Diagnosis chart. See **Heating and Air Conditioning - Diagnosis and Testing**.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

Diagnosis and Testing

CLUTCH - FIXED DISPLACEMENT A/C COMPRESSOR

The compressor clutch coil electrical circuit for the Denso 10SR15 and 10SR17 fixed displacement A/C compressors is controlled by the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) through the totally integrated power module (TIPM) (refer to **SYSTEM WIRING DIAGRAMS** for complete HVAC wiring diagrams). Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. Using a scan tool, check for diagnostic trouble codes (DTCs) in the A/C-heater control, TIPM and PCM/ECM. If no diagnostic trouble codes (DTCs) are found, go to 2. If any DTCs are found, repair as required.
2. If the A/C compressor clutch still will not engage, verify the refrigerant charge level. See **Heating and Air Conditioning - Diagnosis and Testing**. If the refrigerant charge level is OK, go to **COIL RESISTANCE TEST** and/or **COIL CURRENT DRAW TEST**. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch field coil connector.
3. Use an ohm meter and Back Probe Tool 6801 and measure the resistance of the clutch field coil at the field coil connector terminals.
4. Refer to the **A/C CLUTCH FIELD COIL SPECIFICATIONS** for the acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21° C (70° F).
    a. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
    b. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge. Refer to **Electrical - Engine Systems/Battery System/BATTERY - Diagnosis and Testing** .
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch coil feed terminal using Back Probe Tool 6801. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the heater-A/C control in the A/C mode and the blower at low speed, start the engine and allow it to run at a normal idle speed.
4. The compressor clutch should engage immediately, and the clutch coil supply voltage should be within two volts of the battery voltage. If the coil supply voltage is OK, go to 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.
5. Refer to the **A/C CLUTCH FIELD COIL SPECIFICATIONS** for the acceptable A/C clutch field coil current draw. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
    a. If the compressor clutch coil current reading is zero, the coil is open and must be replaced.
    b. If the compressor clutch coil current reading is above specifications, the coil is shorted and must be replaced.

A/C CLUTCH FIELD COIL SPECIFICATIONS

Coil Resistance	Current Draw
3.6 ± 0.2 ohms	3.2 - 3.3 amps @ 11.5 - 12.5 volts

A/C SYSTEM NOISE TESTING

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: what sounds like a failed bearing, may be caused by loose bolts, nuts, mounting brackets or a loose A/C compressor.

NOTE: The A/C compressor must be replaced if any unusual noise is heard from the

compressor itself.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C system On and Off several times to clearly identify any compressor noise. Listen to the A/C compressor while it is operating at maximum and minimum displacement. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2600 kPa (377 psi).

   NOTE: Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor is operating at maximum displacement, which may not occur when the compressor is at minimum displacement.

2. Check the condition of the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Diagnosis and Testing** .

   NOTE: The A/C compressor must be replaced if the drive hub is broken or if the compressor shaft does not rotate smoothly.

3. Check the compressor hub and pulley and bearing assembly. Be certain that the hub and pulley are properly aligned and that the pulley bearing is mounted securely to the A/C compressor. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Inspection**.

   NOTE: The A/C compressor must be replaced if any debris or unusually discolored oil is found on the A/C compressor manifold.

4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. See **Heating and Air Conditioning/Plumbing - Description**.
5. Loosen all of the compressor mounting hardware and retighten.

   CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

6. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**. If the high pressure relief valve still does not seat properly, replace the A/C compressor. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal**.
7. If the noise is from liquid refrigerant slugging in the A/C suction line, replace the A/C receiver/drier. See

Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Removal, check the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure** and the refrigerant system charge. See **Heating and Air Conditioning - Diagnosis and Testing**.

8. If a slugging condition still exists after replacing the A/C receiver/drier, then replace the A/C compressor. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal**.

Removal

CLUTCH - FIXED DISPLACEMENT A/C COMPRESSOR

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: The compressor clutch assembly can be serviced with the refrigerant system fully-charged and with the A/C compressor installed on the engine.

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

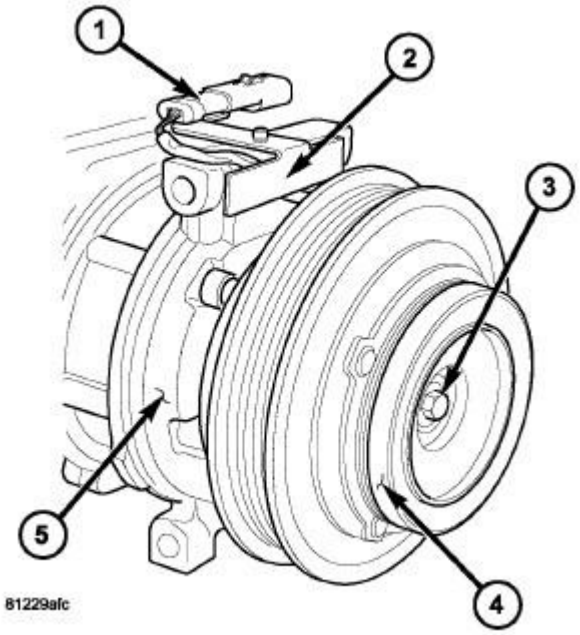

Fig. 206: A/C Compressor Shaft Bolt
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.

3. Remove the splash shield from the right side frame rail. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
4. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1) located on the top of the A/C compressor (5).

NOTE: Some models (depending on engine application) may require the A/C compressor to be removed from its installed location and repositioned to gain access to the compressor shaft bolt and/or pulley and field coil snap rings. However, the refrigerant system can still remain fully charged.

6. If necessary, remove the bolts that secure the A/C compressor to the engine and reposition the compressor to gain access to the shaft bolt and/or pulley and field coil snap rings. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal**.
7. Carefully remove the compressor clutch field coil connector and wire lead from the connector bracket (2).
8. Remove the compressor shaft bolt (3). A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate (4) from rotating during bolt removal.

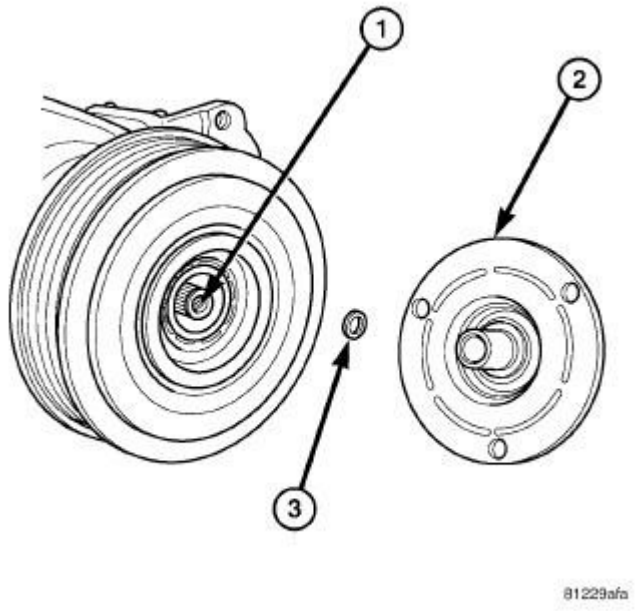

Fig. 207: Clutch Plate & Shim(s)
Courtesy of CHRYSLER LLC

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

9. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).

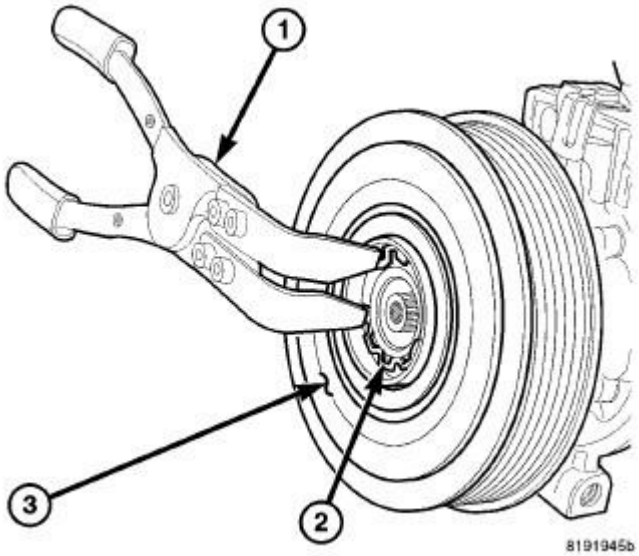

Fig. 208: Clutch Pulley & Snap Ring
Courtesy of CHRYSLER LLC

10. Using A/C Snap Ring Pliers 9764 or equivalent (1), remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor and remove the pulley and bearing assembly.

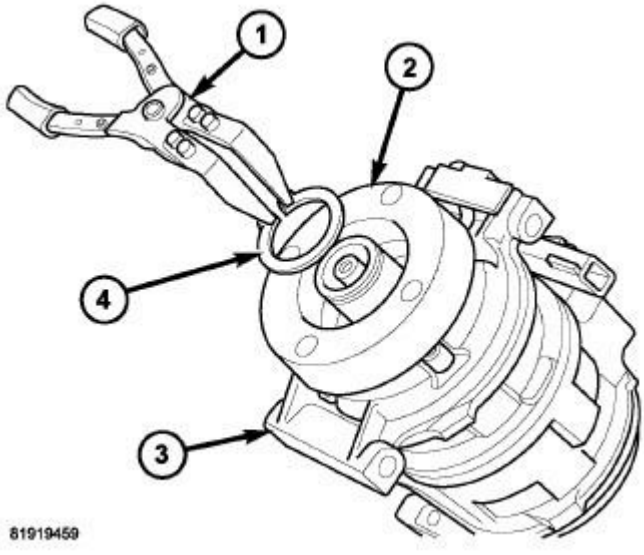

Fig. 209: Clutch Coil & Snap Ring

Courtesy of CHRYSLER LLC

11. Using A/C Snap Ring Pliers 9764 or equivalent (1), remove the snap ring (4) that secures the compressor clutch field coil (2) to the front of the A/C compressor (3) and remove the field coil.

A/C COMPRESSOR

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Variable displacement compressor shown in illustrations. Fixed displacement similar.

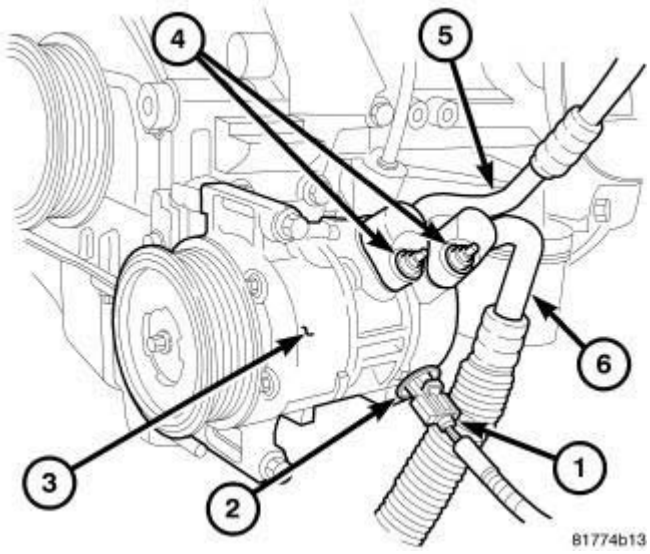

Fig. 210: A/C Compressor-Refrigerant Lines
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Raise and support the vehicle.
4. Remove the splash shield from the right side frame rail. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
5. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
6. Disconnect the engine wire harness (1) from the clutch coil or compressor control valve (2), depending on application.
7. Remove the nuts (4) that secure the A/C discharge line (5) and the A/C suction line (6) to the A/C

compressor (3).

8. Disconnect the A/C discharge and suction lines from the A/C compressor and remove and discard the O-ring seals and gaskets.

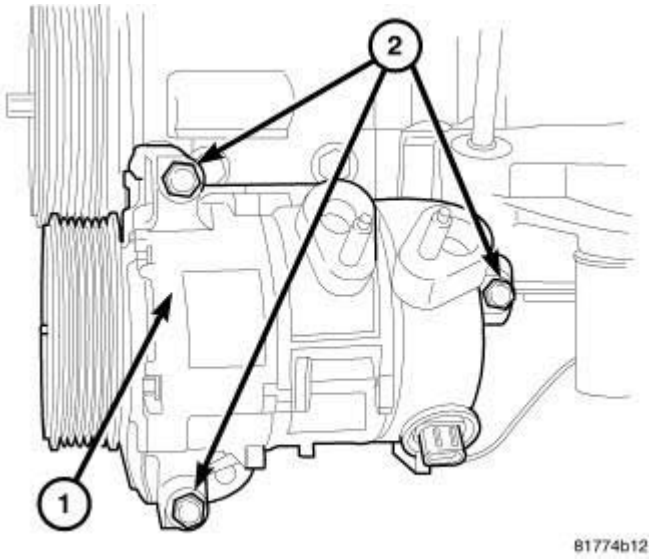

Fig. 211: A/C Compressor-Removal/Installation
Courtesy of CHRYSLER LLC

9. Support the A/C compressor (1) and remove the three bolts (2) that secure the compressor to the engine and remove the compressor.
10. Install plugs in, or tape over the opened refrigerant line fittings and compressor ports.

Inspection

CLUTCH INSPECTION - FIXED DISPLACEMENT A/C COMPRESSOR

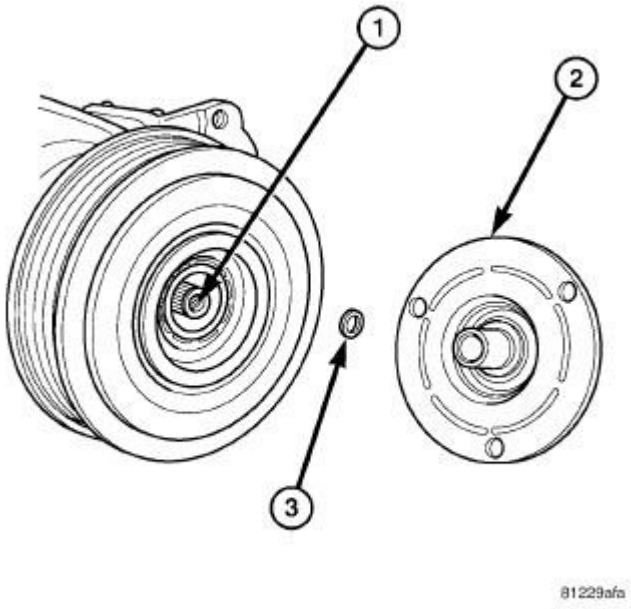

Fig. 212: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER LLC

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and clutch plate if required.

HUB AND PULLEY INSPECTION - VARIABLE DISPLACEMENT A/C COMPRESSOR

NOTE: The compressor drive hub and the pulley and bearing assembly can not be serviced separately from the A/C compressor. In the event of drive hub or pulley and bearing assembly damage or failure, the A/C compressor, drive hub and pulley and bearing must be replaced as an assembly.

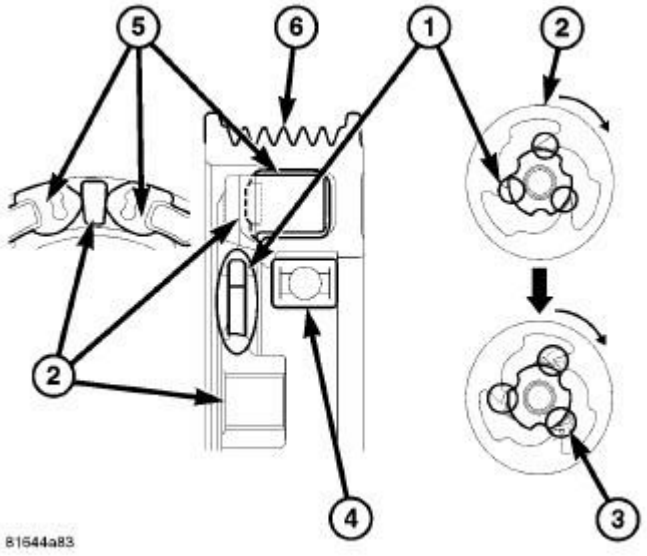

Fig. 213: Compressor Hub & Pulley Inspection
Courtesy of CHRYSLER LLC

NOTE: Typical clutchless compressor drive hub and pulley and bearing assembly shown.

The bridges (1) located on the non-servicable compressor hub (2) are designed to break away in the event of compressor seizure. Examine the bridges for separation or cracks (3). Damage to the bridges are an indication of excessive compressor torque, which is most likely caused by compressor failure.

Check the non-servicable pulley bearing (4) for roughness or excessive noise. Check the pulley dampeners (5) for excessive play which can be caused by deterioration or damage. Inspect the belt surfaces of the non-servicable pulley (4) for wear. If the pulley surfaces are oily, inspect the shaft and nose area of the A/C compressor for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Replace the A/C compressor if wear or damage is found to the drive hub or pulley and bearing assembly. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal**.

Installation

CLUTCH - FIXED DISPLACEMENT A/C COMPRESSOR

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

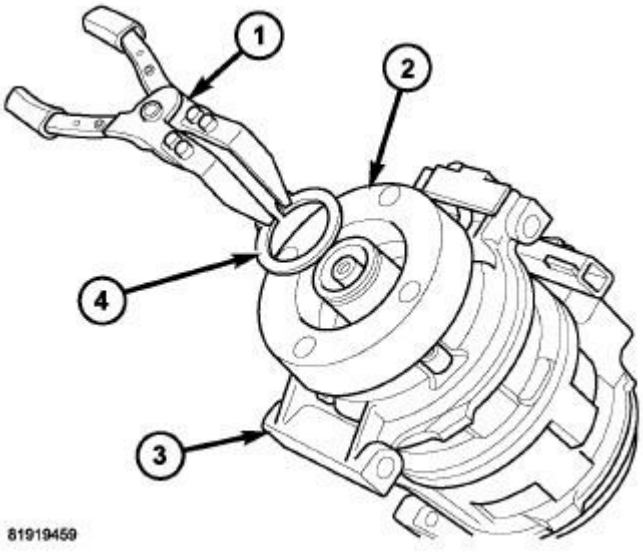

Fig. 214: Clutch Coil & Snap Ring
Courtesy of CHRYSLER LLC

1. Align the dowel pin on the back of the compressor clutch field coil (2) with the hole in the front of the A/C compressor (3) and position the field coil onto the compressor. Be certain that the compressor clutch field coil wire lead is properly routed so that it is not pinched between the A/C compressor and the field coil.

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the compressor clutch field coil to the A/C compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or to the left of the field coil dowel pin location on the A/C compressor.

2. Using A/C Snap Ring Pliers 9764 or equivalent (1), install the snap ring (4) that secures the compressor clutch field coil to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove and oriented correctly.

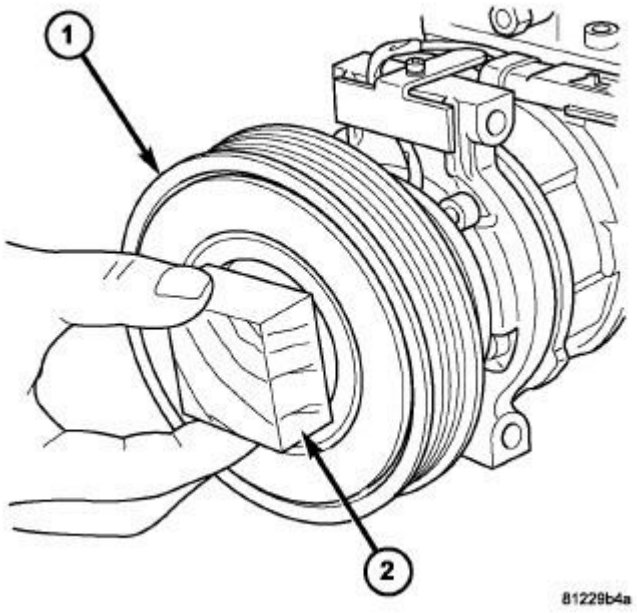

Fig. 215: Clutch Pulley - Installation
Courtesy of CHRYSLER LLC

CAUTION: Be certain to position the A/C clutch coil wire lead so that it is not damaged during A/C compressor pulley and bearing installation.

CAUTION: When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the A/C clutch will result.

3. Install the pulley and bearing assembly (1) onto the front of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

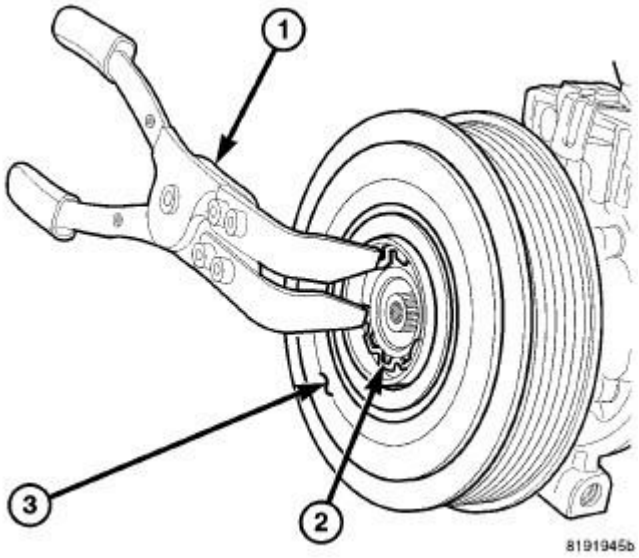

Fig. 216: Clutch Pulley & Snap Ring
Courtesy of CHRYSLER LLC

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

4. Using A/C Snap Ring Pliers 9764 or equivalent (1), install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.

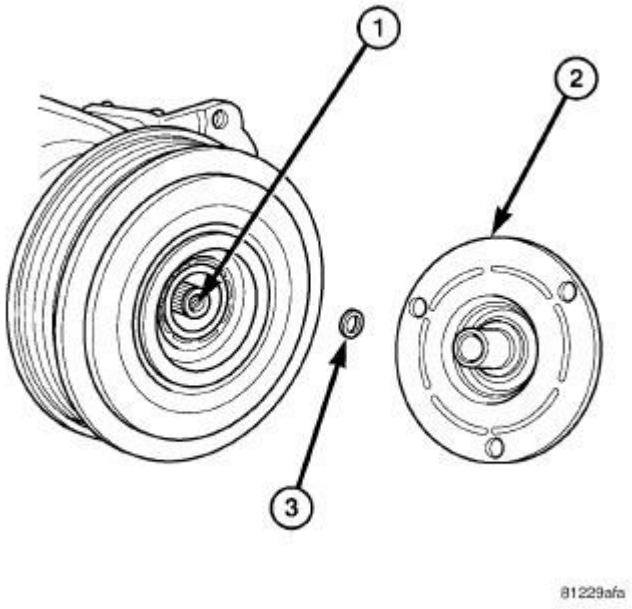

Fig. 217: Clutch Plate & Shim(s)
Courtesy of CHRYSLER LLC

5. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim (s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick onto the compressor shaft.

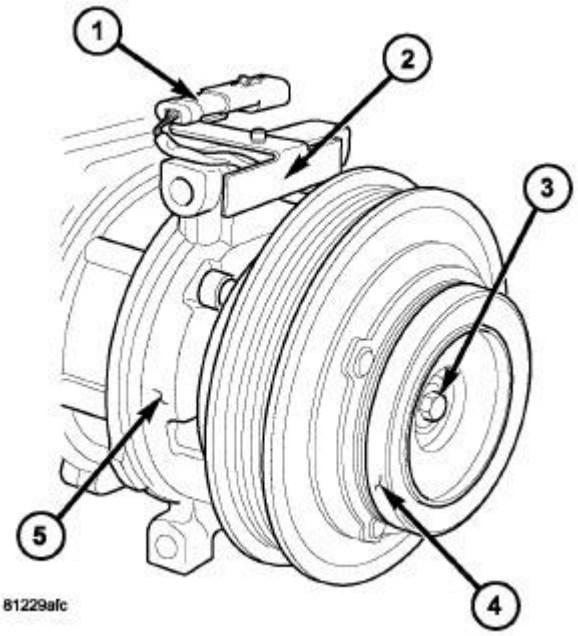

Fig. 218: A/C Compressor Shaft Bolt

Courtesy of CHRYSLER LLC

6. Install the clutch plate (4) onto the front of the A/C compressor (5).
7. Install the compressor shaft bolt (3). Tighten the bolt to 19 N.m (168 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

NOTE: On models with the clutch plate recessed into the pulley, use a 90° wire gap gauge to measure the clutch air gap. On other models, use a blade type feeler gauge to measure the air gap.

8. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. The air gap should be between 0.35 - 0.60 mm (0.014 - 0.024 in.). If the air gap is not between specifications, add or subtract shims as needed until the correct air gap is obtained.

CAUTION: Be certain that the compressor clutch coil wire lead is routed so that it is not pinched between the A/C compressor and the coil connector bracket.

9. Carefully route the compressor clutch field coil wire lead behind the connector bracket (2).
10. Install the compressor clutch field coil connector (1) onto the connector bracket.
11. Reinstall the A/C compressor onto the engine if removed for A/C clutch service. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Installation**.
12. Connect the engine wire harness to the compressor clutch field coil connector.
13. Install the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .
14. Install the splash shield onto the right side frame rail. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
15. Lower the vehicle.
16. Reconnect the negative battery cable.

A/C COMPRESSOR

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. See Heating and Air

Conditioning/Plumbing/DRIER, A/C Receiver - Removal. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, see the REFRIGERANT OIL CAPACITIES to determine how much oil should be removed from the new A/C compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets may result in a refrigerant system leak.

NOTE: Variable displacement compressor shown in illustrations. Fixed displacement similar.

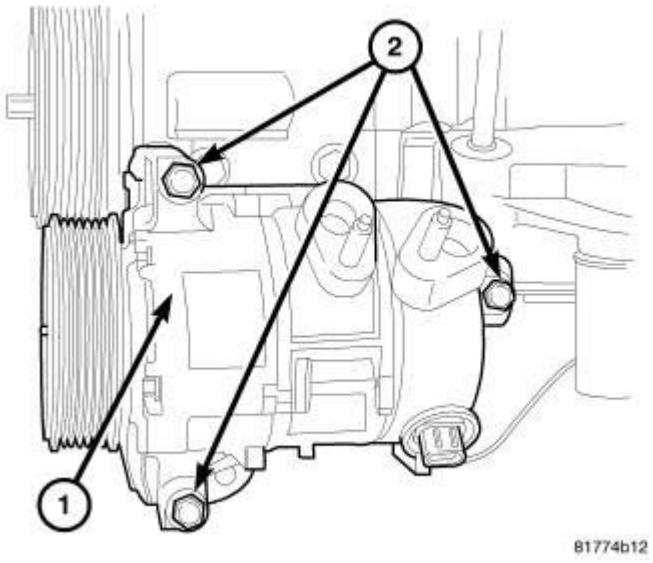

Fig. 219: A/C Compressor-Removal/Installation
Courtesy of CHRYSLER LLC

1. If the A/C compressor (1) is being replaced, refrigerant oil must first be drained from the new A/C compressor. When replacing multiple A/C system components, see the **REFRIGERANT OIL CAPACITIES** to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor into the engine compartment.
3. Install the three bolts (2) that secure the A/C compressor to the engine. Tighten the bolts to 25 N.m (18 ft. lbs.).

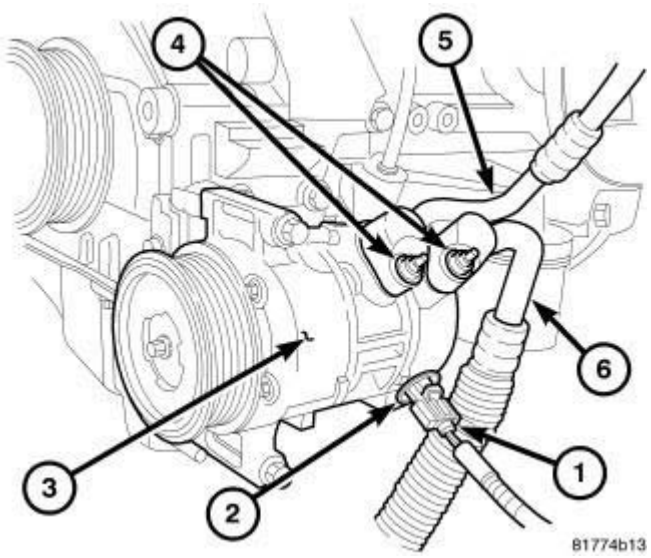

Fig. 220: A/C Compressor-Refrigerant Lines
Courtesy of CHRYSLER LLC

4. Remove the tape or plugs from the compressor ports and the refrigerant line fittings.
5. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Connect the A/C discharge line (5) and the A/C suction line (6) to the A/C compressor (3).
7. Install the nuts (4) that secure the A/C suction and discharge lines to the A/C compressor. Tighten the nuts to 20 N.m (15 ft. lbs.).
8. Connect the engine wire harness (1) to the clutch coil or compressor control valve (2), depending on application.
9. Install the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .
10. Install the splash shield onto the right side frame rail. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
11. Lower the vehicle.
12. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

13. Evacuate and charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

CONDENSER, A/C

Description

DESCRIPTION

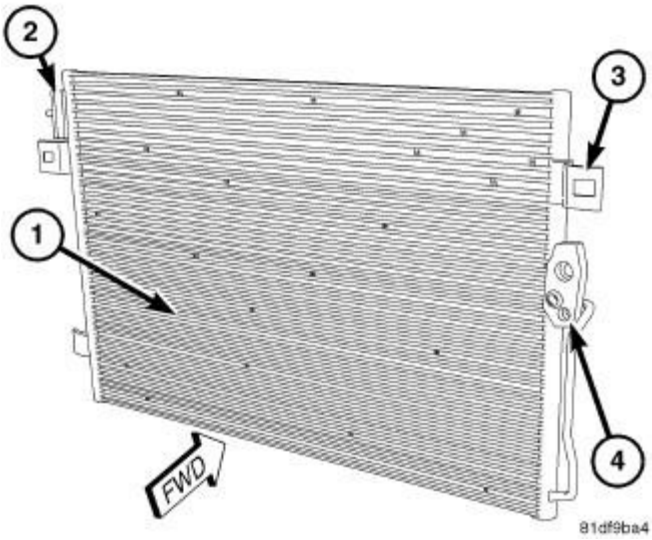

Fig. 221: Condenser Description
Courtesy of CHRYSLER LLC

NOTE: A/C condenser with automatic transmission cooler shown. A/C Condenser without cooler similar.

The A/C condenser (1) is located in the front of the engine compartment behind the grille. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with mounting tabs (3), a tapping block for the A/C discharge and liquid lines (4) and a tapping block for the integral automatic transmission cooler (2), when equipped with an automatic transaxle.

Operation

OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and

metal gaskets could result in a refrigerant system leak.

The A/C condenser has no serviceable parts. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is disconnected from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

CAUTION: Before removing the A/C condenser, note the location of each of the radiator/condenser air seals. These air seals are used to direct air through the A/C condenser and radiator. The air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

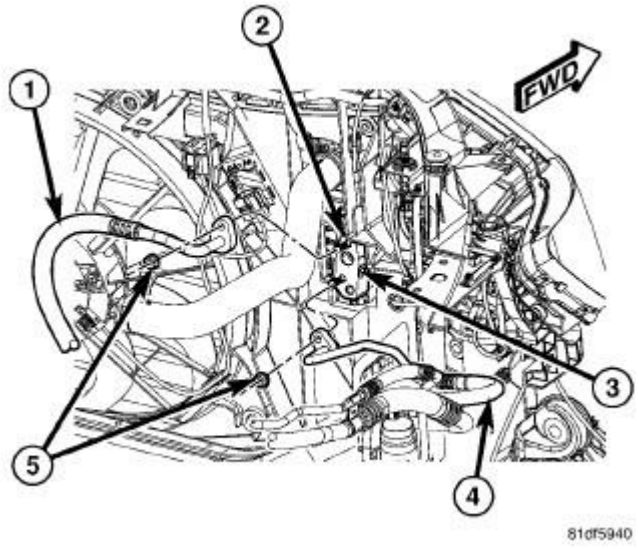

Fig. 222: Refrigerant Lines to Condenser Tapping Block
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing -**

Standard Procedure.

3. Remove the nuts (5) that secure the A/C discharge line (1) and the A/C liquid line (4) to the tapping block (2) located on the right side of the A/C condenser.
4. Disconnect the A/C discharge and liquid lines from the tapping block and remove and discard the O-ring seals and gaskets.
5. Remove the bolt (3) that secures the tapping block to the right side of the radiator support.
6. Install plugs in, or tape over the opened refrigerant line fittings and condenser ports.

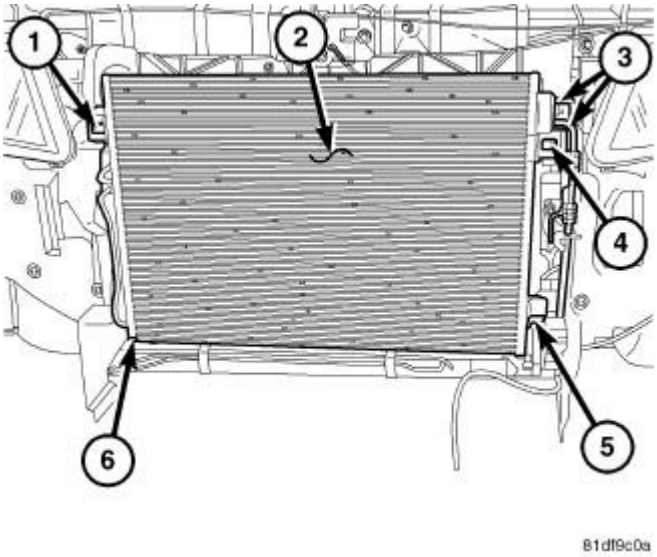

Fig. 223: Condenser Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: A/C condenser with automatic transmission cooler shown. A/C Condenser without cooler similar.

7. Remove the front fascia. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Removal** .
8. Remove the front bumper reinforcement. Refer to **Frame and Bumpers/Bumpers/REINFORCEMENT, Bumper - Removal** .
9. If equipped, disconnect the automatic transmission cooler lines (3) from the left side of the A/C condenser (2). Refer to **Cooling - Standard Procedure** .
10. If equipped with the 2.0L diesel engine, remove the charge air cooler. Refer to **Engine/Turbocharger System/COOLER and HOSES, Charge Air - Removal** .
11. Disengage the two plastic retaining tabs (1 and 4) that secure the top mounting brackets of the A/C condenser to the radiator.
12. Lift the A/C condenser slightly upward to disengage the two lower mounting brackets (5 and 6) from the condenser and remove the condenser from the engine compartment.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: If only the A/C condenser is being replaced, add 10 milliliters (0.3 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

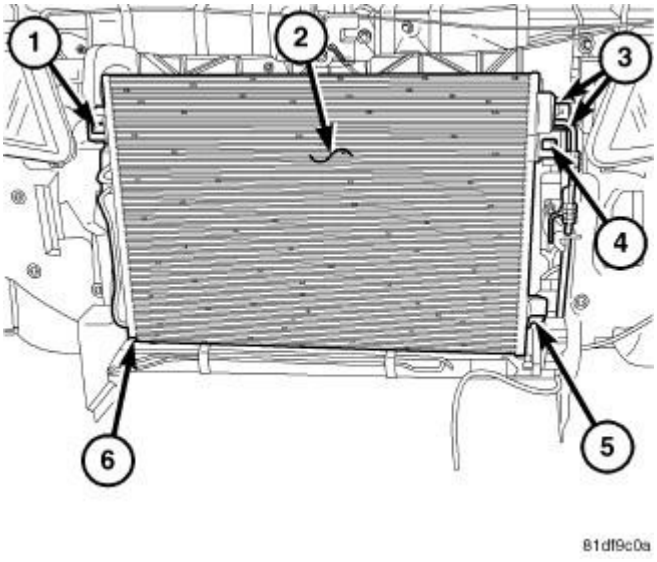

Fig. 224: Condenser Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: A/C condenser with automatic transmission cooler shown. A/C Condenser without cooler similar.

1. Position the A/C condenser (1) to the front of the engine compartment and engage the condenser to the two lower mounting brackets.
2. Engage the two plastic retaining tabs (1 and 4) that secure the top mounting brackets of the A/C condenser to the radiator. Make sure the retaining tabs are fully engaged.

3. If equipped, connect the automatic transmission cooler lines (2) to the left side of the A/C condenser. Refer to **Cooling - Standard Procedure** .
4. If equipped with the 2.0L diesel engine, install the charge air cooler. Refer to **Engine/Turbocharger System/COOLER and HOSES, Charge Air - Installation** .
5. Install the front bumper reinforcement. Refer to **Frame and Bumpers/Bumpers/REINFORCEMENT, Bumper - Installation** .
6. Install the front fascia. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Installation** .

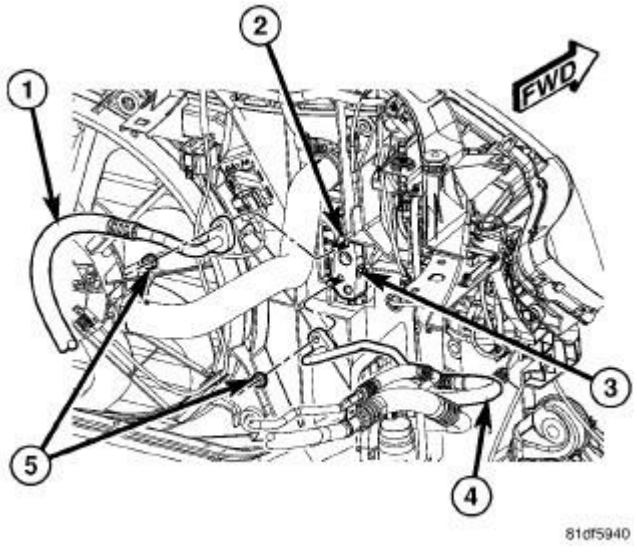

Fig. 225: Refrigerant Lines to Condenser Tapping Block
Courtesy of CHRYSLER LLC

7. Install the bolt (3) that secures the condenser tapping block (2) to the right side of the radiator support. Tighten the bolt securely.
8. Remove the tape or plug from the opened refrigerant line fittings and condenser ports.
9. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Connect the A/C liquid line (4) and the A/C discharge line (1) to the tapping block and install the retaining nuts (5). Tighten the nuts to 20 N.m (15 ft. lbs.).
11. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

12. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**
13. If the A/C condenser is being replaced, add 10 milliliters (0.3 fluid ounce) of refrigerant oil to the

refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

14. Charge the A/C system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

CORE, HEATER, FRONT

Description

DESCRIPTION

NOTE: LHD model shown. RHD model similar.

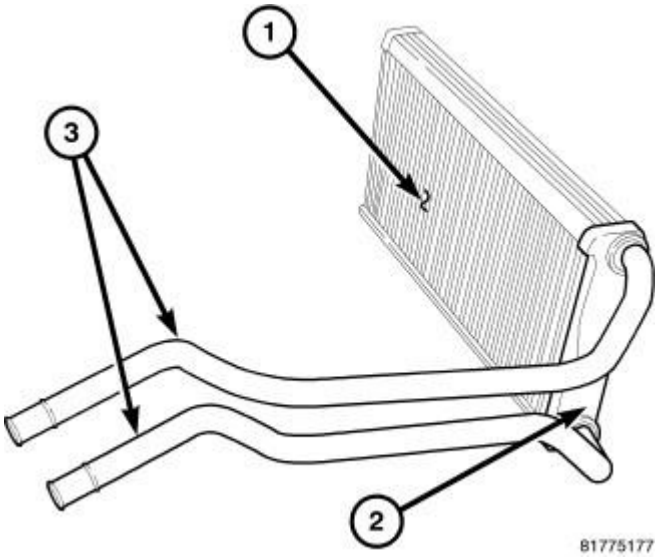

Fig. 226: Heater Core-Description
Courtesy of CHRYSLER LLC

The heater core (1) for the heating-A/C system is mounted within the HVAC air distribution housing, which is located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes with fins and is positioned within the air distribution housing so that only the selected amount of air entering the housing passes through the heater core before it is distributed through the heating-A/C system ducts and outlets. One end of the heater core is fitted with a tank (2) that includes the fittings for the heater core tubes (3).

The heater core can only be serviced by removing the HVAC housing from the vehicle.

Operation

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air

directed through the heater core picks up the heat from the heater core fins. The blend-air door allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and it must be replaced if inoperative, leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: The HVAC housing assembly must be removed from vehicle for service of the heater core.

NOTE: LHD model with A/C shown. RHD and heater-only models similar.

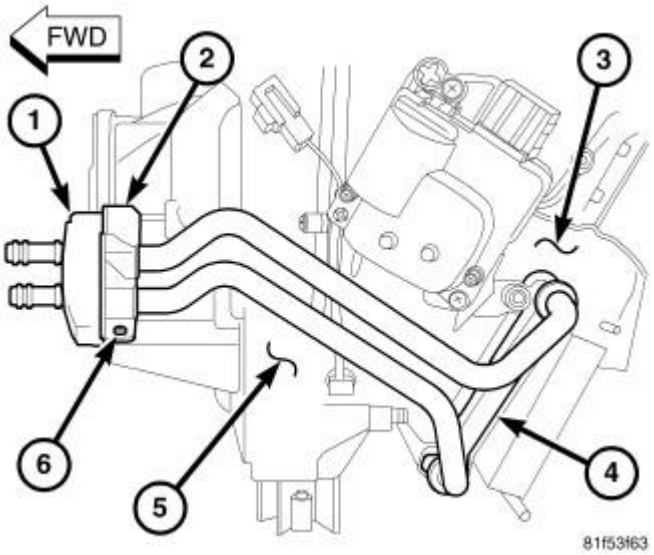

Fig. 227: Heater Core Removal/Installation
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
2. Remove the left side front floor duct. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Removal**.

NOTE: If the foam seal for the flange is deformed or damaged, it must be

replaced.

3. Remove the foam seal (1) from the flange (2) located on the front of the HVAC housing (5).
4. Remove the screw (6) that secures the flange to the front of the HVAC housing and remove the flange.
5. On RHD models, remove the air distribution housing from the HVAC housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**
6. Carefully pull the heater core (4) out of the driver side of the air distribution housing (3).

Installation

INSTALLATION

NOTE: LHD model with A/C shown. RHD and heater-only models similar.

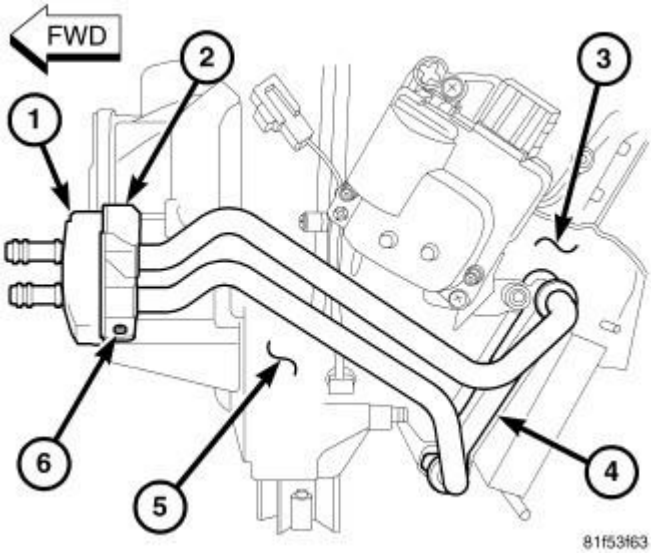

Fig. 228: Heater Core Removal/Installation
Courtesy of CHRYSLER LLC

1. Carefully install the heater core (4) into the side of the air distribution housing (3).
2. On RHD models, install the air distribution housing onto the HVAC housing (5). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
3. Install the flange (2) that secures the heater core tubes to the front of the HVAC housing.
4. Install the screw (6) that secures the flange to the HVAC housing. Tighten the screw to 1.2 N.m (10 in. lbs.).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

5. Install the foam seal (1) onto the flange.
6. Install the left side front floor duct. See **Heating and Air Conditioning/Distribution/DUCT, Floor**

Distribution - Installation.

NOTE: If the heater core is being replaced, flush the cooling system. Refer to Cooling - Standard Procedure .

7. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.

CORE, SERVICE PORT VALVE

Description

DESCRIPTION

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

The high side service port is located on the A/C liquid line near the right front strut tower. The low side service port is located on the A/C suction line near the dash panel.

Both the high side and low side A/C service port valve cores are serviceable.

NOTE: The protective cap aids in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective caps onto the service ports when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

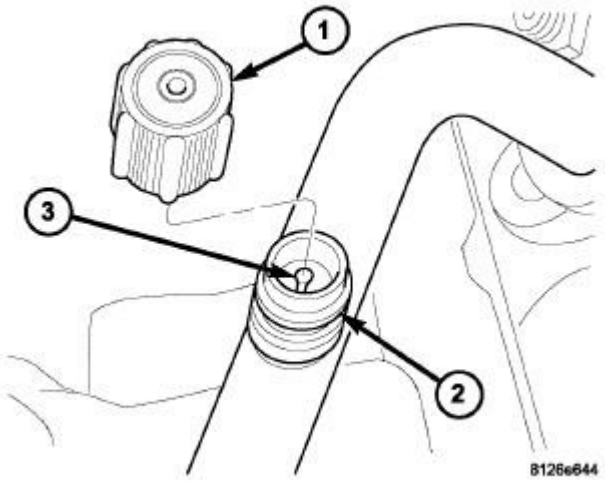

Fig. 229: Identifying A/C Service Port Components
Courtesy of CHRYSLER LLC

NOTE: Typical A/C service port shown.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

Installation

INSTALLATION

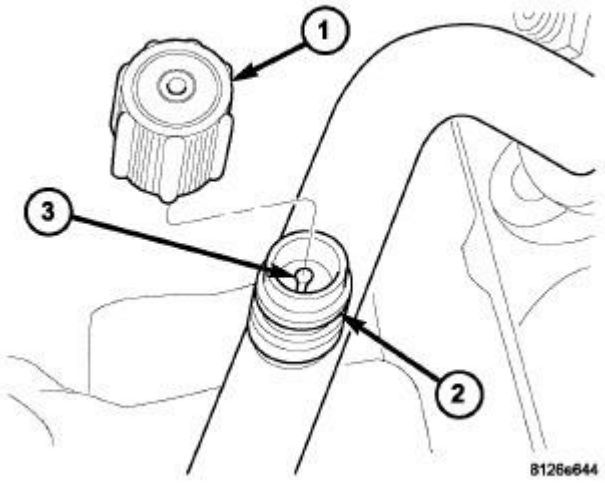

Fig. 230: Identifying A/C Service Port Components
Courtesy of CHRYSLER LLC

NOTE: Typical A/C service port shown.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

4. Evacuate and charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

5. Install the protective cap (1) onto the service port.

DRIER, A/C RECEIVER

Description

DESCRIPTION

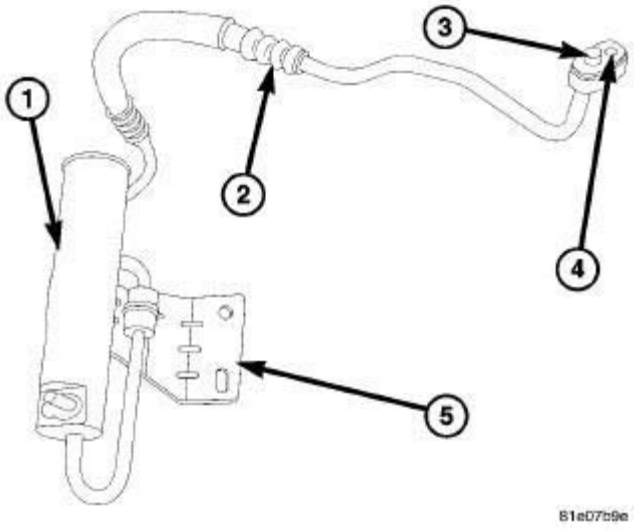

Fig. 231: Receiver/Drier Description
Courtesy of CHRYSLER LLC

The A/C receiver/drier (1) stores unused refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser until it becomes a liquid.

The A/C receiver/drier is installed on the high-side of the A/C system, below the engine compartment behind the right side of the front fascia and is connected to the right side of the A/C condenser by an integral refrigerant line (2). An integral mounting bracket (5) secures the A/C receiver/drier to the right front frame rail and the connections are sealed by use of rubber O-ring seals (3) and metal gaskets (4).

Operation

OPERATION

The A/C receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime

a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C receiver/drier has no serviceable parts except for the O-ring seals and gaskets. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C receiver/drier is disconnected.

The A/C receiver/drier cannot be repaired and must be replaced if leaking or damaged, or if an internal failure of the A/C compressor has occurred.

Removal

REMOVAL

WARNING: Review safety precautions and warnings in this part before performing this procedure. See Heating and Air Conditioning/Plumbing - Warning and. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions could result in possible serious or fatal injury.

NOTE: LHD model shown in illustrations. RHD model similar.

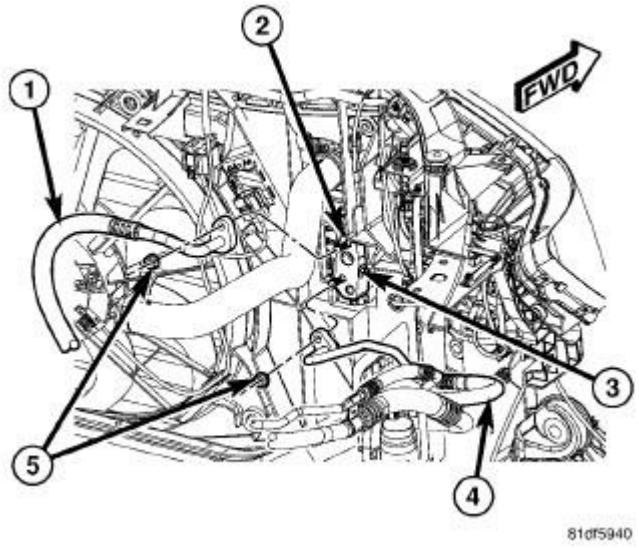

Fig. 232: Refrigerant Lines to Condenser Tapping Block
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Remove the nut (5) that secures the A/C liquid line (4) to the tapping block (2) located on the right side of

the A/C condenser.

4. Disconnect the A/C liquid line from the tapping block and remove and discard the O-ring seal and gasket.
5. Install plugs in, or tape over the opened refrigerant line fitting and condenser port.

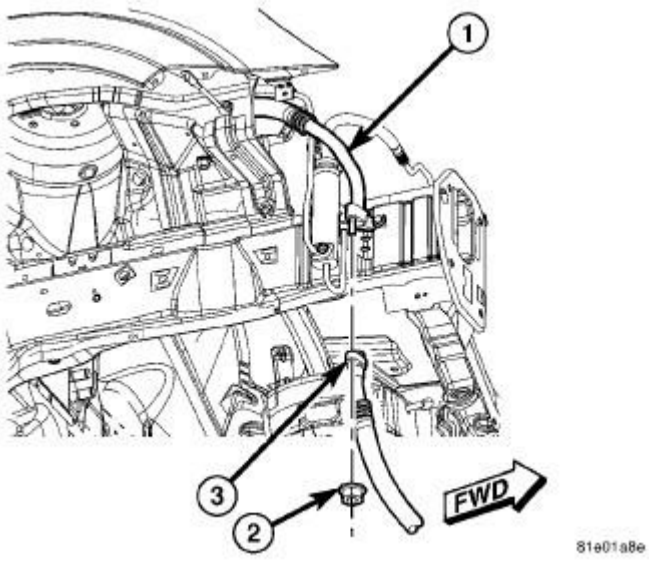

Fig. 233: Lower to Upper Suction Line
Courtesy of CHRYSLER LLC

6. Raise and support the vehicle.
7. Position the front portion of the right front wheelhouse splash shield out of the way to gain access to the A/C receiver/drier. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
8. Remove the nut (2) that secures the lower A/C suction line (3) to the upper A/C suction line (1).
9. Disconnect the lower A/C suction line to the upper A/C suction line and remove and discard the O-ring seal and gasket.

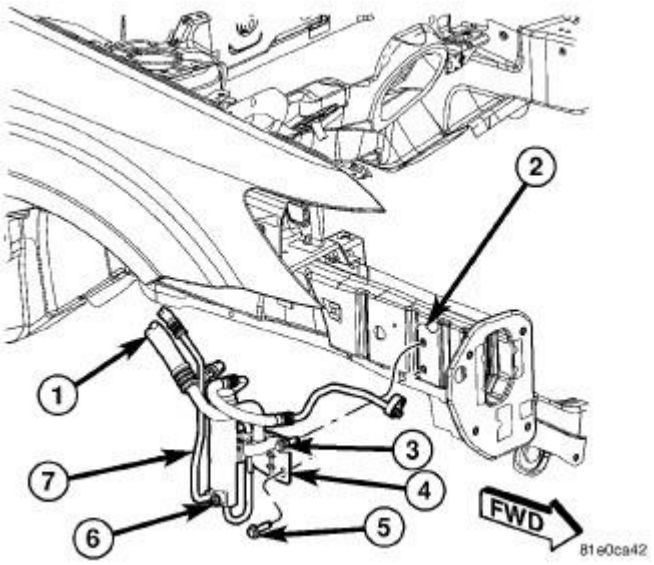

Fig. 234: Receiver/Drier Removal/Installation 09
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with front fascia and headlamp removed for clarity.

10. Remove the bolt (3) that secures the rear section of the A/C suction line (1) to the right front frame rail (2) and position the suction line out of the way.
11. Remove the nut (6) that secures the rear section of the A/C liquid line (7) to the A/C receiver/drier (4).
12. Disconnect the rear section of the A/C liquid line from the A/C receiver/drier, remove and discard the O-ring seal and gasket and position the liquid line out of the way.
13. Remove the bolt (5) that secure the A/C receiver/drier to the right front frame rail and remove the receiver/drier.
14. Install plugs in, or tape over all of the opened refrigerant line fittings and the receiver/drier port.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. See Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Removal. Failure to replace the A/C Receiver Drier can cause serious damage to the replacement A/C

compressor.

NOTE: If only the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

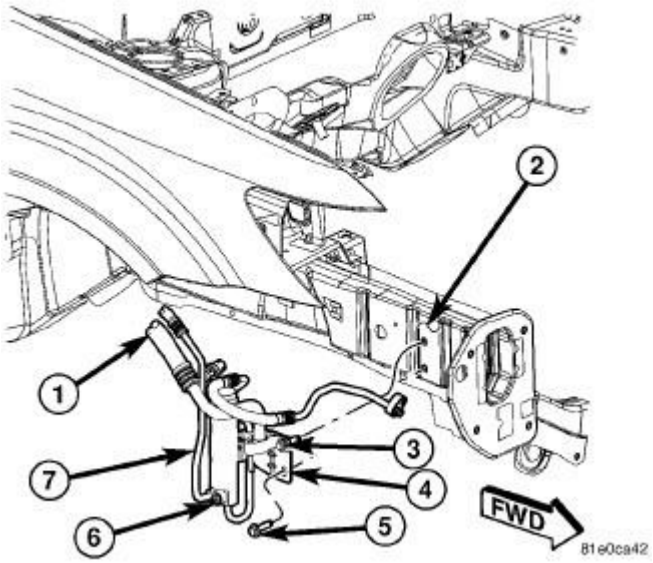

Fig. 235: Receiver/Drier Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with front fascia and headlamp removed for clarity.

1. Position the A/C receiver/drier (4) to the right front frame rail (2) and loosely install the lower retaining bolt (5).
2. Install the bolt (3) that secures the upper portion of the A/C suction line (1) to the right front frame rail. Tighten both bolts securely.
3. Remove the tape or plugs from the opened refrigerant line fittings and the receiver/drier port.

4. Lubricate new O-ring seals with clean refrigerant oil and install them and new gaskets onto the refrigerant line fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the rear section of the A/C liquid line (7) to the A/C receiver/drier.
6. Install the nut (6) that secures the rear section of the A/C liquid line to the A/C receiver/drier. Tighten the nut to 20 N.m (15 ft. lbs.).

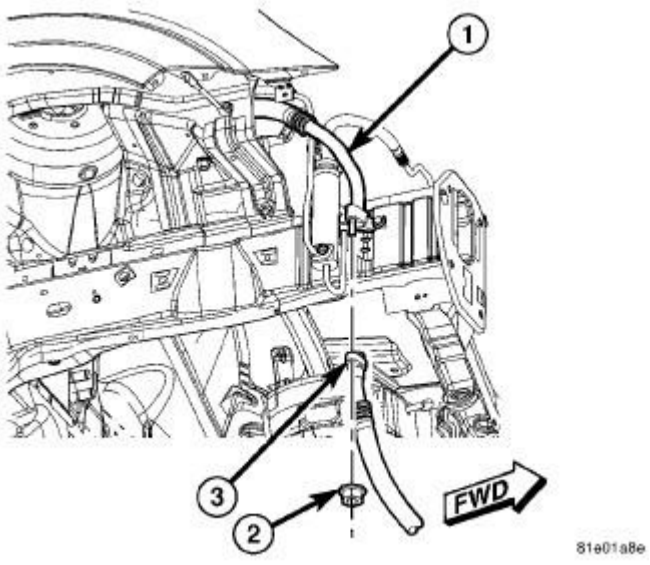

Fig. 236: Lower to Upper Suction Line
Courtesy of CHRYSLER LLC

7. Connect the lower portion of the A/C suction line (3) to the upper suction line (1)
8. Install the nut (2) that secures the lower portion of the A/C suction line to the upper suction line. Tighten the nut to 20 N.m (15 ft. lbs.).
9. Reposition the right front wheel house splash shield to the body. Refer to **Body/Exterior/SHIELD, Splash - Installation** .

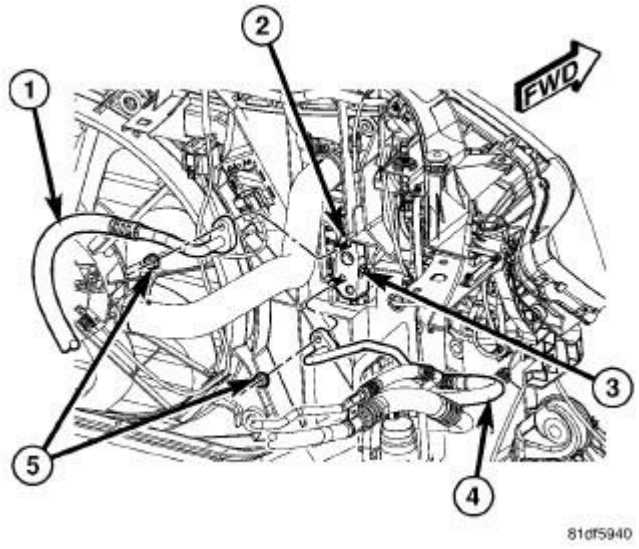

Fig. 237: Refrigerant Lines to Condenser Tapping Block
Courtesy of CHRYSLER LLC

10. Lower the vehicle.
11. Remove the tape or plug from the opened refrigerant line fitting and condenser ports.
12. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gaskets onto the refrigerant line fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
13. Connect the A/C liquid line (4) to the tapping block (2) and install the retaining nut (5). Tighten the nut to 20 N.m (15 ft. lbs.).
14. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

15. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**
16. If the A/C condenser is being replaced, add 10 milliliters (0.3 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
17. Charge the A/C system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

EVAPORATOR, A/C, FRONT

Description

DESCRIPTION

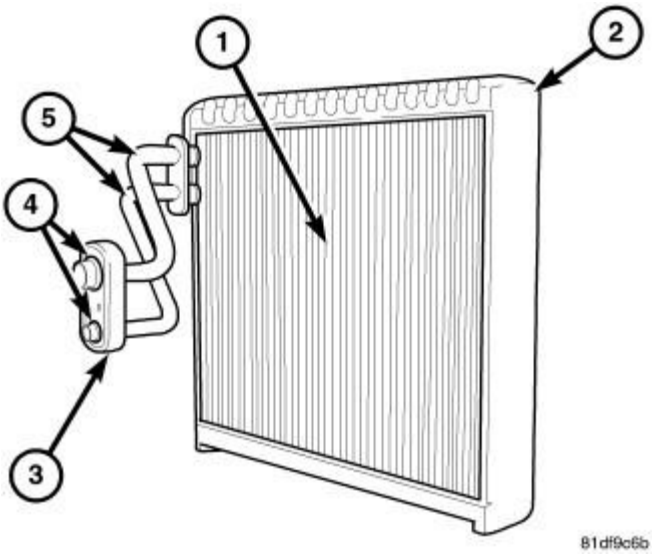

Fig. 238: Evaporator Description
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

The A/C evaporator (1) for the heating-A/C system is mounted in the HVAC housing, which is located behind the instrument panel. The A/C evaporator and its insulator (2) are positioned within the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets.

A tapping block (3) and O-ring seals (4) are used to connect and seal the A/C evaporator tubes (5) to the A/C expansion valve.

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

Operation

OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the

connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C expansion valve is removed from the A/C evaporator.

The A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: The HVAC housing assembly must be removed from vehicle and disassembled for service of the A/C evaporator.

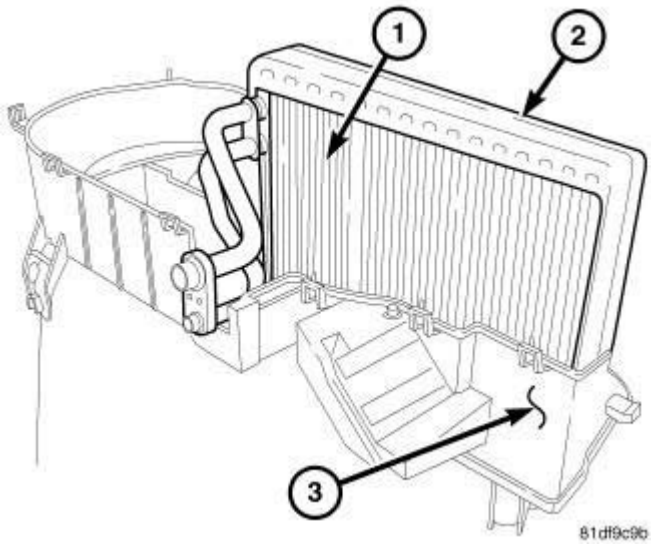

Fig. 239: Evaporator Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Remove the HVAC housing and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
2. Disassemble the HVAC housing to gain access to the A/C evaporator. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Disassembly**.

NOTE: If the foam insulator around the A/C evaporator is deformed or damaged, the insulator must be replaced.

3. Carefully lift the A/C evaporator (1) and the foam insulator (2) out of the lower half of the HVAC housing (3).

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: If only the A/C evaporator is being replaced, add 10 milliliters (0.3 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown. RHD model similar.

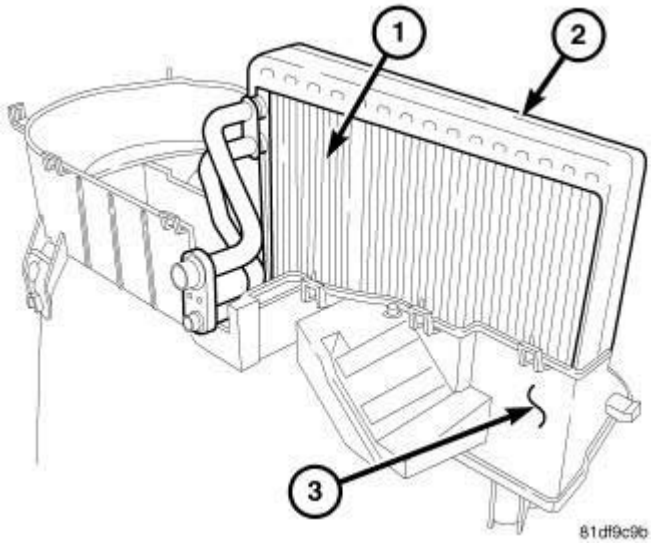

Fig. 240: Evaporator Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: Make sure that the foam insulator is properly positioned around the A/C evaporator and in the HVAC housing.

1. Carefully install the A/C evaporator (1) and foam insulator (2) into the lower half of the HVAC housing (3).
2. Assemble the HVAC housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Assembly**.
3. Install the HVAC housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
4. If the A/C evaporator is being replaced, add 10 milliliters (0.3 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

LINE, A/C DISCHARGE

Description

DESCRIPTION

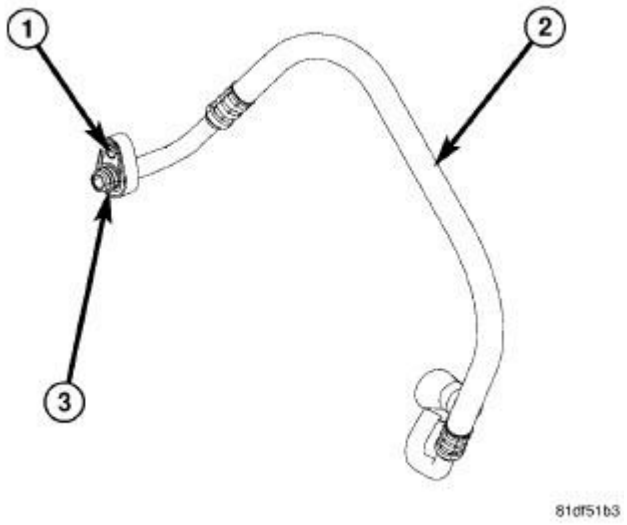

Fig. 241: Discharge Line Description
Courtesy of CHRYSLER LLC

NOTE: 2.7L shown. Other engines similar.

The A/C discharge line (2) is the refrigerant line that carries refrigerant from the A/C compressor to the A/C condenser.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C discharge line has no serviceable parts except for the metal gaskets (1) and rubber O-ring seals (3) used on the fittings. The O-ring seals are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C discharge line is disconnected.

The A/C discharge line cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

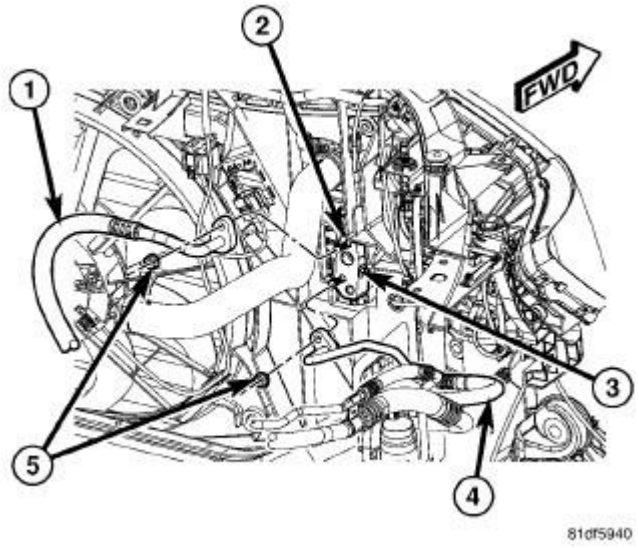

Fig. 242: Refrigerant Lines to Condenser Tapping Block
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Remove the nut (5) that secures the A/C discharge line (1) to the condenser tapping block (2) located on the right side of the condenser.
4. Disconnect the A/C discharge line from the tapping block.

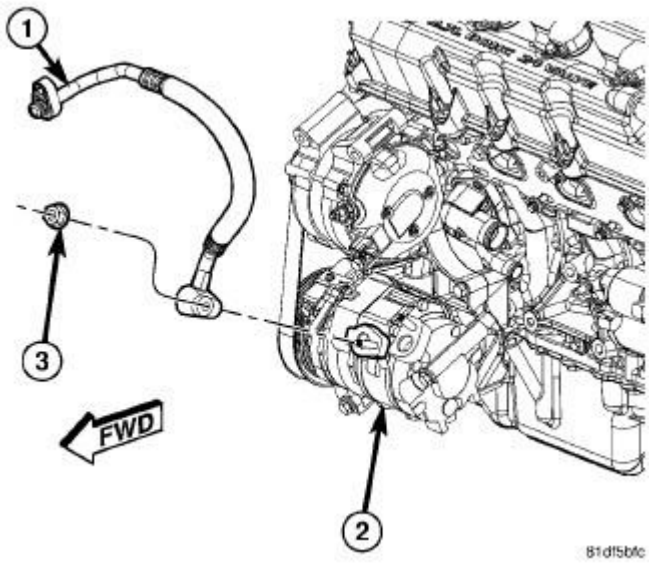

Fig. 243: Discharge Line to Compressor
Courtesy of CHRYSLER LLC

NOTE: 2.7L shown. Other engines similar.

5. Remove the nut (3) that secures the A/C discharge line (1) to the A/C compressor (2).
6. Disconnect the A/C discharge line from the A/C compressor and remove the discharge line from the engine compartment.
7. Remove and discard the O-ring seals and gaskets and install plugs in, or tape over the opened discharge line fittings and the compressor and condenser ports.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and

metal gaskets could result in a refrigerant system leak.

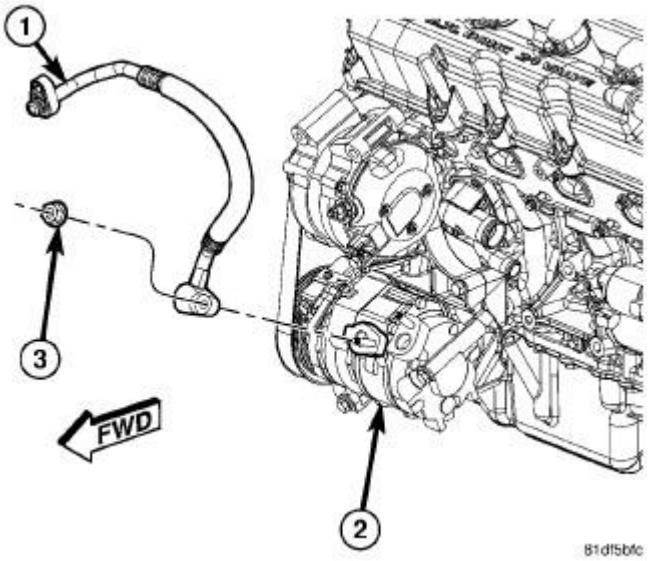

Fig. 244: Discharge Line to Compressor
Courtesy of CHRYSLER LLC

NOTE: 2.7L shown. Other engines similar.

1. Remove the tape or plugs from the opened discharge line fittings and the compressor and condenser ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the A/C discharge line (1) into the engine compartment and connect it to the A/C compressor (2).
4. Install the nut (3) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 20 N.m (15 ft. lbs.).

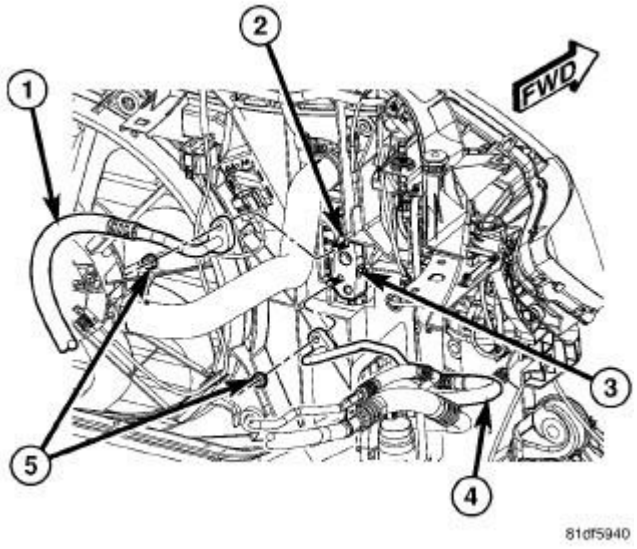

Fig. 245: Refrigerant Lines to Condenser Tapping Block
Courtesy of CHRYSLER LLC

5. Connect the A/C discharge line (1) to the condenser tapping block (2).
6. Install the nut (5) that secures the A/C discharge line to the tapping block. Tighten the nut to 20 N.m (15 ft. lbs.).
7. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

8. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
9. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
10. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

LINE, A/C LIQUID

Description

DESCRIPTION

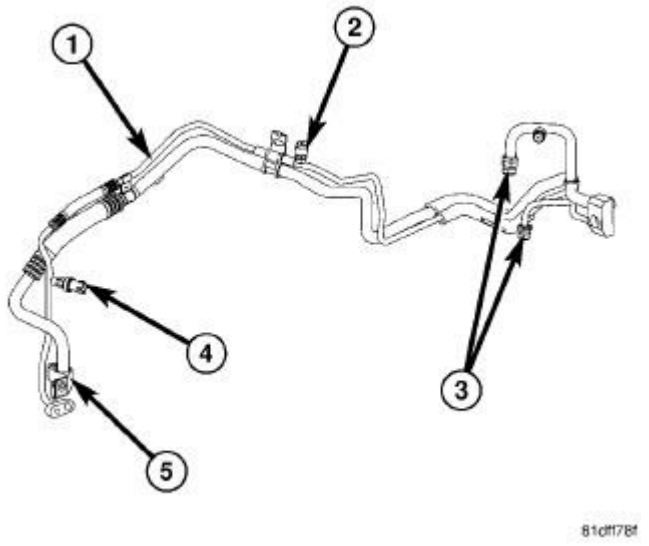

Fig. 246: Liquid/Suction Line Assembly with Rear A/C
Courtesy of CHRYSLER LLC

NOTE: A/C liquid and suction line assembly with rear A/C shown. Front A/C only line assembly similar.

The A/C liquid line is serviced in two sections. The front section of the A/C liquid line is the refrigerant line that carries liquid refrigerant from the A/C condenser to the A/C receiver/drier and is only serviced as an assembly with receiver/drier. See **Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Description**.

The rear section of the A/C liquid line (1) carries liquid refrigerant from the A/C receiver/drier to the A/C expansion valve and includes the high side service port (2) and a fitting for the A/C pressure transducer (4). The rear section of the A/C liquid line is only serviced as an assembly with the A/C suction line (5). When equipped with rear A/C, the A/C liquid and suction line assembly includes connections for the underbody refrigerant lines (3).

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C liquid and suction line assembly has no serviceable parts except for the metal gaskets, rubber O-ring seals and the service port valve cores. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C liquid/suction line assembly is disconnected.

The A/C liquid and suction line assembly cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Review safety precautions and warnings in this part before performing this procedure. See Heating and Air Conditioning/Plumbing - Warning and. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions could result in possible serious or fatal injury.

NOTE: The rear A/C liquid line is only serviced as an assembly with the upper A/C suction line.

NOTE: LHD model shown in illustrations. RHD model similar.

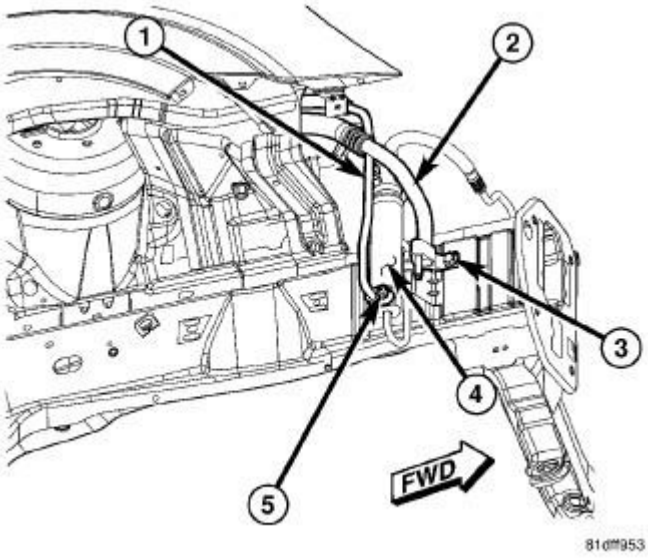

Fig. 247: Liquid Line to Receiver/Drier
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with front fascia and headlamp removed for clarity.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Raise and support the vehicle.
4. Position the front portion of the right front wheelhouse splash shield out of the way to gain access to the A/C receiver/drier. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
5. Remove the nut (5) that secures the rear section of the A/C liquid line (1) to the A/C receiver/drier (4).
6. Disconnect the rear section of the A/C liquid line from the A/C receiver/drier and remove and discard the O-ring seal and gasket.

7. Disconnect the lower portion of the A/C suction line from the A/C liquid and suction line assembly. See **Heating and Air Conditioning/Plumbing/LINE, A/C Suction - Removal**.
8. Remove the bolt (3) that secures the rear section of the A/C suction line (2) to the right front frame rail.

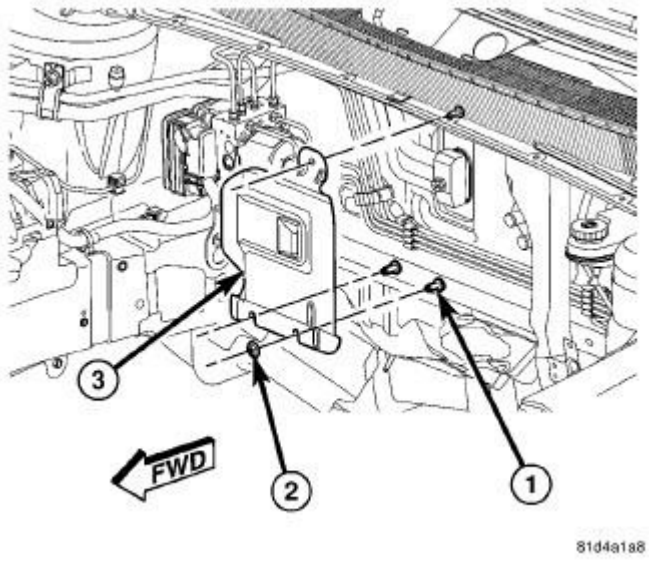

Fig. 248: Heat Shield - Unified Line
Courtesy of CHRYSLER LLC

9. Lower the vehicle.
10. If equipped with heat shield (3), remove the top nut (2) that secures the heat shield to the stud (1) located on the dash panel.

NOTE: Two slots are provided at the bottom of the heat shield to aid in heat shield removal, if equipped. Complete removal of the two bottom heat shield retaining nuts is not required.

11. If equipped, reach behind the engine and remove the two bottom nuts the that secure the heat shield to the studs located on the dash panel and remove the heat shield. Rotate and tilt the heat shield as required.

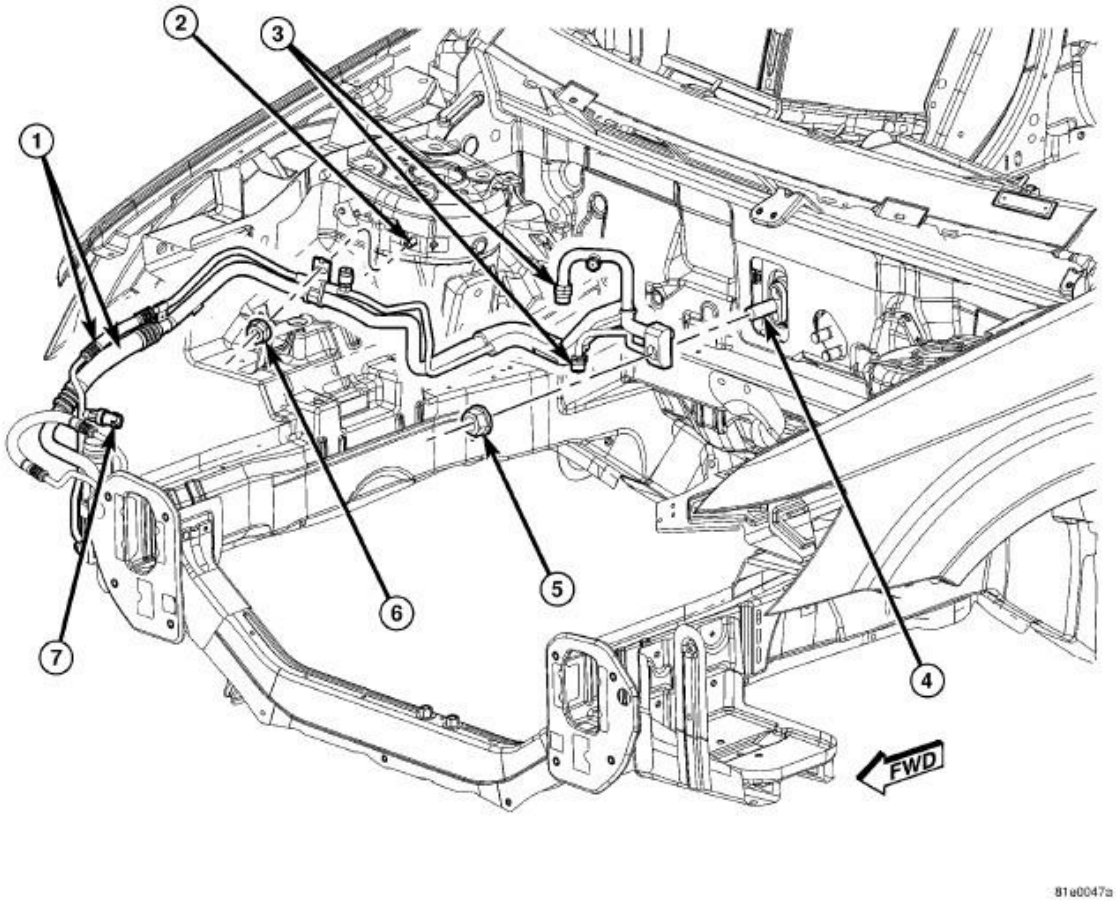

Fig. 249: Liquid & Suction Line Assembly Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: It is only necessary to position the engine coolant reservoir and the power steering fluid reservoir out of the way. Draining of the coolant and power steering fluid is not required.

12. Remove the engine coolant reservoir from the right side of the engine compartment and position it out of the way. Refer to **Cooling/Engine/BOTTLE, Coolant Recovery - Removal** .
13. Remove the power steering fluid reservoir from the right front strut tower and position it out of the way. Refer to **Steering/Pump/RESERVOIR, Power Steering Pump - Removal** .
14. If equipped with ABS, remove the ABS control module and pump assembly and position the brake lines out of the way as necessary. Refer to **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Installation** .
15. Disconnect the wire harness connector from the A/C pressure transducer (7) located on the A/C liquid line and remove the transducer if required. See **Heating and Air Conditioning/Controls/TRANSDUCER, A/C Pressure - Removal**.
16. If equipped with rear A/C, disconnect the rear A/C extension lines from the fittings (3) located on the A/C liquid and suction line assembly. See **Heating and Air Conditioning/Plumbing/LINES, A/C Underbody - Removal**.

17. Remove the nut (6) that secures the refrigerant line retaining bracket to the stud (2) located on the right front strut tower.
18. Remove the nut (5) that secures the A/C liquid and suction line assembly (1) to the A/C expansion valve (4).
19. Disconnect the A/C liquid and suction line assembly from the A/C expansion valve and remove and discard the O-ring seals.
20. Remove the A/C liquid and suction line assembly from the engine compartment.
21. Install plugs in, or tape over all of the opened refrigerant line fittings and the expansion valve and receiver/drier ports.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

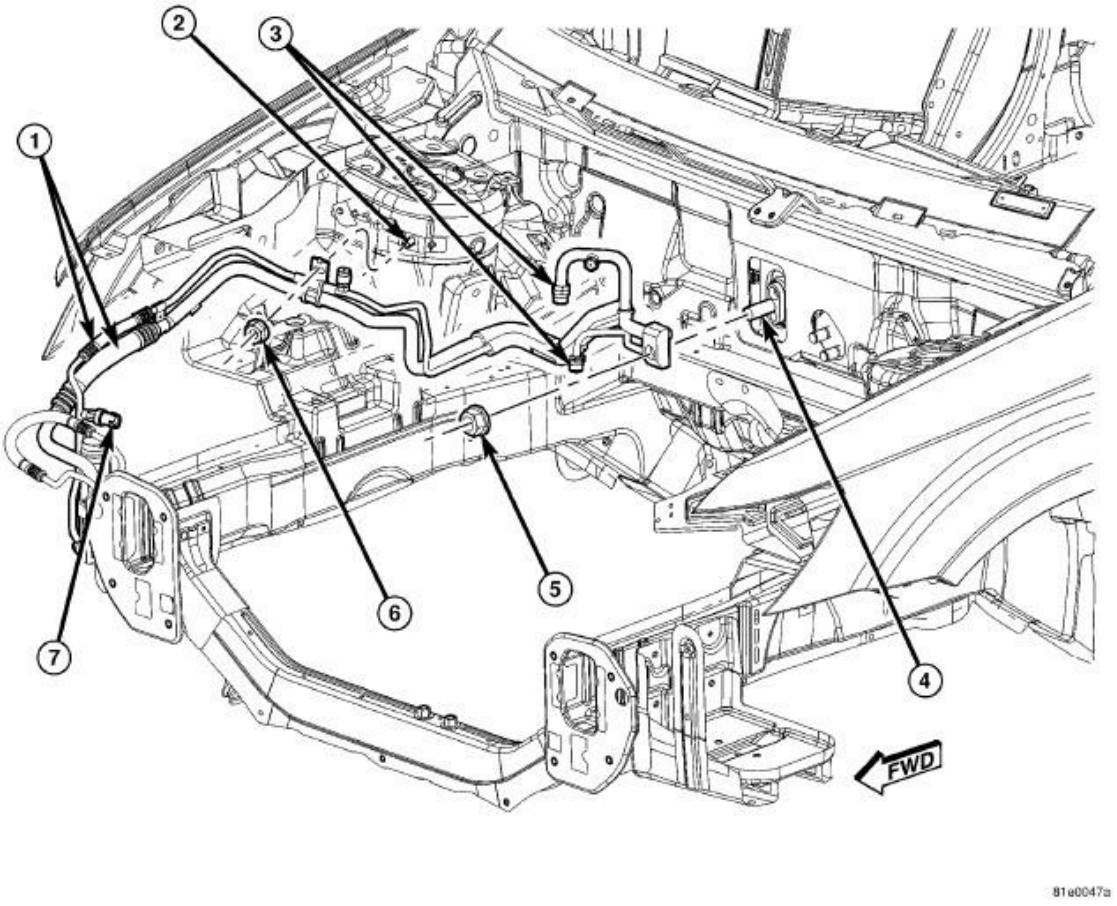

Fig. 250: Liquid & Suction Line Assembly Removal/Installation
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from all of the opened refrigerant line fittings and the expansion valve and receiver/drier ports.
2. Lubricate new rubber O-rings with clean refrigerant oil and install them and new gaskets onto the liquid and suction line fittings. Use only the specified O-ring seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the A/C liquid and suction line assembly (1) into the engine compartment.
4. Connect the A/C liquid and suction line assembly to the A/C expansion valve (4).

CAUTION: Use care when installing the A/C lines to the A/C expansion valve. Carefully align the tube ends with the valve prior to tightening the A/C line retaining nut or damage to the sealing rings and tube ends may occur.

5. Install the nut (5) that secures the A/C liquid and suction line assembly to the A/C expansion valve. Tighten the nut to 20 N.m (15 ft. lbs.).
6. Install the nut (6) that secures the refrigerant line retaining bracket to the stud (2) located on the right

front strut tower. Tighten the nut securely.

7. If equipped with rear A/C, connect the rear A/C extension lines to the fittings (3) located on the A/C liquid and suction line assembly. See **Heating and Air Conditioning/Plumbing/LINES, A/C Underbody - Installation**.
8. If removed, lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the fitting for the A/C pressure transducer (7) located on the A/C liquid line and install the pressure transducer. Tighten the A/C pressure transducer to 5.6 N.m (50 in. lbs.).
9. Connect the wire harness connector to the A/C pressure transducer.
10. If equipped with ABS, install the ABS control module and pump assembly. Refer to **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Installation** .
11. Install the power steering fluid reservoir. Refer to **Steering/Pump/RESERVOIR, Power Steering Pump - Installation** .
12. Install the engine coolant reservoir. Refer to **Cooling/Engine/BOTTLE, Coolant Recovery - Installation** .

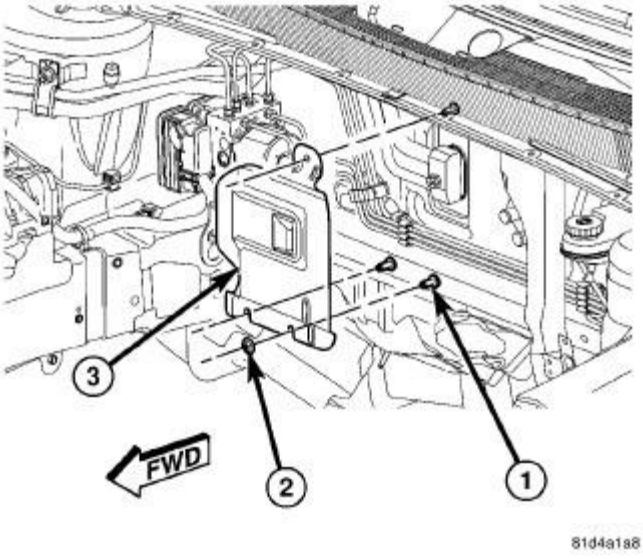

Fig. 251: Heat Shield - Unified Line
Courtesy of CHRYSLER LLC

13. If equipped, position the heat shield (3) onto the three studs (1) located on the dash panel in the engine compartment and install the three retaining nuts (2). Tighten the nuts to 1 N.m (10 in. lbs.).

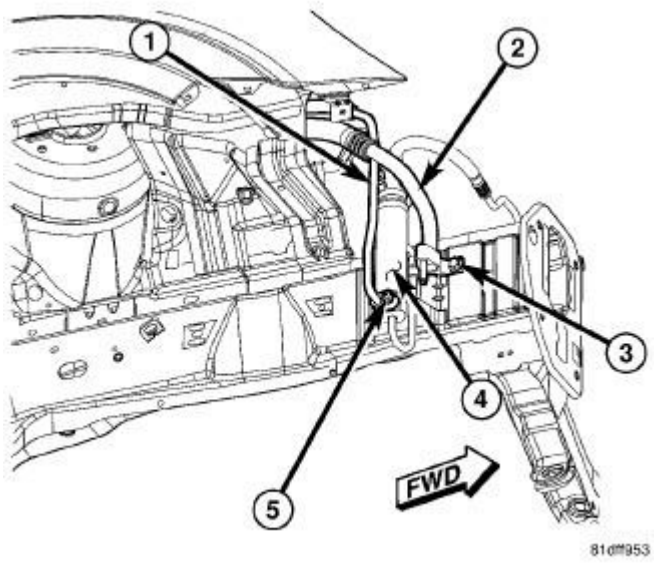

Fig. 252: Liquid Line to Receiver/Drier
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with front fascia and headlamp removed for clarity.

14. Raise and support the vehicle.
15. Install the bolt (3) that secures the upper portion of the A/C suction line (2) to the right front frame rail. Tighten the bolt securely
16. Install the lower portion of the A/C suction line to the upper suction line. See **Heating and Air Conditioning/Plumbing/LINE, A/C Suction - Installation**.
17. Connect the rear section of the A/C liquid line (1) to the A/C receiver/drier (4).
18. Install the nut (5) that secures the rear section of the A/C liquid line (1) to the A/C receiver/drier (4). Tighten the nut to 20 N.m (15 ft. lbs.).
19. Reposition the right front wheel house splash shield to the body. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
20. Lower the vehicle.
21. Reconnect the negative battery cable.
22. If equipped with ABS, bleed the brake system. Refer to **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Installation** .

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

23. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
24. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant -**

Standard Procedure.

25. Charge the A/C system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

LINE, A/C SUCTION

Description

DESCRIPTION

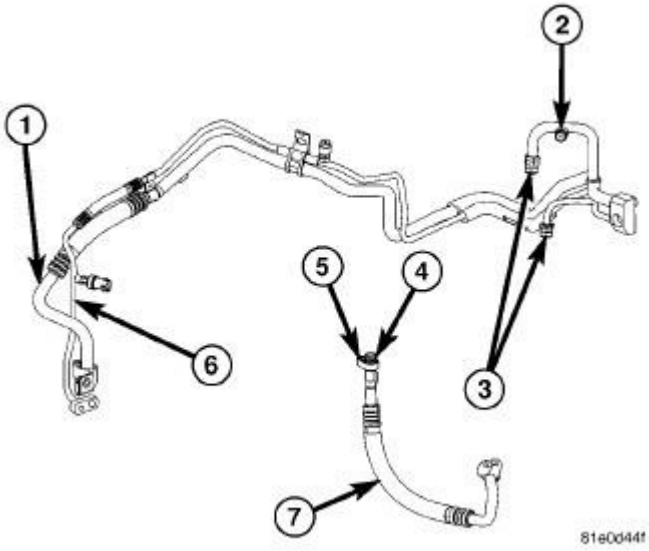

Fig. 253: Upper Suction/Liquid Line Assembly
Courtesy of CHRYSLER LLC

NOTE: A/C Suction line for 2.7L engine shown. Other engines similar.

The A/C suction line carries refrigerant from the A/C expansion valve to the A/C compressor and is serviced in two sections. The upper section of the A/C suction line (1) includes the low side service port (2) and is only serviced as an assembly with the rear A/C liquid line (6). When equipped with rear A/C, the A/C liquid and suction line assembly includes connections for the underbody refrigerant lines (3). The lower section of the A/C suction line (7) connects to the upper section of the suction line and the connections are sealed by use of metal gaskets (5) and rubber O-ring seals (4)

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The lower A/C suction line and the A/C liquid and suction line assembly has no serviceable parts except for the metal gaskets, rubber O-ring seals and the service port valve cores. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the lower A/C suction line and/or the A/C liquid and suction line assembly is disconnected.

The lower A/C suction line and the A/C liquid and suction line assembly cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Review safety precautions and warnings in this part before performing this procedure. See Heating and Air Conditioning/Plumbing - Warning and. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions could result in possible serious or fatal injury.

NOTE: The A/C suction line is serviced in two sections.

NOTE: LHD model shown in illustrations. RHD model similar.

Upper A/C Suction Line

NOTE: The upper portion of the A/C suction line is only serviced as an assembly with the rear A/C liquid line.

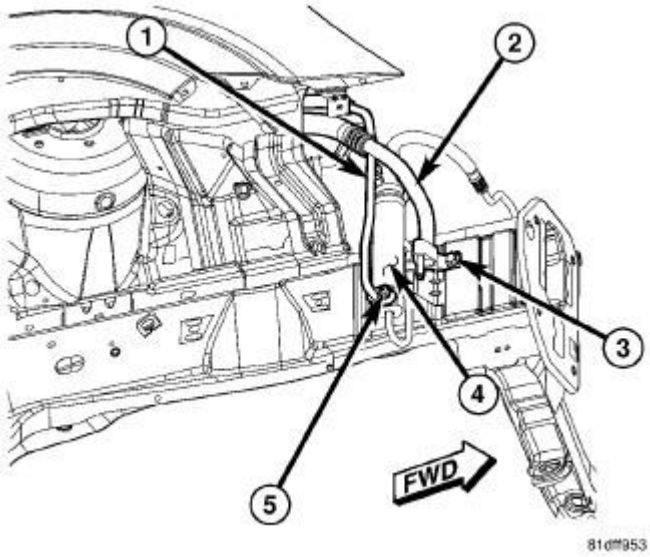

Fig. 254: Liquid Line to Receiver/Drier 09
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with front fascia and headlamp removed for clarity.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing -**

Standard Procedure.

3. Raise and support the vehicle.
4. Position the front portion of the right front wheelhouse splash shield out of the way to gain access to the A/C receiver/drier. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
5. Remove the nut (5) that secures the rear section of the A/C liquid line (1) to the A/C receiver/drier (4).
6. Disconnect the rear section of the A/C liquid line from the A/C receiver/drier and remove and discard the O-ring seal and gasket.
7. Disconnect the lower portion of the A/C suction line from the A/C liquid and suction line assembly. See **Heating and Air Conditioning/Plumbing/LINE, A/C Suction - Removal**.
8. Remove the bolt (3) that secures the rear section of the A/C suction line (2) to the right front frame rail.

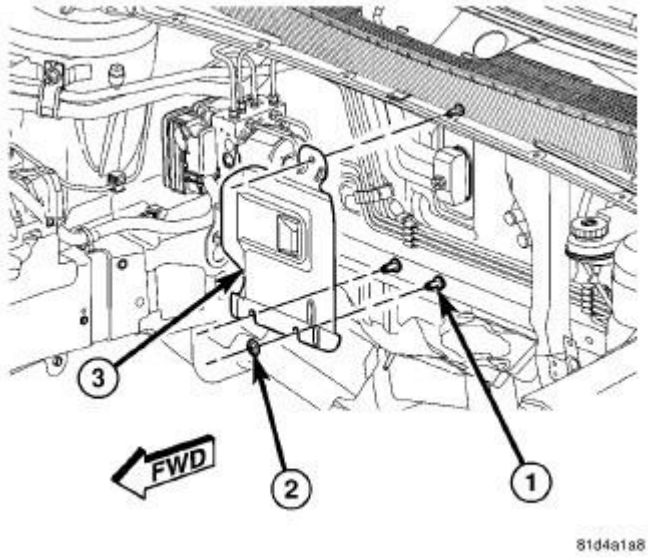

Fig. 255: Heat Shield - Unified Line
Courtesy of CHRYSLER LLC

9. Lower the vehicle.
10. If equipped with heat shield (3), remove the top nut (2) that secures the heat shield to the stud (1) located on the dash panel.

NOTE: Two slots are provided at the bottom of the heat shield to aid in heat shield removal, if equipped. Complete removal of the two bottom heat shield retaining nuts is not required.

11. If equipped, reach behind the engine and remove the two bottom nuts the that secure the heat shield to the studs located on the dash panel and remove the heat shield. Rotate and tilt the heat shield as required.

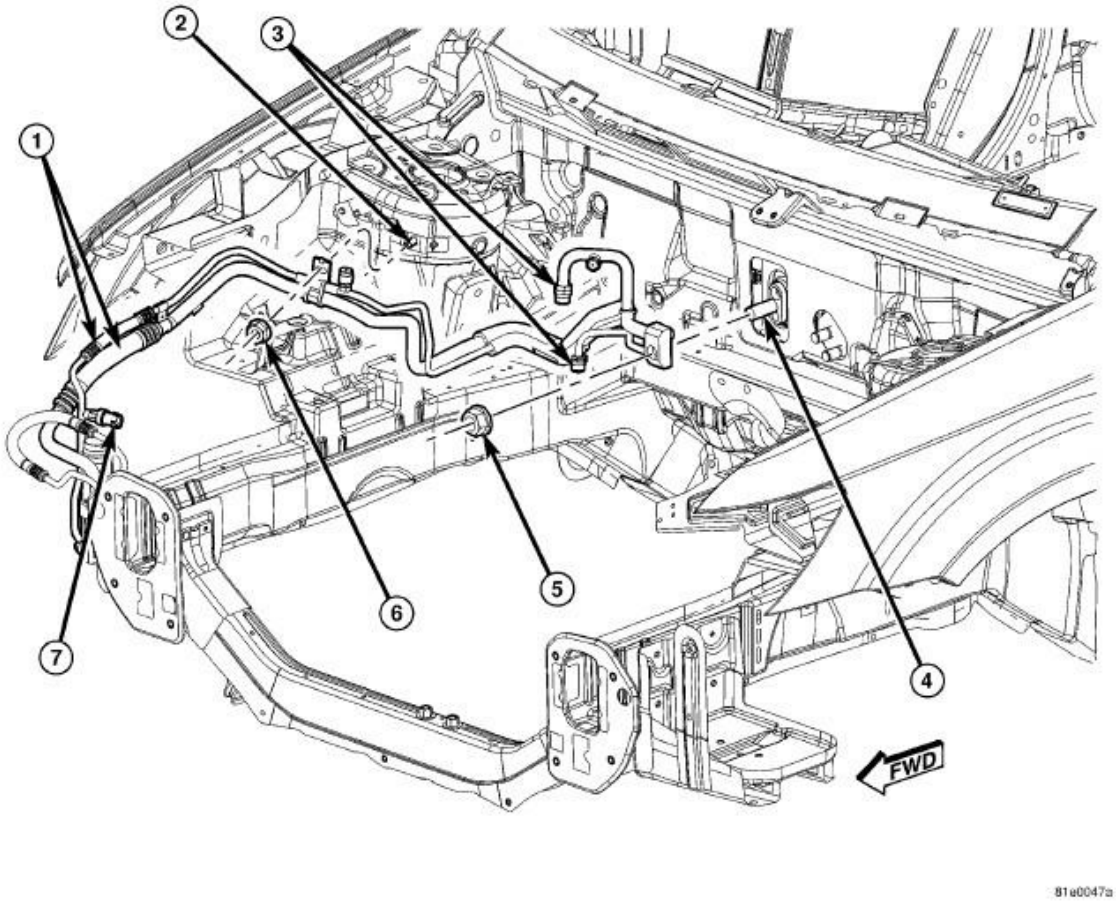

Fig. 256: Liquid & Suction Line Assembly Removal/Installation
Courtesy of CHRYSLER LLC

NOTE: It is only necessary to position the engine coolant reservoir and the power steering fluid reservoir out of the way. Draining of the coolant and power steering fluid is not required.

12. Remove the engine coolant reservoir from the right side of the engine compartment and position it out of the way. Refer to **Cooling/Engine/BOTTLE, Coolant Recovery - Removal** .
13. Remove the power steering fluid reservoir from the right front strut tower and position it out of the way. Refer to **Steering/Pump/RESERVOIR, Power Steering Pump - Removal** .
14. If equipped with ABS, remove the ABS control module and pump assembly and position the brake lines out of the way as necessary. Refer to **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Installation** .
15. Disconnect the wire harness connector from the A/C pressure transducer (7) located on the A/C liquid line and remove the transducer if required. See **Heating and Air Conditioning/Controls/TRANSDUCER, A/C Pressure - Removal**.
16. If equipped with rear A/C, disconnect the rear A/C extension lines from the fittings (3) located on the A/C liquid and suction line assembly. See **Heating and Air Conditioning/Plumbing/LINES, A/C Underbody - Removal**.

17. Remove the nut (6) that secures the refrigerant line retaining bracket to the stud (2) located on the right front strut tower.
18. Remove the nut (5) that secures the A/C liquid and suction line assembly (1) to the A/C expansion valve (4).
19. Disconnect the A/C liquid and suction line assembly from the A/C expansion valve and remove and discard the O-ring seals.
20. Remove the A/C liquid and suction line assembly from the engine compartment.
21. Install plugs in, or tape over all of the opened refrigerant line fittings and the expansion valve and receiver/drier ports.

Lower A/C Suction Line

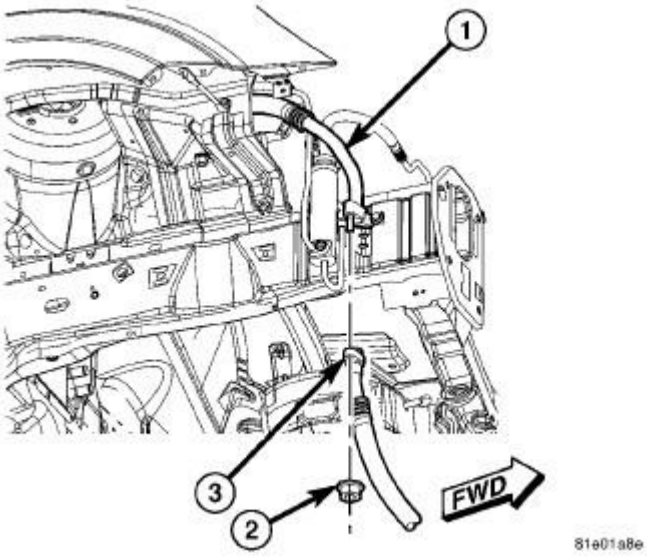

Fig. 257: Lower to Upper Suction Line
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with front fascia and headlamp removed for clarity.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Raise and support the vehicle.
4. Position the front portion of the right front wheelhouse splash shield out of the way to gain access to the A/C receiver/drier. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
5. Remove the nut (2) that secures the lower A/C suction line (3) to the upper A/C suction line (1).
6. Disconnect the lower A/C suction line to the upper A/C suction line and remove and discard the O-ring seal and gasket.

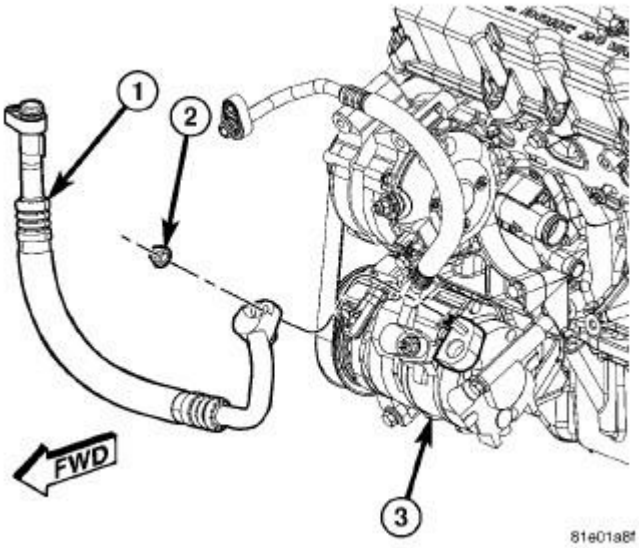

Fig. 258: Lower Suction Line to Compressor
Courtesy of CHRYSLER LLC

NOTE: 2.7L shown. Other engines similar.

7. Remove the nut (2) that secures the lower A/C suction line (1) to the A/C compressor (3).
8. Disconnect the lower A/C suction line from the A/C compressor and remove the lower line from the engine compartment.
9. Remove and discard the O-ring seals and gaskets and install plugs in, or tape over all the opened suction line fittings and the compressor port.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Upper A/C Suction Line

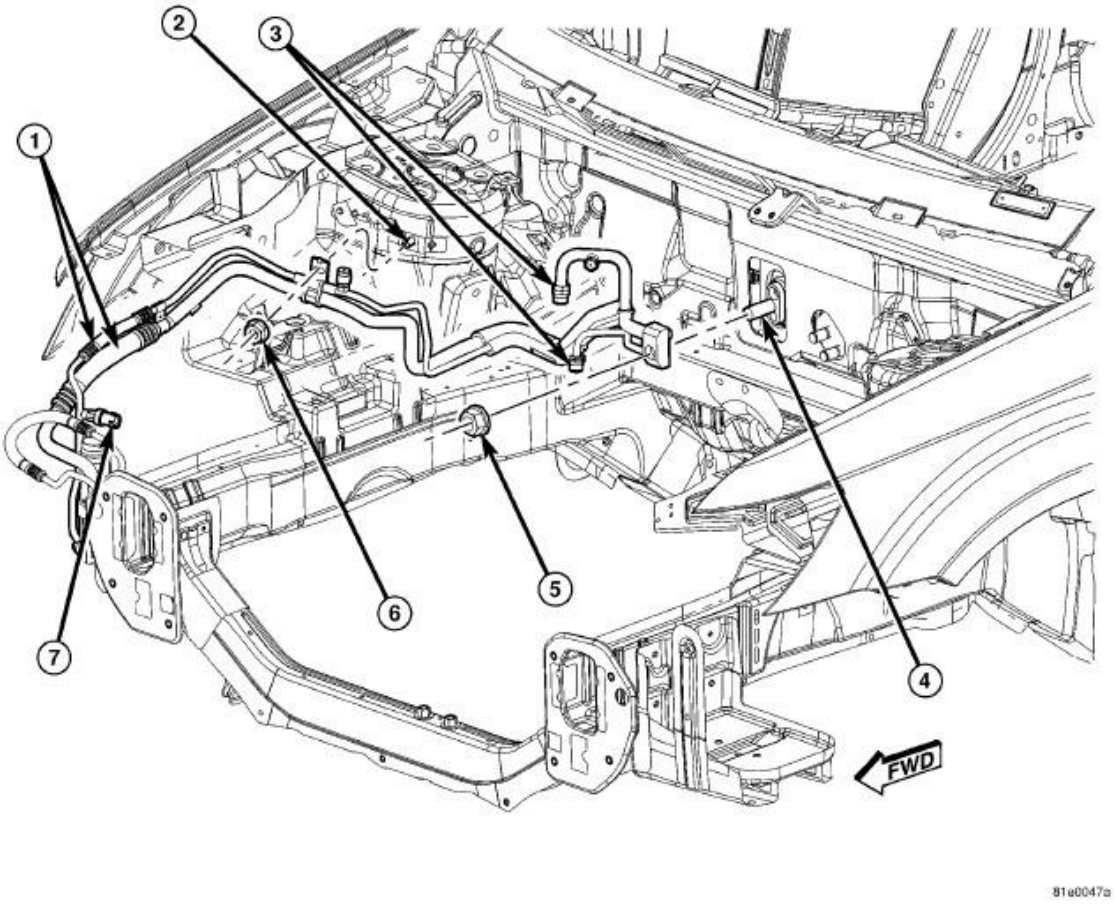

Fig. 259: Liquid & Suction Line Assembly Removal/Installation
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from all of the opened refrigerant line fittings and the expansion valve and receiver/drier ports.
2. Lubricate new rubber O-rings with clean refrigerant oil and install them and new gaskets onto the liquid and suction line fittings. Use only the specified O-ring seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the A/C liquid and suction line assembly (1) into the engine compartment.
4. Connect the A/C liquid and suction line assembly to the A/C expansion valve (4).

CAUTION: Use care when installing the A/C lines to the A/C expansion valve. Carefully align the tube ends with the valve prior to tightening the A/C line retaining nut or damage to the sealing rings and tube ends may occur.

5. Install the nut (5) that secures the A/C liquid and suction line assembly to the A/C expansion valve. Tighten the nut to 20 N.m (15 ft. lbs.).
6. Install the nut (6) that secures the refrigerant line retaining bracket to the stud (2) located on the right front strut tower. Tighten the nut securely.
7. If equipped with rear A/C, connect the rear A/C extension lines to the fittings (3) located on the A/C liquid and suction line assembly. See **Heating and Air Conditioning/Plumbing/LINES, A/C Underbody - Installation**.
8. If removed, lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the fitting for the A/C pressure transducer (7) located on the A/C liquid line and install the pressure transducer. Tighten the A/C pressure transducer to 5.6 N.m (50 in. lbs.).
9. Connect the wire harness connector to the A/C pressure transducer.
10. If equipped with ABS, install the ABS control module and pump assembly. Refer to **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Installation** .
11. Install the power steering fluid reservoir. Refer to **Steering/Pump/RESERVOIR, Power Steering Pump - Installation** .
12. Install the engine coolant reservoir. Refer to **Cooling/Engine/BOTTLE, Coolant Recovery - Installation** .

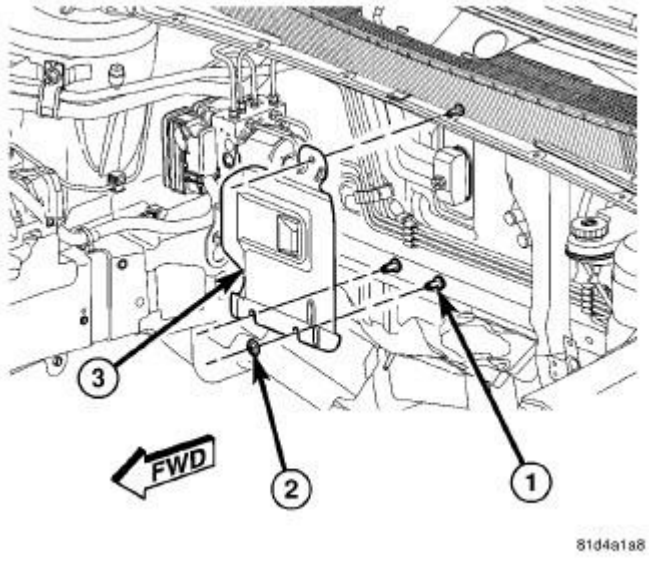

Fig. 260: Heat Shield - Unified Line
Courtesy of CHRYSLER LLC

13. If equipped, position the heat shield (3) onto the three studs (1) located on the dash panel in the engine compartment and install the three retaining nuts (2). Tighten the nuts to 1 N.m (10 in. lbs.).

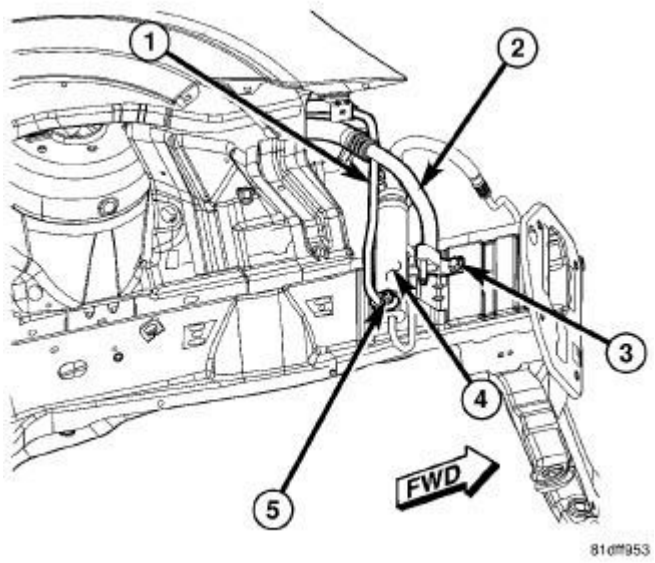

Fig. 261: Liquid Line to Receiver/Drier
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with front fascia and headlamp removed for clarity.

14. Raise and support the vehicle.
15. Install the bolt (3) that secures the upper portion of the A/C suction line (2) to the right front frame rail. Tighten the bolt securely
16. Connect the lower portion of the A/C suction line to the A/C liquid and suction line assembly. See **Heating and Air Conditioning/Plumbing/LINE, A/C Suction - Installation**.
17. Connect the rear section of the A/C liquid line (1) to the A/C receiver/drier (4).
18. Install the nut (5) that secures the rear section of the A/C liquid line (1) to the A/C receiver/drier (4). Tighten the nut to 20 N.m (15 ft. lbs.).
19. Reposition the right front wheel house splash shield to the body. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
20. Lower the vehicle.
21. Reconnect the negative battery cable.
22. If equipped with ABS, bleed the brake system. Refer to **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Installation** .

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

23. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
24. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant -**

Standard Procedure.

25. Charge the A/C system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

Lower A/C Suction Line

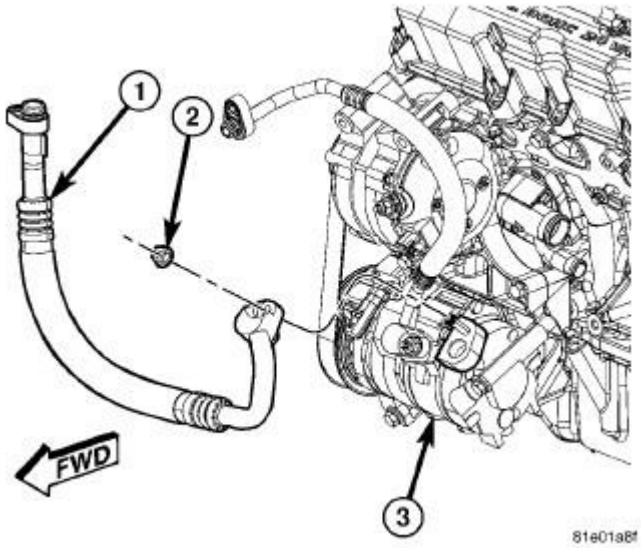

Fig. 262: Lower Suction Line to Compressor
Courtesy of CHRYSLER LLC

NOTE: 2.7L shown. Other engines similar.

1. Position the lower A/C suction line (1) into the engine compartment.
2. Remove the tape or plugs from the suction line fittings and the compressor port.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the suction line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the lower A/C suction line to the A/C compressor (3).
5. Install the nut (2) that secures the lower A/C suction line to the A/C compressor. Tighten the nut to 20 N.m (15 ft. lbs.).

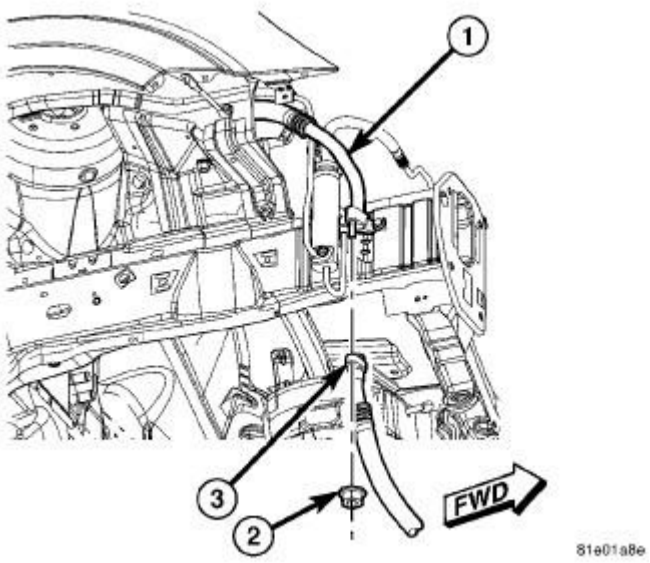

Fig. 263: Lower to Upper Suction Line
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with front fascia and headlamp removed for clarity.

6. Connect the lower portion of the A/C suction line (3) to the upper suction line (1)
7. Install the nut (2) that secures the lower portion of the A/C suction line to the upper suction line. Tighten the nut to 20 N.m (15 ft. lbs.).
8. Reposition the right front wheel house splash shield to the body. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
9. Lower the vehicle.
10. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

11. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
12. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
13. Charge the A/C system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

OIL, REFRIGERANT

Description

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, polyalkylene glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available and each contain a different additive package. Always use only the type of refrigerant oil recommended for the A/C compressor in the vehicle.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

The A/C compressors used in this vehicle is designed to use ND-8 PAG refrigerant oil. Use only this type of refrigerant oil in the refrigerant system.

Operation

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

Standard Procedure

REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The A/C receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Drain the refrigerant oil from the A/C compressor using the procedures described below. Failure to properly drain the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

CAUTION: ND-8 PAG refrigerant oil is used in the A/C system. Only refrigerant oil of the same type should be used to service this R-134a A/C system. Do not use any other refrigerant oil. The refrigerant oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from moisture and dirt. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the amount of refrigerant oil being removed during the recovery process. This amount of refrigerant oil should always be added back into the refrigerant system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level within the A/C refrigerant system or to add oil, unless there has been an oil loss. A refrigerant oil loss may occur due to component replacement or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak does occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C receiver/drier, A/C evaporator or A/C condenser is replaced. Refer to the **REFRIGERANT OIL CAPACITIES**.

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation. Refer to the following **COMPRESSOR OIL DRAIN PROCEDURE - DENSO 6SEU16 VARIABLE DISPLACEMENT**.

REFRIGERANT OIL CAPACITIES

Component	ml.	oz.
Total System Fill	100	3.4
A/C Receiver/drier	30	1.0
A/C Condenser	10	0.3
A/C Evaporator	10	0.3
A/C Compressor - Denso 6SEU16	50	1.7
	(Refer to **COMPRESSOR OIL DRAIN PROCEDURE - DENSO 6SEU16 VARIABLE DISPLACEMENT**)	
A/C Compressor - Denso 10SR15 and 10SR17	Drain and measure the oil from the old compressor (Refer to **COMPRESSOR OIL DRAIN PROCEDURE - DENSO 10SR15 AND 10SR17 FIXED DISPLACEMENT**).	

COMPRESSOR OIL DRAIN PROCEDURE - DENSO 6SEU16 VARIABLE DISPLACEMENT

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. The refrigerant oil in the Denso 6SEU16 A/C compressor can

only be drained using the procedure described below. Failure to properly drain the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

If the Denso 6SEU16 A/C compressor is being replaced, some refrigerant oil must first be drained from the replacement A/C compressor. The 6SEU16 A/C compressor is filled with 100 milliliters (3.4 oz.) from the factory. Drain 50 milliliters (1.7 oz.) of refrigerant oil from the replacement 6SEU16 compressor. Use the following procedure to drain and measure refrigerant oil from the Denso 6SEU16 A/C compressor.

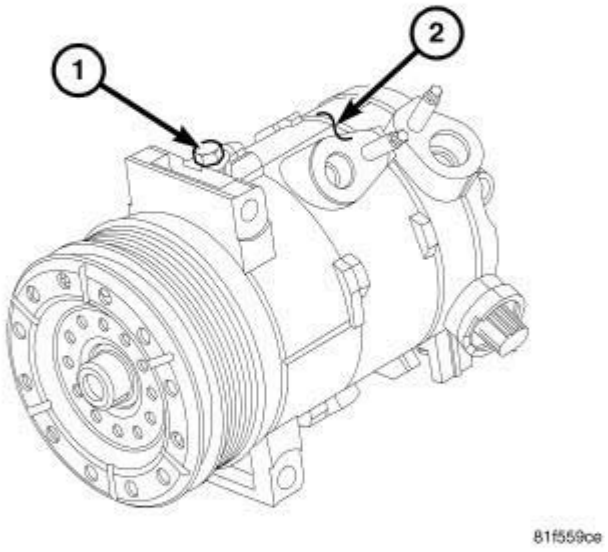

Fig. 264: 6SEU16 Compressor Drain Plug JC
Courtesy of CHRYSLER LLC

1. Place the replacement A/C compressor (2) on a workbench and remove the drain plug (1).

CAUTION: The 6SEU16 A/C compressor is filled with 100 milliliters (3.4 oz.) from the factory. Drain 50 milliliters (1.7 oz.) of refrigerant oil from the new 6SEU16 compressor when replacing only the compressor.

NOTE: When replacing multiple A/C system components, see the REFRIGERANT OIL CAPACITIES to determine how much oil should be removed from the replacement A/C compressor (example: new 6SEU16 compressor and receiver/drier requires 80 ml. (2.7 oz.) of oil to be added to the system. 100 ml. (3.4 oz.) of oil is in replacement compressor. 100 ml. (3.4 oz.) minus 80 ml. (2.7 oz.) equals 20 ml. (0.7 oz.) oil to be drained from replacement compressor).

2. Position the replacement A/C compressor so that the refrigerant oil can drain out of the drain port into a suitable clean measured container. Hold the replacement A/C compressor in this position until the required amount of refrigerant oil is drained from the compressor.

CAUTION: Failure to properly adjust the refrigerant oil level prior to installation of a replacement compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

3. Reinstall the drain plug. Tighten the drain plug securely.
4. Install the replacement A/C compressor onto the engine. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Installation**.

COMPRESSOR OIL DRAIN PROCEDURE - DENSO 10SR15 AND 10SR17 FIXED DISPLACEMENT

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

The Denso 10SR15 and 10SR17 A/C compressors are filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the Denso 10SR15 and 10SR17 A/C compressors.

1. Position the original A/C compressor so that the refrigerant oil can drain out of the suction and discharge ports into a suitable clean measured container. Hold the original A/C compressor in this position until all of the refrigerant oil is drained from the compressor.
2. Drain all of the refrigerant oil from the replacement A/C compressor into a clean measured container.
3. Refill the replacement A/C compressor with the same amount of refrigerant oil that was drained out of the original compressor. Use only clean refrigerant oil of the type recommended for the A/C compressor in the vehicle.

CAUTION: Failure to properly adjust the refrigerant oil level prior to installation of a replacement compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Installation**.

REFRIGERANT

Description

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

Operation

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

Specifications

REFRIGERANT CHARGE CAPACITY

REFRIGERANT CHARGE CAPACITY

Application	Capacity
Front A/C Only	0.624 kg (22 oz.)
Front and Rear A/C	0.907 kg (32 oz.)

VALVE, A/C EXPANSION

Description

DESCRIPTION

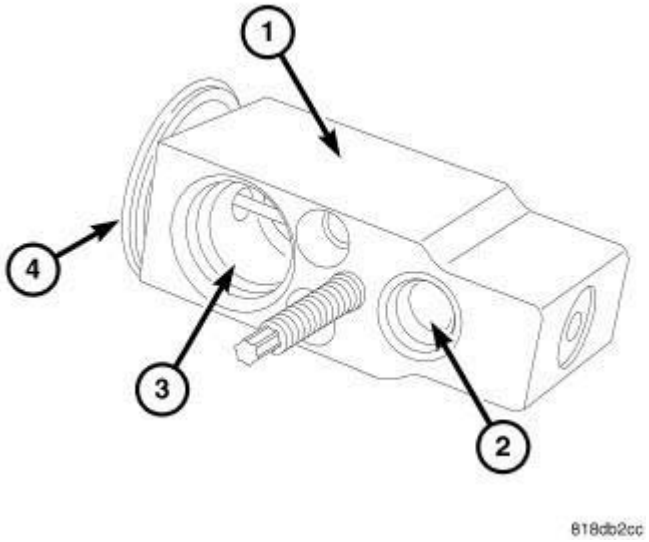

Fig. 265: A/C Expansion Valve Description KA
Courtesy of CHRYSLER LLC

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator. The A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1) with an inlet port (2), outlet port (3) and an integral thermal sensor (4).

The A/C expansion valve is located in the engine compartment at the dash panel, between the A/C refrigerant lines and the A/C evaporator.

Operation

OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the A/C liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the A/C suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve, or if the expansion valve is removed. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Diagnosis and Testing

A/C EXPANSION VALVE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: The A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid CO^2 is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO^2 is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.
4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to 6. If not OK, replace the inoperative A/C expansion valve.

WARNING: Protect the skin and eyes from exposure to liquid CO^2 or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO^2 or another suitable super-cold material.**Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to 7. If not OK, replace the inoperative A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve.
8. When expansion valve testing is complete, test the overall A/C system performance. See **Heating and Air Conditioning - Diagnosis and Testing**.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

NOTE: LHD model shown in illustrations. RHD model similar.

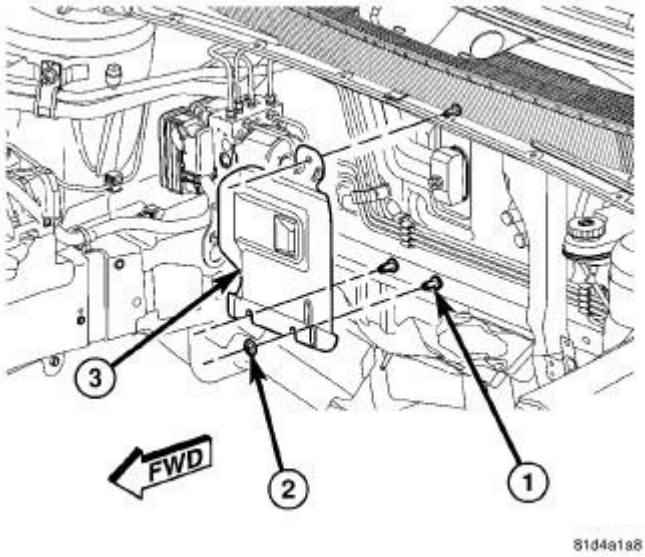

Fig. 266: Heat Shield - Unified Line
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. If equipped with heat shield (3), remove the top nut (2) that secures the heat shield to the stud (1) located on the dash panel.

NOTE: Two slots are provided at the bottom of the heat shield to aid in heat shield removal, if equipped. Complete removal of the two bottom heat shield retaining nuts is not required.

4. If equipped, reach behind the engine and remove the two bottom nuts the that secure the heat shield to the studs located on the dash panel and remove the heat shield. Rotate and tilt the heat shield as required.

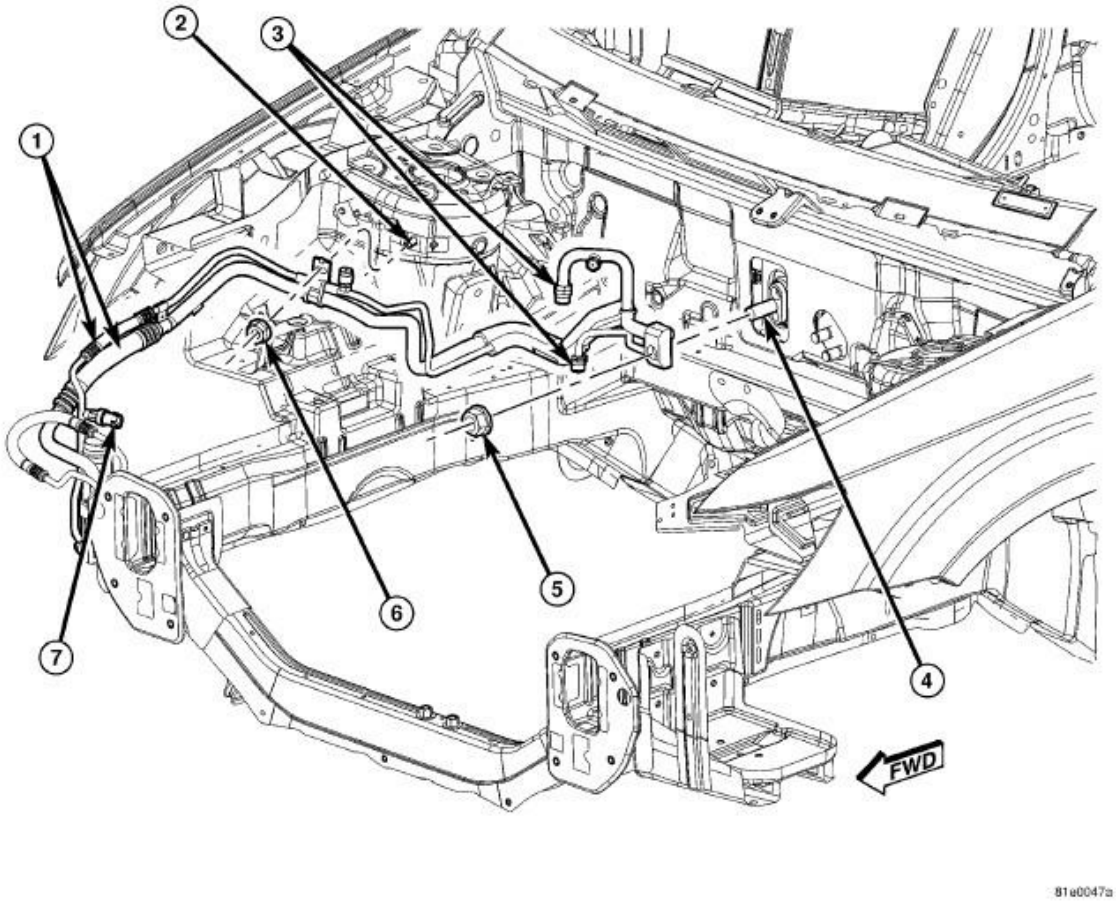

Fig. 267: Liquid & Suction Line Assembly Removal/Installation
Courtesy of CHRYSLER LLC

5. Remove the nut (6) that secures the A/C liquid and suction line assembly (1) to the stud (2) located on the right front shock tower.
6. Remove the nut (5) that secures the A/C liquid and suction line assembly to the A/C expansion valve (4).
7. Disconnect the A/C liquid and suction line assembly from the A/C expansion valve, remove and discard the O-ring seals and position the refrigerant lines out of the way.

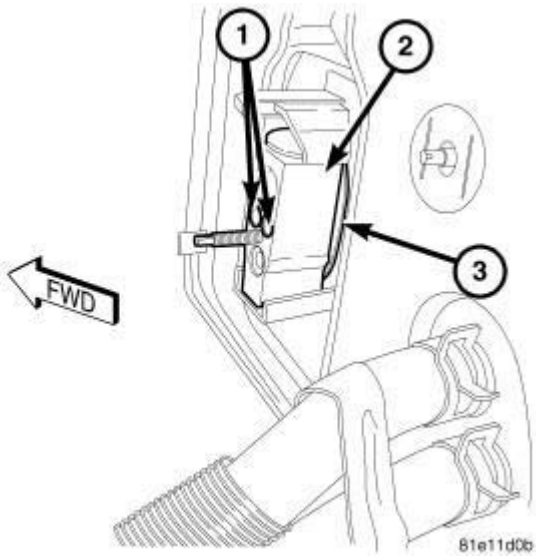

Fig. 268: Front Expansion Valve Removal/Installation
Courtesy of CHRYSLER LLC

8. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block (3).
9. Remove the A/C expansion valve from the tapping block and remove and discard the O-ring seals
10. Install plugs in, or tape over the opened refrigerant fittings and all expansion valve and evaporator tube ports.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve, or if the expansion valve is removed. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

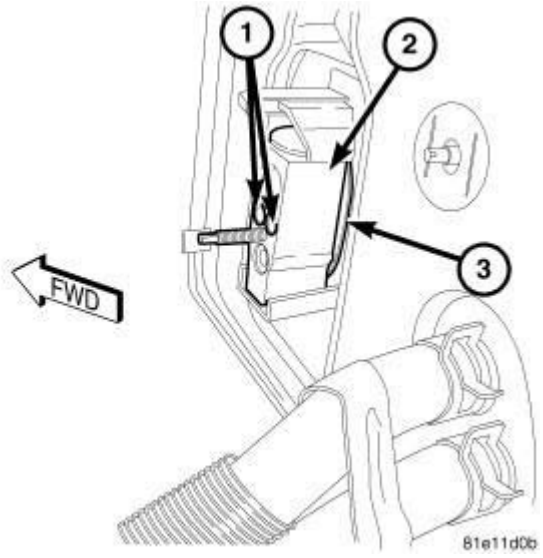

Fig. 269: Front Expansion Valve Removal/Installation
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened refrigerant fittings and all expansion valve and evaporator ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line and evaporator tube fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block (3)
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N.m (97 in. lbs.).

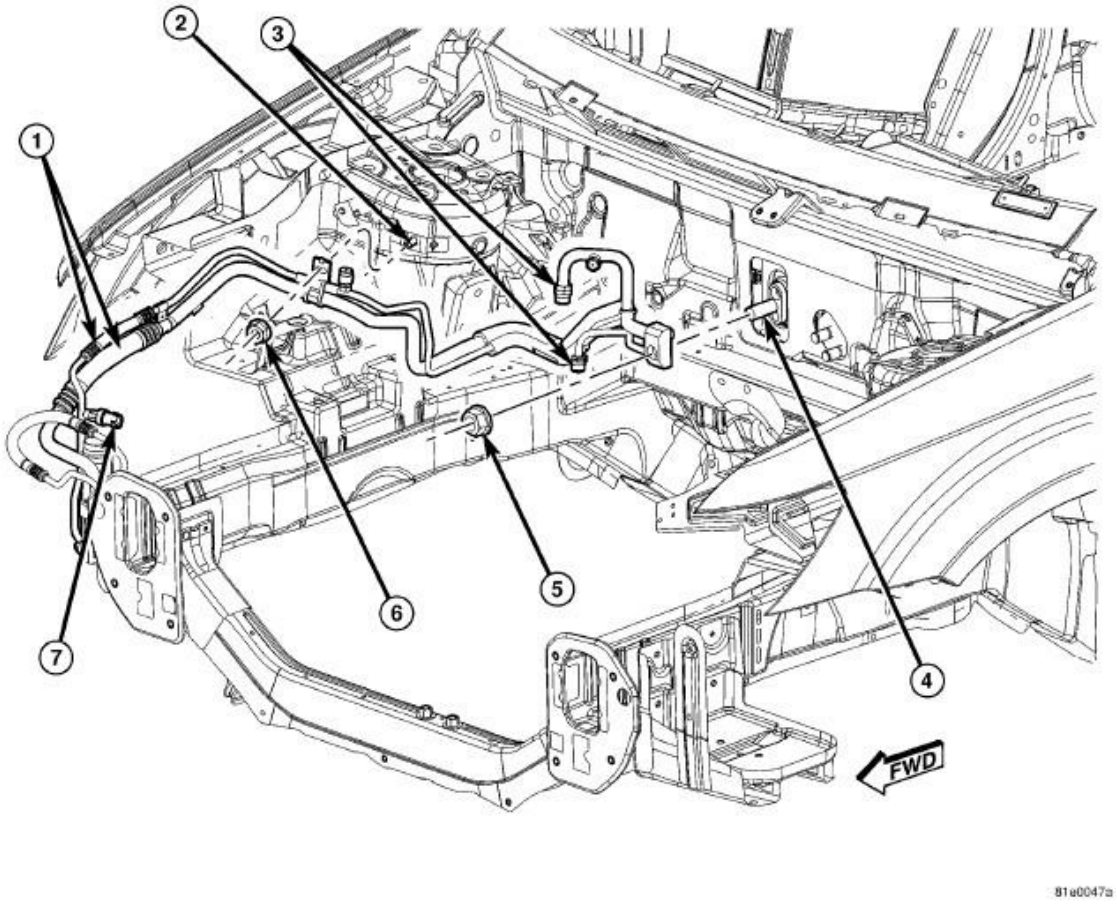

Fig. 270: Liquid & Suction Line Assembly Removal/Installation
Courtesy of CHRYSLER LLC

5. Connect the A/C liquid and suction line assembly (1) to the A/C expansion valve (4).

CAUTION: Use care when installing the A/C lines to the A/C expansion valve. Carefully align the tube ends with the valve prior to tightening the A/C line retaining nut or damage to the sealing rings and tube ends may occur.

6. Install the nut (5) that secures the A/C liquid and suction line assembly to the A/C expansion valve. Tighten the nut to 20 N.m (15 ft. lbs.).
7. Install the nut (6) that secures the refrigerant line retaining bracket to the stud (2) located on the right front strut tower. Tighten the nut securely.

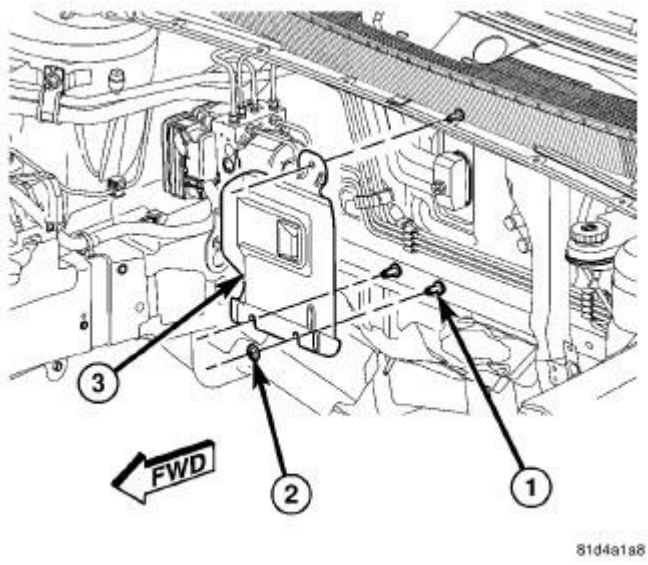

Fig. 271: Heat Shield - Unified Line
Courtesy of CHRYSLER LLC

8. If equipped, position the heat shield (3) onto the three studs (1) located on the dash panel in the engine compartment and install the three retaining nuts (2). Tighten the nuts to 1 N.m (10 in. lbs.).
9. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with the Denso 6SEU16 variable displacement compressor. Failure to follow this caution will result in serious A/C compressor damage.

10. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
11. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
12. Charge the A/C system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

PLUMBING, REAR

CORE, HEATER, REAR

Description

DESCRIPTION

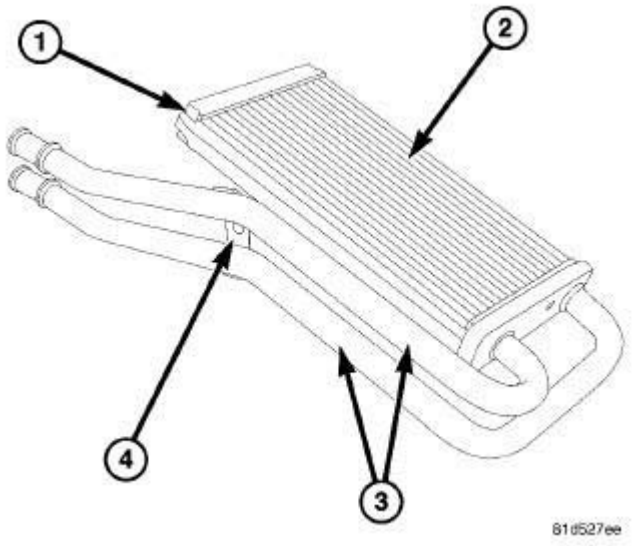

Fig. 272: Rear Heater Core Description
Courtesy of CHRYSLER LLC

The rear heater core (1) is located in the rear heater-A/C housing behind the right interior quarter trim panel. The rear heater core is a heat exchanger made of rows of tubes and fins (2). The heater core tubes (3) are permanently soldered to the heater core tank and are retained to the outboard side of the rear heater-A/C housing by use of an integral bracket (4) and screw.

The rear heater-A/C housing must be removed from the vehicle to service the rear heater core.

Operation

OPERATION

Engine coolant is circulated through heater hoses and tubes to the rear heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and the air directed through the heater core picks up the heat from the fins. The rear blend-air door allows control of the rear heater output air temperature by controlling the amount of air flowing through or around the rear heater core. The rear blower motor speed controls the volume of air flowing through the rear heater-A/C housing.

The rear heater core cannot be repaired and must be replaced if inoperative, leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may

result in serious or fatal injury.

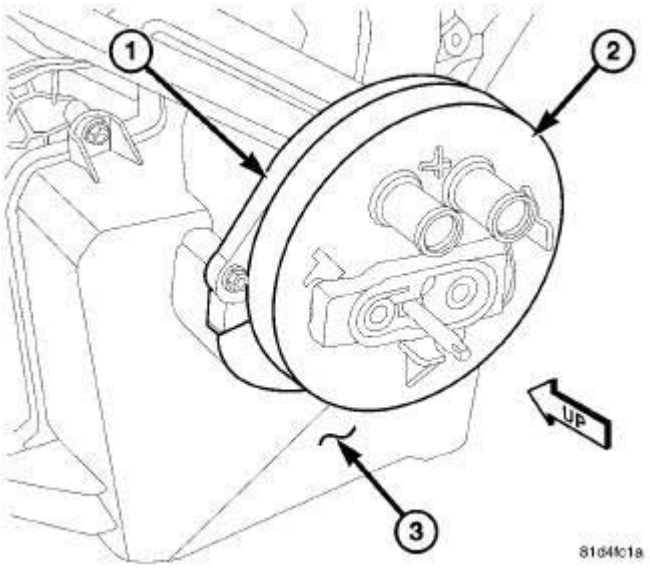

Fig. 273: Rear Housing Flange Seal
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the rear heater-A/C housing and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, A/C and Heater - Removal**.
3. Remove the foam seal (2) from the flange (1) located at the bottom of the rear heater-A/C housing (3). If the foam seal is deformed or damaged, it must be replaced.

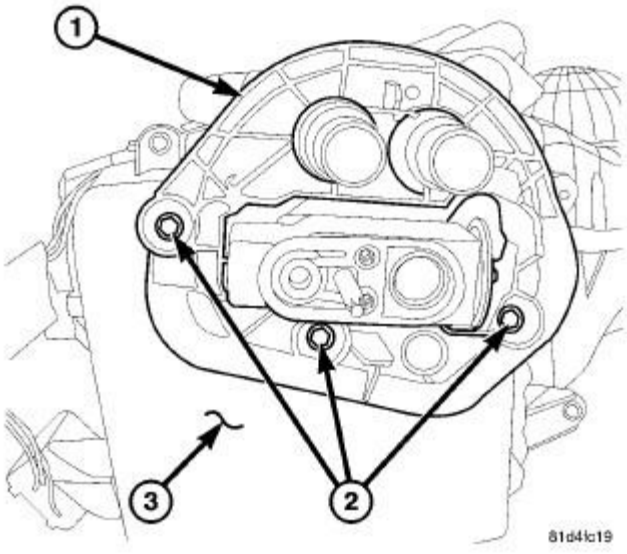

Fig. 274: Rear Housing Flange

Courtesy of CHRYSLER LLC

4. Remove the three screws (2) that secure the flange (1) to the bottom of the rear heater-A/C housing (3) and remove the flange.

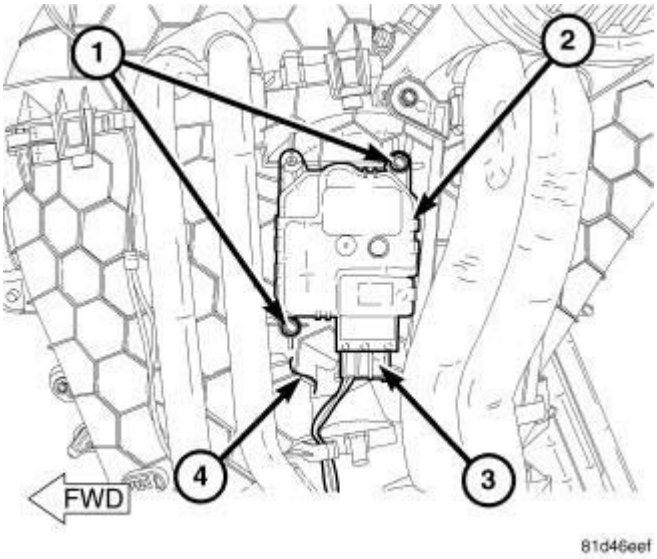

Fig. 275: Rear Blend Door Actuator Removal/Installation
Courtesy of CHRYSLER LLC

5. Disconnect the wire harness connector (3) from the rear blend door actuator (2) located on the outboard side of the rear heater-A/C housing (4).
6. Remove the two screws (1) that secure the rear blend door actuator to the rear heater-A/C housing and remove the actuator.

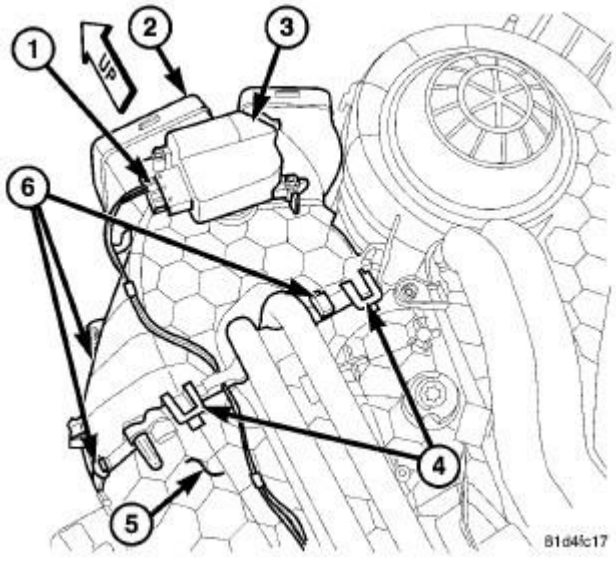

Fig. 276: Rear Distribution Housing Removal/Installation

Courtesy of CHRYSLER LLC

7. Disconnect the wire harness connector (1) from the rear mode door actuator (3) located on the outboard side of the rear heater-A/C distribution housing (2).
8. Remove the three metal retaining clips (4) that secure the rear distribution housing to the rear heater-A/C housing (5).
9. Release the five plastic retaining tabs (4) that secure the rear distribution housing and rear heater-A/C housing together and separate the housings.

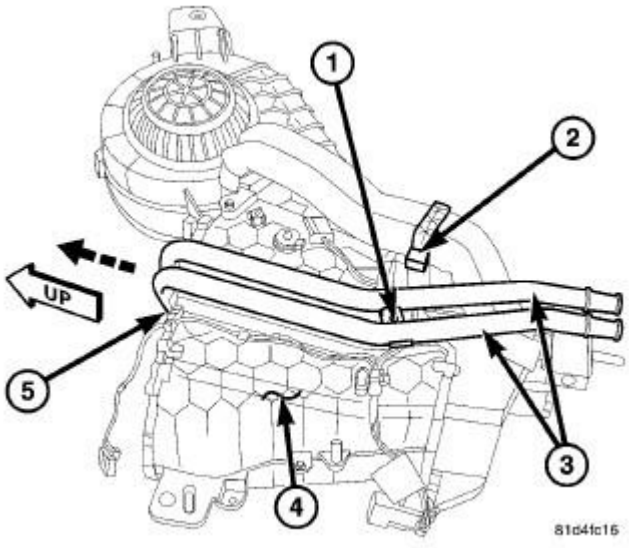

Fig. 277: Rear Heater Core Remove
Courtesy of CHRYSLER LLC

10. Remove the screw (1) that secures the rear heater core tubes (3) to the outboard side of the rear heater-A/C housing (4).

CAUTION: To prevent damage to the plastic evaporator tube bracket, carefully guide the heater core tubes past the bracket during removal of the heater core.

11. Carefully pull the rear heater core (5) out of the top of the rear heater-A/C housing. Guide the heater core tubes past the plastic evaporator tube bracket (2). If the foam seals on the heater core are deformed or damaged, they must be replaced.

Installation

INSTALLATION

CAUTION: To prevent damage to the plastic evaporator tube bracket, carefully guide the heater core tubes past the bracket during installation of the heater

core.

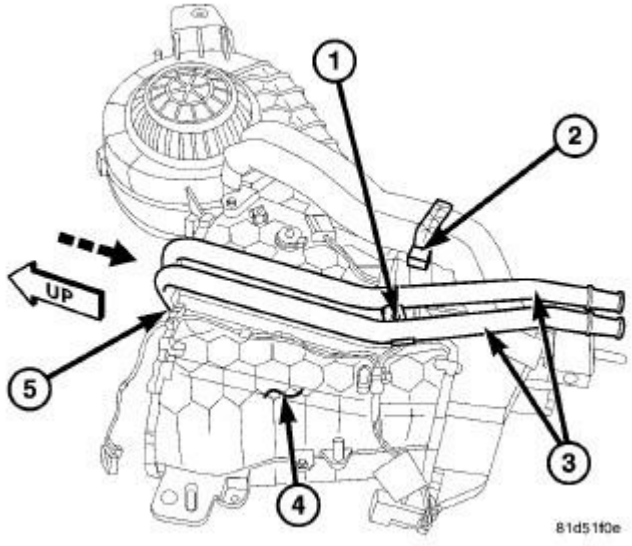

Fig. 278: Rear Heater Core Install
Courtesy of CHRYSLER LLC

1. Carefully install the rear heater core (5) into the rear heater-A/C housing (4). Guide the heater core tubes past the plastic evaporator tube bracket (2). Make sure that the foam seals are properly installed.
2. Install the screw (1) that secures the rear heater core tubes (3) to the outboard side of the rear heater-A/C housing. Tighten the screw to 1.2 N.m (10 in. lbs.).

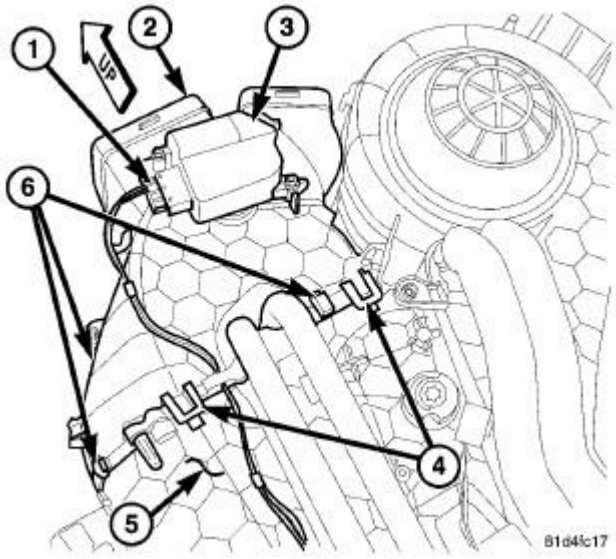

Fig. 279: Rear Distribution Housing Removal/Installation
Courtesy of CHRYSLER LLC

3. Position the rear heater-A/C distribution housing (2) to the rear heater-A/C housing (5) and engage the five plastic retaining tabs (4). Make sure the retaining tabs are fully engaged.
4. Install the three metal retaining clips (6) that secure the rear distribution housing to the rear heater-A/C housing.
5. Connect the wire harness connector (1) to the rear mode door actuator (3).

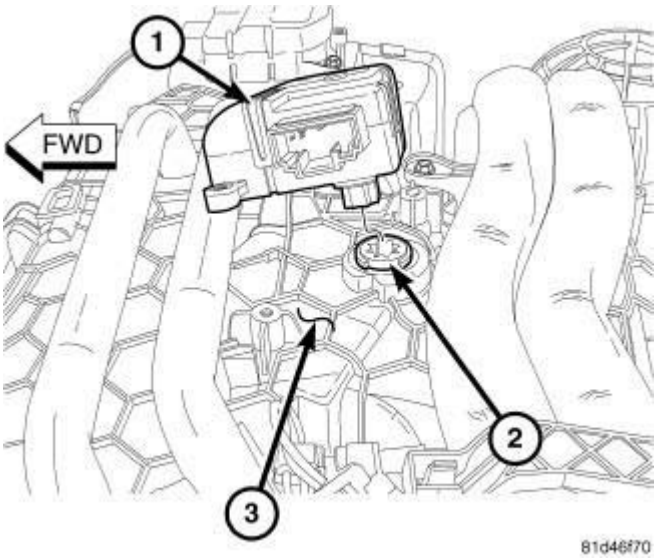

Fig. 280: Rear Blend Door Actuator Align
Courtesy of CHRYSLER LLC

6. Position the rear blend door actuator (1) onto the rear heater-A/C housing (3). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the rear blend-air door pivot shaft (2).

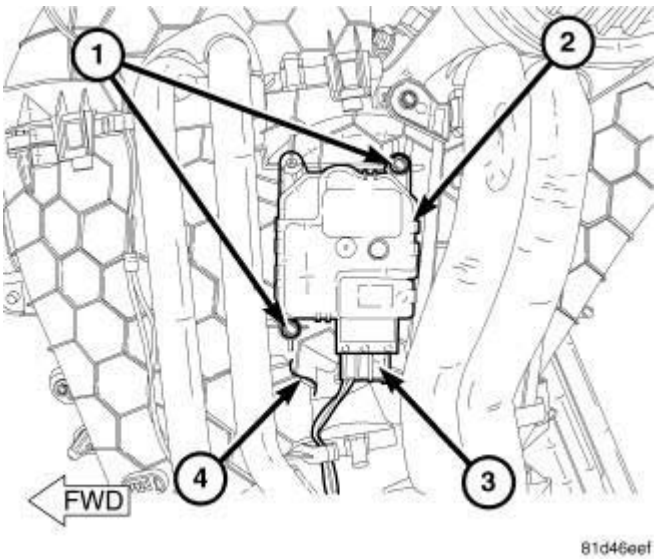

Fig. 281: Rear Blend Door Actuator Removal/Installation
Courtesy of CHRYSLER LLC

7. Install the two screws (1) that secure the rear blend door actuator (2) to the rear heater-A/C housing (4). Tighten the screws to 1.2 N.m (10 in. lbs.).
8. Connect the wire harness connector (3) to the rear blend door actuator.

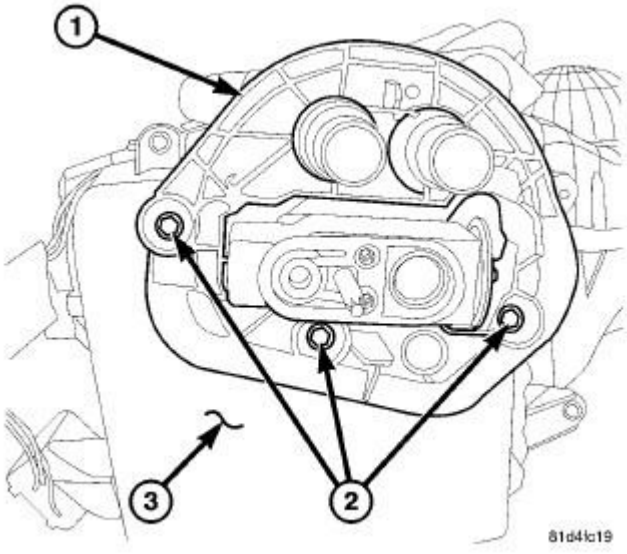

Fig. 282: Rear Housing Flange
Courtesy of CHRYSLER LLC

9. Position the flange (1) to the bottom of the rear heater-A/C housing (3) and install the three retaining screws (2). Tighten the screws to 1.2 N.m (10 in. lbs.).

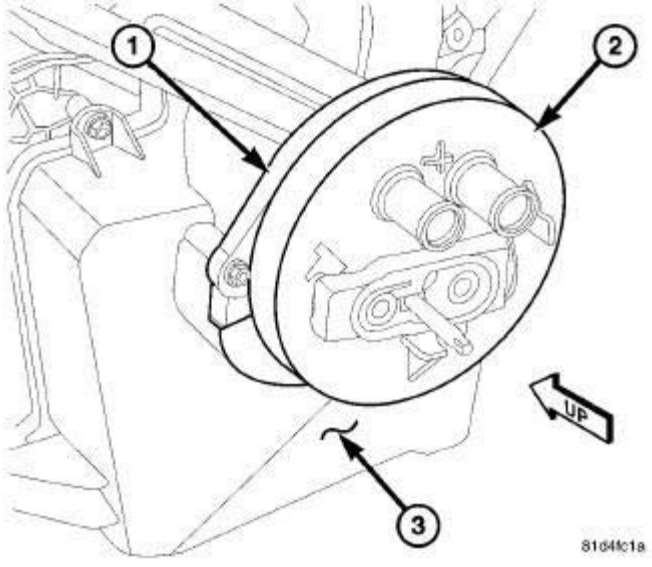

Fig. 283: Rear Housing Flange Seal
Courtesy of CHRYSLER LLC

10. Install the foam seal (2) onto the flange (1) at the bottom of the rear heater-A/C housing (3). Make sure that the foam seal is properly installed.
11. Install the rear heater-A/C housing. See **Heating and Air Conditioning/Distribution/HOUSING, A/C and Heater - Installation**.
12. Reconnect the negative battery cable.
13. If the rear heater core is being replaced, flush the cooling system. Refer to **Cooling - Standard Procedure** .
14. Refill the engine cooling system. Refer to **Cooling - Standard Procedure** .
15. Evacuate and charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

EVAPORATOR, A/C

Description

DESCRIPTION

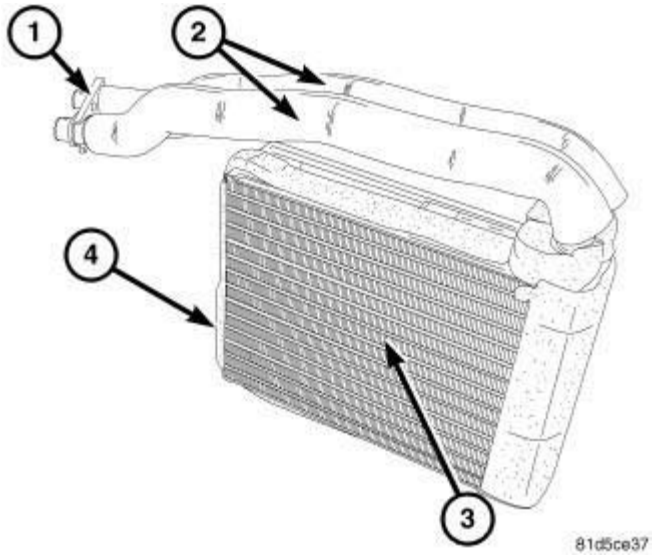

Fig. 284: Rear Evaporator Description
Courtesy of CHRYSLER LLC

The rear A/C evaporator (4) is located within the rear heater-A/C housing, behind the right interior quarter panel trim. The rear A/C evaporator is positioned in the rear heater-A/C housing so that all air entering the housing must pass over the evaporator fins (3) before it is distributed through the rear heating-A/C system ducts and outlets. However, air passing over the rear evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C expansion valve is connected and sealed to the A/C evaporator tubes (2) by use of rubber O-ring seals and a tapping plate (1).

The rear A/C evaporator can only be serviced by removing and disassembling the rear heater-A/C housing.

Operation

OPERATION

Refrigerant enters the rear A/C evaporator from the rear A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the rear A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the rear A/C evaporator.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the rear A/C expansion valve is removed from the rear A/C evaporator.

The rear A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

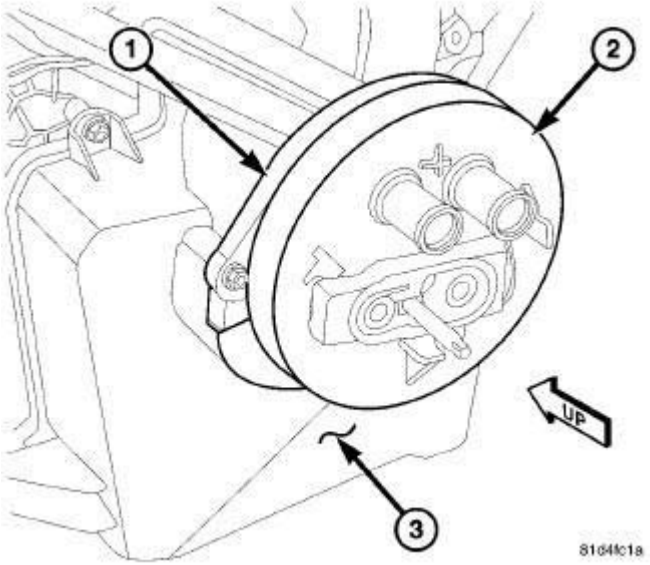

Fig. 285: Rear Housing Flange Seal
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the rear heater-A/C housing and place it on a workbench. See **Heating and Air Conditioning/Distribution/HOUSING, A/C and Heater - Removal**.
3. Remove the foam seal (2) from the flange (1) located at the bottom of the rear heater-A/C housing (3). If the foam seal is deformed or damaged, it must be replaced.

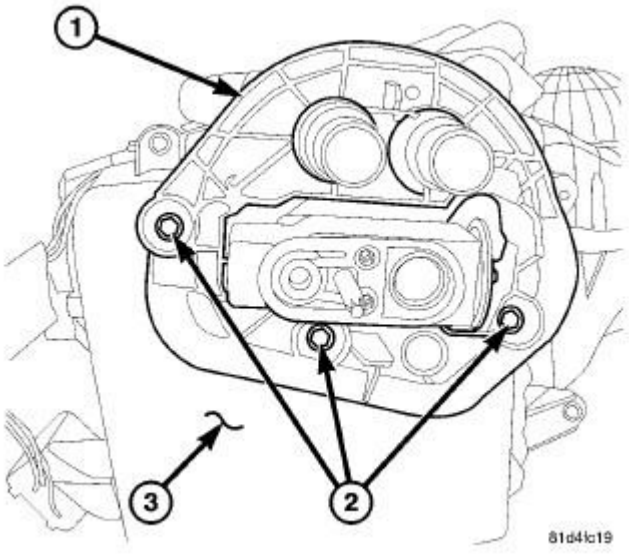

Fig. 286: Rear Housing Flange
Courtesy of CHRYSLER LLC

4. Remove the three screws (2) that secure the flange (1) to the bottom of the rear heater-A/C housing (3) and remove the flange.

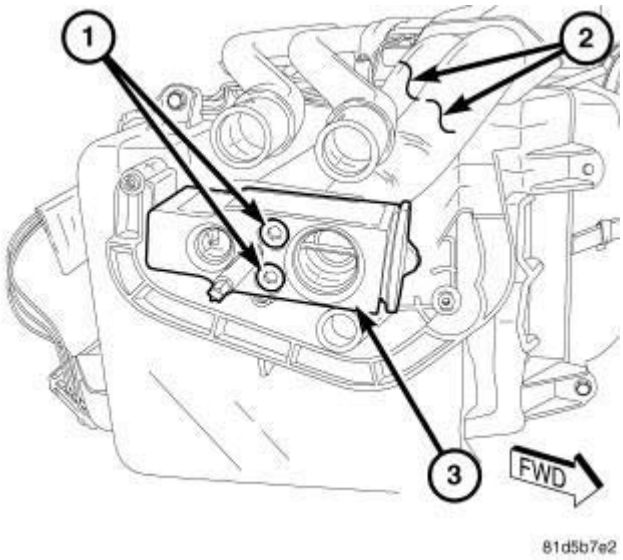

Fig. 287: Rear Expansion Valve Removal/Installation Bench
Courtesy of CHRYSLER LLC

5. Remove the two screws (1) that secure the rear expansion valve (3) to the tapping plate located on the end of the rear evaporator tubes (2) and remove the valve.
6. Remove and discard the O-ring seals and install plugs in, or tape over the opened evaporator tubes and expansion valve ports.

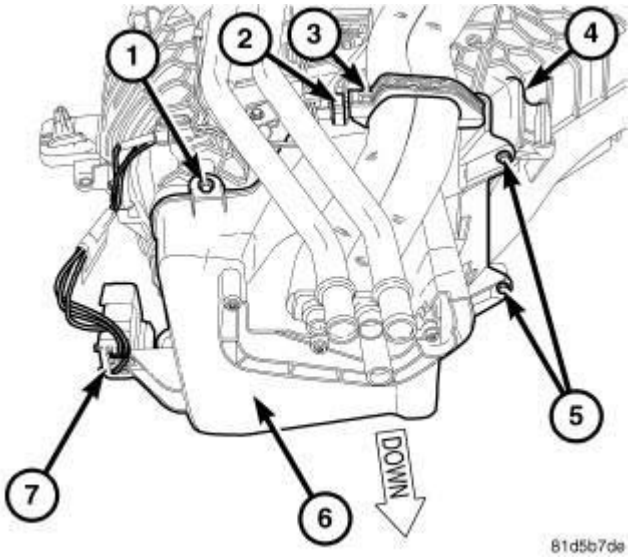

Fig. 288: Lower Rear Housing Removal/Installation
Courtesy of CHRYSLER LLC

7. Remove the wire harness connector (7) from the lower rear heater-A/C housing (6).
8. Open the evaporator tube retaining bracket (3) located on the outboard side of the lower housing.
9. Remove the metal retaining clip (2) that secures the lower housing to the rear heater-A/C housing (4).
10. Remove the five screws (1 and 5) that secure the lower housing the rear heater-A/C housing and carefully

remove the lower housing. Rotate and tilt the lower housing as necessary for removal.

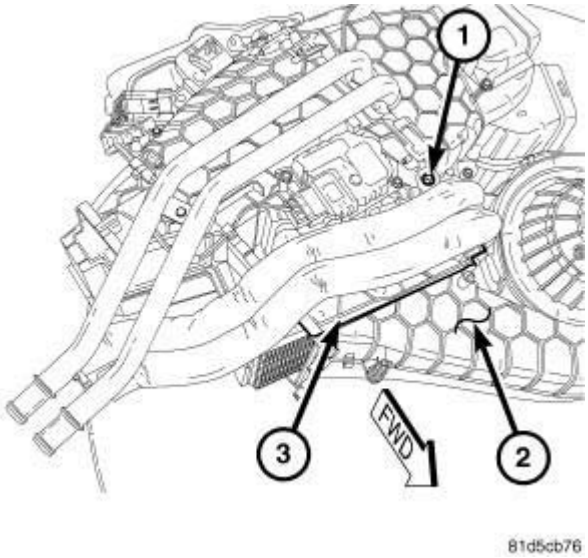

Fig. 289: Rear Evaporator Cover Removal/Installation
Courtesy of CHRYSLER LLC

11. Remove the screw (1) that secures the rear evaporator cover (3) to the outboard side of the rear heater-A/C housing (2) and remove the cover of the housing.

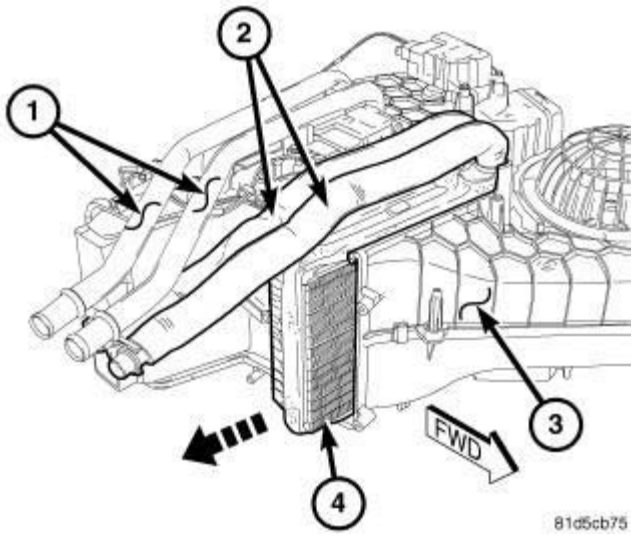

Fig. 290: Rear Evaporator Removal
Courtesy of CHRYSLER LLC

12. Carefully pull the rear A/C evaporator (4) out the bottom of the rear heater-A/C housing (3). Guide the evaporator tubes (2) past the heater core tubes (1). If the foam seals on the A/C evaporator are deformed or damaged, they must be replaced.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: If only the rear A/C evaporator is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.

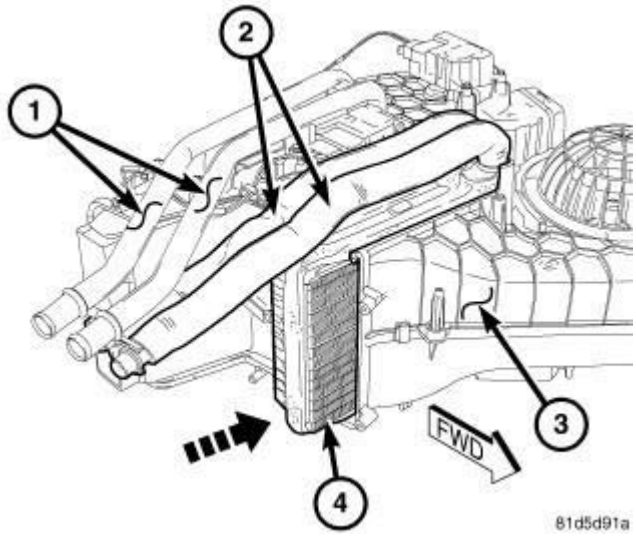

Fig. 291: Rear Evaporator Install
Courtesy of CHRYSLER LLC

1. Install the rear A/C evaporator (4) into the rear heater-A/C housing (3). Guide the evaporator tubes (2) past the rear heater core tubes (1). Make sure that the foam seals are properly installed on the evaporator.

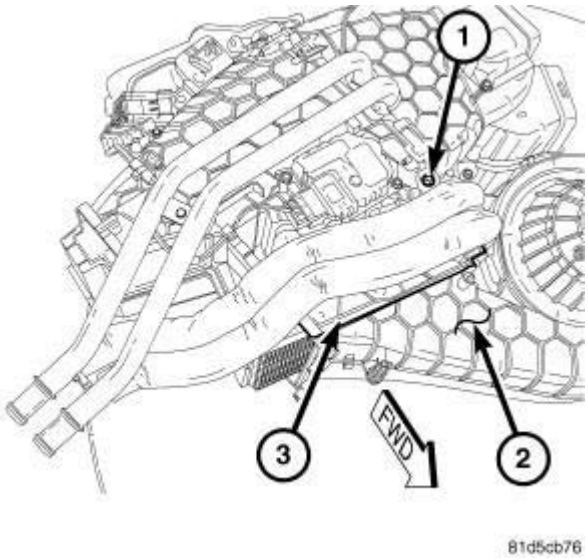

Fig. 292: Rear Evaporator Cover Removal/Installation
Courtesy of CHRYSLER LLC

2. Install the evaporator cover (3) onto the outboard side of the rear heater-A/C housing (2) and install the retaining screw (1). Tighten the screw to 1.2 N.m (10 in. lbs.).

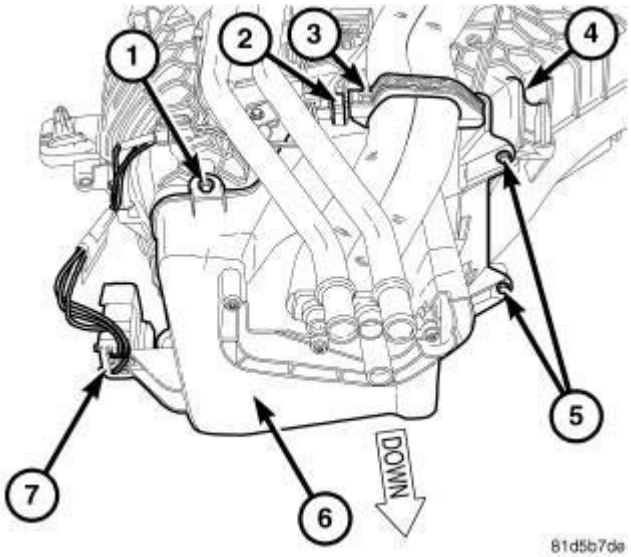

Fig. 293: Lower Rear Housing Removal/Installation
Courtesy of CHRYSLER LLC

3. Install the lower rear heater-A/C housing (6) onto the rear heater-A/C housing (4). Rotate and tilt the lower housing as necessary for installation.
4. Install the five screws (1 and 5) that secure the lower housing to the rear heater-A/C housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
5. Install the metal retaining clip (2) that secures the lower housing to the rear heater-A/C housing.
6. Close the evaporator tube retaining bracket (3). Make sure the bracket retainers are fully engaged.

7. Install the wire harness connector (7) onto the lower rear heater-A/C housing.

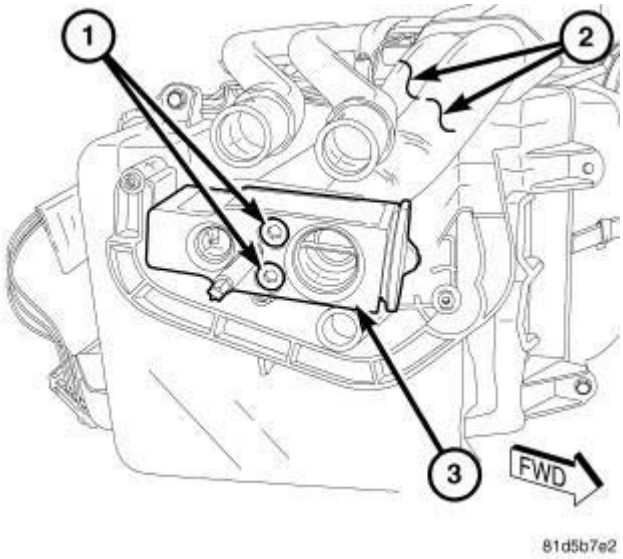

Fig. 294: Rear Expansion Valve Removal/Installation Bench
Courtesy of CHRYSLER LLC

8. Remove the tape or plugs from the rear evaporator tubes and expansion valve ports.
9. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the rear evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Install the rear A/C expansion valve (3) onto the tapping plate located on the end of the rear evaporator tubes (2)
11. Install two bolts (1) that secure the rear A/C expansion valve to the taping plate. Tighten the bolts to 11 N.m (97 in. lbs.).

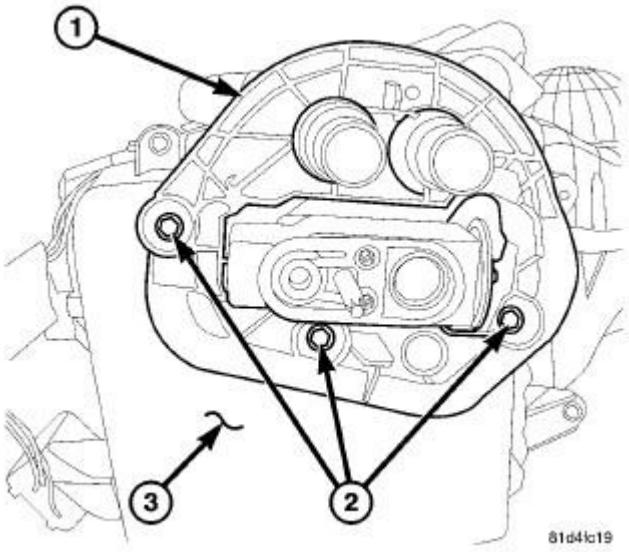

Fig. 295: Rear Housing Flange
Courtesy of CHRYSLER LLC

12. Position the flange (1) to the bottom of the rear heater-A/C housing (3) and install the three retaining screws (2). Tighten the screws to 1.2 N.m (10 in. lbs.).

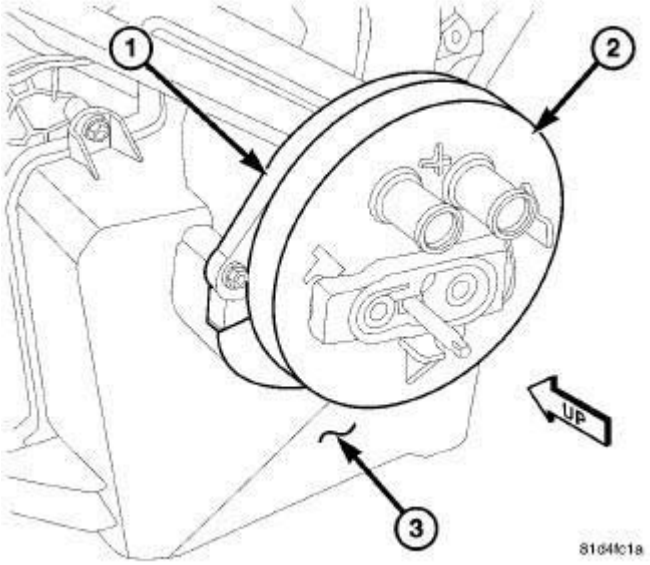

Fig. 296: Rear Housing Flange Seal
Courtesy of CHRYSLER LLC

13. Install the foam seal (2) onto the flange (1) at the bottom of the rear heater-A/C housing (3). Make sure that the foam seal is properly installed.
14. Install the rear heater-A/C housing. See **Heating and Air Conditioning/Distribution/HOUSING, A/C and Heater - Installation**.
15. Reconnect the negative battery cable.
16. If the rear A/C evaporator is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

LINES, A/C UNDERBODY

Description

DESCRIPTION

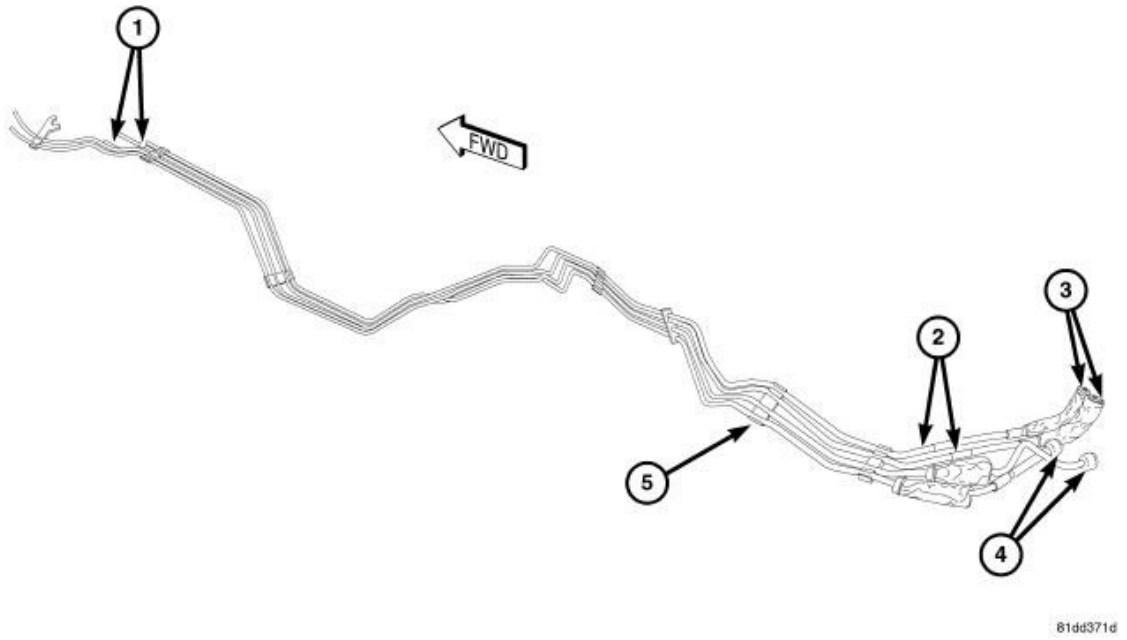

Fig. 297: Underbody Lines
Courtesy of CHRYSLER LLC

Models equipped with the rear heating-A/C system use metal lines attached to the vehicle underbody to carry refrigerant and engine coolant to and from the rear A/C evaporator and heater core. The underbody A/C lines (1) are connected to the front A/C suction and liquid lines and to the rear A/C expansion valve extension tubes using nut type fittings (4) and O-ring seals. The underbody heater lines (2) are connected to the front heater hoses and the rear heater core using spring type clamps (3). The underbody lines are retained to the vehicle by seven plastic mounting brackets (5).

NOTE: Replacement of the refrigerant line O-ring seals is required anytime an underbody refrigerant line is disconnected. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.

The underbody lines have no serviceable parts except for the refrigerant line rubber O-ring seals and metal spring clamps. The O-ring seals used on the refrigerant line connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the underbody refrigerant lines are disconnected.

The underbody lines cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air

Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

NOTE: To prevent any contaminates from entering the rear heating-A/C system, make sure that the area around the underbody line connections is clean of any dirt or foreign residue prior to disconnecting the lines.

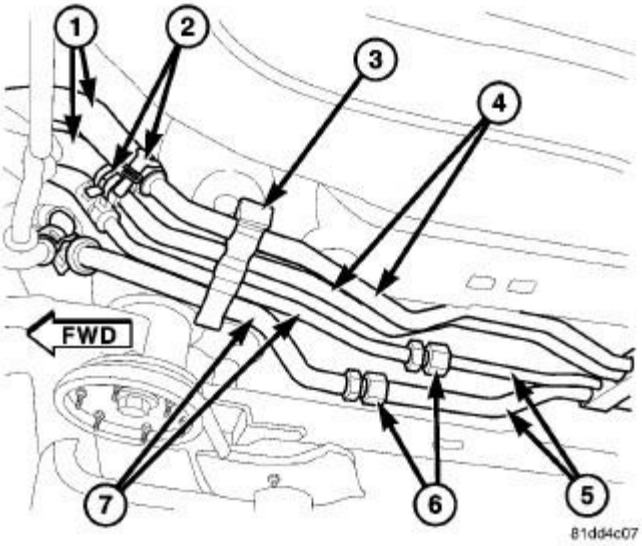

Fig. 298: Underbody Lines Front Connections
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Drain the engine cooling system. Refer to **Cooling - Standard Procedure** .
4. Raise and support the vehicle.
5. Remove the rear section of the exhaust system. Refer to **Exhaust System/PIPE, Exhaust - Removal** .
6. Remove the exhaust heat shields as necessary to gain access to the underbody lines. Refer to **Exhaust System/SHIELD, Heat - Description** .

NOTE: Replacement of the front heater hoses will be required if the hose ends are cut for removal.

7. Release the spring type hose clamps (2) and disconnect the front heater hoses (1) from the underbody heater lines (4).
8. Loosen the fitting nuts (6) that secure the underbody refrigerant lines (5) to the front A/C liquid and suction lines (7).

9. Disconnect the front A/C liquid and suction lines from the underbody refrigerant lines and remove and discard the O-ring seals.
10. Disengage the front A/C liquid and suction lines from the front underbody refrigerant line bracket (3).

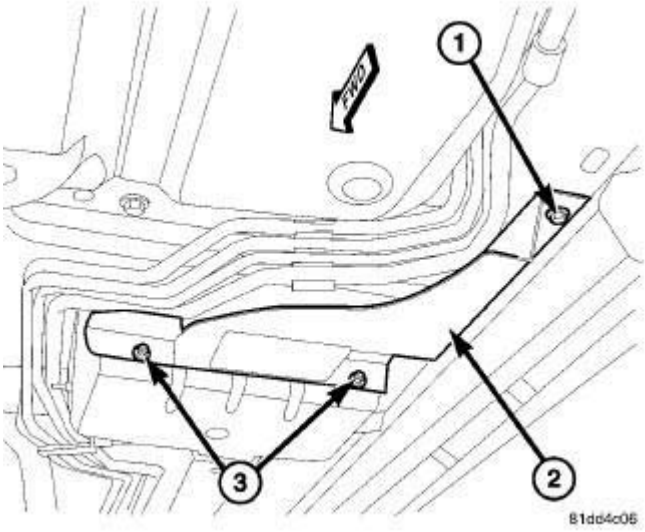

Fig. 299: Underbody Line Shield
Courtesy of CHRYSLER LLC

11. Remove the two nuts (3) and one screw (1) that secure the underbody line shield (2) to the vehicle underbody and remove the shield.

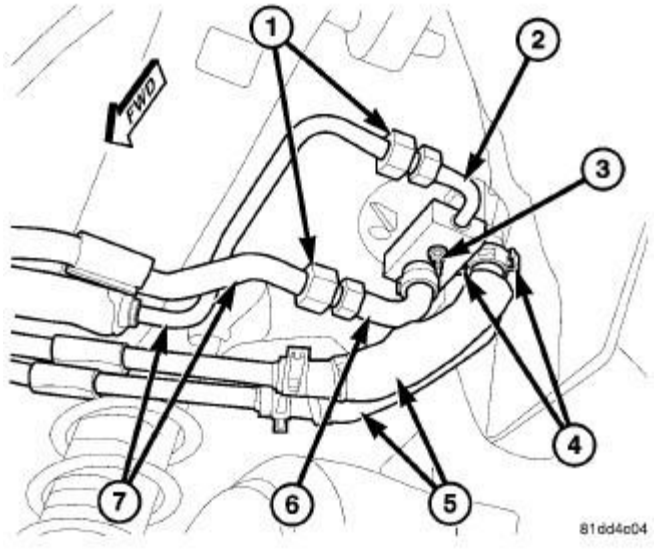

Fig. 300: Underbody Lines to Rear Housing
Courtesy of CHRYSLER LLC

CAUTION: DO NOT apply excessive force on underbody heater lines or rear heater tubes when disconnecting the connections. Excessive force may damage or deform the tubes and or lines, causing an engine coolant leak.

NOTE: Replacement of the rubber heater hose ends will be required if the rubber hoses are cut for removal.

12. Release the spring type hose clamps (4) and disconnect the underbody heater lines (5) from the rear heater core tubes located behind the right rear wheel housing.
13. Lower the underbody heater lines and drain any residual coolant from the lines into a suitable container.
14. Loosen the fitting nuts (1) that secure the underbody refrigerant lines (7) to the underbody refrigerant extension lines and sealing plate (2 and 6).
15. Disconnect the underbody refrigerant lines from underbody refrigerant extension lines and remove and discard the O-ring seals.
16. Remove the nut (3) that secures the underbody refrigerant extension lines and sealing plate to the rear A/C expansion valve.
17. Disconnect the extension lines and sealing plate from the rear A/C expansion valve and remove and discard the O-ring seals.

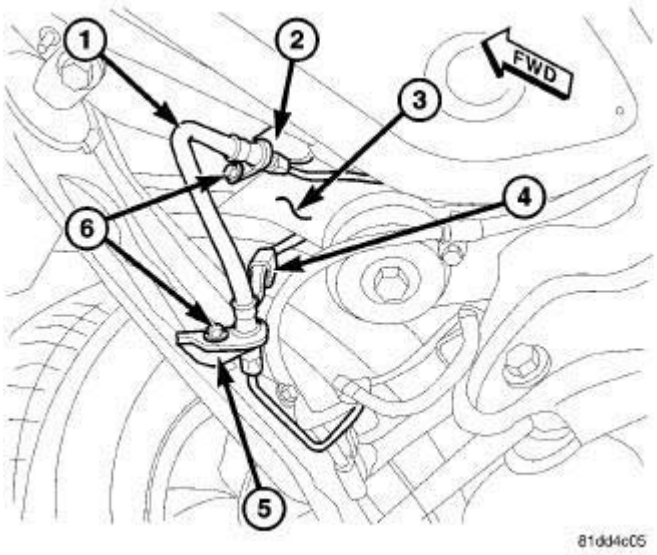

Fig. 301: Right Rear Brake Line Brackets & Wire Harness
Courtesy of CHRYSLER LLC

18. Disconnect the rear ABS wire harness lead and bracket (4) from the right side of the body (3) to gain clearance to partially lower the right side of the rear cradle.

NOTE: It is not necessary to disconnect the brake line to remove it from the brackets.

19. Remove the two bolts (6) that secure the right rear brake line (1) to the two brackets (2 and 5) and remove the brake line from the brackets to gain clearance to partially lower the right side of the rear cradle.

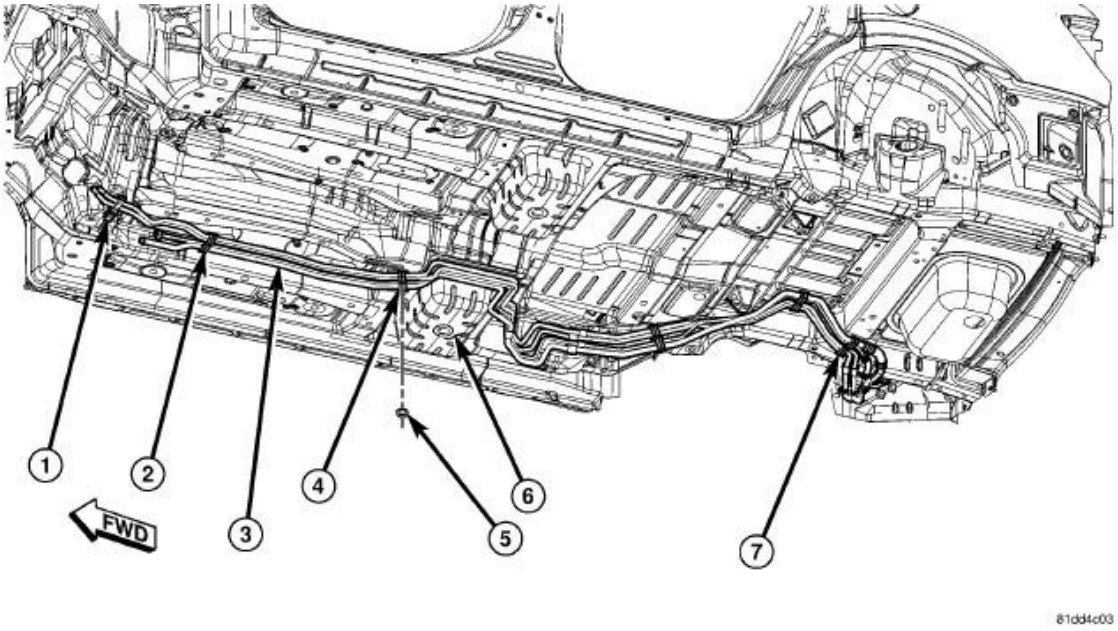

Fig. 302: Underbody Line Brackets
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with rear body cradle removed for clarity.

20. Remove the lower right rear shock retaining bolt. Refer to **Rear Suspension/SHOCK ABSORBER, Suspension - Removal** .

WARNING: Be sure to properly support the rear cradle before removing the right side retaining bolts. Failure to follow this warning may result in serious or fatal injury.

21. Support the right side of the rear cradle with a suitable jack stand and remove the bolts that secure the right side of the cradle to the body. Refer to **Frame and Bumpers/Frame/CROSSMEMBER - Removal** .

CAUTION: Use care not to damage the ABS wire lead or the brake line when lowering the rear cradle for clearance.

22. Carefully lower the jack stand until the right side of the rear cradle (supported by the stand) is approximately 76-101 mm (3-4 in.) below the body. This will allow access to remove the underbody line assembly.
23. Remove the nut (5) that secures the underbody line bracket (4) to the stud located near the center of the underbody (6).

24. Disengage the remainder of the underbody line brackets (1, 2, and 7) from the studs located underneath the vehicle.
25. Rotate and tilt the underbody lines (3) as necessary and remove the lines from the vehicle.
26. Install plugs in, or tape over all the opened refrigerant line fittings and the rear expansion valve ports.

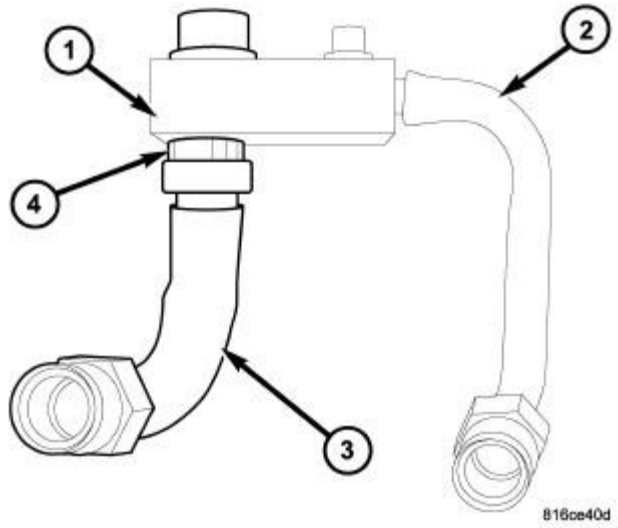

Fig. 303: Underbody Suction Extension Line
Courtesy of CHRYSLER LLC

27. If required, place the extension lines and sealing plate (1) on a workbench, remove the nylon retaining clip (4) that secures the suction extension line (3) to the sealing plate and remove the suction line from the sealing plate.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime an underbody refrigerant line is disconnected. Failure to replace the rubber O-ring

seals may result in a refrigerant system leak.

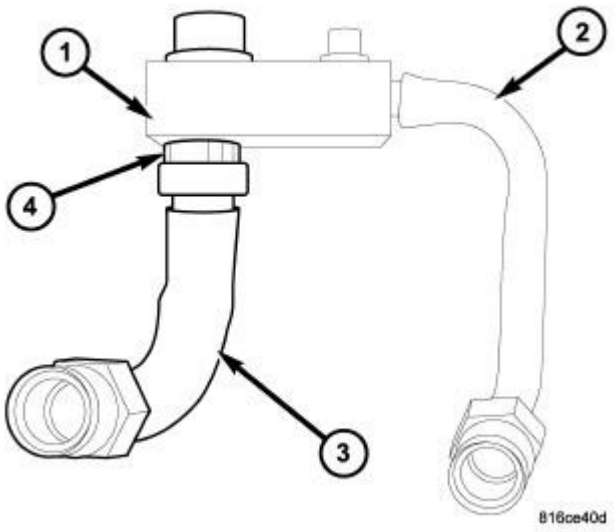

Fig. 304: Underbody Suction Extension Line
Courtesy of CHRYSLER LLC

1. If removed, install the suction extension line (3) into the sealing plate (1) and install the nylon retaining clip (4).

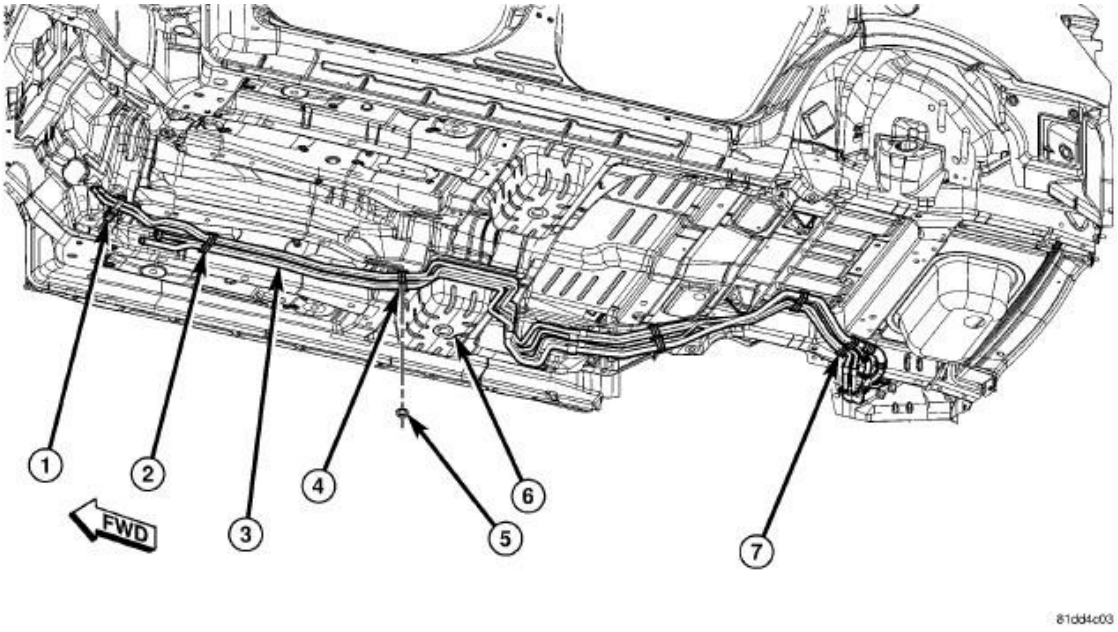

Fig. 305: Underbody Line Brackets
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with rear body cradle removed for clarity.

2. Position the underbody lines (3) and engage the underbody line brackets (1, 2, and 7) to the mounting studs located on the underbody (6). Rotate and tilt the underbody lines as necessary. Make sure the brackets are fully engaged to the studs.
3. Position the underbody line bracket (4) onto the mounting stud located near the center of the underbody and install the retaining nut (5). Tighten the nut securely.

CAUTION: Use care not to damage the ABS wire lead or the brake line when repositioning the rear cradle.

4. Carefully raise the jack stand until the right side of the rear cradle is positioned to the body.

WARNING: Be sure to properly support the rear cradle when installing the right side retaining bolts. Failure to follow this warning may result in serious or fatal injury.

5. Install the bolts that secure the right side of the cradle to the body and remove the jack stand. Refer to **Frame and Bumpers/Frame/CROSSMEMBER - Installation** .
6. Install the lower right rear shock retaining bolt. Refer to **Rear Suspension/SHOCK ABSORBER, Suspension - Installation** .

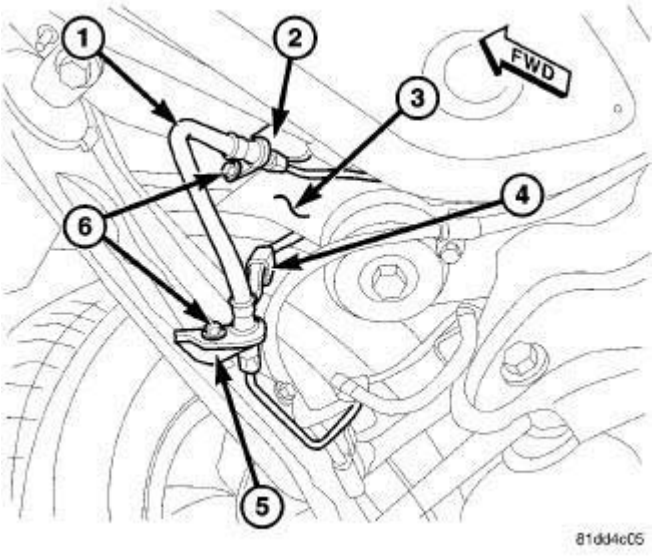

Fig. 306: Right Rear Brake Line Brackets & Wire Harness
Courtesy of CHRYSLER LLC

7. Connect the rear ABS wire harness lead and bracket (4) to the right side of the body (3).
8. Position the right rear brake line (1) onto the two brackets (2 and 5) and install the two retaining bolts (6). Tighten the bolts securely.

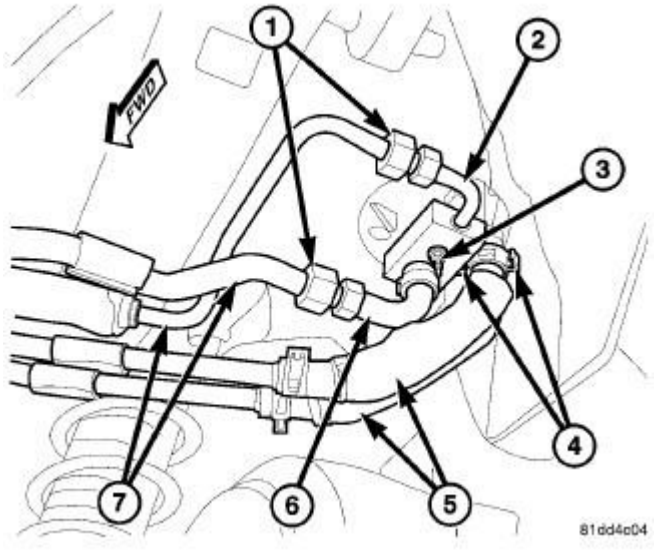

Fig. 307: Underbody Lines to Rear Housing
Courtesy of CHRYSLER LLC

CAUTION: DO NOT apply excessive force on underbody heater lines or rear heater tubes fittings when connecting the connections. Excessive force may damage or deform the tubes and or lines, causing an engine coolant leak.

NOTE: Replacement of the rubber heater hose ends will be required if the rubber hoses were cut for removal.

9. Remove the tape or plugs from all the opened refrigerant line fittings and the rear expansion valve ports.
10. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the underbody refrigerant extension line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
11. Connect the underbody refrigerant extension lines and sealing plate (2 and 6) to the rear A/C expansion valve.
12. Loosely install the nut (3) that secures the extension lines and sealing plate to the rear A/C expansion valve.
13. Connect the underbody refrigerant lines (7) to the underbody refrigerant extension lines and tighten the fitting nuts (1) to 23 N.m (17 ft. lbs.).
14. Tighten the nut that secures the extension lines and sealing plate to the rear A/C expansion valve to 11 N.m (97 in. lbs.).
15. Connect the underbody heater lines (5) to the rear heater core tubes located behind the right rear wheel housing and engage the spring type hose clamps (4).

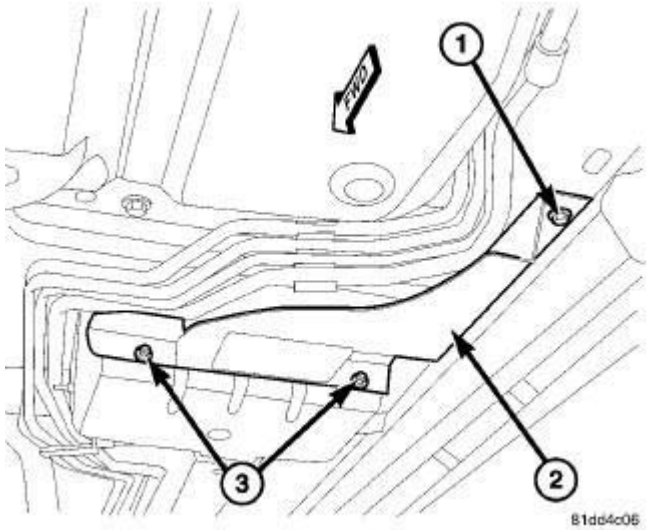

Fig. 308: Underbody Line Shield
Courtesy of CHRYSLER LLC

16. Position the underbody line shield (2) to the vehicle underbody and install the two nuts (3) and one screw (1). Tighten the fasteners securely.

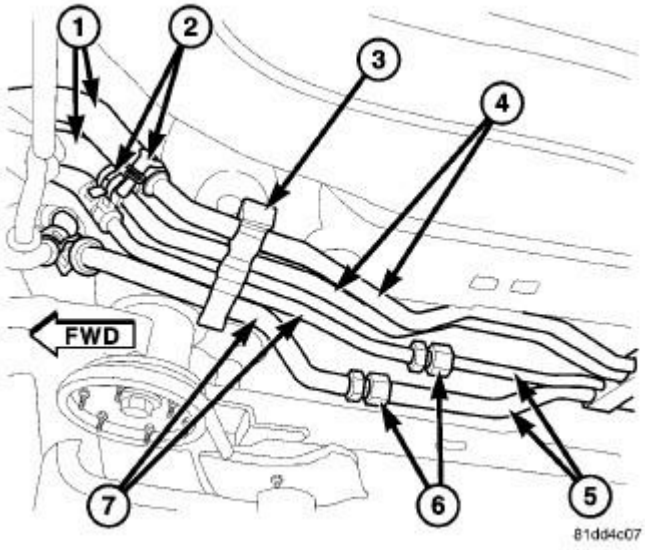

Fig. 309: Underbody Lines Front Connections
Courtesy of CHRYSLER LLC

17. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the underbody refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

18. Connect the front A/C liquid and suction lines (7) to the underbody refrigerant lines (5). Tighten the fitting nuts (6) to 23 N.m (17 ft. lbs.).
19. Position the front A/C liquid and suction lines into the front underbody refrigerant line bracket (3) and engage the bracket retainer.

NOTE: Replacement of the front heater hoses will be required if the hose ends were cut for removal.

20. Connect the front heater hoses (1) to the underbody heater lines (4) and engage the spring type hose clamps (2).
21. Install the exhaust heat shields as necessary.
22. Install the rear section of the exhaust system. Refer to **Exhaust System/PIPE, Exhaust - Installation** .
23. Lower the vehicle.
24. Reconnect the negative battery cable.
25. Fill the engine cooling system. Refer to **Cooling - Standard Procedure** .
26. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
27. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
28. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

LINES, A/C UNDERBODY, EXTENSION

Description

DESCRIPTION

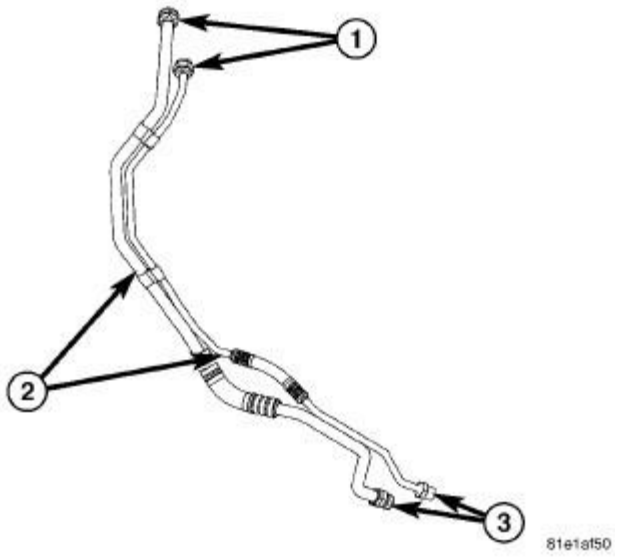

Fig. 310: Underbody A/C Extension Lines Description

Courtesy of CHRYSLER LLC

Models equipped with the rear heating-A/C system use metal lines attached to the vehicle underbody to carry refrigerant and engine coolant to and from the rear A/C evaporator and heater core. The underbody A/C lines are connected to the front A/C suction and liquid lines by use of underbody A/C extension lines (2). The underbody A/C extension lines are connected to the front and underbody refrigerant lines with nut type fittings (1 and 3) and O-ring seals.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime an underbody refrigerant line is disconnected. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.

The underbody A/C extension lines have no serviceable parts except for the rubber O-ring seals. The O-ring seals used on the refrigerant line connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the underbody refrigerant lines are disconnected.

The underbody A/C extension lines cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

NOTE: To prevent any contaminates from entering the rear heating-A/C system, make sure that the area around the underbody line connections is clean of any dirt or foreign residue prior to disconnecting the lines.

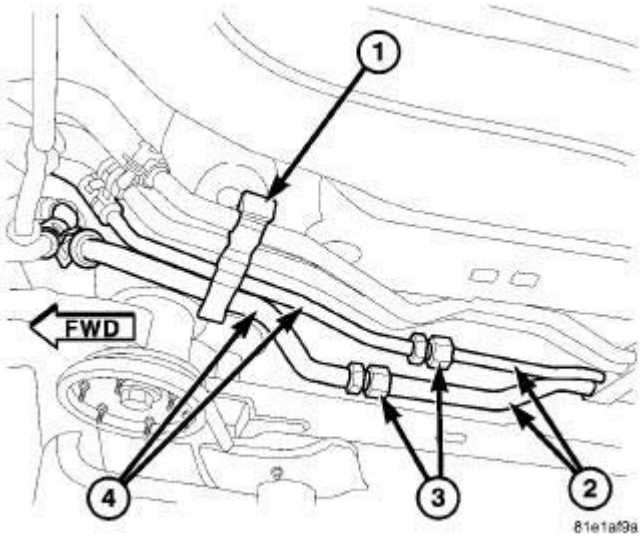

Fig. 311: Extension Lines-Underbody Connections

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Raise and support the vehicle.
4. Disengage the underbody A/C extension lines (4) from the front underbody refrigerant line bracket (1).
5. Loosen the fitting nuts (3) that secure the underbody A/C extension lines to the underbody A/C liquid and suction lines (2).
6. Disconnect the underbody A/C extension lines from the underbody A/C liquid and suction lines and remove and discard the O-ring seals.
7. Install plugs in, or tape over the opened refrigerant line fittings.

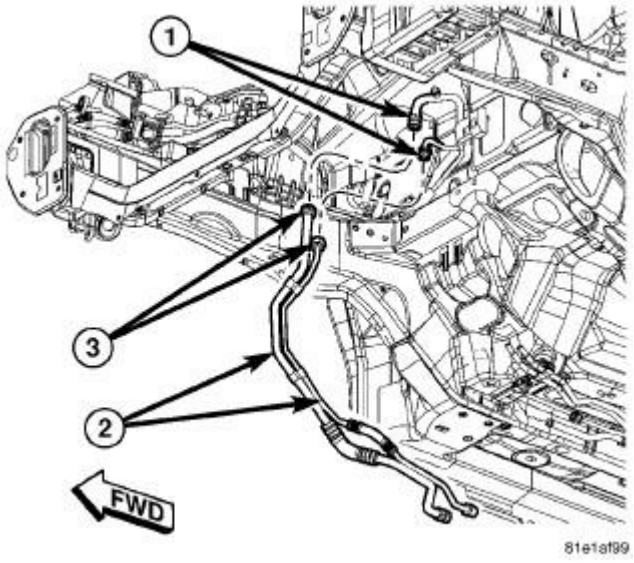

Fig. 312: Extension Lines-Upper Connections
Courtesy of CHRYSLER LLC

8. Lower the vehicle.
9. Loosen the fitting nuts (3) that secure the underbody A/C extension lines (2) to the front A/C liquid and suction lines (1).
10. Disconnect the underbody A/C extension lines from the front A/C liquid and suction lines and remove and discard the O-ring seals.
11. Rotate and tilt the underbody A/C extension lines as necessary and remove the lines from the vehicle.
12. Install plugs in, or tape over the opened refrigerant line fittings.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime an underbody refrigerant line is disconnected. Failure to replace the rubber O-ring

seals may result in a refrigerant system leak.

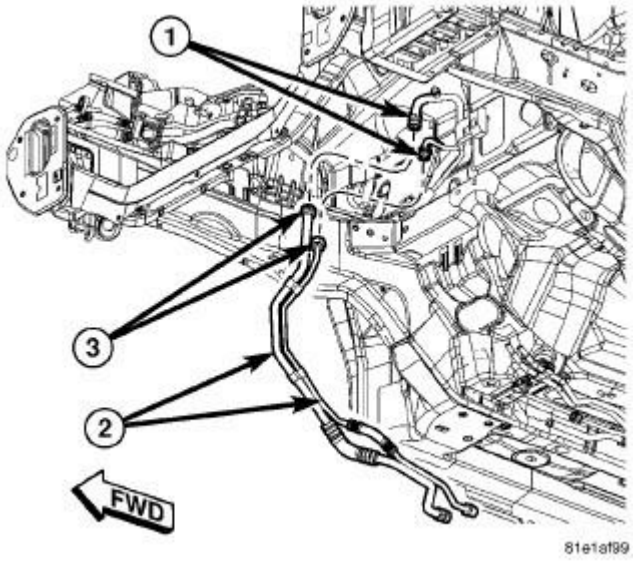

Fig. 313: Extension Lines-Upper Connections
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened refrigerant extension line fittings.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the underbody A/C extension lines (2) into the engine compartment. Rotate and tilt the underbody A/C extension lines as necessary.
4. Connect the underbody A/C extension lines to the front A/C liquid and suction lines (1). Tighten the fitting nuts (3) to 23 N.m (17 ft. lbs.).

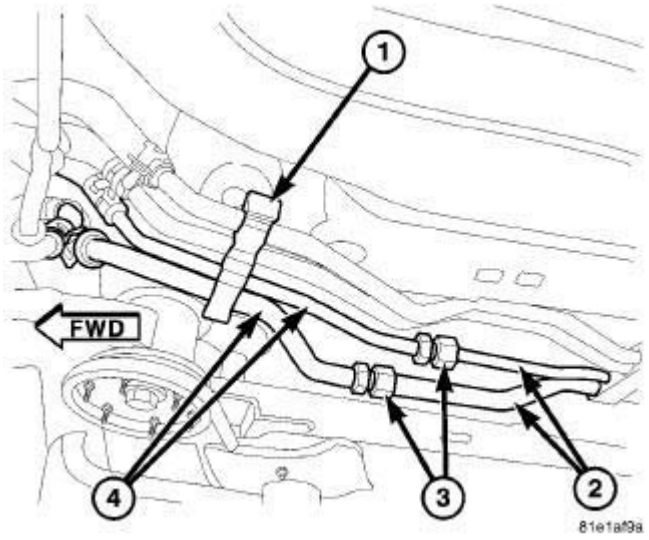

Fig. 314: Extension Lines-Underbody Connections
Courtesy of CHRYSLER LLC

5. Raise and support the vehicle.
6. Remove the tape or plugs from the opened underbody refrigerant line fittings.
7. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Connect the underbody A/C extension lines (4) to the underbody A/C liquid and suction lines (2). Tighten the fitting nuts (3) to 23 N.m (17 ft. lbs.).
9. Position the underbody A/C extension lines into the front underbody refrigerant line bracket (1) and engage the bracket retainer.
10. Lower the vehicle.
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
13. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
14. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

VALVE, A/C EXPANSION

Description

DESCRIPTION

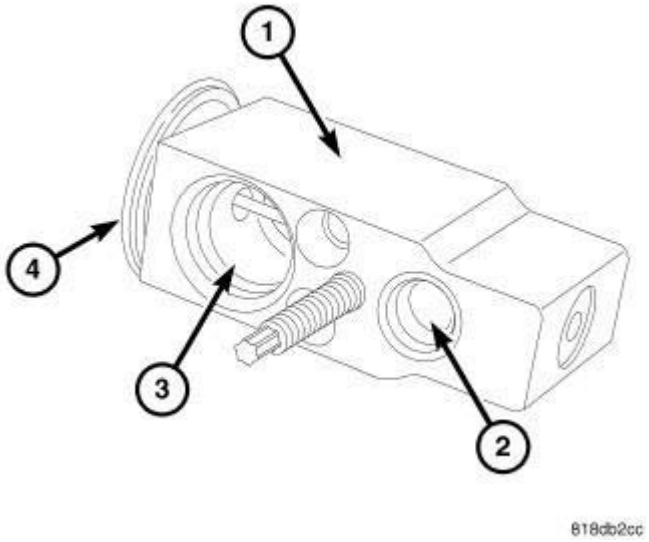

Fig. 315: A/C Expansion Valve Description KA
Courtesy of CHRYSLER LLC

The rear A/C expansion valve controls the amount of refrigerant entering the rear A/C evaporator. The rear A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1) with an inlet port (2), outlet port (3) and an integral thermal sensor (4).

The rear A/C expansion valve is located on the bottom of the rear heater-A/C housing, which extends through the rear floor panel behind the right rear wheel housing.

Operation

OPERATION

The rear A/C expansion valve controls the flow of high-pressure, low temperature liquid refrigerant entering the expansion valve and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the rear A/C evaporator. To meet the vehicles A/C cooling requirements, a mechanical sensor is used in the rear A/C expansion valve to monitor the temperature and pressure of the refrigerant leaving the rear A/C evaporator and then adjust the inlet port orifice size to allow only the proper amount of refrigerant to enter the evaporator. Controlling the refrigerant flow through the rear A/C evaporator ensures that none of the refrigerant leaving the evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve, or if the expansion valve is removed. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.

The rear A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged. See **Heating and Air Conditioning/Plumbing/VALVE, A/C Expansion - Diagnosis and Testing**.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

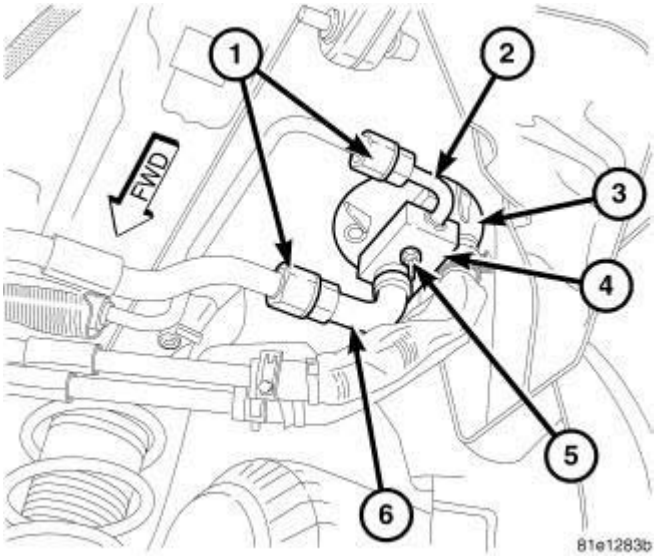

Fig. 316: Rear Underbody Refrigerant Extension Lines
Courtesy of CHRYSLER LLC

1. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
2. Raise and support the vehicle.
3. Loosen the nuts (1) that secure the underbody refrigerant lines to the underbody refrigerant extension lines (2 and 6) located behind the right rear wheel housing.
4. Disconnect the underbody refrigerant lines from underbody refrigerant extension lines and remove and discard the O-ring seals.
5. Remove the nut (5) that secures the underbody refrigerant extension line sealing plate (4) to the rear A/C expansion valve (3).
6. Disconnect the underbody refrigerant extension lines and sealing plate from the rear A/C expansion valve and remove and discard the O-ring seals.

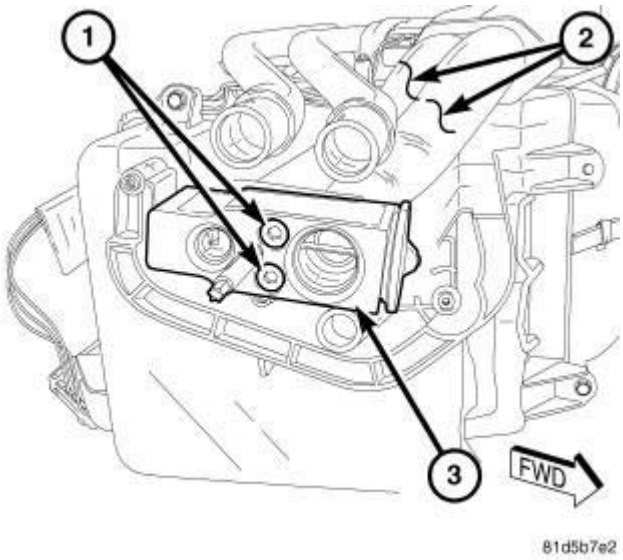

Fig. 317: Rear Expansion Valve Removal/Installation Bench
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with rear heater-A/C housing removed from vehicle.

7. Remove the two bolts (1) that secure the rear A/C expansion valve (3) to the rear evaporator tubes (2), which extend through the rear floor panel behind the right rear wheel housing.
8. Remove the rear A/C expansion valve from the rear evaporator tubes and remove and discard the O-ring seals.
9. Install plugs in, or tape over all the opened underbody refrigerant line fittings and the rear evaporator and expansion valve ports.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve, or if the expansion valve is removed. Failure to replace the rubber O-ring seals may result in a refrigerant

system leak.

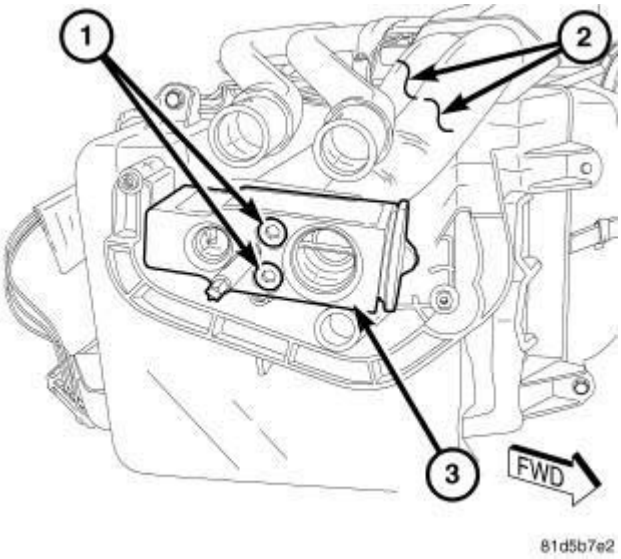

Fig. 318: Rear Expansion Valve Removal/Installation Bench
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with rear heater-A/C housing removed from vehicle.

1. Remove the tape or plugs from the opened underbody refrigerant line fittings and the rear evaporator and expansion valve ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the rear evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the rear A/C expansion valve (3) onto the rear evaporator tubes (2) extending through the rear floor panel behind the right rear wheel housing.
4. Install two bolts (1) that secure the rear A/C expansion valve to the rear evaporator tubes. Tighten the bolts to 11 N.m (97 in. lbs.).

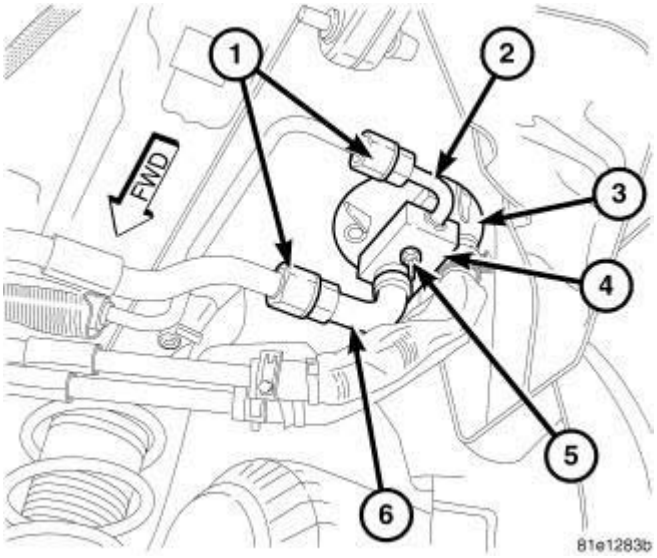

Fig. 319: Rear Underbody Refrigerant Extension Lines
Courtesy of CHRYSLER LLC

5. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the underbody refrigerant extension line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

CAUTION: Use care when installing the underbody refrigerant extension lines to the rear A/C expansion valve. Carefully align the tube ends with the valve prior to tightening the sealing plate retaining nut or damage to the sealing rings and tube ends may occur.

6. Connect the underbody refrigerant extension lines (2 and 6) and the sealing plate (4) to the rear A/C expansion valve (2).
7. Loosely install the nut (5) that secures the extension lines and sealing plate to the rear A/C expansion valve.
8. Connect the underbody refrigerant lines to the underbody refrigerant extension lines and tighten the fitting nuts (1) to 23 N.m (17 ft. lbs.).
9. Tighten the nut that secures the extension lines and sealing plate to the rear A/C expansion valve to 11 N.m (97 in. lbs.).
10. Lower the vehicle.
11. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
12. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
13. Charge the A/C system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

CABIN HEATER

RELAY, HEATER UNIT

Description

DESCRIPTION

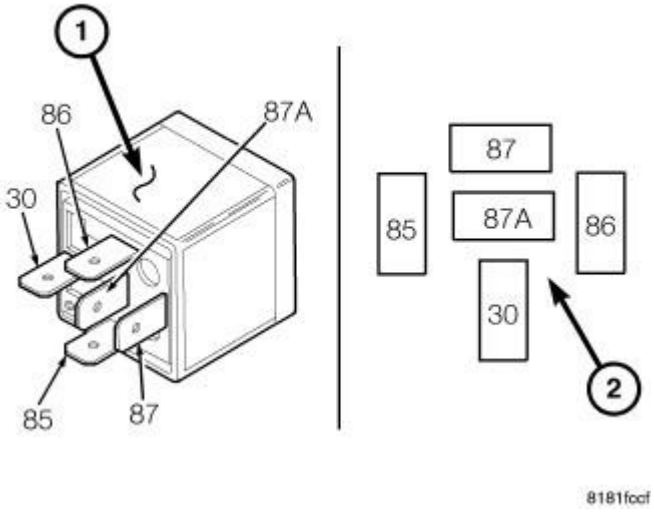

Fig. 320: Standard ISO-Type Relay
Courtesy of CHRYSLER LLC

Three relays (1) are used for the electric positive temperature coefficient (PTC) heater system when equipped with the 2.0L diesel engine. The relays are International Standards Organization (ISO)-type relays. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The PTC relays are electromechanical devices that switch fused battery current directly to the heating elements of the PTC heater unit. The PTC relays are energized by control circuits of the totally integrated power module (TIPM).

The three PTC relays are located in the diesel accessory fuse/relay block in the engine compartment.

Operation

OPERATION

The three ISO-standard relays (1) used for the electric positive temperature coefficient (PTC) heater system are electromechanical switches that use a low current ASD power input to control the high current fused battery power output to the PTC heater unit. On each relay, the movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to one or more of the heating elements of the PTC heater.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to

dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The terminals for the PTC relays are connected to the vehicle electrical system through receptacles in the diesel accessory fuse/relay block. Refer to **SYSTEM WIRING DIAGRAMS** for inputs and outputs of the PTC relays.

The PTC relays cannot be repaired and must be replaced if inoperative or damaged. See **SYSTEM WIRING DIAGRAMS** for diagnosis and testing of the ISO-standard relays and for complete TIPM and HVAC wiring diagrams.

Removal

REMOVAL

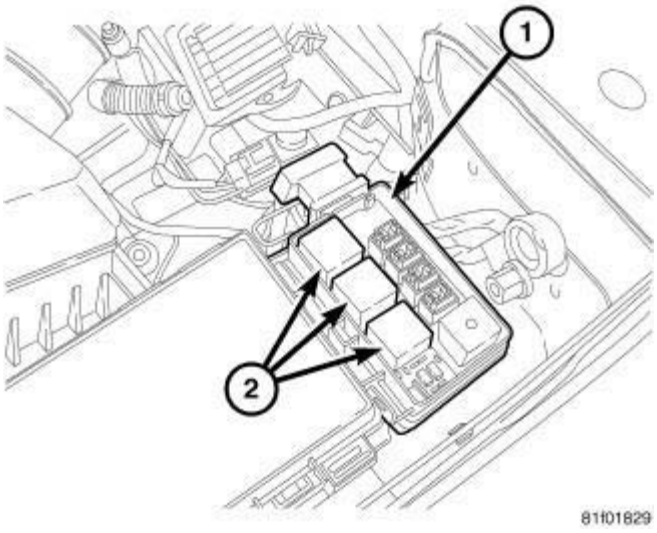

Fig. 321: Diesel Accessory Fuse/Relay Block
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the cover from the diesel accessory fuse/relay block (1) located near the left front strut tower.
3. Remove the positive temperature coefficient (PTC) relays (2) as necessary from the fuse/relay block.

Installation

INSTALLATION

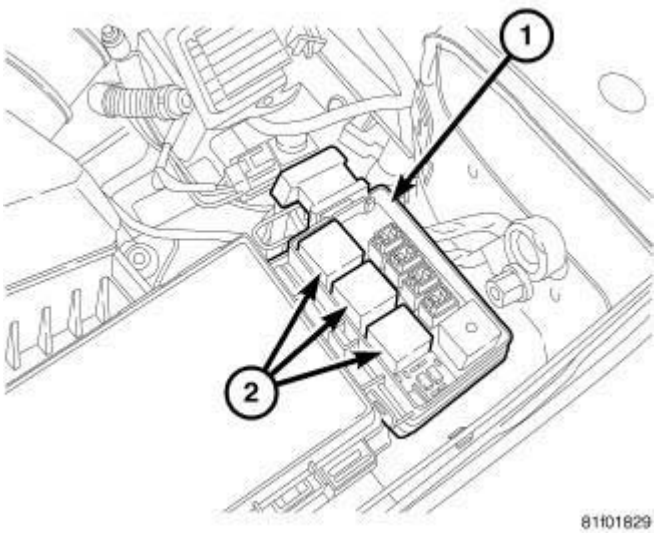

Fig. 322: Diesel Accessory Fuse/Relay Block
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Position the positive temperature coefficient (PTC) relays (2) as necessary into the proper receptacle of the diesel accessory fuse/relay block (1) located near the left front strut tower
2. Align the PTC relay terminals with the terminal cavities in the fuse/relay block and push down firmly on each relay until the terminals are fully seated.
3. Install the cover onto the diesel accessory fuse/relay block.
4. Reconnect the negative battery cable.

UNIT, HEATER

Description

DESCRIPTION

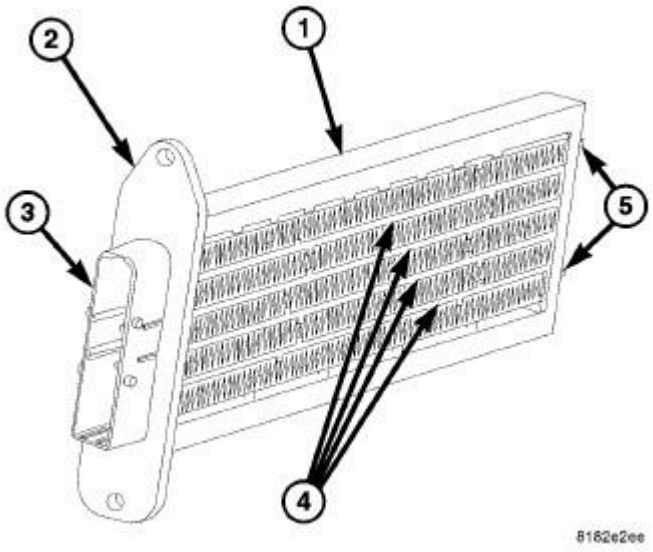

Fig. 323: Positive Temperature Coefficient Heater - Description
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

An electric positive temperature coefficient (PTC) heater unit (1) is used on vehicles when equipped with the 2.0L diesel engine. The PTC heater unit aids in passenger compartment heating by compensating for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core and is controlled by the diesel engine control module (ECM) and the totally integrated power module (TIPM) through three relays.

The PTC heater consists of a molded plastic mounting plate (2) with an integral wire connector receptacle (3). Concealed behind the mounting plate are heating elements with fins (4) that transfer the heat produced by the PTC heater to the conditioned air flowing within the air distribution housing. Two retaining tabs (5) are molded onto the opposite end of the heater unit to support the heater unit inside the air distribution housing. The PTC heater unit is connected to the vehicle electrical system through the instrument panel wire harness.

The PTC heater unit is accessed for service from under the left side of the instrument panel.

Operation

OPERATION

The positive temperature coefficient (PTC) heater unit dissipates 1 kW of electrical power through three heating elements. The PTC heater unit is split into three "banks". Each bank (element) is driven separately based on alternator load. This allows for lower in-rush current and optimum battery charging. After a bank has been turned on, another bank can only be turned on 10 seconds after the previous. On average, the PTC banks are not switched more than 25 times for each vehicle start. Electrical power output is between 900-1050 W. The totally integrated power module (TIPM) operates three relays for the PTC heater unit. See **Heating and Air Conditioning/Cabin Heater/RELAY, Heater Unit - Description**.

The control system for the PTC heater unit is diagnosed using a scan tool. Prior to replacing a PTC heater unit, check for any diagnostic trouble codes (DTCs) related to the ECM, TIPM and heating-A/C system.

The PTC heater unit cannot be adjusted or repaired must be replaced if inoperative or damaged.

Diagnosis and Testing

POSITIVE TEMPERATURE COEFFICIENT (PTC) HEATER UNIT

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: See SYSTEM WIRING DIAGRAMS for circuit descriptions and diagrams. Wiring Information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

Prior to replacing the Positive Temperature Coefficient (PTC) heater unit, check for any Diagnostic Trouble Codes (DTCs) related to the Engine Control Module (ECM), Totally Integrated Power Module (TIPM) and the heating-A/C system and repair as necessary. See **DTC-Based Diagnostics/HVAC - Standard Procedure** .

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the PTC heater unit. See **Heating and Air Conditioning/Cabin Heater/UNIT, Heater - Removal**.
3. Using an ohmmeter, check for continuity between all of the PTC heater unit terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the PTC heater unit, PTC relays and the TIPM. If NOT OK, replace the PTC heater unit.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning and Heating and Air Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in possible serious or fatal injury.

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect

and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

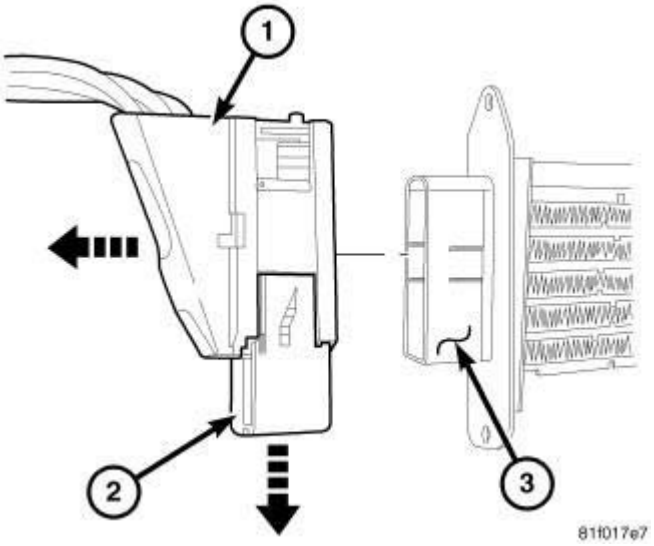

Fig. 324: Positive Temperature Coefficient Connector - Disconnect
Courtesy of CHRYSLER LLC

NOTE: PTC heater removed from distribution housing for clarity.

1. Disconnect and isolate the negative battery cable.

   NOTE: To disconnect the wire harness connector from the heater unit, pull downward on the connector lock while pulling the connector away from the heater unit.

2. Disengage the wire connector lock (2) that secures the wire harness connector (1) to the positive temperature coefficient (PTC) heater unit (3) located on the left side of the HVAC air distribution housing and disconnect the connector from the heater.

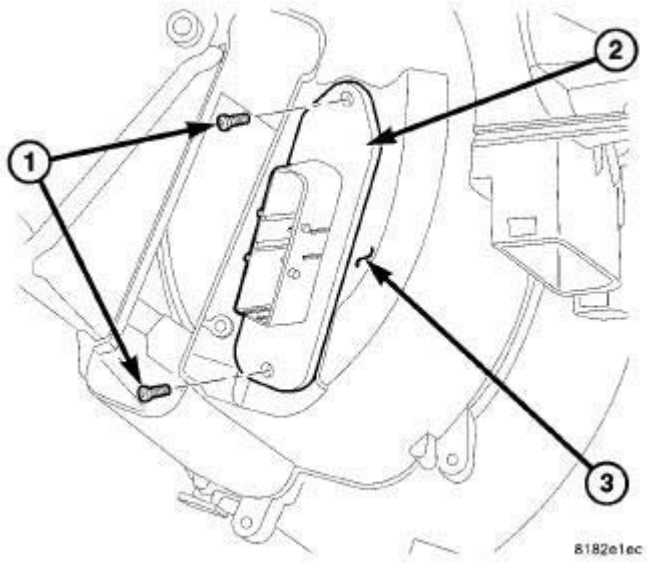

Fig. 325: PM/MK Positive Temperature Coefficient Heater Unit
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

3. Remove the two screws (1) that secure the PTC heater unit (2) to the left side of the HVAC air distribution housing (3).
4. Carefully remove the PTC heater unit from the air distribution housing by pulling it straight out of the housing.

Installation

INSTALLATION

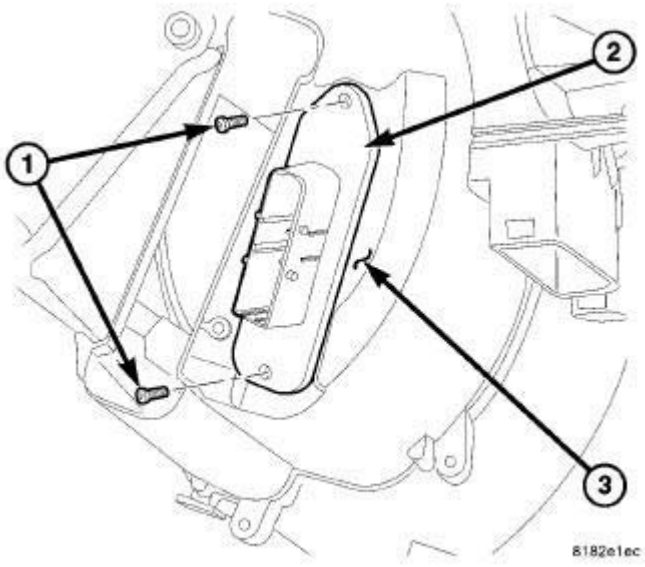

Fig. 326: PM/MK Positive Temperature Coefficient Heater Unit
Courtesy of CHRYSLER LLC

NOTE: LHD model shown. RHD model similar.

1. Carefully install the positive temperature coefficient (PTC) heater unit (2) into the left side of the HVAC air distribution housing (3). Make sure to position the two locator tabs on the end of the heater unit into the molded locator indentations on the right side of the air distribution housing.
2. Install the two screws (1) that secure the PTC heater unit to the air distribution housing. Tighten the screws to 1.2 N.m (10 in. lbs.).

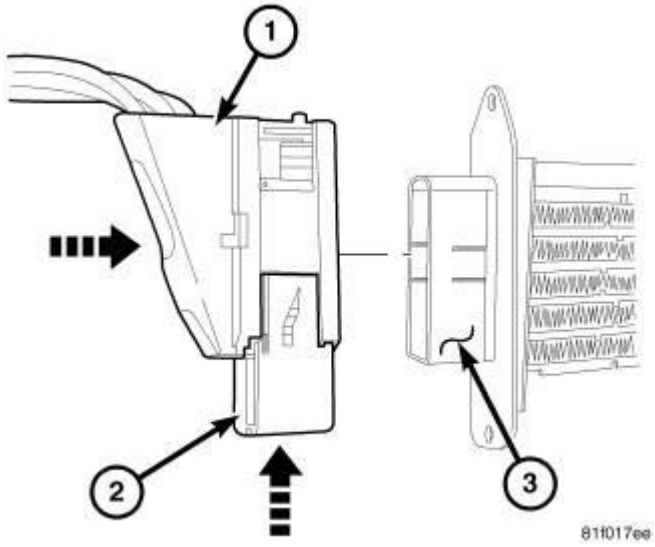

Fig. 327: Positive Temperature Coefficient Connector - Connect
Courtesy of CHRYSLER LLC

NOTE: PTC heater shown removed from distribution housing for clarity.

3. Connect the wire harness connector (1) to the PTC heater unit (3) while pushing upward on the connector lock (2). Make sure the wire harness connector and lock are fully engaged.
4. Reconnect the negative battery cable.

2009 ACCESSORIES AND EQUIPMENT

Instrument Cluster - Service Information - Journey

DESCRIPTION

DESCRIPTION

The instrument cluster contains the necessary hardware and software to serve as the vehicle electronic body control module and is commonly referred to as the Cab Compartment Node (CCN). The CCN utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus and the Local Interface Network (LIN) data bus, along with several hardwired analog and multiplexed inputs to monitor sensors and switches throughout the vehicle. The CCN also contains various indicators, analog gauges, and a standard blue-green digital Vacuum Fluorescent Display (VFD) unit. The standard VFD is a fixed segment unit that displays odometer information, automatic transmission gear selector position (PRNDL), and several other indicators, some of which are model dependant.

There are several versions of the CCN offered for this vehicle. These versions accommodate all of the variations of optional equipment for the various markets in which the vehicle is offered. The CCN may also contain a separate reconfigurable blue-green digital VFD unit that has either a Compass Mini-Trip Computer (CMTC) option or an Electronic Vehicle Information Center (EVIC) option. Both of these options provide the outside ambient temperature, compass headings, average fuel economy, and elapsed time. The EVIC option also offers a user interface for customer programmable features, audio system setting displays, numerous textual warnings, reminder indicators, and certain diagnostic information.

A dedicated Light Emitting Diode (LED) soldered onto the circuit board illuminates each indicator in the CCN, except those within a VFD unit. Several dimmable LED units illuminate each gauge dial face for visibility when the exterior lighting is turned on. These LED units are not available for service replacement and, if damaged or ineffective, the entire CCN must be replaced.

The CCN is serviced only as a complete unit and cannot be adjusted or repaired. If a gauge, LED unit, VFD unit, electronic circuit board, circuit board hardware, cluster overlay, or cluster housing is damaged or ineffective, the entire CCN must be replaced. The cluster lens is available for separate service replacement.

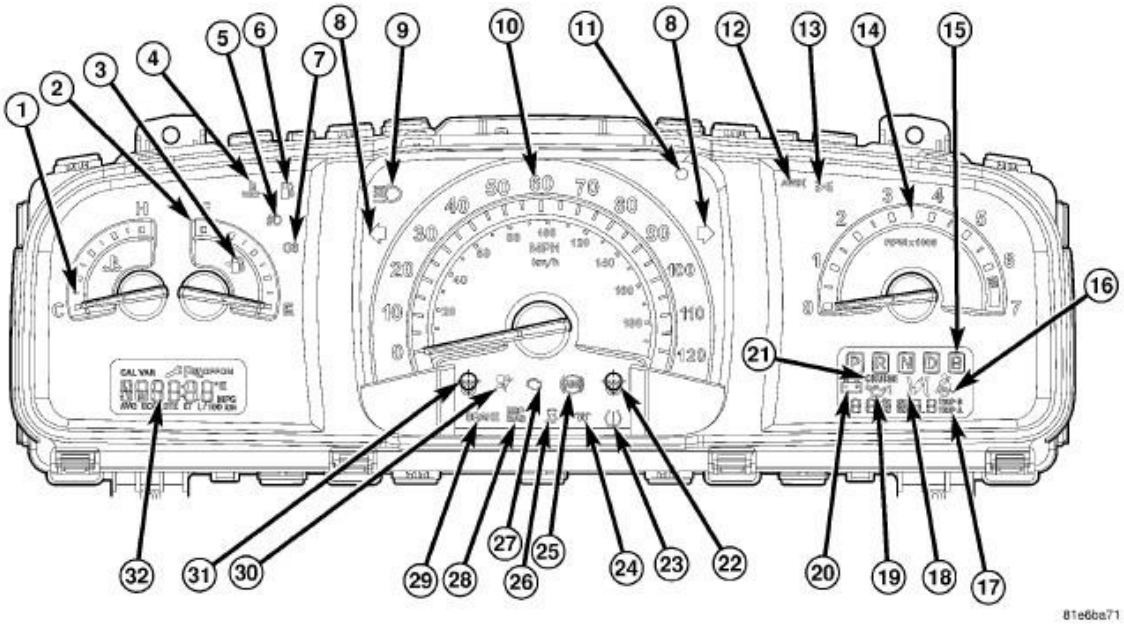

Fig. 1: Mechanical Instrument Cluster
Courtesy of CHRYSLER LLC

The mechanical instrument cluster is an electromechanical module that receives most of its information directly from the various control modules, with the data bus.

The cluster includes:

- A speedometer (10)
- A tachometer (14)
- A fuel gauge (2)
- A coolant Temperature gauge (1)

The warning and information indicators include the following:

- Coolant temperature warning (4)
- Front fog lamp indicator, front (5), and rear (7) (export only)
- Low fuel (6)
- Turn signal indicator (8)
- High beam (9)
- Vehicle theft security system alarm LED indicator (if equipped) (11)
- All-Wheel Drive (AWD) failure indicator (12)
- Front position lamps (13) (export only)
- Transaxle range indicator (15)
- Seat belt reminder (16)
- Odometer/Trip odometer (17)

- Electronic Throttle Control (ETC) warning lamp (18)
- Low oil pressure (19)
- Charging system (20)
- Cruise (if equipped) (21)
- Trip odometer reset button (cycle to change display; Trip A, Trip B, Outside Temperature for base vehicle) (22)
- Tire Pressure Monitoring (TPM) (23)
- Wait to Start Indicator (Export Diesel) (24)
- Anti-lock brake system (If equipped) (25)
- Electronic Stability Program (ESP) and Traction Control System (TSC) (26)
- Check engine (27)
- Electronic Stability Program (ESP) and / Brake Assist System (BAS) Malfunction Lamp (28)
- Brake/park brake warning (29) (Export will display an ICON)
- Airbag (30)
- Compass/Temp display and calibrate button (CMTC Only) (31)
- Vacuum Fluorescent Display (VFD) (32) (if equipped) - For CMTC option, use 31 Compass/Temp display and calibrate button to interface with display. For EVIC option, use front mounted steering wheel switches to interface with display.

Vehicle Warning Messages

When the appropriate conditions exist, messages such as "HOOD" (hood ajar), "DOOR" (door ajar), "GATE" (liftgate ajar), "LoCOOL" (low engine coolant), "LoWASH" (low washer fluid), "GASCAP" (fuel cap fault), "ESPOFF" (ESP in partial off mode), "NoBUS" (data bus communication fault), "NoFUSE" (IOD fuse out), "HotOIL" (2.4L engine oil temp too hot), or "CHANGE OIL" displays in the odometer.

Change Oil Message (Base and mid line clusters only)

Your vehicle is equipped with an engine oil change indicator system. The "CHANGE OIL" message flashes in the instrument cluster odometer for approximately 12 seconds after a single chime has sounded to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate dependent upon your personal driving style.

Unless reset, this message continues to display each time you turn the ignition switch to the ON position. To turn off the message temporarily, press and release the TRIP ODOMETER button on the instrument cluster. To reset the oil change indicator system, (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the ON position. (Do not start the engine).
2. Fully press the accelerator pedal slowly three times within 10 seconds.
3. Turn the ignition switch to the LOCK position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure

OPERATION

OPERATION

The instrument cluster contains the necessary hardware and software to serve as the vehicle's electronic body control module and is commonly referred to as the Cab Compartment Node (CCN). The following information deals primarily with the instrument cluster functions of this unit. Additional details of the electronic body control functions may be found within the service information for the system or component that the CCN controls. For example, additional details of the audible warning functions of the CCN are found within the **CHIME/BUZZER - SERVICE INFORMATION** .

The CCN is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the CCN provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The CCN is installed in the instrument panel so that the operator of the vehicle can view all of these monitors easily, yet still allow relative ease of access for service.

The microprocessor-based CCN hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus and the Local Interconnect Network (LIN) data bus. The CCN is the master of the LIN bus. These four modules talk to the CCN: The Heated Seat Module (HSM); the Remote Compass Module (RCM); the Steering Control Module (SCM); and the Accessory Switch Bank Module (ASBM). Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/COMMUNICATION - Operation** .

The CCN microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable, and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microprocessor can sound a chime through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The CCN may also produce audible warnings for other electronic modules in the vehicle based upon electronic tone request messages received over the CAN/LIN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The CCN circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the/CCN to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the On or Start positions. The CCN circuitry is grounded through a ground circuit of the instrument panel wire harness.

The CCN also has a self-diagnostic actuator test capability that tests each of the CAN bus message-controlled functions of the cluster. This test illuminates the appropriate indicators, positions the gauge needles at several predetermined calibration points across the gauge faces, and illuminates all segments of the odometer/trip

odometer/gear selector indicator Vacuum-Fluorescent Display (VFD) unit and Electronic Vehicle Information Center (EVIC). The EVIC will display the hardware/software version, and the CAN and LIN Vehicle Maintenance Monitor (VMM) used in the CCN. See **Diagnosis and Testing** .

The CCN collects data and provides control signals for the following electrical equipment via the CAN data bus:

- Gauges
- Interior lighting controls
- Variable-intensity cluster lighting and illumination of instrument panel mounted equipment
- Vehicle Theft Alarm and Sentry Key Theft Deterrent System
- Power door lock system controls (automatic locking, and Remote Keyless Entry locking and unlocking)
- Headlamp switch actuation signal
- Steering wheel radio actuation signals
- Accessory power delay relay control
- Wiper control
- Turn signal flasher audible click
- Heated seat actuation signal (if equipped)
- UConnect® Hands-Free, Voice-Actuated Communication system actuation signal (if equipped)
- Display of the outputs for the HomeLink® universal home security system and compass (if equipped)
- Illuminated entry system
- Key-in-ignition warning chime
- Seat belt warning chime and lamp (Including BeltAlert®)
- Door ajar warning indicator
- Liftgate/trunk ajar warning indicator
- LIN master module

The CCN also provides the following enhancements to the above features:

- Time-out for interior lamps left on inadvertently
- Driver programmability of the power locks to unlock only the driver's door or all doors with the first actuation of the RKE unlock button
- Ability to program vehicle response to lock and unlock commands from the RKE transmitter
- The improved BeltAlert® seatbelt warning indication
- Filtering of input signals to the fuel gauge, temperature gauge, and speedometer to avoid sudden, unexpected pointer movements
- Headlamp control for turning the headlamps on if the windshield wipers are operated in daylight as required by law in some states

GAUGES

All gauges receive battery current through the CCN circuitry only when the ignition switch is in the On or Start positions. With the ignition switch in the Off position, battery current is not supplied to any gauges, and the CCN circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the On or Start positions.

All of the CCN gauges are stepper motors. The gauges are diagnosed using the CCN self-diagnostic actuator test. See **Diagnosis and Testing** . Proper testing of the CAN data bus and the electronic data bus message inputs to the CCN that control each gauge require the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information. Specific operation details for each gauge may be found elsewhere in this service information.

VACUUM-FLUORESCENT DISPLAYS

The Vacuum-Fluorescent Display (VFD) units are soldered to the CCN electronic circuit board. With the ignition switch in the Off or Accessory positions, the standard left and optional right VFD displays are activated when the driver door is opened and is deactivated when the driver door is closed. Otherwise, the display units are active when the ignition switch is in the On or Start positions, and inactive when the ignition switch is in the Off or Accessory positions.

The illumination intensity of the VFD units are controlled by the CCN circuitry based upon an input from the headlamp switch and a dimming level input received from the panel dimmer switch. The CCN synchronizes the illumination intensity of other VFD units with that of the unit in the CCN by sending electronic dimming level messages to other electronic modules in the vehicle over the CAN/LIN data bus.

The CCN VFD units have several display capabilities. The standard VFD unit displays odometer, trip odometer, engine hours, gear selector indication (PRNDL) for models with an automatic transmission, several warning or reminder indications, and various diagnostics information when certain fault conditions exist. An odometer/trip odometer switch on the CCN circuit board is used to control some of the display modes of the standard VFD. This switch is actuated manually by depressing the odometer/trip odometer switch button, which extends through the cluster lens below the speedometer at the bottom right hand side. Actuating this switch momentarily with the ignition switch in the On position will toggle the VFD between odometer, trip odometer modes, and outside ambient temperature (for base vehicle only). Depressing the switch button for about two seconds while the VFD is in the trip odometer mode will reset the trip odometer value to zero. The optional VFD unit on the left hand side displays the Compass Mini-Trip Computer (CMTC) or the Electronic Vehicle Information Center (EVIC). The left switch button, which extends through the cluster lens below the speedometer at the bottom left hand side, is used as a STEP button for the CMTC display and for customer programmable features. Refer to **Electrical - Message Systems/Message Center/CENTER, Electronic Vehicle Information - Operation** . The front mounted steering wheel switches are used to interface with the EVIC display.

NOTE: If the vehicles OnBoard Diagnostic (OBD) system determines that the fuel filler cap is loose, improperly installed, or damaged; a "GASCAP" message will be displayed in the Odometer/Trip Odometer. In this instance, tighten the fuel filler cap and press the odometer/trip odometer reset button once to turn the message OFF. The key must be in the Run/Start position during the reset, or you may just cycle the key. If left loose for three trips, or key cycles, a DTC will set and the MIL lamp will illuminate.

Holding the right switch depressed while turning the ignition switch from the Off position to the On position will initiate the CCN self-diagnostic actuator test. Refer to**Diagnosis and Testing** service information for additional details on this cluster function. The CCN microprocessor remembers which display mode is active when the ignition switch is turned to the Off position, and returns the VFD display to that mode when the ignition switch is turned On again.

The VFD unit is diagnosed using the CCN self-diagnostic actuator test. See **Diagnosis and Testing** . Proper testing of the CAN data bus and the electronic data bus message inputs to the CCN that control some of the VFD functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information. Specific operation details for the odometer, the trip odometer, the gear selector indicator, and the various warning and reminder indicator functions of the VFD unit may be found elsewhere in this service information. Refer to the vehicle owner's manual for further information on various readout messages.

ODOMETER/TRIP ODOMETER DISPLAY

The odometer and trip odometer give an indication to the vehicle operator of the distance the vehicle has traveled. The engine hours give an indication of the cumulative engine-ON time. This indicator is controlled by the instrument cluster circuitry based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) or Engine Control Module (ECM) over the Controller Area Network (CAN) data bus.

The odometer/trip odometer will display some warning messages such as "DOOR" and "GATE" ajar. If equipped with the optional Electronic Vehicle Information Center (EVIC), the EVIC will display all messages except GASCAP.

The odometer, trip odometer, and engine hours information is displayed by the instrument cluster Vacuum Fluorescent Display (VFD). The VFD will display the odometer information whenever the driver side front door is opened with the ignition switch in the OFF or ACCESSORY positions, and will display the last previously selected odometer or trip odometer information when the ignition switch is turned to the ON or START positions. If your vehicle is equipped with an engine oil change indicator system, the "Change Oil" message will flash in the instrument cluster odometer for approximately 12 seconds after a single chime has sounded to indicate the next scheduled oil change interval. The instrument cluster circuitry controls the VFD and provides the following features:

- **Odometer/Trip Odometer Display Toggling** - Actuating the trip odometer reset switch button momentarily with the VFD illuminated will toggle the display between the odometer and trip odometer information. Each time the VFD is illuminated with the ignition switch in the ON or START positions, the display will automatically return to the last mode previously selected (odometer or trip odometer).
- **Engine Hours Display Toggling** - When the trip odometer reset switch button is pressed and held for 10 seconds with the ignition switch in the ON position and the engine not running and the engine speed message from the PCM is zero, the trip odometer information will be momentarily displayed, then the engine hours information will be displayed. The VFD must be displaying the odometer information when the trip odometer reset switch button is pressed in order to toggle to the engine hours display. The engine hours will remain displayed for about 30 seconds, until the engine speed message is greater than zero, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Trip Odometer Reset** - When the trip odometer reset switch button is pressed and held for longer than about two seconds with the ignition switch in the ON or START position, the trip odometer will reset to

0.0 kilometers (miles). The VFD must be displaying the trip odometer information in order for the trip odometer information to reset.

- **GASCAP Message Display** - For vehicles manufactured with a United States country code, each time the cluster receives an electronic message from the PCM indicating a monitored leak in the evaporative emissions system the cluster replaces the displayed odometer/trip odometer value with the textual message, **GASCAP** . This message serves as a reminder to the vehicle operator to check that the gas cap is properly installed and tightened, but could also indicate another source of air leakage in the on-board evaporative and vapor recovery emissions systems. Unless the leak is corrected, this message will latch and remain displayed during the current and each subsequent ignition cycle until the trip odometer reset button is pressed and released momentarily, which will revert the display to the odometer/trip odometer information that was last displayed for the remainder of that ignition cycle. Once the source of a leak has been corrected, the GASCAP message display will stay illuminated until the evaporative emission system runs the next leak check and passes.
- **Change Oil Indicator** A change oil indicator is standard equipment on all instrument clusters built for the US market. The change oil indication appears within the fixed segment odometer Vacuum Fluorescent Display (VFD) unit on vehicles not equipped with an optional Electronic Vehicle Information Center (EVIC). On vehicles equipped with the optional EVIC, the change oil indication in the odometer VFD is electronically suppressed so as not to duplicate indications that are provided by the EVIC. The odometer VFD change oil indicator consists of cycling textual **CHANGE** then **OIL** messages, which appear in place of the odometer/trip odometer information. The EVIC change oil indicator consists of a textual **Oil Change Required** message that appears within the EVIC VFD
- **Communication Error** - If the cluster fails to receive an electronic **distance** message during normal operation, it will hold and display the last data received until the ignition switch is turned to the OFF position. If the cluster does not receive a **distance** message within one second after the ignition switch is turned to the ON position, it will display the last distance value stored in the cluster memory. If the cluster is unable to display distance information due to an error internal to the cluster, the VFD will display **Error** .
- **Actuator Test** - Each time the cluster is put through the actuator test, the odometer VFD will display all of its segments simultaneously, and then step through each character segment individually during the VFD portion of the test to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the vehicle speed pulse information received from the Vehicle Speed Sensor (VSS) or the Controller Anti-lock Brake (CAB) and engine speed pulse information received from the crankshaft position sensor, and then sends the proper messages to the CCN. For further diagnosis of the odometer/trip odometer or the instrument cluster circuitry that controls these functions. See **Diagnosis and Testing** .

For proper diagnosis of the VSS, the crankshaft position sensor, the CAB, the PCM, the CAN data bus, or the electronic communication related to odometer/trip odometer operation a diagnostic scan tool is required. Refer to the appropriate diagnostic service information.

COMPASS MINI-TRIP COMPUTER (CMTC) DISPLAY

The CMTC system conveniently allows the driver to select a variety of useful information by pressing the Compass/Temp Display and Calibrate button, which extends through the cluster lens below the speedometer at the bottom left hand side. The CMTC displays the following information:

- **Compass display**
- **Outside temperature display**
- **Trip computer functions**
- **Elapsed time**

For additional information. Refer to **Electrical - Message Systems/Message Center/CENTER, Electronic Vehicle Information - Operation** .

ELECTRONIC VEHICLE INFORMATION CENTER (EVIC) DISPLAY

The EVIC system conveniently allows the driver to select a variety of useful information by pressing the **MENU** button and **STEP/SELECT** button, which are located on the front of the steering wheel. The EVIC displays information related to the following:

- **Audio mode display**
- **Compass display**
- **Navigation system screens (if equipped)**
- **Outside temperature display**
- **Personal Settings (customer programmable features)**
- **System Status**
- **Trip computer functions**
- **UConnect™ hands-free communication system displays (if equipped)**
- **Vehicle information warning message displays**

For additional information. Refer to **Electrical - Message Systems/Message Center/CENTER, Electronic Vehicle Information - Operation** .

INDICATORS

Indicators are located in various positions within the CCN and are all connected to the CCN electronic circuit board. All indicators, except the inverter indicator (if equipped), are controlled by CAN data bus messages. The brake indicator is controlled by CAN data bus messages from the Controller Antilock Brake (CAB) as well as by hard-wired park brake switch inputs to the CCN. The seatbelt indicator is controlled by the CCN and is turned on and off depending upon the CAN message received. The Malfunction Indicator Lamp (MIL) is normally controlled by CAN data bus messages from the Powertrain Control Module (PCM); however, if the CCN loses CAN data bus communication, the CCN circuitry will automatically turn the MIL on and display NoBUS in the right VFD until CAN data bus communication is restored. The CCN uses CAN data bus messages from the Totally Integrated Power Module (TIPM), the ORC, the CAB, and the Sentry Key Remote Entry Module (SKREEM) to control all of the remaining indicators.

The various CCN indicators are controlled by different strategies. Some receive fused ignition switch output from the CCN circuitry and have a switched ground. Others are grounded through the CCN circuitry and have a switched battery feed. However, all indicators are completely controlled by the CCN microprocessor based upon various hard wired and electronic message inputs. The cruise indicator located within the VFD unit is

dimmable. All other indicators are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the CCN general illumination LED's. The illumination intensity of the dimmable indicators is synchronized with that of the CCN general illumination LED's.

In addition, certain indicators in this instrument cluster are automatically configured or self-configured. This feature allows the configurable indicators to be enabled by the CCN circuitry for compatibility with certain optional equipment. The CCN defaults for the ABS indicator and airbag indicator are enabled, and these configuration settings must be programmatically disabled in the CCN using a diagnostic scan tool for vehicles that do not have this equipment. The automatically configured or self-configured indicators remain latent in each CCN at all times and will be active only when the CCN receives the appropriate CAN message inputs for that optional system or equipment.

The hard-wired indicator inputs may be diagnosed using conventional diagnostic methods. However, the CCN circuitry and CAN/LIN bus message controlled indicators are diagnosed using the CCN self-diagnostic actuator test. Some indicators are requested to be turned on via the LIN bus. See **Diagnosis and Testing** . Proper testing of the CAN/LIN data bus and the electronic message inputs to the CCN that control an indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information. Specific details of the operation for each indicator may be found elsewhere in this service information.

CLUSTER ILLUMINATION

The CCN has several illumination lamps that are illuminated whenever the exterior lighting is turned On. The illumination intensity of these lamps is adjusted when the left multifunction dimming control ring is rotated (down to dim, up to brighten) to one of five available minor detent positions. The CCN monitors a resistor-multiplexed input from the headlamp switch on a dimmer input circuit. In response to that input, the CCN electronic circuitry converts a fused 12-volt input it receives on a hard-wired panel lamps dimmer switch signal circuit into a 12-volt Pulse Width Modulated (PWM) output.

The CCN uses this PWM output to control the illumination intensity of the cluster, the instrument panel center stack illumination, and the VFD unit on the CCN circuit board. The CCN also transmits electronic dimming level messages over the LIN data bus to other electronic modules (such as the ASBM, HVAC control head, the radio, and the clock) in the vehicle to control and synchronize their illumination intensity.

In addition, the dimming control ring on the headlamp switch has a Parade Mode position to provide a parade or funeral mode. The CCN monitors the request for this mode from the headlamp switch, then transmits an electronic dimming level message to illuminate all VFD units in the vehicle at full (daytime) intensity for easier visibility when driving in daylight with the exterior lighting turned on.

The hard-wired headlamp switch and panel lamps dimmer inputs to and outputs from the CCN may be diagnosed using conventional diagnostic methods. However, proper testing of the PWM processing of the CCN and the electronic dimming level messages sent by the CCN over the CAN data bus requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information.

DIAGNOSIS AND TESTING

INSTRUMENT CLUSTER

As a quick diagnosis, the cluster will perform a functional check of the odometer display, transmission range display and warning indicators after the ignition is switched to RUN/START. If the cluster is not receiving any bus messages, the cluster will appear non-functional and "no bus" will appear in the odometer display.

A self-test of the cluster can also be initiated by pressing and holding the odometer reset button and switching the ignition from lock to unlock. The cluster will then step through several displays for functional verification. By pressing the trip odometer reset button while going through the self-test, you can temporarily freeze the test. Pressing the bottom again will continue sequence. The cluster will store bus communication faults with other modules. It will also store faults for the AIRBAG and ABS lamps. During the self-diagnostics, the AIRBAG and ABS lamps are tested.

If the cluster is not functioning properly, refer to **BODY** article.

If the cluster is not receiving bus messages, refer to **BODY** article.

In order to diagnose the instrument cluster functions, a scan tool and the proper Body Diagnostic article are required.

If the diagnostic procedure determines that a replacement of an instrument cluster component is required, refer to **Removal** and **Installation** .

REMOVAL

REMOVAL

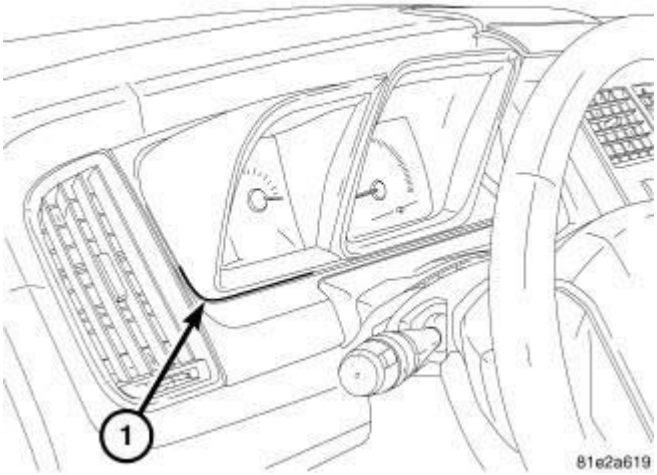

Fig. 2: Instrument Cluster
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

NOTE: The left hand side of the instrument cluster trim bezel is under the AC vent

on the inboard side. When removing the instrument cluster trim bezel, it may be necessary to flex the AC vent slightly to relieve the bezel from under the AC vent.

2. Remove the instrument cluster trim bezel using a trim stick or equivalent and gently prying at point (1).

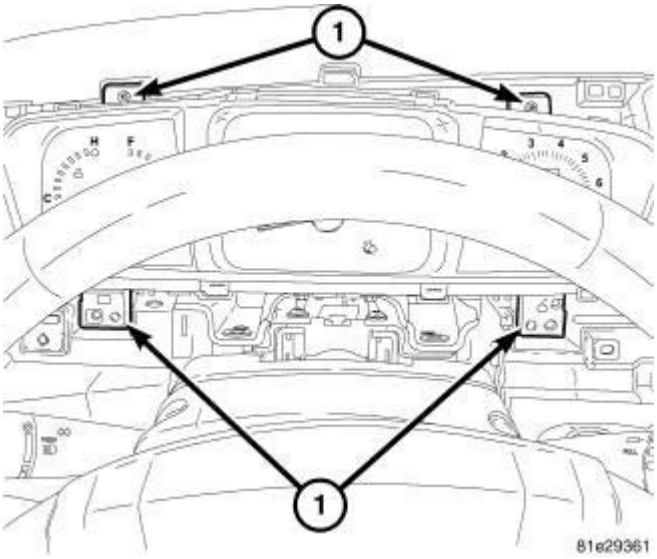

Fig. 3: Instrument Cluster
Courtesy of CHRYSLER LLC

3. Remove the four attaching screws (1) from the cluster.

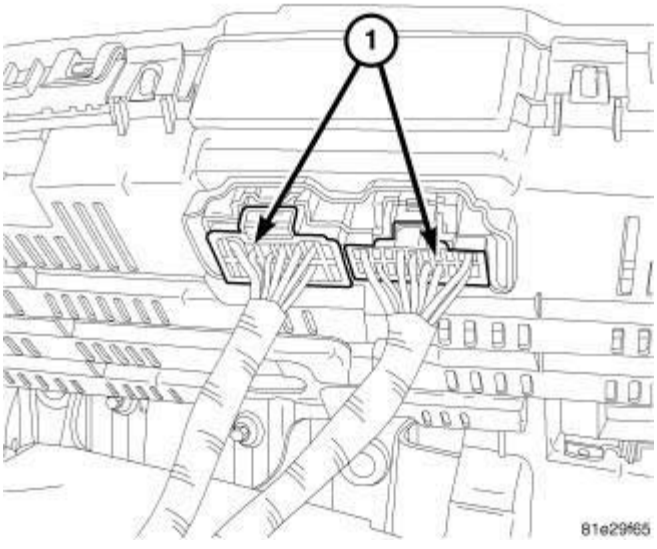

Fig. 4: Instrument Cluster & Electrical Connectors
Courtesy of CHRYSLER LLC

4. Pull the cluster forward and disconnect the two electrical connectors (1).

5. Remove the cluster from the instrument panel.

INSTALLATION

INSTALLATION

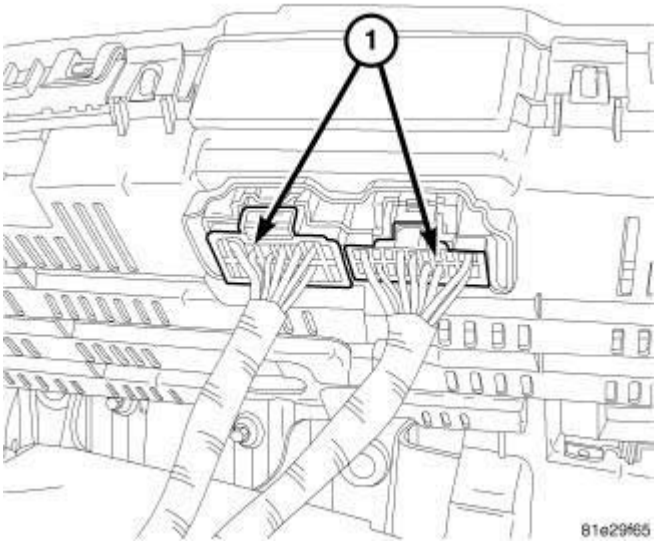

Fig. 5: Instrument Cluster & Electrical Connectors
Courtesy of CHRYSLER LLC

1. Carefully slide the cluster into its location and connect the two electrical connectors (1) to the cluster.

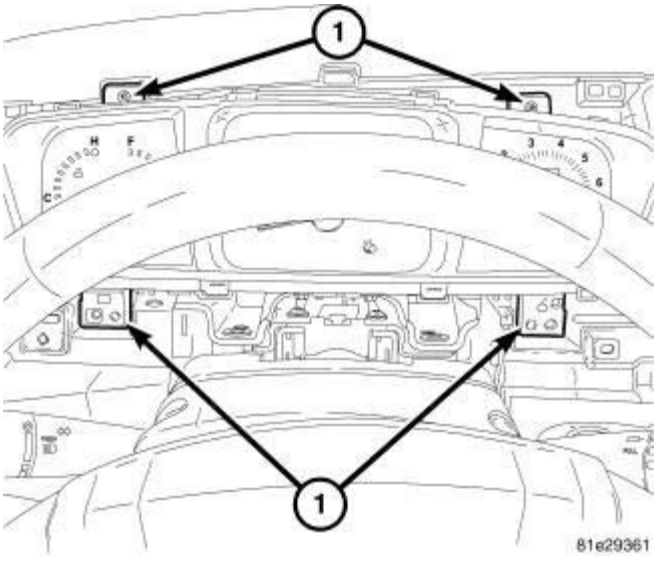

Fig. 6: Instrument Cluster
Courtesy of CHRYSLER LLC

2. Position the cluster in the instrument panel and Install the four cluster attaching screws (1).

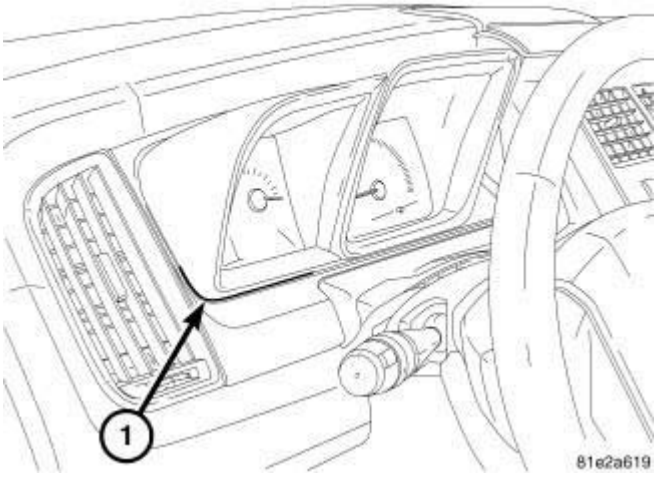

Fig. 7: Instrument Cluster
Courtesy of CHRYSLER LLC

NOTE: When installing the cluster trim bezel, be sure to place the left hand side of the bezel underneath the AC vent. It may be necessary to flex the trim on the AC vent slightly to allow the cluster trim bezel locking clips secure entry into the instrument panel.

3. Install the cluster trim bezel.
4. Connect the battery negative cable.

LENS, INSTRUMENT CLUSTER

REMOVAL

REMOVAL

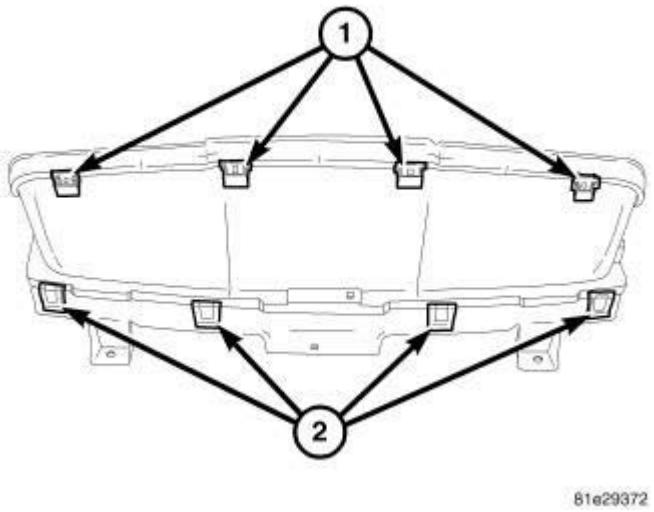

Fig. 8: Instrument Cluster Lens Locking Tabs
Courtesy of CHRYSLER LLC

1. Remove instrument cluster from vehicle. See **Removal** .
2. Separate the lens from the cluster by gently prying on the locking clips (1) around the perimeter of the lens.
3. Separate lens from instrument cluster and remove.

INSTALLATION

INSTALLATION

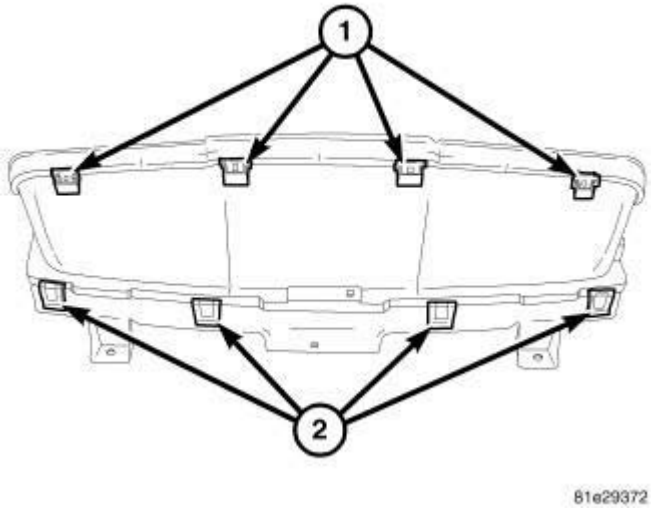

Fig. 9: Instrument Cluster Lens Locking Tabs
Courtesy of CHRYSLER LLC

1. Align lens locking tabs (1) with instrument cluster mask assembly and snap securely into place.
2. Install the instrument cluster into vehicle. See **Installation** .
3. Connect battery negative cable.

POD, SWITCH

DESCRIPTION

DESCRIPTION

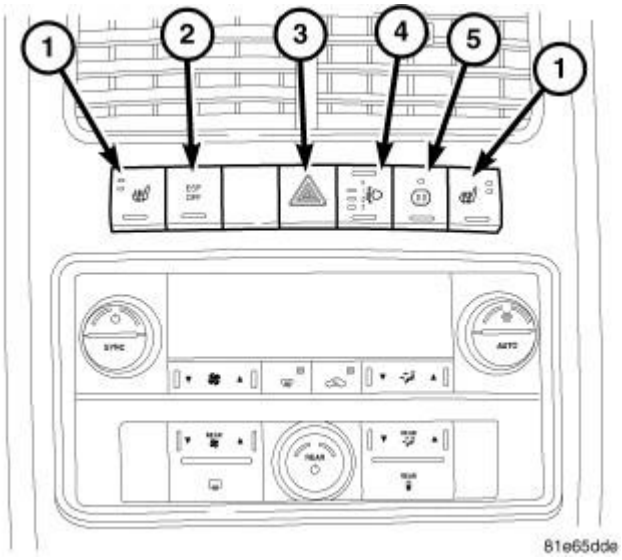

Fig. 10: Accessory Switch Bank Module
Courtesy of CHRYSLER LLC

The Accessory Switch Bank Module (ASBM) is located in the center stack area of the instrument panel just below the heater and air conditioner duct and above the radio. This switch is available in multiple configurations, which vary from a single momentary push button switch to as many as six momentary push button switches, depending upon the optional equipment in the vehicle. The pod may include the following switches:

- **Heated Seats (if equipped) (1)**
- **Electronic Stability Program Off (2)**
- **Hazard Warning (3)**
- **Headlamp Leveling (export only) (4)**
- **Electrical Inverter On/Off (domestic only) (5)**

The switch housing and the push buttons are constructed of molded plastic. Each push button has a smooth finish and is clearly identified with the appropriate text and International Control and Display Symbol icons. Several of the push buttons feature Light Emitting Diode (LED) units to give the vehicle operator an indication when the function of that switch is currently active.

Four screws secure the switch to the back of the instrument panel center bezel through integral mounting tabs that are molded into each corner of the switch housing. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

Panel lamps dimmer controlled illumination lamps integral to the circuit board within the switch provide back lighting for visibility at night, but these lamps are not serviceable. The individual switches in the ASBM cannot be repaired and are not serviced individually. If any component within the switch pod is ineffective or damaged, the entire switch pod must be replaced.

The Domestic version of the ASBM is as follows:

- **Heated Seat Switches** (if equipped) -. Refer to **Electrical - Heated/Cooled Systems/Heated Seats/SWITCH, Heated Seat - Description** .
- **ESP Off** -. Refer to **Brakes - Description** .
- **Hazard Switch** (all models) -. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Hazard Warning - Description** .
- **Electrical Inverter** (domestic models).

The Export version of the ASBM will vary from the domestic:

- **Heated Seat Switches** (if equipped) -. Refer to **Electrical - Heated/Cooled Systems/Heated Seats/SWITCH, Heated Seat - Description** .
- **Hazard Switch** (all models) -. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Hazard Warning - Description** .
- **Headlamp Leveling Switch** (if equipped) -. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Headlamp Leveling - Description** .

Each individual switch is not available for service replacement. If one or more switches are inoperative, the entire ASBM must be replaced. See **Removal** . To diagnose the ASBM switches, use a scan tool and the appropriate diagnostic service information.

OPERATION

OPERATION

For information covering details of operation for the individual switches or indicator contained within the instrument panel switch pod, refer to the specific service information covering the system to which that switch or indicator belongs.

- **Heated Seat Switches** (if equipped) -. Refer to **Electrical - Heated/Cooled Systems/Heated Seats/SWITCH, Heated Seat - Description** .
- **ESP On/Off** (domestic models) -. Refer to **Brakes - Description** .
- **Hazard Switch** (all models) -. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Hazard Warning - Description** .

- **Electrical Inverter** (domestic models)
- **Headlamp Leveling Switch** (if equipped) -. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Headlamp Leveling - Description** .

REMOVAL

REMOVAL

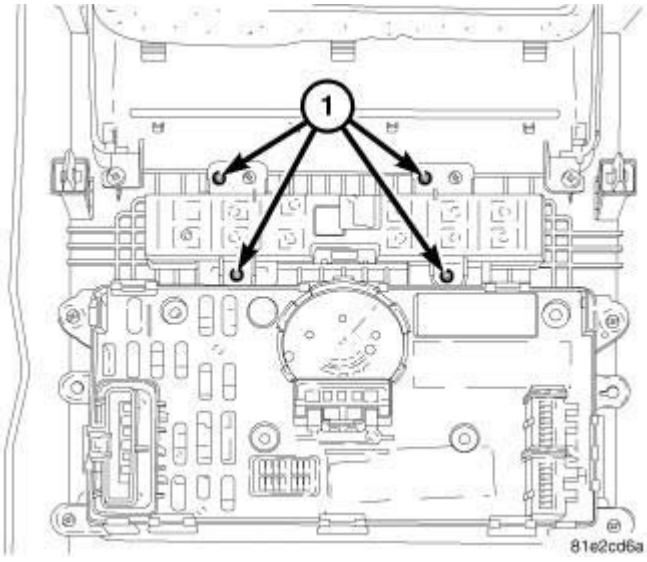

Fig. 11: Instrument Panel Center Bezel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal** .
3. Disconnect the electrical connector from the switch by depressing the lock tab and pulling connector from the ASBM.
4. Remove the four screws (1) to the Accessory Switch Bank Module (ASBM).
5. Remove the ASBM from the instrument panel center bezel.

INSTALLATION

INSTALLATION

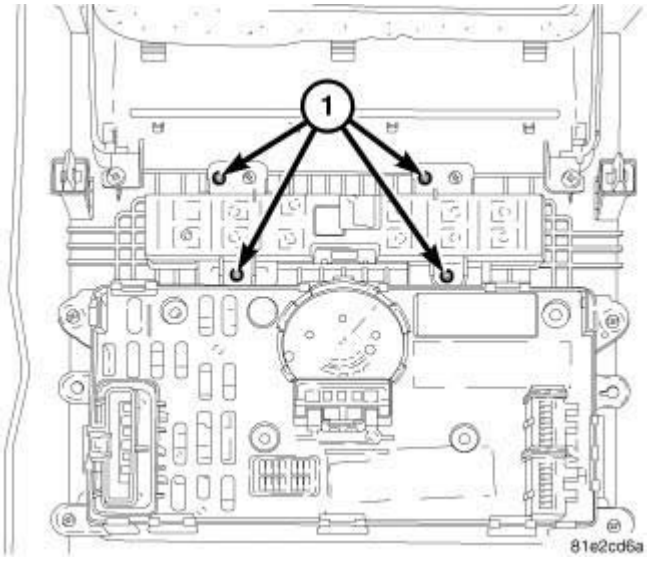

Fig. 12: Instrument Panel Center Bezel
Courtesy of CHRYSLER LLC

1. Position the accessory switch bank module (ASBM) in the center bezel and install the four screws (1).
2. Connect the electrical connector to the ASBM. Be sure the lock tab engages securely into the ASBM.
3. Install the instrument panel center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** .
4. Connect the battery negative cable.

2009 ACCESSORIES AND EQUIPMENT

Lamps/Lighting - Exterior - Service Information - Journey

DESCRIPTION

DESCRIPTION

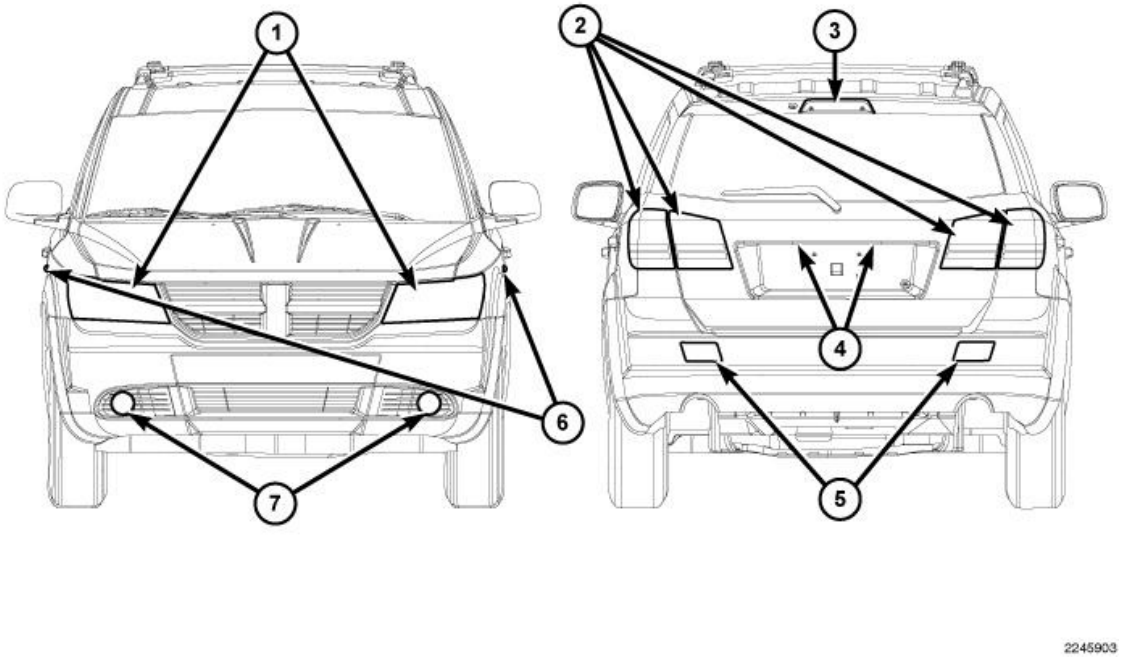

Fig. 1: Exterior Lighting System
Courtesy of CHRYSLER LLC

The exterior lighting system for this vehicle includes the following exterior lamp units:

- **Center High Mounted Stop Lamp (3)** - A standard equipment Center High Mounted Stop Lamp (CHMSL) is centered on the upper liftgate header above the liftgate glass opening at the rear of the vehicle.
- **Front Fog Lamps (7)** - Vehicles equipped with this option have a separate front fog lamp unit mounted near each outboard end of the front fascia, below each front lamp unit.
- **Front Lamp Units (1)** - A standard equipment front lamp unit with two, single-filament headlamp bulbs is located at each outboard side of the grille opening in the Front End Module (FEM).
- **Front Position Lamps** - A front position lamp is integral to each front lamp unit on vehicles manufactured for export markets where they are required.
- **License Plate Lamps (4)** - Two standard equipment rear license plate lamp units are integral to the liftgate handle assembly, just above the license plate tub formation on the outer liftgate panel.

- **Rear Fog Lamps (5)** - A rear fog lamp unit is mounted near each outboard end of the rear fascia, below each rear lamp unit on vehicles manufactured for export markets where they are required.
- **Rear Lamp Units (2)** - A standard equipment two-piece rear lamp unit is mounted on each side at the rear of the vehicle. One piece of the rear lamp is secured to the end of each quarter panel on either side of the liftgate opening and the second piece is secured to each side of the liftgate outer panel, adjacent to the first piece of the rear lamp when the liftgate is closed.
- **Repeater Lamps (6)** - A repeater lamp is mounted to each front fender just behind the front wheel opening on vehicles manufactured for export markets where they are required.

These exterior lighting lamp units and their controls are combined to provide the following exterior lighting features:

- **Automatic Headlamps** - Vehicles with the automatic headlamps option are equipped with a unique left (lighting) multi-function switch that includes an **AUTO** (Automatic) position and have an automatic headlamp sensor to sense ambient light levels. The automatic headlamp sensor is integral to the sun load sensor located on the top of the instrument panel. When the **AUTO** position of the headlamp switch is selected, the headlamps are turned ON and OFF automatically as ambient light levels dictate.
- **Backup Lamps** - The backup (or reverse) lamps include a clear bulb, reflector and clear lens that are integral to the liftgate portions of each rear lamp unit.
- **Brake Lamps** - The brake (or stop) lamps include a clear bulb, reflector and red lens that are integral to the quarter panel portions of each rear lamp unit, and the red lens and multiple Light-Emitting Diode (LED) units of the CHMSL.
- **Daytime Running Lamps** - Daytime Running Lamps (DRL) are standard equipment on vehicles manufactured for sale in Canada and optional on vehicles manufactured for the United States. Vehicles with the DRL feature enabled illuminate the high beam headlamp bulb in each front lamp unit at a reduced intensity to serve as the DRL.
- **Exterior Lamp Fail-Safe Operation** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the Totally Integrated Power Module (TIPM) provide a fail-safe feature which will automatically turn ON the low beam headlamps and all park lamps when the ignition switch is in the ON position and there is no detected communication from the Steering Control Module (SCM), or when the Local Interface Network (LIN) data bus or Controller Area Network (CAN) data bus are inoperative.
- **Exterior Lamp Load Shedding** - The TIPM provides a battery saver feature which will automatically turn OFF all exterior lamps (except the park/tail lamps in certain export markets) that remain ON with the ignition switch in the LOCK position after a timed interval of about eight minutes.
- **Front Fog Lamps** - The optional front fog lamps include the clear bulb, reflector and clear lens of each adjustable front fog lamp unit.
- **Hazard Warning Lamps** - The hazard warning lamps include the bulbs, reflectors and lenses of each lamp in the right and left, front and rear turn signal circuits.
- **Headlamps** - The headlamps include dual, single filament halogen bulbs, an adjustable reflector and a clear lens integral to each front lamp unit.
- **Headlamp Leveling** - Headlamp leveling is available only in certain markets where it is required equipment. A headlamp leveling actuator motor on each headlamp unit and a headlamp leveling switch integral to the switch pod in the instrument panel center stack allows the headlamp beam pattern to be

adjusted by the vehicle operator from the interior of the vehicle to compensate for passenger or cargo loads.

- **Headlamp Time Delay** - On vehicles equipped with the automatic headlamps option, when this feature is enabled the low or high beam headlamps remain illuminated for a programmable delay interval of 0 (disabled), 30, 60 or 90 seconds after the ignition switch has been turned to the OFF position. If the vehicle is equipped with the optional Electronic Vehicle Information Center (EVIC), this feature is customer programmable through the EVIC.
- **Headlamps With Wipers** - Vehicles with the automatic headlamps option have an automatic headlamps-with-wipers feature. When this feature is enabled and the **AUTO** position of the headlamp switch is selected, the headlamps are turned ON automatically whenever the windshield wipers are turned ON; and, if the headlamps were turned ON automatically when the wipers were turned ON, they will also turn OFF automatically when the wipers are turned OFF if the appropriate ambient light conditions exist. If the vehicle is equipped with the optional EVIC, this feature is customer programmable through the EVIC.
- **Optical Horn** - Also known as flash-to-pass, the beam selection function of the left (lighting) multi-function switch control stalk has a momentary intermediate position that allows the headlamp high beams to be flashed momentarily, without changing the headlamp beam selection.
- **Park/Tail Lamps** - The front park lamps include the amber bulbs, reflectors and clear lenses integral to each front lamp unit and, if the vehicle is so equipped, the clear position lamp bulb integral to each front lamp unit. The rear tail lamps include the clear bulbs, reflectors and red lenses integral to both the quarter panel and liftgate portions of each rear lamp unit as well as the bulbs and lenses of the license plate lamp units.
- **Rear Fog Lamps** - Rear fog lamps are available only in certain export markets where they are required equipment. The rear fog lamps include a clear bulb, a red lens and a reflector that are integral to each rear fog lamp unit.
- **Turn Signal Lamps** - The front turn signal lamps include an amber bulb, a reflector and a clear lens that are integral to each front lamp unit. In certain export markets where they are required, the clear bulbs and lenses of the repeater lamps on each front fender will also be included in the front turn signal circuits. The rear turn signal lamps include an amber bulb, a reflector and a clear lens that are integral to the quarter panel portion of each rear lamp unit.

Other components of the exterior lighting system for this vehicle include:

- **Backup Lamp Switch** - A plunger-type backup lamp switch is installed through the transmission housing of vehicles equipped with a manual transmission and is actuated by the shifter mechanism within the transmission when REVERSE gear is selected. On vehicles with an optional automatic transmission, a stand alone Transmission Range Sensor (TRS) performs the backup lamp switch function.
- **Brake Lamp Switch** - A plunger-type brake lamp switch is located on the brake pedal support bracket under the instrument panel and is actuated by the brake pedal arm when the brake pedal is depressed.
- **Clockspring** - The clockspring includes an integral turn signal cancel cam, which provides automatic turn signal cancellation as the steering wheel is rotated back to its centered position following a vehicle turning maneuver. The clockspring is located near the top of the steering column, directly beneath the steering wheel. Refer to **Restraints/CLOCKSPRING - Description** .
- **Hazard Switch** - A latching push button-actuated hazard switch is integral to the switch pod located just above the heater and air conditioner controls in the center stack area of the instrument panel.
- **Headlamp Leveling Switch** - A four mode push button-actuated headlamp leveling switch is integral to

the switch pod located just above the heater and air conditioner controls in the center stack area of the instrument panel of vehicles manufactured for certain export markets where the headlamp leveling feature is required.

- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .
- **Instrument Panel Switch Pod** - The instrument panel switch pod contains the hazard switch and, on vehicles so equipped, the headlamp leveling switch. The switch pod is located just above the heater and air conditioner controls in the center stack area of the instrument panel. Refer to **Electrical - Instrument Cluster/Instrument Cluster/POD, Switch - Description** .
- **Left Multi-Function Switch** - The left (lighting) multi-function switch is located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the switch is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn). A control knob on the control stalk is used to select the park lamps, headlamps or fog lamps.
- **Park Brake Switch** - A park brake switch is located on the park brake mechanism. On vehicles with a manual transmission, a park brake hand lever mechanism is located on the side of the floor panel transmission tunnel between the two front seats. On vehicles with an automatic transmission, a park brake foot lever mechanism is located on the driver side cowl side inner panel below the instrument panel.
- **Steering Control Module** - The Steering Control Module (SCM) is located within the left multi-function switch housing on the top of the steering column, just below the steering wheel. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Steering Column - Description** .
- **Stop Lamp Inhibit Relay** - A stop lamp inhibit relay (also known as a brake lamp relay, brake lamp activation relay or trailer tow damping relay) is located in a connector on the left rear quarter inner panel just forward of the shock tower within the passenger compartment.
- **Totally Integrated Power Module** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **Electrical - Wiring/Power Distribution/MODULE, Totally Integrated Power (TIPM) - Description** .
- **Trailer Tow Wiring** - Vehicles equipped with an optional Trailer Tow Prep package include a wire harness, four relays, a conventional 4-way light duty trailer tow connector and an installation instruction sheet shipped loose in the glove box from the factory for installation by the vehicle owner or the dealer.

Hard wired circuitry connects the exterior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the exterior lighting components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

Following are paragraphs that briefly describe the operation of each of the major exterior lighting systems. The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

AUTOMATIC HEADLAMPS

The optional automatic headlamp system includes the left (lighting) multi-function switch, the Steering Control Module (SCM), the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), the Totally Integrated Power Module (TIPM), the heater and air conditioner control unit and the sun load sensor on the top of the instrument panel.

The sun load sensor provides an ambient light level input to the A/C - heater control whenever the ignition switch is in the ON position. The A/C - heater control responds to this input by sending the appropriate electronic **light level** messages to the TIPM over the Controller Area Network (CAN) data bus. When the **AUTO** (Automatic) position is selected with the left multi-function switch, the SCM responds to this input by sending the appropriate electronic **lighting switch status** messages to the EMIC over the Local Interface Network (LIN) data bus. The EMIC responds to this input by sending the appropriate electronic **lighting request** messages to the TIPM over the CAN data bus.

With the engine running, the TIPM responds to these messages by automatically controlling a pulse width modulated voltage output to the selected headlamp bulb filaments through the right and left low or high beam driver circuits to illuminate the headlamps. The TIPM also remembers which beams (low or high) were selected when the headlamps were last turned OFF, and energizes those beams and lamps again the next time it turns the headlamps ON.

BACKUP LAMPS

The backup (or reverse) lamps have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured to the body sheet metal within the passenger compartment. On vehicles with a manual transmission, the backup lamp switch provides an input to the TIPM through a backup lamp switch signal circuit, and the TIPM provides battery voltage to the backup lamps on the backup lamp control output circuit whenever the ignition switch is in the ON position and the REVERSE position is selected with the transmission shift linkage.

On vehicles with an automatic transmission, the Powertrain Control Module (PCM) continually monitors a hard wired multiplex input from the Transmission Range Sensor (TRS), then sends the appropriate electronic **transmission gear selector status** messages to other electronic modules over the Controller Area Network (CAN) data bus. Whenever the ignition switch is in the ON position and the TIPM receives an electronic message indicating the status of the transmission gear selector is REVERSE, it provides a battery voltage output

to the backup lamps on the backup lamp control output circuit.

BRAKE LAMPS

The brake (or stop) lamps and the Center High Mounted Stop Lamp (CHMSL) each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a ground screw to the body sheet metal within the passenger compartment. The TIPM and the CHMSL receive battery voltage on the brake lamp switch output circuit when the brake lamp switch is closed by the brake pedal arm. The brake lamps are then controlled by the TIPM through High Side Drivers (HSD) on the left and right stop lamp control circuits. A stop lamp inhibit relay (also known as a brake lamp relay, brake lamp activation relay or trailer tow damping relay) is used by the Controller Antilock Brake (CAB) to mitigate undesirable brake lamp operation when the CAB activates various brake hydraulic circuits as part of its Traction Control System (TCS) and Trailer Sway Control (TSC) functions. The brake lamp function of the trailer tow wiring is also controlled by an output from the TIPM based upon a hard wired input from the brake lamp switch.

DAYTIME RUNNING LAMPS

Vehicles equipped with this option or manufactured for sale in Canada illuminate the high beam filament of both headlamps at a reduced intensity when the engine is running, the parking brake is released and the exterior lamps are turned OFF. The TIPM must be programmed appropriately for this feature to be enabled. Once enabled, anytime the TIPM receives electronic messages over the CAN data bus from the PCM indicating the engine is running and from the EMIC indicating the status of the left multi-function switch exterior lighting switch input is OFF and that the parking brake is released, the TIPM provides a pulse width modulated voltage output to the proper headlamp bulb filaments through the right and left high beam feed circuits to produce illumination at a reduced intensity.

FRONT FOG LAMPS

Vehicles equipped with optional front fog lamps include a front fog lamp switch integral to the left (lighting) multi-function switch on the steering column. The front fog lamps have a path to ground at all times through their connection to the headlamp and dash wire harness and a takeout with an eyelet terminal that is secured to the body sheet metal. The SCM monitors a hard wired multiplex input from the left multi-function switch to determine whether the fog lamps are selected, then sends the appropriate electronic **front fog lamp switch status** messages to the EMIC over the LIN data bus. The EMIC then relays the appropriate electronic **front fog lamp switch request** messages to the TIPM over the CAN data bus.

When the TIPM receives a **front fog lamp switch request** message, it controls front fog lamp operation by providing a battery voltage output to the fog lamps through the right and left front fog lamp control circuits. The TIPM also sends the appropriate electronic messages back to the EMIC to illuminate or extinguish the front fog lamp indicator. The TIPM will automatically de-energize the front fog lamps any time the headlamp high beams are selected, except on vehicles manufactured for certain export markets.

The TIPM also provides a battery saver (load shedding) feature for the front fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position, if there is a charging system failure, or if the electrical system voltage falls below about 11.75 volts for more than about 30 seconds.

Each front fog lamp includes an integral adjustment screw to be used for static aiming of the fog lamp beams.

HAZARD WARNING LAMPS

The hazard warning system includes the EMIC, the TIPM and the hazard switch in the switch pod located in the center stack area of the instrument panel, above the heater and air conditioner control unit. The hazard switch provides a hard wired input to the TIPM. When the TIPM receives an input from the hazard switch it controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the front and rear, right and left turn signal control circuits. On vehicles manufactured for certain export markets where they are required, the TIPM provides battery voltage to the repeater lamps through right and left repeater lamp control output circuits based upon the hazard switch input.

The TIPM also sends the appropriate electronic messages back to the EMIC over the CAN data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher.

HEADLAMPS

The headlamp system includes the SCM, the EMIC, the TIPM, the headlamp switch on the instrument panel and the left (lighting) multi-function switch on the steering column. The headlamp bulbs have a path to ground at all times through their connection to the headlamp and dash wire harness. The headlamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The TIPM will store a Diagnostic Trouble Code (DTC) for any shorts or opens in the headlamp circuits.

The SCM monitors hard wired multiplex inputs to determine the status of the exterior lighting switches in the left multi-function switch and whether the headlamp high or low beams are selected. The SCM then sends the appropriate electronic **lighting switch status** and **headlamp beam select switch status** messages to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **headlamp request** and **headlamp beam request** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a Pulse Width Modulated (PWM) voltage output to the headlamps through high side drivers on the right and left low and high beam feed circuits to illuminate the selected headlamp filaments. The TIPM also sends the appropriate electronic messages back to the EMIC to control the illumination of the high beam indicator.

When the optical horn feature is selected, the low beams will shut OFF about 200 milliseconds after the high beams are activated. The TIPM also remembers which beams (LOW or HIGH) were selected when the headlamps were last turned OFF, and energizes those beams again the next time the headlamps are turned ON. The TIPM provides a battery saver (load shedding) feature for the headlamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position. The SCM and the EMIC each provide a fail-safe feature for the headlamps, which will cause the TIPM to turn the low beam headlamps ON automatically if there is no input available from the SCM or the left multi-function switch. The TIPM also provides a fail-safe feature for the headlamps that will turn the headlamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

Each headlamp includes integral reflector adjustment screws to be used for static aiming of the headlamps.

HEADLAMP DELAY

The headlamp delay feature includes the left (lighting) multi-function switch, the SCM, the EMIC and the

TIPM. On vehicles equipped with an optional Electronic Vehicle Information Center (EVIC), this feature has customer programmable delay intervals of 0 seconds (disabled), 30 seconds, 60 seconds and 90 seconds. If the exterior lighting switch is in the **AUTO** (Automatic) position when the ignition switch is moved from the ON position to any position except ON, then the headlamps will remain illuminated until after the selected delay interval has elapsed. The park lamps will not stay ON during the headlamp delay interval. The default delay interval is 90 seconds, but can be reprogrammed by the customer using the customer programmable features function of the EVIC, if the vehicle is so equipped.

HEADLAMP LEVELING

In certain export markets where required, a headlamp leveling system is provided on the vehicle. The headlamp leveling system includes unique front lamp units each equipped with a headlamp leveling actuator motor, and a rocker-actuated headlamp leveling switch integral to the switch pod in the instrument panel center stack. The headlamp leveling system allows the headlamp beams to be adjusted to one of four vertical positions to compensate for changes in inclination caused by the loading of the vehicle suspension. The leveling motors are mechanically connected through an integral pushrod to the adjustable headlamp reflector.

Each time the headlamp leveling switch is depressed the circuitry of the switch pod provides the appropriate electronic **select status up** or **select status down** messages to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **select request up** or **select request down** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a voltage output to the headlamp leveling motors through a high side driver on the headlamp level sensor signal circuit to move the headlamp reflectors to the selected position based upon the voltage input received from the TIPM. The TIPM also sends the appropriate electronic messages back to the EMIC and the EMIC relays the messages back to the switch to control the illumination of the **1** , **2** , or **3** Light Emitting Diode (LED) selected position indicator in the headlamp leveling switch button.

The EMIC and TIPM logic will only allow the headlamp leveling system to operate while the ignition switch is in the ON position and the exterior lighting is turned ON.

PARK LAMPS

The park lamps system includes the left multi-function switch on the steering column, the SCM, the EMIC and the TIPM. The front park lamp, side marker lamp and, on vehicles manufactured for certain export markets, position lamp bulbs each have a path to ground at all times through their connection to the headlamp and dash wire harness. The headlamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear park/tail lamp, side marker lamp and license plate lamp bulbs each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a ground screw to the body sheet metal.

The SCM monitors a hard wired multiplex input from the exterior lighting switch of the left multi-function switch, then sends the appropriate electronic **lighting switch status** messages to the EMIC over the LIN data bus. The EMIC then relays the appropriate electronic **lighting request** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a battery voltage output to the appropriate lamp bulbs through high side drivers on the front and rear, right and left lamp driver and control circuits.

The TIPM provides a battery saver (load shedding) feature for the park lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position. The SCM

and the EMIC each provide a fail-safe feature for the park lamps, which will cause the TIPM to turn the park lamps and low beam headlamps ON automatically if there is no input available from the SCM or the left multi-function switch. The TIPM also provides a fail-safe feature for the park lamps that will turn the park lamps and low beam headlamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

REAR FOG LAMPS

Rear fog lamps are installed on vehicles manufactured for certain export markets where they are required. The rear fog lamp system includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. The rear fog lamp bulbs have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured to the body sheet metal.

The SCM monitors a hard wired multiplex input from the left multi-function switch to determine whether the rear fog lamps are selected, then sends the appropriate electronic **rear fog lamp switch status** messages to the EMIC over the LIN data bus. Then the EMIC relays the appropriate electronic **rear fog lamp request** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by controlling a battery voltage output to the rear fog lamp bulbs through a high side driver on the rear fog lamp signal control circuit. The TIPM also sends the appropriate electronic messages back to the EMIC to control the rear fog lamp indicator.

The TIPM will automatically energize and de-energize the front fog lamps in concert with the rear fog lamps. The TIPM also provides a battery saver (load shedding) feature for the rear fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position.

TRAILER TOW WIRING

Vehicles equipped with an optional trailer tow preparation package are shipped from the factory with a trailer tow wiring harness and 4-pin trailer connector that is packaged with an instruction card and placed in the glove box of the vehicle. The trailer tow harness includes four relays designed to isolate the trailer turn signal and stop lamp lighting from the rear vehicle lighting and prevent overloading of the turn signal and stop lamp lighting drivers in the TIPM. These vehicles also include a dedicated park lamp control output circuit protected by a 15 ampere fuse located in the TIPM.

If the trailer lighting is connected directly to the vehicle wiring without using the necessary relays, the vehicle electrical system will become overloaded and the rear lighting of the vehicle will cease to function. The TIPM will store a Diagnostic Trouble Code (DTC) for this condition.

TURN SIGNAL LAMPS

The turn signal lamps system includes the left (lighting) multi-function switch on the steering column, the SCM, the EMIC and the TIPM. The front turn signal lamp bulbs each have a path to ground at all times through their connection to the headlamp and dash wire harness. The headlamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear turn signal lamp bulbs have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a ground screw to the body sheet metal.

The SCM monitors a hard wired multiplex input from the left multi-function switch to determine the status of the turn signal switch, then sends the appropriate electronic **turn signal switch status** messages to the EMIC

over the LIN data bus. Then the EMIC relays the appropriate electronic **turn signal request** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps through high side drivers on the appropriate front and rear, right or left turn signal control circuits. The TIPM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional turn signal flasher.

The EMIC also provides a **turn signal ON warning** that will generate repetitive chimes to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per-hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers (2.49 miles) for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first.

WARNING

WARNINGS

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table. See Electrical/Lamps/Lighting - Exterior - Specifications. In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DIAGNOSIS AND TESTING

LAMPS/LIGHTING - EXTERIOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: When diagnosing the exterior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.

The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BACKUP LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
BACKUP LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace backup lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open backup lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open backup lamp feed circuit if required.
	4. Ineffective switch.	4. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) if required.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
BACKUP LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted backup lamp feed circuit if required.
	2. Ineffective switch.	2. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) if required.
	3. Ineffective TIPM inputs or	3. Use a diagnostic scan tool to test the

	outputs.	TIPM inputs and outputs. Refer to the appropriate diagnostic information.

BRAKE LAMPS

NOTE: The Center High Mounted Stop Lamp (CHMSL) is illuminated by several Light-Emitting Diode (LED) units that are soldered to the electronic circuit board within the lamp housing. The CHMSL is hard wired to the output of the brake lamp switch, while the brake lamps are powered by high side drivers within the TIPM based upon an input from the brake lamp switch. If the brake lamps and all of the LED units within the CHMSL fail to operate, diagnose and repair the brake lamps before attempting to repair the CHMSL. If the brake lamps operate but none of the CHMSL LED units illuminate, test and repair the CHMSL ground or feed circuit if required. If some of the CHMSL LED units operate and others do not, the CHMSL assembly must be replaced with a new unit.

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKE LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace brake lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open brake lamp ground circuit if required.
	3. Ineffective fuse.	3. Test and replace the fuse in the TIPM if required.
	4. Ineffective feed circuit.	4. Test and repair open brake lamp switch output circuit or stop lamp output circuit if required.
	5. Ineffective switch.	5. Test and replace brake lamp switch if required.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
BRAKE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted brake lamp switch output circuit or stop lamp output circuit if required.
	2. Improperly adjusted switch.	2. Adjust the brake lamp switch if required.
	3. Ineffective switch.	3. Test and replace brake lamp switch if required.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

DAYTIME RUNNING LAMPS

NOTE: Before performing the following tests, determine whether the headlamp low and

high beams operate. If the headlamp low and high beams are also ineffective, diagnose and repair that problem before attempting to repair the Daytime Running Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE	1. Incorrect TIPM programming.	1. Use a diagnostic scan tool to check and configure TIPM if required.
	2. Automatic transmission in PARK position.	2. Place the transmission gear selector lever in any position except PARK.
	3. Parking brake applied.	3. Release the parking brake.
	4. Engine not running.	4. Start the engine.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

FRONT FOG LAMPS

NOTE: The front fog lamp switch is integral to the left multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Front Fog Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace front fog lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open front fog lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open front fog lamp feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
FRONT FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted front fog lamp feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective TIPM inputs or	3. Use a diagnostic scan tool to test the

	outputs.	TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HAZARD WARNING LAMPS

NOTE: The hazard switch is integral to the upper instrument panel switch pod, which provides a hard wired output to the TIPM. Before performing any of the following tests, confirm whether the left and right turn signals operate satisfactorily. Then determine whether the other functions of the upper instrument panel switch pod are operational. If the turn signals are ineffective or operate improperly, or if the other instrument panel switch pod functions are ineffective, diagnose and repair those problems before attempting to repair the hazard warning lamps system.

CONDITION	POSSIBLE CAUSES	CORRECTION
HAZARD WARNING LAMPS DO NOT FLASH	1. Ineffective upper instrument panel switch pod. 2. Ineffective TIPM inputs or outputs.	1. Test and replace upper instrument panel switch pod if required. 2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
HAZARD WARNING LAMPS DO NOT STOP FLASHING	1. Ineffective upper instrument panel switch pod. 2. Ineffective TIPM inputs or outputs.	1. Test and replace upper instrument panel switch pod if required. 2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMPS

NOTE: As part of the exterior lighting fail-safe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the TIPM. Diagnose and repair those problems before attempting to repair the Headlamps. In addition, the TIPM will store a Diagnostic Trouble Code (DTC) for an open or shorted headlamp circuit.

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace headlamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open headlamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open headlamp low beam or high beam feed circuit if required.

	4. Ineffective EMIC (CCN) inputs or outputs. 5. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit. 2. Ineffective EMIC (CCN) inputs or outputs. 3. Ineffective TIPM inputs or outputs.	1. Test and repair shorted headlamp low beam or high beam feed circuit if required. 2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMPS ILLUMINATE WITH IGNITION ON AND HEADLAMP SWITCH OFF (FAIL-SAFE OPERATION)	1. Loss of LIN or CAN data bus communication.	1. Test and repair the LIN or CAN data bus if required. Refer to the appropriate diagnostic information.
HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS	1. Ineffective EMIC (CCN) inputs or outputs. 2. Ineffective TIPM inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMP LEVELING

NOTE: The headlamp leveling switch is integral to the instrument panel switch pod, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, confirm whether the park lamps operate satisfactorily. Then determine whether the other functions of the instrument panel switch pod are operational. If the park lamps are ineffective or operate improperly, or if the other instrument panel switch pod functions are ineffective, diagnose and repair those problems before attempting to repair the Headlamp Leveling function.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE LEVELING MOTOR IS INEFFECTIVE	1. Ineffective ground circuit. 2. Ineffective feed circuit. 3. Ineffective signal circuit. 4. Ineffective motor.	1. Test and repair open leveling motor ground circuit if required. 2. Test and repair open leveling motor feed circuit if required. 3. Test and repair open headlamp leveling motor signal circuit if required. 4. Test and replace headlamp leveling

		motor if required.
BOTH LEVELING MOTORS ARE INEFFECTIVE	1. Ineffective EMIC (CCN) inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	2. Ineffective motor ground circuit.	2. Test and repair open leveling motor ground circuit if required.
	3. Ineffective motor feed circuit.	3. Test and repair open leveling motor feed circuit if required.
	4. Ineffective signal circuit.	4. Test and repair open or shorted headlamp leveling motor signal circuit if required.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective motors.	6. Test and replace leveling motors if required.

PARK LAMPS

NOTE: As part of the exterior lighting fail-safe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the TIPM. Diagnose and repair those problems before attempting to repair the Park Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
PARK LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace park lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open park lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open park lamp feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
PARK LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted park lamp feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.

	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

REAR FOG LAMPS

NOTE: The rear fog lamp switch is integral to the left multi-function switch/SCM, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Rear Fog Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
REAR FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace rear fog lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open rear fog lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open fog lamp relay control rear circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	5. Incorrect TIPM configuration.	5. Use a diagnostic scan tool to check and correct the TIPM configuration settings if required. Refer to the appropriate diagnostic information.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
REAR FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted fog lamp relay control rear circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

TURN SIGNAL LAMPS

NOTE: The turn signal switch is integral to the left multi-function switch/SCM, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM

functions are ineffective, diagnose and repair that problem before attempting to repair the Turn Signal Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE TURN SIGNAL LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNAL LAMPS (OR BOTH SIDES) DO NOT FLASH	1. Ineffective feed circuit.	1. Test and repair open right or left turn signal feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS FLASH TOO RAPIDLY (MORE THAN 100 FLASHES PER MINUTE)	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open bulb ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
TURN SIGNALS DO NOT AUTOMATICALLY CANCEL	1. Ineffective cancel cam.	1. Inspect and replace the turn signal cancel cam (clockspring) if required.
-	2. Ineffective cancel actuator.	2. Inspect and replace the turn signal cancel actuator (left multi-function switch) if required.

STANDARD PROCEDURE

FRONT LAMP AIMING

VEHICLE PREPARATION FOR LAMP ALIGNMENT

1. Check for and correct any burnt out bulbs.
2. If the vehicle is equipped with headlamp leveling, be certain that the headlamp leveling switch is in the **0** (zero) position.
3. Repair or replace any ineffective, worn or damaged body or suspension components that could hinder

proper lamp alignment.

4. Verify proper tire inflation pressures.
5. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
6. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.
7. The fuel tank should be FULL. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
8. Verify correct vehicle suspension height.

LAMP ALIGNMENT SCREEN PREPARATION

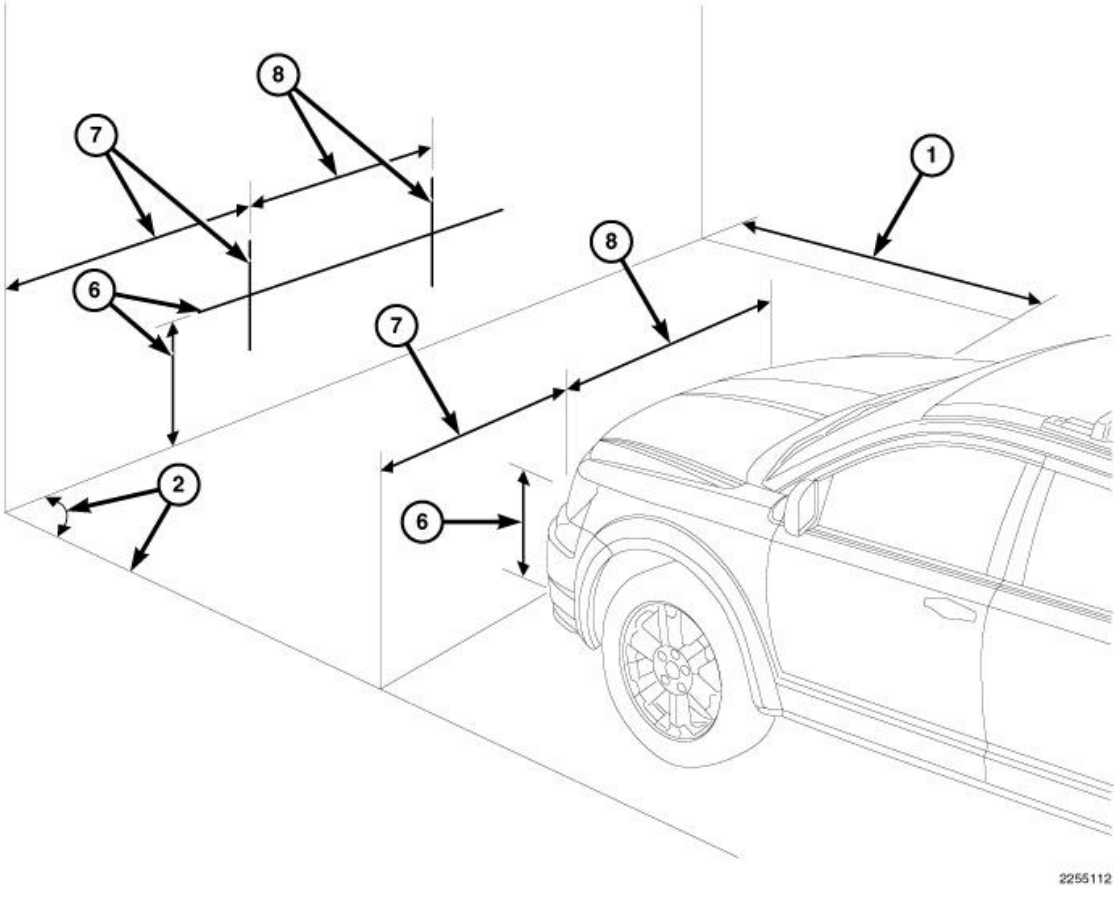

Fig. 2: Lamp Alignment Screen Preparation
Courtesy of CHRYSLER LLC

The procedure that follows will prepare a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a

second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.

3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate lamp (head or fog) horizontal reference. This is the centerline reference for the first lamp.
8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate lamp (head or fog) horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

NOTE: Due to the linear nature of the headlamp cutoff, a properly aimed low beam headlamp will project the top edge of the high intensity pattern on the alignment screen just below the horizontal line to 50 millimeters (2 inches) below the horizontal line for domestic market vehicles, or to 130 millimeters (5.12 inches) below the horizontal line for export market vehicles. No horizontal (right/left) adjustment is required for this headlamp beam pattern in domestic market vehicles. Export market vehicles have a second horizontal (right/left) adjustment screw provided on the outboard side of the headlamp unit rear housing. The high beam pattern will be correct when the low beams are properly aimed.

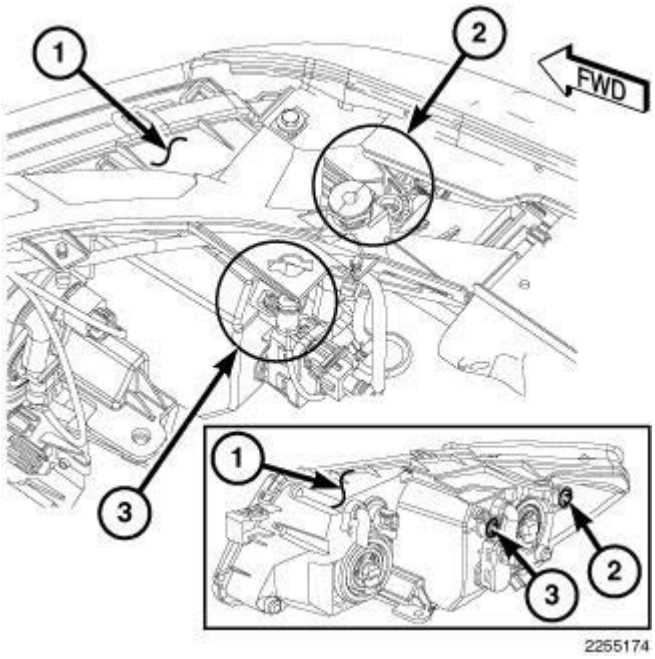

Fig. 3: Headlamp Alignment
Courtesy of CHRYSLER LLC

1. Turn the headlamps ON and select the LOW beams.
2. Rotate the vertical adjustment screw (3) on each front lamp unit (1) to adjust the beam height as required.
3. For export markets only, rotate the horizontal adjustment screw (2) on each lamp to adjust the beam right or left as required.

FOG LAMP ALIGNMENT

NOTE: A properly aimed front fog lamp will project a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp for domestic market vehicles. On export market vehicles, a properly aimed fog lamp will project a pattern on the alignment screen 200 millimeters (8 inches) below the fog lamp centerline and straight ahead of the lamp.

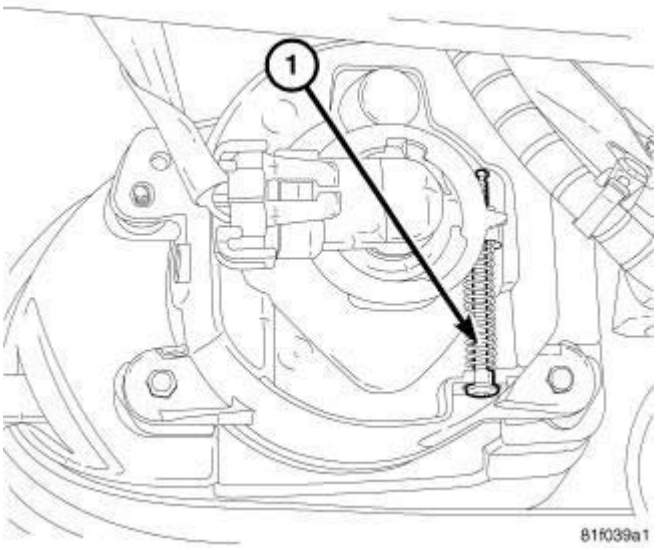

Fig. 4: Fog Lamp Alignment
Courtesy of CHRYSLER LLC

1. Turn the fog lamps ON.
2. Raise the lower portion of the inner wheel house shield to gain access to the rear of the fog lamp unit.
3. Rotate the vertical adjustment screw (1) on each lamp to adjust the beam height as required.

CAM, TURN SIGNAL CANCEL

DESCRIPTION

DESCRIPTION

The turn signal cancel cam is concealed within the clockspring case on the steering column. The turn signal cancel cam consists of integral eccentrics on the outer circumference of the molded plastic clockspring rotor. The clockspring mechanism provides turn signal cancellation as well as a constant electrical connection between the horn switch, driver airbag, speed control switches, Electronic Vehicle Information Center (EVIC) switches and remote radio switches on the steering wheel and the instrument panel wire harness on the steering column. The housing of the clockspring is secured to the steering column and remains stationary. The rotor of the clockspring, including the turn signal cancel cam lobes rotate with the steering wheel.

The turn signal cancel cam is serviced as a unit with the clockspring and cannot be repaired. If ineffective or damaged, the entire clockspring unit must be replaced. Refer to **Restraints/CLOCKSPRING - Removal** .

OPERATION

OPERATION

When the left multi-function switch control stalk is moved to a latched turn signal ON position, a turn signal cancel actuator is extended from the inside surface of the switch housing through a small rectangular opening on the left side of the clockspring case toward the turn signal cancel cam. As the steering wheel is rotated to complete the turn, one of the cam eccentrics will contact the actuator, automatically cancelling the turn signal event and releasing the latched left multi-function switch control stalk to the neutral or OFF position.

LAMP, CENTER HIGH MOUNTED STOP

REMOVAL

REMOVAL

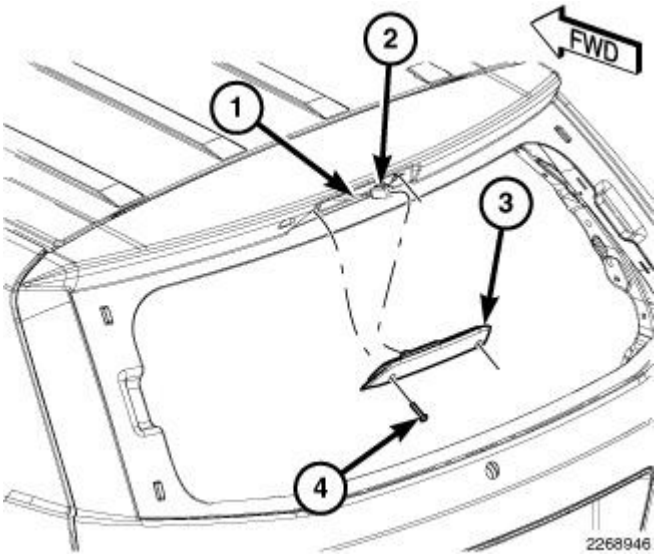

Fig. 5: Center High Mounted Stop Lamp
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws (4) that secure the Center High Mounted Stop Lamp (CHMSL) (3) to the liftgate header panel (1).
3. Pull the CHMSL away from the liftgate far enough to access and disconnect the connector (2) of the liftgate wire harness (1) from the connector receptacle on the back of the lamp.
4. Remove the CHMSL from the liftgate.

INSTALLATION

INSTALLATION

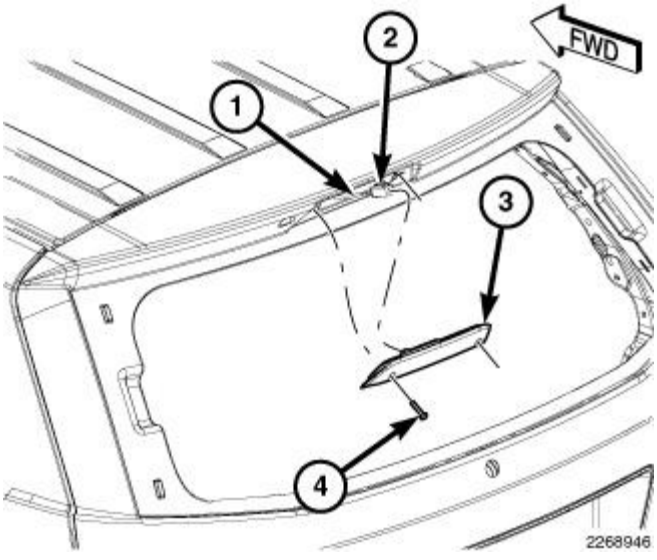

Fig. 6: Center High Mounted Stop Lamp

Courtesy of CHRYSLER LLC

1. Check to be certain that the two U-nuts in the Center High Mounted Stop Lamp (CHMSL) opening of the liftgate header panel are properly installed and in good condition.
2. Position the CHMSL (3) near the opening in the liftgate header panel.
3. Reconnect the connector (2) of the liftgate wire harness (1) to the connector receptacle on the back of the lamp.
4. Position the CHMSL into the liftgate header opening.
5. Install and tighten the two screws (4) that secure the CHMSL to the liftgate header panel. Tighten the screws to 1.5 N.m (15 in. lbs.).
6. Reconnect the battery negative cable.

LAMP, FOG, FRONT

REMOVAL

BULB

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

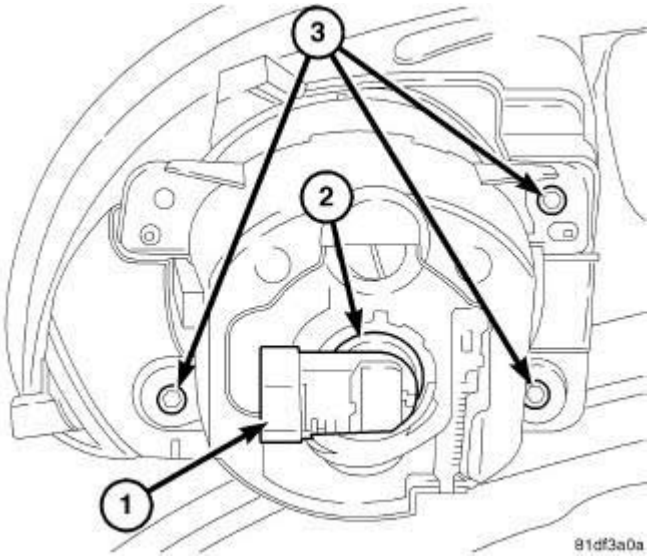

Fig. 7: Front Fog Lamp Bulb Connector Receptacle
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the lower inner front wheel house splash shield. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
3. Disconnect the headlamp and dash wire harness connector from the front fog lamp bulb (2) connector receptacle (1).

4. Firmly grasp the bulb on the back of the front fog lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
5. Pull the bulb straight out from the keyed opening in the housing.

LAMP

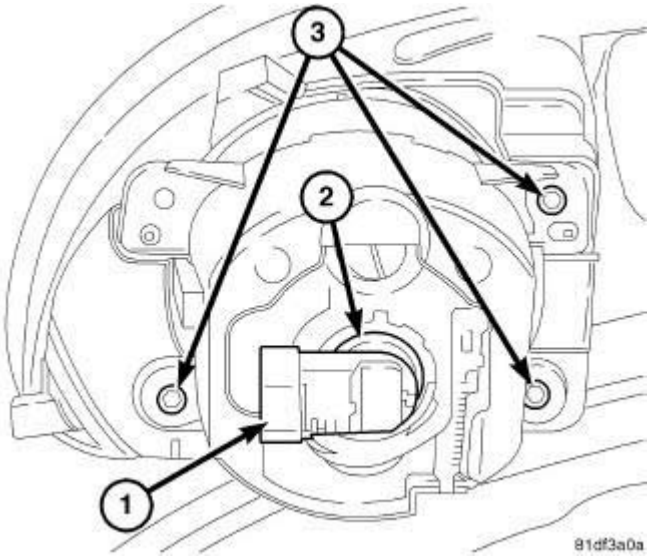

Fig. 8: Front Fog Lamp Bulb Connector Receptacle
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the lower inner front wheel house splash shield. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
3. Disconnect the headlamp and dash wire harness connector from the front fog lamp bulb (2) connector receptacle (1).
4. Remove the three screws (3) that secure the front fog lamp mounting bracket to the fog lamp bezel on the back of the lower front fascia.
5. Remove the front fog lamp from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

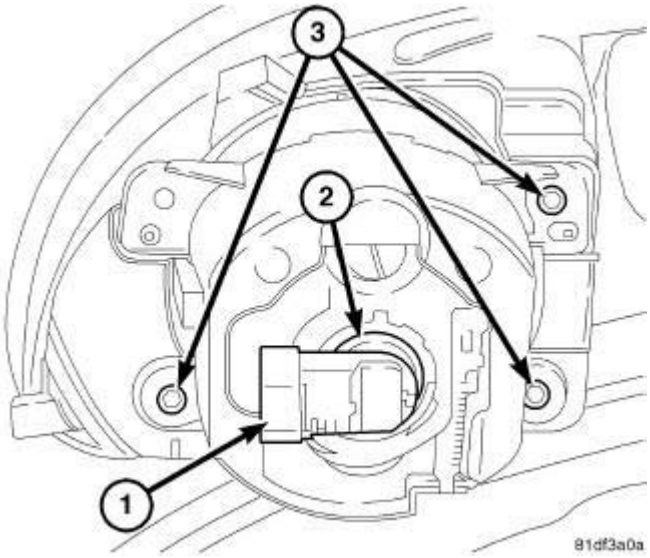

Fig. 9: Front Fog Lamp Bulb Connector Receptacle
Courtesy of CHRYSLER LLC

1. Align the front fog lamp bulb (2) with the keyed opening on the back of the front fog lamp housing.
2. Insert the bulb into the housing until it is firmly seated.
3. Rotate the bulb clockwise about 30 degrees to lock it into place. The bulb connector receptacle should be pointed outboard and horizontal in orientation.
4. Reconnect the headlamp and dash wire harness connector to the front fog lamp bulb connector receptacle (1).
5. Reinstall the lower inner front wheel house splash shield. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
6. Reconnect the battery negative cable.

LAMP

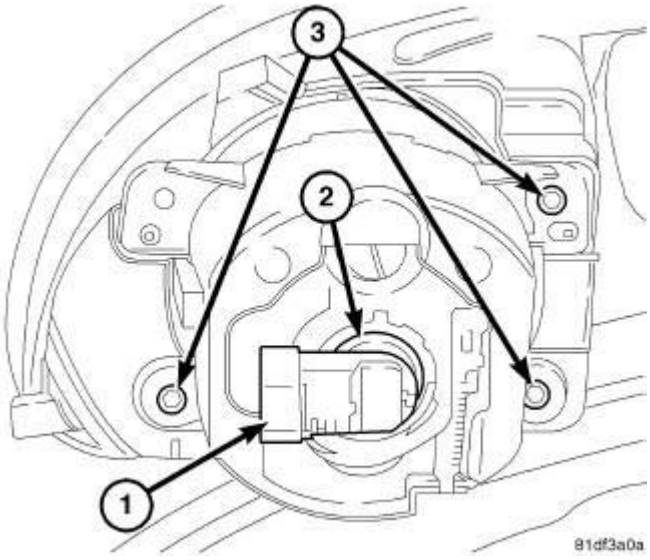

Fig. 10: Front Fog Lamp Bulb Connector Receptacle Screw
Courtesy of CHRYSLER LLC

1. Position the front fog lamp mounting bracket to the fog lamp bezel on the back of the lower front fascia.
2. Install and tighten the three screws (3) that secure the mounting bracket to the bezel. Tighten the screws securely.
3. Reconnect the headlamp and dash wire harness connector to the front fog lamp bulb (2) connector receptacle (1).
4. Reinstall the lower inner front wheel house splash shield. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
5. Reconnect the battery negative cable.
6. Confirm proper fog lamp alignment. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior - Standard Procedure**.

LAMP, FOG, REAR EXPORT

REMOVAL

BULB

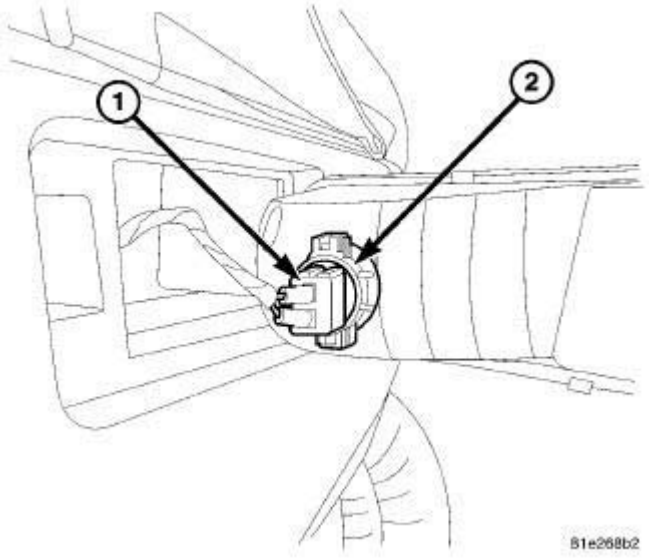

Fig. 11: Rear Fascia Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear fog lamp from the rear fascia. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Fog - Removal**.
3. Disconnect the rear fascia wire harness connector (1) from the rear fog lamp bulb connector receptacle.
4. Firmly grasp the bulb (2) by the two latch features and squeeze them together to unlock the bulb from the

back of the rear fog lamp housing.

5. Pull the bulb straight out from the keyed opening in the housing.

LAMP

NOTE: The following procedure applies only to vehicles manufactured for certain export markets where rear fog lamps are optional or required equipment. Rear fog lamps are not available for vehicles manufactured for North American markets.

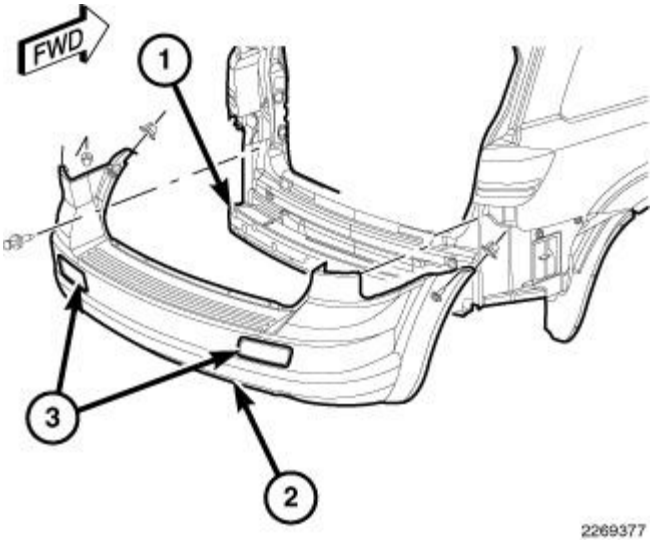

Fig. 12: Rear Bumper Reinforcement
Courtesy of CHRYSLER LLC

NOTE: The rear fog lamps can be removed without removing the rear fascia. The graphic shows the fascia removed only to clearly identify the involved components.

1. Disconnect and isolate the battery negative cable.
2. From behind the rear fascia (2), reach between the body sheet metal and above the rear bumper reinforcement (1) to access the back of the rear fog lamp (3).

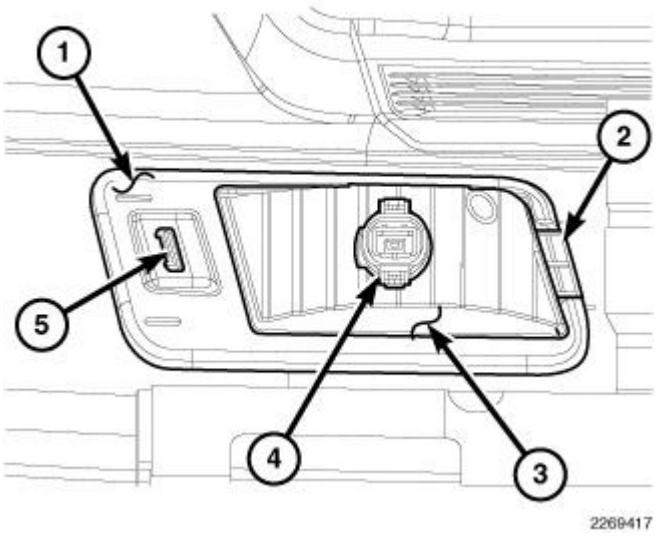

Fig. 13: Integral Latch Feature Of Rear Fog Lamp
Courtesy of CHRYSLER LLC

3. Locate the integral latch feature (5) of the rear fog lamp (3) protruding through the outboard side of the rear fog lamp seat (1) integral to the rear fascia.
4. Press the latch feature toward the center of the lamp and out through the face of the rear fog lamp seat of the rear fascia.
5. From the face of the rear fascia, pull the lamp outboard far enough to disengage the integral interlocking tab mounting feature (2) from behind the inboard side of the rear fog lamp seat of the fascia.
6. Pull the rear fog lamp out from the rear fascia far enough to access and disconnect the rear fascia wire harness connector from the rear fog lamp bulb connector receptacle (4) on the back of the lamp.
7. Remove the rear fog lamp from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

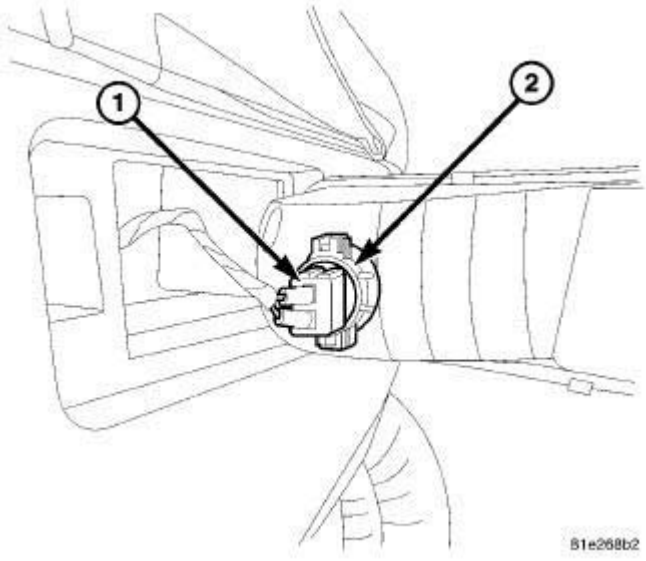

Fig. 14: Rear Fascia Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Align the index tabs of the rear fog lamp bulb (2) with the slots in the collar of the bulb opening on the back of the rear fog lamp housing.
2. Insert the bulb into the housing until the index tabs are engaged in the slots of the collar.
3. Firmly and evenly push the bulb straight into the lamp housing until both bulb latch features snap into place and are fully engaged.
4. Reconnect the rear fascia wire harness connector (1) to the rear fog lamp bulb connector receptacle.
5. Reinstall the rear fog lamp into the rear fascia. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Fog - Installation**.
6. Reconnect the battery negative cable.

LAMP

NOTE: The following procedure applies only to vehicles manufactured for certain export markets where rear fog lamps are optional or required equipment. Rear fog lamps are not available for vehicles manufactured for North American markets.

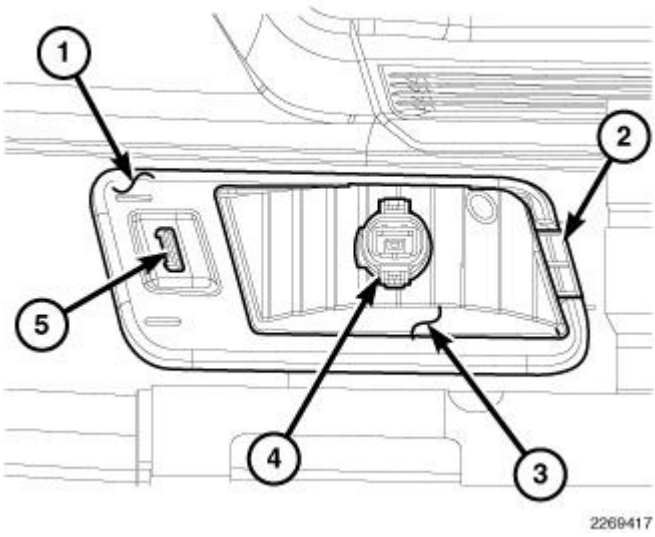

Fig. 15: Integral Latch Feature Of Rear Fog Lamp
Courtesy of CHRYSLER LLC

1. From the face of the rear fascia, position the rear fog lamp (3) close enough to the rear fog lamp seat (1) to access and reconnect the rear fascia wire harness connector to the rear fog lamp bulb connector receptacle (4).
2. Engage the integral interlocking tab mounting feature (2) behind the inboard side of the rear fog lamp seat of the fascia.
3. Align the integral latch feature (5) on the outboard side of the rear fog lamp housing with the clearance hole in the rear fog lamp seat of the fascia.
4. Using hand pressure, push the outboard side of the rear fog lamp firmly and evenly into the seat until the latch engages the back of the rear fascia and the lamp is fully seated.
5. Reconnect the battery negative cable.

LAMP, LICENSE PLATE

REMOVAL

BULB

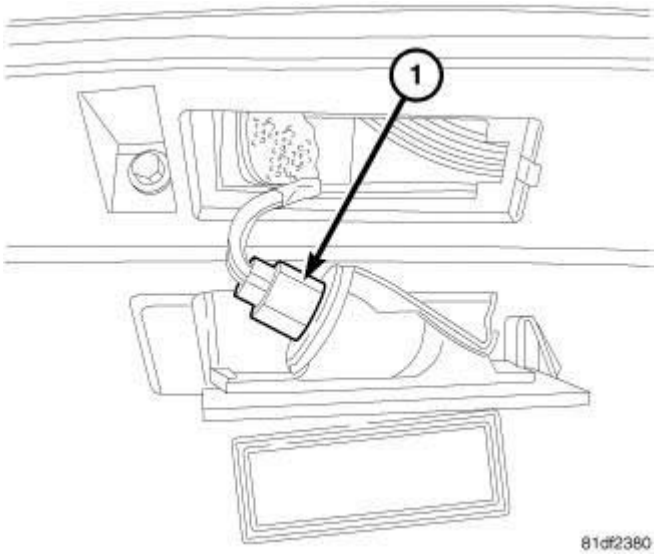

Fig. 16: License Plate Lamp Bulb Socket
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the license plate lamp from the underside of the liftgate handle and light bar assembly. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, License Plate - Removal**.
3. Pull the base of the bulb straight out of the license plate lamp bulb socket (1).

LAMP

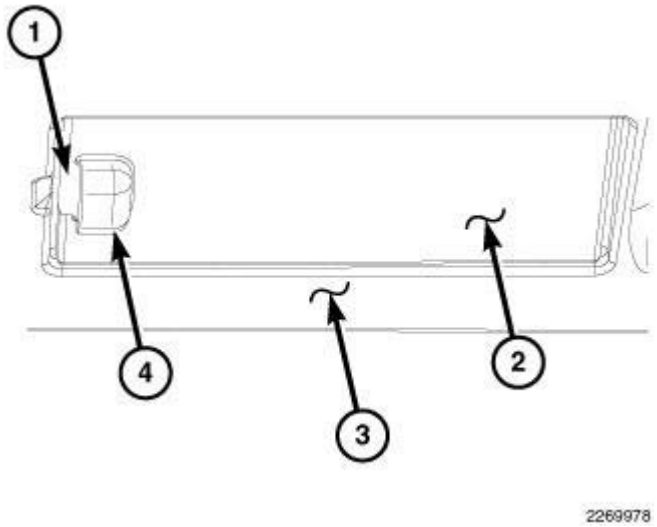

Fig. 17: License Plate Lamps
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Locate the two license plate lamps (2) on the underside of the liftgate handle and light bar assembly (3)

above the license plate tub on the liftgate outer panel.

3. Insert the end of a trim stick or a small screwdriver into the open end of the hood formation (4) on one end of the lamp lens to depress the latch tab (1) and pull that end of the lamp down from the handle and light bar assembly.
4. Pull the lamp towards the center of the vehicle far enough to disengage the lamp interlocking tab mounting feature from the outboard edge of the mounting hole.
5. Pull the lamp out of the mounting hole far enough to access the lamp wiring and bulb socket on the top of the lamp housing.
6. Firmly grasp the socket and rotate it counterclockwise about 30 degrees to unlock it.
7. Pull the socket and bulb straight out from the keyed opening in the lamp housing.
8. Remove the lamp from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

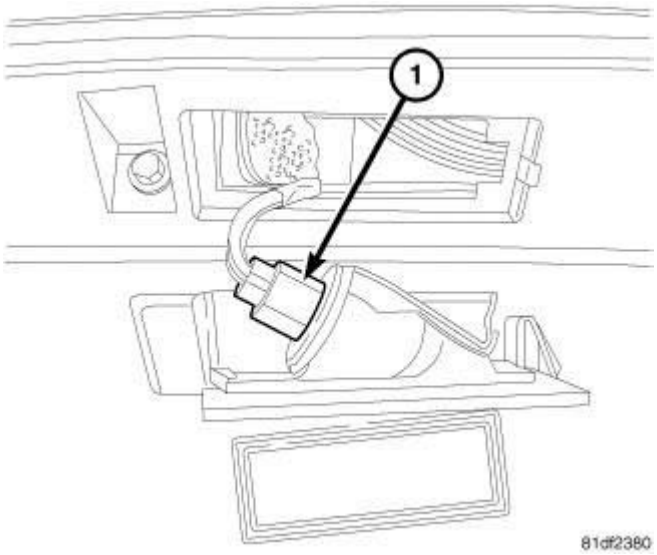

Fig. 18: License Plate Lamp Bulb Socket
Courtesy of CHRYSLER LLC

1. Align the base of the license plate lamp bulb with the socket (1).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the top of the license plate lamp housing.
4. Insert the bulb and socket into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.

6. Reinstall the lamp into the mounting hole on the underside of the liftgate handle and light bar assembly. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, License Plate - Installation**.

LAMP

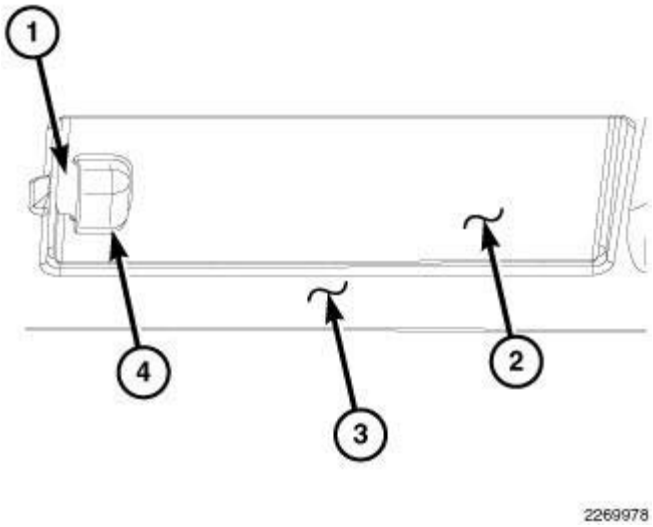

Fig. 19: License Plate Lamps
Courtesy of CHRYSLER LLC

1. Position the license plate lamp (2) to the underside of the liftgate handle and light bar assembly (3).
2. Align the socket and bulb with the keyed opening on the top of the lamp housing.
3. Insert the bulb and socket into the housing until the socket is firmly seated.
4. Rotate the socket clockwise about 30 degrees to lock it into place.
5. Engage the lamp interlocking tab mounting feature at the end of the lamp housing opposite from the hooded (4) latch (1) with the outboard edge of the mounting hole in the handle and light bar assembly.
6. Push the lamp toward the outboard side of the vehicle while pushing the inboard end of the lamp firmly and evenly into the mounting hole until the lamp latch feature snaps into place.
7. Reconnect the battery negative cable.

LAMP, SIDE REPEATER, EXPORT

REMOVAL

BULB

NOTE: Side repeater lamps are used only on vehicles manufactured for certain export markets where they are required.

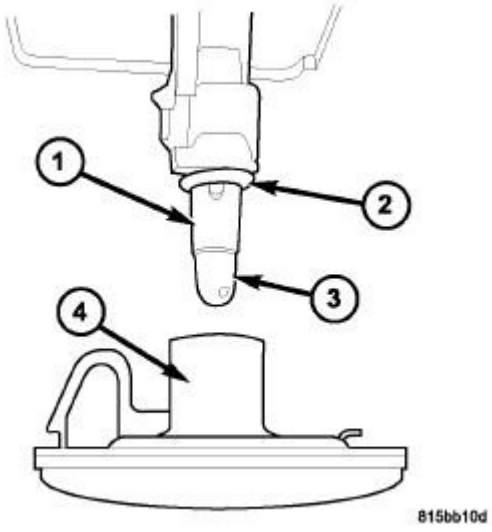

Fig. 20: Remove/Install Repeater Lamp Bulb
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the side repeater lamp from the fender mounting hole, but do not disconnect the wire harness connector. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Side Repeater - Removal**.
3. Firmly grasp the bulb socket (1) on the back of the lamp lens/housing (4) and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the lamp housing.
5. Pull the base of the bulb (3) straight out of the socket.

LAMP

NOTE: Side repeater lamps are used only on vehicles manufactured for certain export markets where they are required.

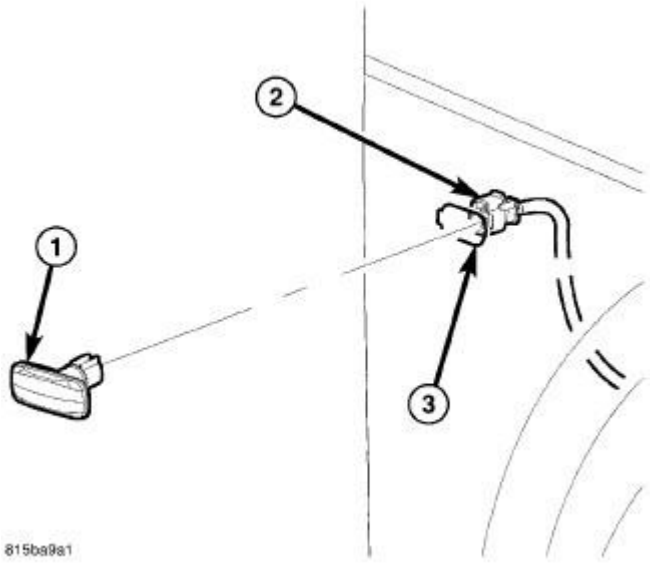

Fig. 21: Remove/Install Repeater Lamp
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

NOTE: The same repeater lamp is used on both sides of the vehicle. Regardless of which side of the vehicle the lamp is mounted on, when properly oriented the fixed hook interlock tab feature integral to the back of the lamp housing is on the right-hand side of the lamp and the latch feature is on the left-hand side.

2. Using hand pressure, press the right edge of the repeater lamp lens/housing (1) toward the left against the spring pressure of the latch feature, then pull the right edge of the lamp outward far enough to disengage the fixed hook interlock tab feature from the right side of the fender mounting hole (3).
3. Pull the lamp out from the fender far enough to access and disconnect the wire harness connector (2) from the connector receptacle of the bulb socket on the back of the lamp lens/housing.
4. Remove the repeater lamp from the fender.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: Side repeater lamps are used only on vehicles manufactured for certain export markets where they are required.

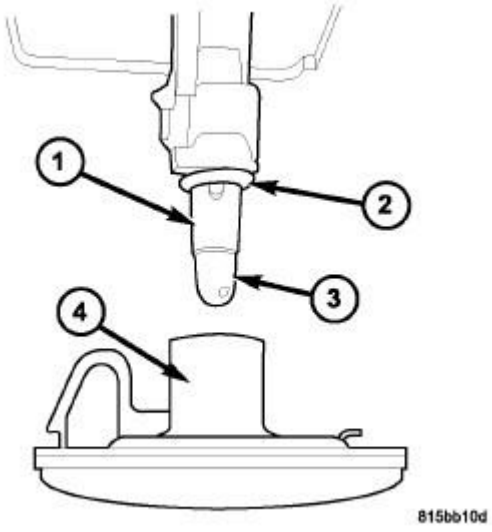

Fig. 22: Remove/Install Repeater Lamp Bulb
Courtesy of CHRYSLER LLC

1. Align the base of the bulb (3) with the socket (1).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Be certain that a rubber O-ring seal (2) is properly installed and in good condition around the base of the bulb socket.
4. Align the socket and bulb with the keyed opening on the back of the side repeater lamp lens/housing (4).
5. Insert the socket and bulb into the housing until the socket is firmly seated.
6. Rotate the socket clockwise about 30 degrees to lock it into place.
7. Reinstall the side repeater lamp into the fender mounting hole. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Side Repeater - Installation**.
8. Reconnect the battery negative cable.

LAMP

NOTE: Side repeater lamps are used only on vehicles manufactured for certain export markets where they are required.

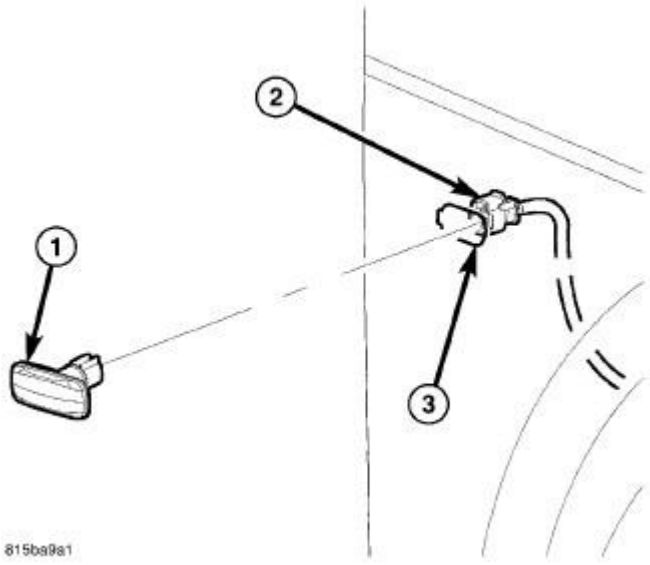

Fig. 23: Remove/Install Repeater Lamp
Courtesy of CHRYSLER LLC

1. Position the repeater lamp lens/housing (1) close enough to the fender mounting hole (3) to access and reconnect the wire harness connector (2) to the bulb socket on the back of the lamp lens/housing.

NOTE: The same repeater lamp is used on both sides of the vehicle. Regardless of which side of the vehicle the lamp is mounted on, when properly oriented the fixed hook interlock tab features integral to the back of the lamp housing is on the right-hand side of the lamp and the latch feature is on the left-hand side.

2. With the lamp lens/housing properly oriented, engage the fixed hook interlock tab feature on the back of the right side of the lamp with the right edge of the fender mounting hole.
3. Using hand pressure, press the left side of the lamp lens/housing into the mounting hole against the spring pressure of the latch feature until the latch snaps into place.
4. Reconnect the battery negative cable.

LAMP, TAIL STOP TURN

REMOVAL

BULB

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel includes bulbs for the park (or tail) lamps, the brake (or stop) lamps and the turn signal lamps. An inner rear lamp is secured on each outboard side of the liftgate outer panel adjacent to the outer lamp and also includes a bulb for the park (or tail) lamps as well as a bulb for the backup (or reverse) lamps.

OUTER LAMP

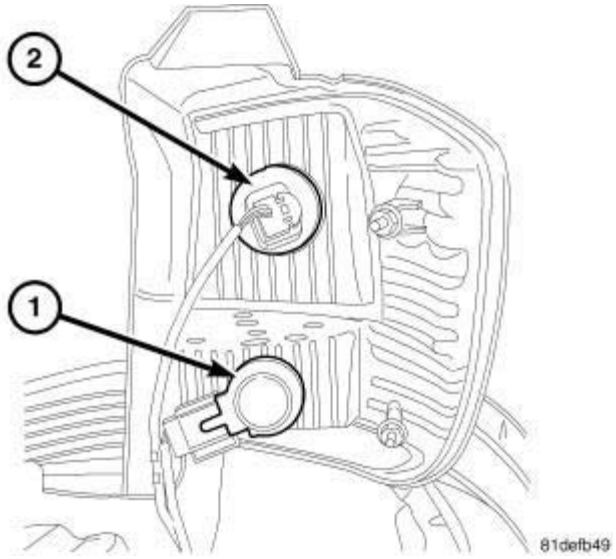

Fig. 24: Tail/Stop/Rear Side Marker And Turn Signal
Courtesy of CHRYSLER LLC

NOTE: The outer rear lamp unit contains two bulbs. They are the tail/stop/rear side marker (1) and the turn signal (2). The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Disconnect and isolate battery negative cable.
2. Remove the outer rear lamp unit. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Tail Stop Turn - Removal**.
3. Firmly grasp the appropriate bulb socket (1 or 2) on the back of the lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out of the lamp.
5. Pull the base of the bulb straight out of the socket.

INNER LAMP

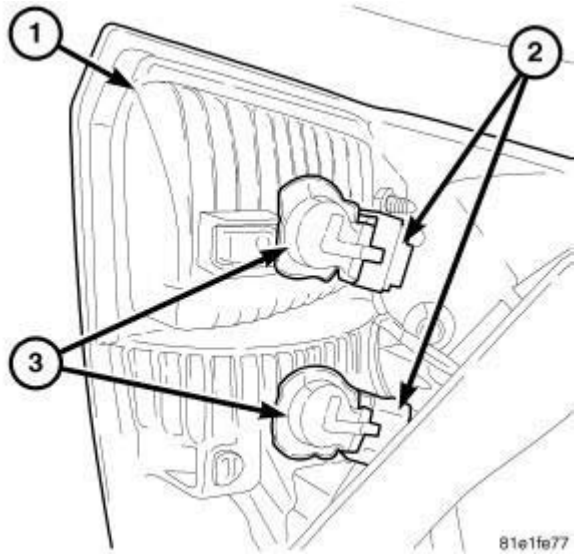

Fig. 25: Bulb Socket On Back Of Lamp Housing
Courtesy of CHRYSLER LLC

NOTE: The inner rear lamp unit contains two bulbs. The upper socket contains the tail lamp bulb, while the lower socket contains the backup lamp bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Disconnect and isolate the battery negative cable.
2. Remove the inner rear lamp unit. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Tail Stop Turn - Removal**.
3. Firmly grasp the appropriate bulb socket (3) on the back of the lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out of the lamp.
5. Pull the base of the bulb straight out of the socket.

LAMP

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel includes bulbs for the park (or tail) lamps, the brake (or stop) lamps and the turn signal lamps. An inner rear lamp is secured on each outboard side of the liftgate outer panel adjacent to the outer lamp and also includes a bulb for the park (or tail) lamps as well as a bulb for the backup (or reverse) lamps. These lamp units are serviced individually as follows.

OUTER

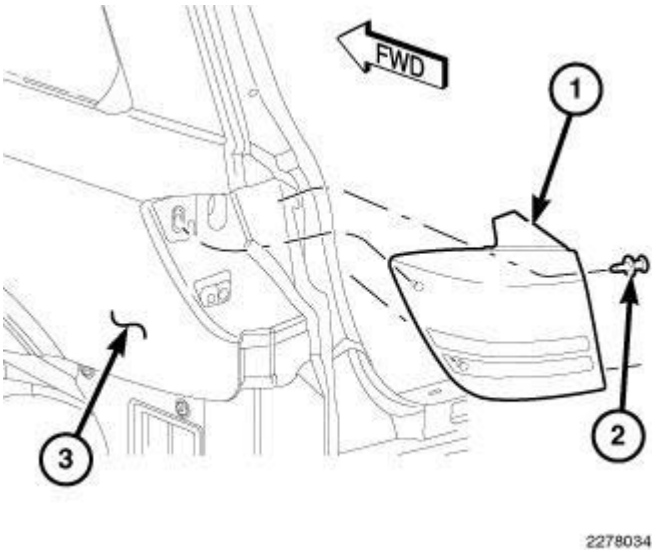

Fig. 26: Outer Rear Lamp Unit
Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable.
2. Open the liftgate to access and remove the two push pin fasteners (2) that secure the inboard side of the outer rear lamp unit (1) to the side jamb of the liftgate opening.
3. Pull the outboard side of the outer rear lamp unit rearward far enough to disengage the two locating pins on the back of the lamp housing from the plastic grommets in the lamp opening of the body sheet metal (3).

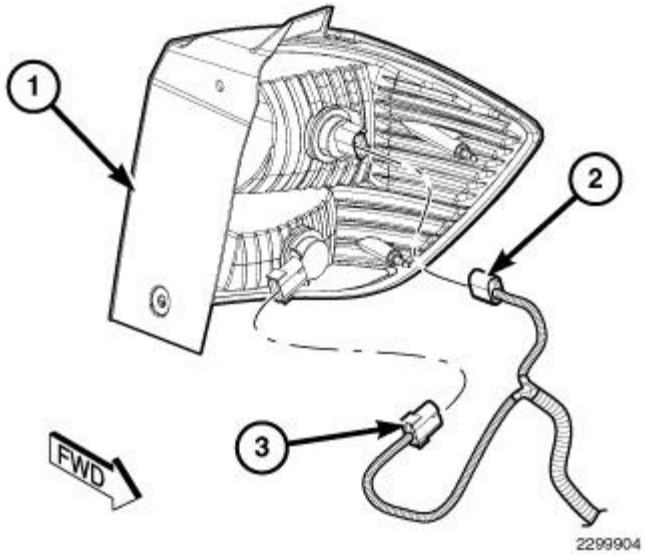

Fig. 27: Body Wire Harness Connectors
Courtesy of CHRYSLER LLC

4. Pull the lamp (1) away from the vehicle far enough to access and disconnect the two body wire harness connectors (2 and 3) from the bulb socket connector receptacles on the back of the lamp housing.

5. Remove the lamp from the vehicle.

INNER

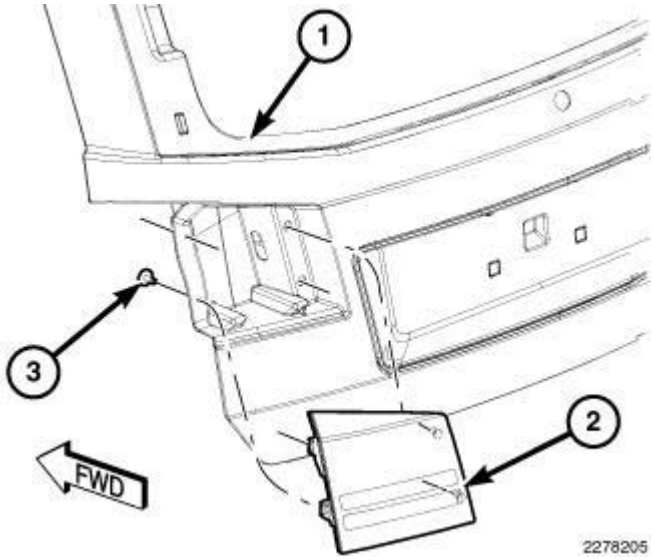

Fig. 28: Inner Rear Lamp Unit
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Open the liftgate (1) to access and remove the two screws (3) that secure the outboard side of the inner rear lamp unit (2) to the liftgate lamp opening.
3. Pull the inboard side of the inner rear lamp unit rearward far enough to disengage the two locating pins on the back of the lamp housing from the plastic grommets in the liftgate lamp opening.

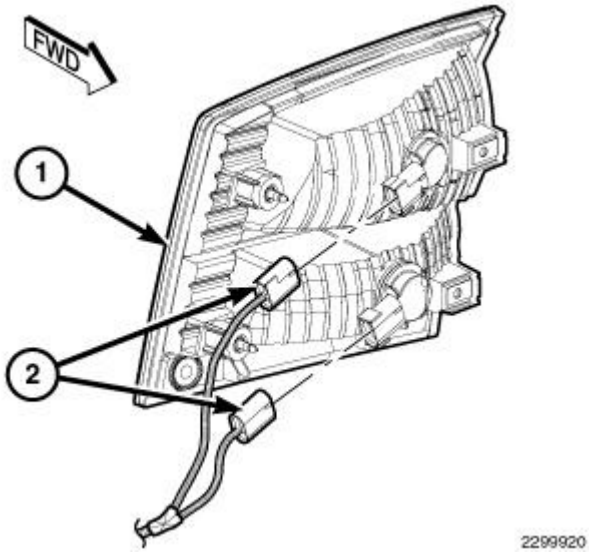

Fig. 29: Liftgate Wire Harness Connectors
Courtesy of CHRYSLER LLC

4. Pull the lamp (1) away from the vehicle far enough to access and disconnect the two liftgate wire harness connectors (2) from the bulb socket connector receptacles on the back of the lamp housing.
5. Remove the lamp from the vehicle.

INSTALLATION

BULB

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel includes bulbs for the park (or tail) lamps, the brake (or stop) lamps and the turn signal lamps. An inner rear lamp is secured on each outboard side of the liftgate outer panel adjacent to the outer lamp and also includes a bulb for the park (or tail) lamps as well as a bulb for the backup (or reverse) lamps.

OUTER LAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

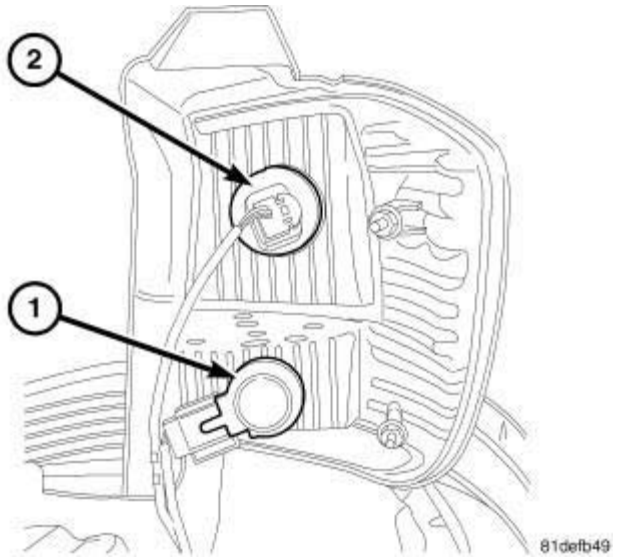

Fig. 30: Tail/Stop/Rear Side Marker And Turn Signal
Courtesy of CHRYSLER LLC

NOTE: The outer rear lamp unit contains two bulbs. They are the tail/stop/rear side marker (1) and the turn signal (2). The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Align the base of the bulb with the appropriate bulb socket (1 or 2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the outer rear lamp unit housing.
4. Insert the socket and bulb into the housing until the socket is firmly seated.

5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the outer rear lamp unit. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Tail Stop Turn - Installation**.
7. Reconnect the battery negative cable.

INNER LAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

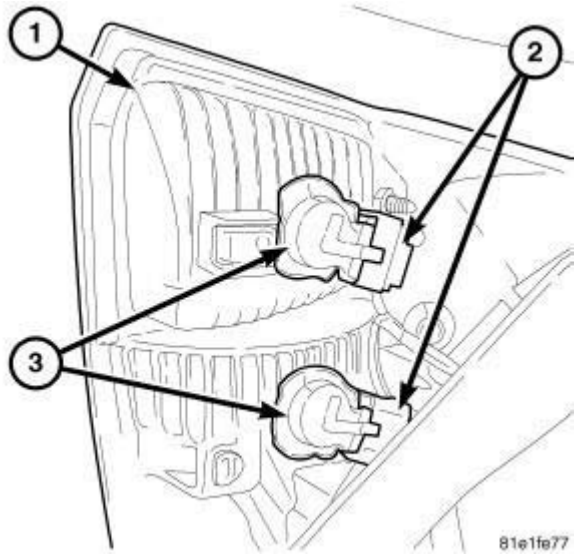

Fig. 31: Bulb Socket On Back Of Lamp Housing
Courtesy of CHRYSLER LLC

NOTE: The inner rear lamp unit contains two bulbs. The upper socket contains the tail lamp bulb, while the lower socket contains the backup lamp bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Align the base of the bulb with the appropriate bulb socket (3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the inner rear lamp unit housing.
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the inner rear lamp unit. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Tail Stop Turn - Installation**.
7. Reconnect the battery negative cable.

LAMP

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel includes bulbs for the park (or tail) lamps, the brake (or stop) lamps and the turn signal lamps. 1. Check to be certain that the two plastic grommets (2 and 3) are in good condition and properly installed in the outboard side of the lamp opening of the body sheet metal (1).

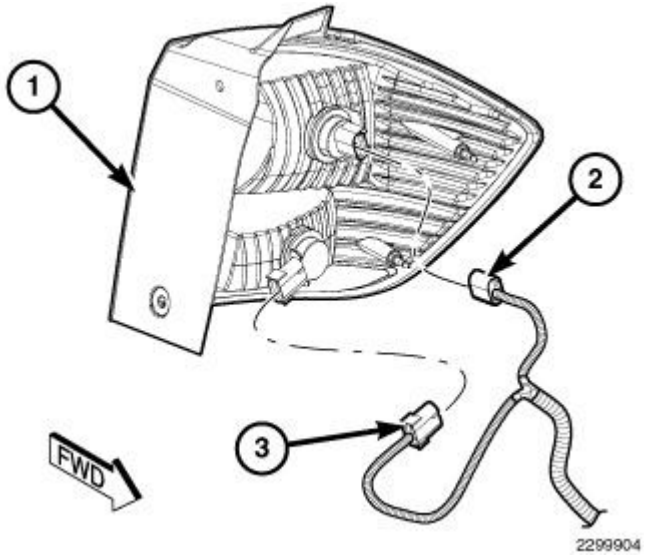

Fig. 33: Body Wire Harness Connectors
Courtesy of CHRYSLER LLC

2. Position the outer rear lamp unit (1) to the lamp opening of the body sheet metal.
3. Reconnect the two body wire harness connectors (2 and 3) to the bulb socket connector receptacles on the back of the lamp housing.

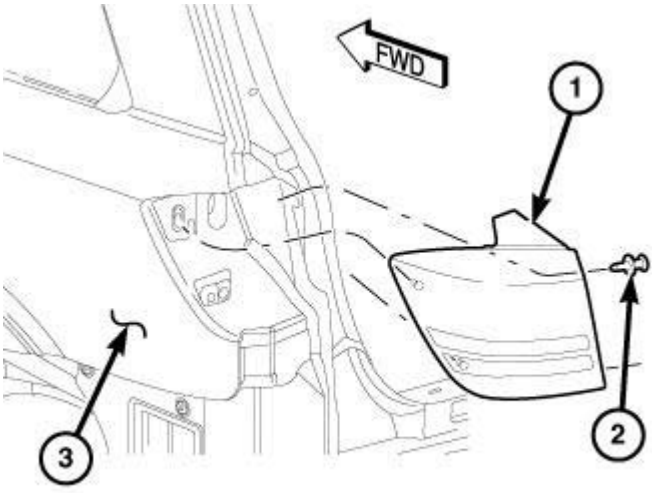

Fig. 34: Outer Rear Lamp Unit
Courtesy of CHRYSLER LLC

4. Align the two locating pins on the back of the lamp housing (1) with the plastic grommets in the lamp opening of the body sheet metal (3).
5. Using hand pressure, push firmly and evenly on the outboard top and bottom of the lamp until both alignment pins snap into the grommets.
6. Reinstall the two push pin fasteners (2) that secure the inboard side of the outer rear lamp unit to the side jamb of the liftgate opening.
7. Reconnect the battery negative cable.

INNER

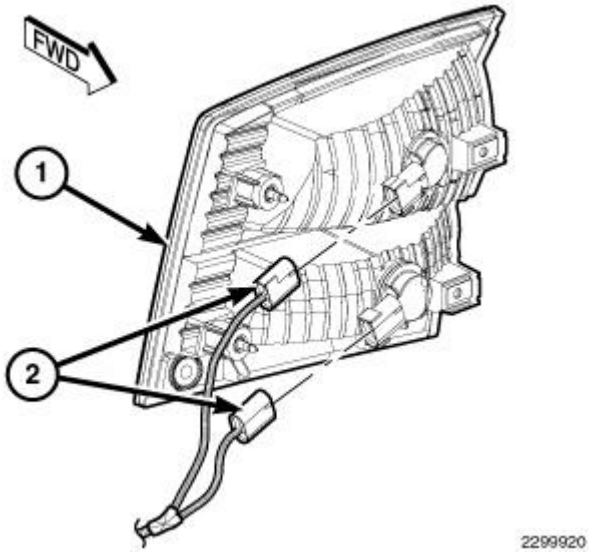

Fig. 35: Liftgate Wire Harness Connectors
Courtesy of CHRYSLER LLC

1. Check to be certain that the two plastic grommets are in good condition and properly installed on the inboard side of the liftgate lamp opening. If a grommet is removed, it must be replaced with a new unit.
2. Check to be certain that the two U-nuts are in good condition and properly installed on the outboard side of the inner rear lamp unit (1).
3. Position the lamp to the liftgate lamp opening.
4. Reconnect the two liftgate wire harness connectors (2) to the bulb socket connector receptacles on the back of the lamp housing.

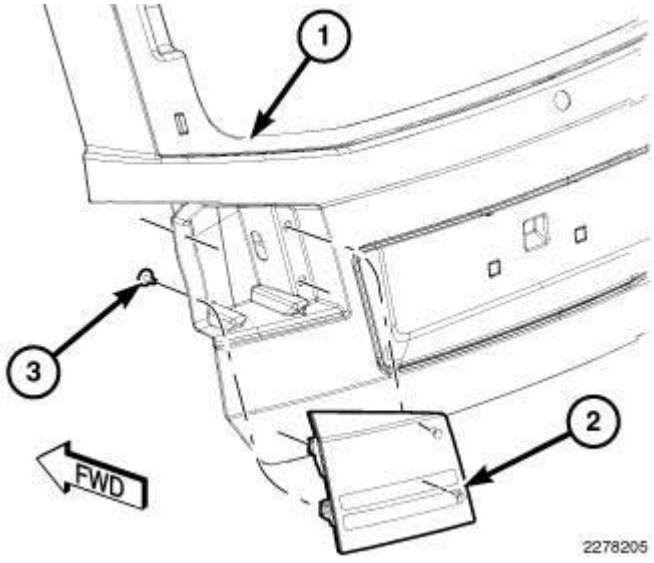

Fig. 36: Inner Rear Lamp Unit
Courtesy of CHRYSLER LLC

5. Align the two locating pins on the back of the lamp housing (2) with the plastic grommets in the liftgate

(1) lamp opening.

6. Using hand pressure, push firmly and evenly on the inboard top and bottom of the lamp until both alignment pins snap into the grommets.
7. Install and tighten the two screws (3) that secure the outboard side of the inner rear lamp unit to the liftgate lamp opening. Tighten the screws to 1.5 N.m (15 in. lbs.).
8. Reconnect the battery negative cable.

MOTOR, HEADLAMP LEVELING, EXPORT

DESCRIPTION

DESCRIPTION

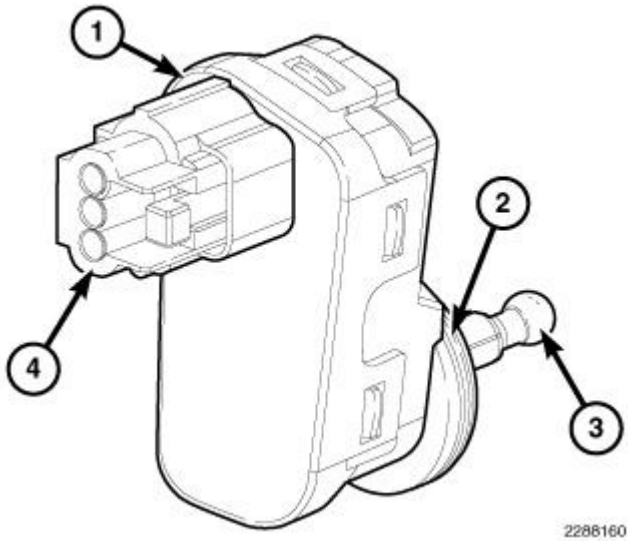

Fig. 37: Headlamp Leveling Motor
Courtesy of CHRYSLER LLC

The headlamp leveling motor (1) is located on the rear surface of each front lamp unit on vehicles equipped with the headlamp leveling system, which is available only in certain export markets where it is required equipment. The motor is encased within a molded plastic housing and is secured by an integral wedge-type mounting flange (2) to a keyed flange on the back of the front lamp unit housing. A rubber seal around the circumference of the mounting boss seals the motor to the lamp housing.

The outside of the motor housing features an integral molded connector (4) on its upper rearward surface and a plastic pushrod with a ball formation (3) on its free end extends from the motor mounting flange. Within the motor housing is a 12-volt Direct Current (DC) servo motor, an electronic controller board that includes the motor logic circuits, and an integral screw-drive transmission. The headlamp leveling motor is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The headlamp leveling motor cannot be repaired and, if ineffective or damaged, the entire motor unit must be replaced.

OPERATION

OPERATION

The controller board and logic circuitry of the headlamp leveling motor controls motor operation based upon a voltage signal input received from the Totally Integrated Power Module (TIPM). The TIPM uses electronic messages received over the Controller Area Network (CAN) data bus from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the correct voltage signal to provide the leveling motor, while the EMIC uses electronic messages received over the Local Interface Network (LIN) data bus from the instrument panel switch pod to monitor the headlamp leveling switch selection.

The headlamp leveling motors have a path to ground at all times. The motors operate on battery voltage received through the headlamp low beam feed circuits so that the system will only operate when the headlamp low beams are turned ON. When the motor is energized it will extend or retract the motor pushrod through an integral screw-drive transmission. The ball on the end of the pushrod is snapped into a saddle bracket on the back of the reflector within the front lamp unit housing, which will cause the reflector to move as the pushrod is extended or retracted, changing the angle at which the light is projected from the headlamp bulb filaments.

The hard wired circuits for the headlamp leveling motors may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the active electronic elements within the headlamp leveling motors or the electronic controls and communication between other modules and devices that provide some features of the headlamp leveling system. The most reliable, efficient, and accurate means to diagnose the headlamp leveling motor or the electronic controls and communication related to headlamp leveling system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

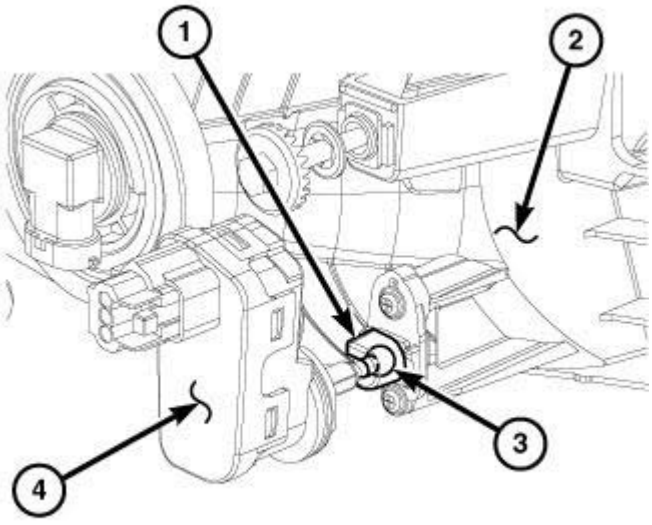

Fig. 38: Headlamp Leveling Motor On Back Of Lamp Housing
Courtesy of CHRYSLER LLC

NOTE: The graphic shows the right side front lamp unit as viewed from the back of the lamp with the housing removed. However, the housing cannot be removed from the lamp for service. This view was necessary in order to clearly illustrate the internal engagement of the headlamp leveling motor pushrod with the saddle bracket on the lamp reflector.

1. Disconnect and isolate the battery negative cable.
2. Remove front lamp unit from the vehicle. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Removal**.
3. Rotate the headlamp leveling motor (4) on the back of the lamp housing counterclockwise about 30 degrees to unlock it from the housing.
4. Grasp the motor firmly with one hand and twist it toward the inboard side of the lamp far enough to disengage the ball on the end of the motor pushrod (3) from the saddle bracket (1) secured to the reflector (2) within the lamp housing.
5. Pull the motor and pushrod straight back and out of the front lamp unit housing.

INSTALLATION

INSTALLATION

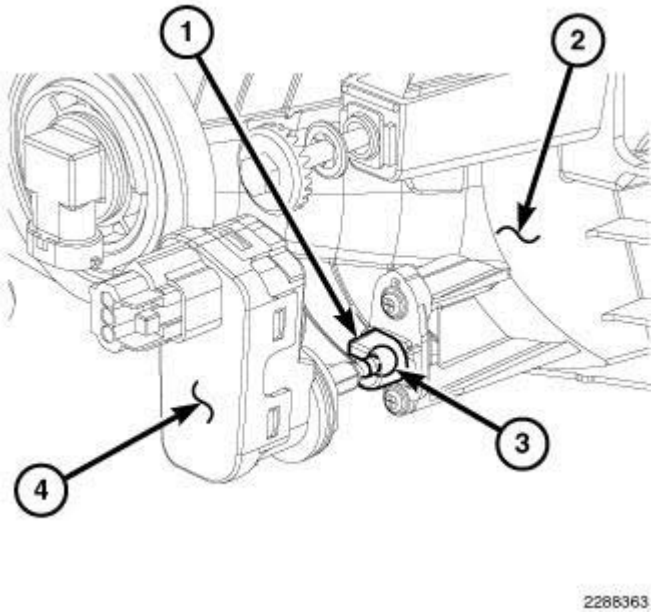

Fig. 39: Headlamp Leveling Motor On Back Of Lamp Housing

NOTE: The graphic shows the right side front lamp unit as viewed from the back of the lamp with the housing removed. However, the housing cannot be removed from the lamp for service. This view was necessary in order to clearly illustrate the internal engagement of the headlamp leveling motor pushrod with the saddle bracket on the lamp reflector.

1. Align and insert the headlamp leveling motor (4) and pushrod into the front lamp unit housing.
2. Grasp the motor firmly with one hand and twist it toward the inboard side of the lamp far enough to align the ball on the end of the motor pushrod (3) with the saddle bracket (1) secured to the reflector (2) within the lamp housing.

NOTE: It may be helpful to also remove a headlamp bulb from the lamp reflector and insert a finger through the bulb opening to move the reflector far enough to align the saddle bracket with the motor pushrod ball.

3. With the motor pushrod ball and reflector saddle bracket aligned, twist the motor back toward the outboard side of the lamp far enough to engage the pushrod ball into the reflector saddle bracket.
4. Insert the mounting flange of the headlamp leveling motor into the mounting boss on the back of the front lamp unit housing until the motor is firmly seated.
5. Rotate the motor clockwise about 30 degrees to lock it into place.
6. Reinstall the front lamp unit into the vehicle. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Installation**.
7. Reconnect the battery negative cable.

RELAY, TRAILER TOW

DESCRIPTION

DESCRIPTION

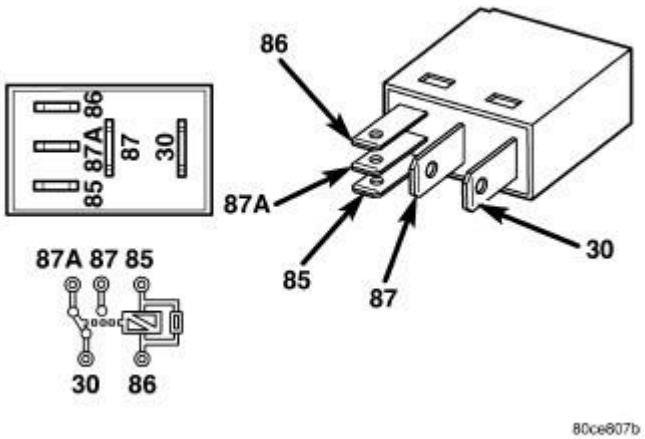

Fig. 40: Identifying Relay & Terminals
Courtesy of CHRYSLER LLC

Vehicles equipped with an optional trailer tow preparation package have four trailer tow relays, one each for the trailer tow stop/turn right and left and one each for the trailer stop lamp right and left. The trailer tow relays are conventional International Standards Organization (ISO) micro relays. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. Each relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male spade-type terminals that extend from the relay base plate.

The trailer tow relays are included with the trailer tow preparation wire harness that is shipped loose in the glove box for customer or dealer installation at the rear of the vehicle. A trailer tow stop/turn relay is located behind the rear fascia below each outer tail lamp, while a trailer stop lamp relay is located behind the rear fascia below each outboard end of the rear bumper reinforcement. Each relay and connector is wrapped within an isolator envelope for sound deadening and anti-rattle protection. Refer to **SYSTEM WIRING DIAGRAMS** for specific relay cavity assignment information.

Any of the trailer tow relays cannot be adjusted or repaired and, if ineffective or damaged, the affected unit must be replaced.

OPERATION

OPERATION

The trailer tow relays are electromechanical switches that use a low current input from the Totally Integrated Power Module (TIPM) to the tail lamps to control a high current output to the trailer brake and turn signal

lamps. Within each relay are an electromagnetic coil, a movable contact and two fixed contact points. A resistor is connected in parallel with the coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the field of the relay coil collapses.

The movable common supply contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This field draws the movable contact away from the normally closed contact, and holds it against the normally open contact. When the relay coil is de-energized, spring pressure returns the movable contact back against the normally closed contact.

The inputs and outputs of the trailer tow relays include:

- **Common Supply Terminal (30)** - The common feed terminal of both the left and right trailer tow stop/turn relays is connected to their respective left or right trailer tow stop/turn signal pins of the 4-way trailer tow connector at all times. The common feed terminals of both the left and right trailer tow stop relays is connected to the normally closed (87A) terminal of their respective left or right trailer tow stop/turn relay at all times.
- **Coil Ground Terminal (85)** - The coil ground terminal of both the left and right trailer tow stop/turn relays is connected to their respective left or right rear turn signal control circuits from the TIPM at all times. The coil ground terminals of both the left and right trailer tow stop relays are connected to the stop lamp control circuit from the TIPM at all times.
- **Coil Battery Terminal (86)** - The coil battery terminal of both the left and right trailer tow stop/turn relays is connected to a path to ground at all times. The coil battery terminal of both the left and right trailer tow stop relays is connected to their respective left or right rear turn signal control circuits from the TIPM at all times.
- **Normally Open Terminal (87)** - The normally open terminal of both the left and right trailer tow stop/turn relays is connected to the stop lamp control circuit from the TIPM whenever that relay is energized. The normally open terminal of both the left and right trailer tow stop relays is connected to a path to ground whenever that relay is energized.
- **Normally Closed Terminal (87A)** - The normally closed terminal of both the left and right trailer tow stop/turn relays is connected are connected to the common supply (30) terminal of their respective left or right trailer tow stop relay whenever the relay is de-energized. The normally closed terminal of both the left and right trailer tow stop relays is not connected to any circuit in this application.

The trailer tow relays and the hard wired circuits for the relays may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide some features of the trailer tow turn and stop lamp lighting system. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to trailer tow turn and stop lamp lighting operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

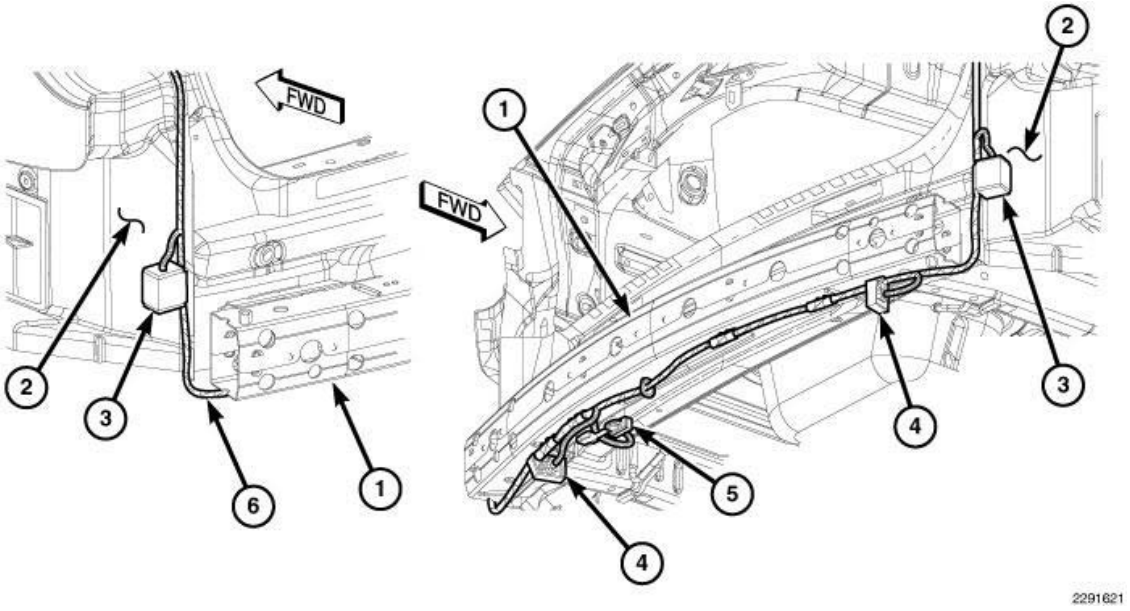

Fig. 41: Isolator Envelope
Courtesy of CHRYSLER LLC

TRAILER TOW STOP/TURN RELAYS

1. Disconnect and isolate the battery negative cable.
2. Remove the rear fascia from the vehicle. Refer to **Frame and Bumpers/Bumpers/FASCIA, Rear - Removal**
3. Disengage the left or right trailer tow stop/turn relay and connector from the isolator envelope (3) secured to the trailer tow wire harness (6) along the left or right body side aperture (2) just below the outer tail lamp.
4. Pull the relay straight out from the wire harness connector.

TRAILER TOW STOP LAMP RELAYS

1. Disconnect and isolate the battery negative cable.
2. Remove the rear fascia from the vehicle. Refer to **Frame and Bumpers/Bumpers/FASCIA, Rear - Removal**
3. Disengage the left or right trailer tow stop lamp relay and connector from the isolator envelope (4) secured to the trailer tow wire harness (6) on the underside of the rear bumper reinforcement (1) on the left or right side of the 4-way trailer tow connector (5).
4. Pull the relay straight out from the wire harness connector.

INSTALLATION

INSTALLATION

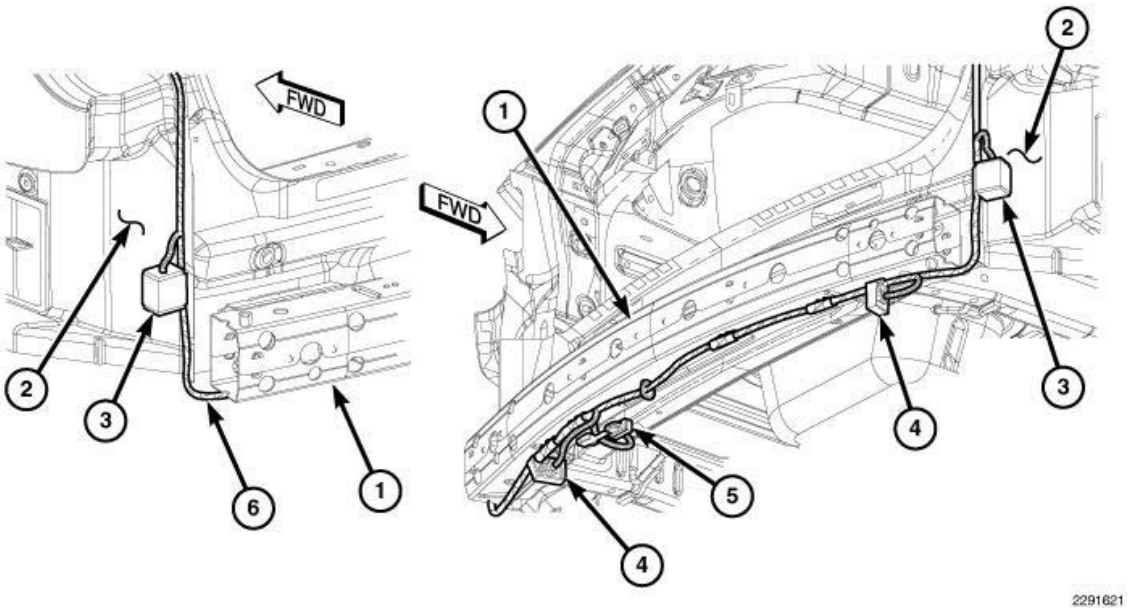

Fig. 42: Isolator Envelope
Courtesy of CHRYSLER LLC

TRAILER TOW STOP/TURN RELAYS

1. Align the terminals of the left or right trailer tow stop/turn relay with the terminal receptacles of the trailer tow wire harness connector.
2. Firmly and evenly push the relay into the connector until it is fully seated.
3. Insert the relay and connector into the isolator envelope (3) secured to the wire harness (6) along the left or right body side aperture (2) just below the outer tail lamp.
4. Reinstall the rear fascia onto the vehicle. Refer to **Frame and Bumpers/Bumpers/FASCIA, Rear - Installation** .
5. Reconnect the battery negative cable.

TRAILER TOW STOP LAMP RELAYS

1. Align the terminals of the left or right trailer tow stop lamp relay with the terminal receptacles of the trailer tow wire harness connector.
2. Firmly and evenly push the relay into the connector until it is fully seated.
3. Insert the relay and connector into the isolator envelope (4) secured to the trailer tow wire harness (6) on the underside of the rear bumper reinforcement (1) on the left or right side of the 4-way trailer tow connector (5).
4. Reinstall the rear fascia onto the vehicle. Refer to **Frame and Bumpers/Bumpers/FASCIA, Rear - Installation** .
5. Reconnect the battery negative cable.

SWITCH, BACKUP LAMP

DESCRIPTION

DESCRIPTION

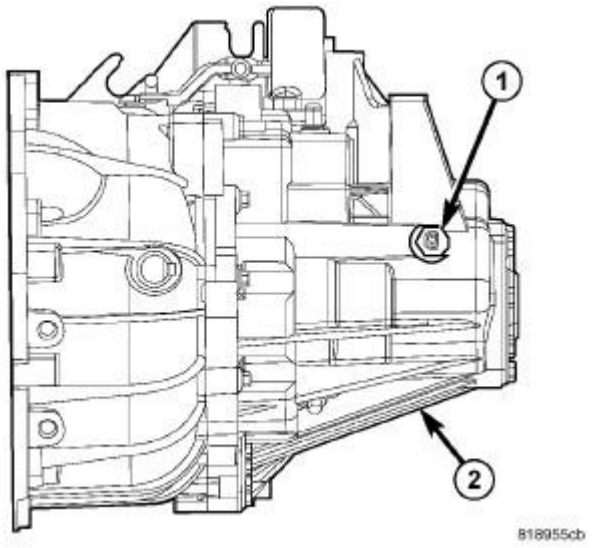

Fig. 43: Backup Lamp Switch
Courtesy of CHRYSLER LLC

Vehicles equipped with a manual transmission (2) have a normally open, spring-loaded plunger type backup lamp switch (1). Vehicles with an optional electronic automatic transmission have a Transmission Range Sensor (TRS) that is used to perform several functions, including that of the backup lamp switch. The TRS is described in further detail elsewhere in this service information. Refer to the service and diagnostic information for the automatic transmission type installed in the vehicle.

The backup lamp switch is located in a threaded hole on the left facing surface of the manual transmission housing. The switch has a threaded body and a hex formation near the plunger end of the switch. An integral connector receptacle at the end of the switch opposite the plunger connects the switch to the vehicle electrical system through a take out and connector of the engine wire harness. When installed, only the switch connector and the hex formation are visible on the outside of the transmission housing.

The backup lamp switch cannot be adjusted or repaired and, if ineffective or damaged, the entire switch unit must be replaced. Refer to the service and diagnostic information for the manual transmission type installed in the vehicle.

OPERATION

OPERATION

The backup lamp switch controls a path to ground for the Totally Integrated Power Module (TIPM) on the reverse switch signal circuit. The TIPM reads this input through an internal pull-up, then controls an output through a high side driver that regulates the flow of battery voltage to the backup lamp bulbs as appropriate on

the backup lamp feed circuit. The switch plunger is mechanically actuated by the gearshift mechanism within the transmission, which will depress the switch plunger and close the switch contacts whenever the REVERSE gear has been selected. The switch receives ground at all times through a take out and eyelet terminal of the wire harness that is secured to the body sheet metal.

The backup lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that rely upon inputs from the backup lamp switch. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to backup lamp switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

BACKUP LAMP SWITCH

1. Disconnect and isolate the battery negative cable.
2. Locate and disconnect the engine wire harness connector from the backup lamp switch connector receptacle.
3. Check for continuity between the two terminal pins in the backup lamp switch connector receptacle.
   a. With the gear selector lever in the REVERSE position, there should be continuity.
   b. With the gear selector lever in any position other than REVERSE, there should be no continuity.
4. If the switch fails either of these two continuity tests, replace the ineffective backup lamp switch.

SWITCH, HAZARD WARNING

DESCRIPTION

DESCRIPTION

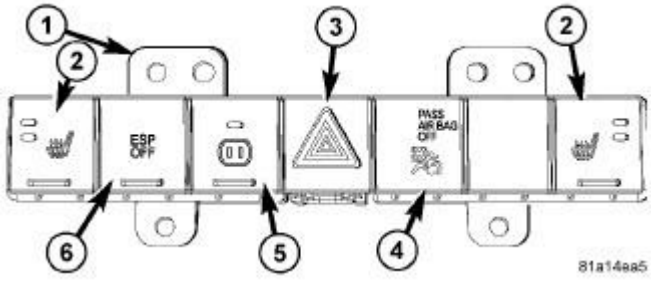

Fig. 44: Instrument Panel Switch Pod
Courtesy of CHRYSLER LLC

The hazard switch (3) is integral to the instrument panel switch pod (1), which is secured to the instrument panel center bezel just above the heater and air conditioner controls. A red, stencil-like International Control and Display Symbol icon for **Hazard Warning** identifies the hazard switch button. The remainder of the hazard

switch circuitry is concealed within the instrument panel switch pod.

The hazard switch button has panel lamps dimmer controlled illumination for night visibility. The switch button latches to a slightly lowered position when the hazard warning system is activated and the icon on the switch button will illuminate at an increased intensity while the turn signals and turn signal indicators are flashing. The switch button unlatches to a position flush with the other push buttons in the switch pod when the hazard warning is deactivated.

All of the circuitry and components of the hazard switch are contained within a molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The hazard switch cannot be adjusted or repaired and, if ineffective or damaged, the entire instrument panel switch pod unit must be replaced. Refer to **Electrical - Instrument Cluster/Instrument Cluster/POD, Switch - Removal** .

OPERATION

OPERATION

The status of the hazard switch is continually monitored by the circuitry within the instrument panel switch pod. The switch pod receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The only other inputs to the switch pod consists of electronic communication with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the single wire Local Interface Network (LIN) data bus.

Whenever the hazard switch is in its unlatched and raised position, the hazard warning system is selected and the switch pod circuitry provides a hard wired output to the Totally Integrated Power Module (TIPM). When the TIPM receives a hazard switch input it then controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left, front and rear turn signal feed circuits. The TIPM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher.

The hard wired circuits for the instrument panel switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the hazard warning switch or the electronic controls and communication between other modules and devices that provide some features of the hazard warning system. The most reliable, efficient, and accurate means to diagnose the hazard switch or the electronic controls and communication related to hazard warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, HEADLAMP LEVELING, EXPORT

DESCRIPTION

DESCRIPTION

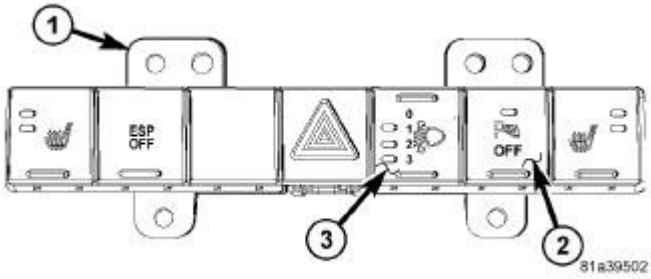

Fig. 45: Identifying Park Assist Switch
Courtesy of CHRYSLER LLC

The headlamp leveling switch (3) is used only on vehicles manufactured for certain export markets where the headlamp leveling system is required. The headlamp leveling switch is integral to the switch pod (1), which is secured to the instrument panel center bezel just above the heater and air conditioner controls. A stencil-like International Control and Display Symbol icon for **Headlamp Levelling Control** identifies the headlamp leveling switch button.

The switch push button is also marked with the numbers **0** , **1** , **2** , and **3** , which indicates each of the four headlamp leveling positions. Each higher number represents a lower aiming position of the headlamp beam relative to the road surface. The headlamp leveling switch button has panel lamps dimmer controlled illumination for night visibility. The switch button also features a jewel like Light Emitting Diode (LED) indicator adjacent to the numbers **1** , **2** , and **3** . The appropriate LED is illuminated when that headlamp position is currently selected. The momentary switch push button is operated by depressing, then releasing the top or bottom of the button in a rocker-like manner to enable the selection of a sequentially higher or lower position with each button press.

All of the circuitry and components of the headlamp leveling switch are contained within the molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch pod is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The headlamp leveling switch cannot be adjusted or repaired and, if ineffective or damaged, the entire instrument panel switch pod unit must be replaced. Refer to **Electrical - Instrument Cluster/Instrument Cluster/POD, Switch - Removal** .

OPERATION

OPERATION

The status of the headlamp leveling switch is continually monitored by the circuitry within the instrument panel switch pod. The switch pod receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The only other inputs to and outputs from the switch pod consist of electronic communication with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the single wire Local Interface Network (LIN) data bus.

Whenever the headlamp leveling switch push button is depressed the switch pod circuitry sends an electronic **select status up** or **select status down** message input to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **select request up** or **select request down** message to the TIPM over the Controller Area Network (CAN) data bus.

The TIPM responds to these messages by providing a voltage output to the headlamp leveling motors through high side drivers on the headlamp leveling motor right and left signal circuits to move the headlamp reflectors to the selected position based upon the voltage input received from the TIPM. The TIPM also sends the appropriate electronic messages back to the EMIC and the EMIC relays the messages back to the switch pod to control the illumination of the **1** , **2** or **3** Light Emitting Diode (LED) selected position indicator in the leveling switch button. The EMIC and TIPM logic will only allow the headlamp leveling system to operate while the ignition switch is in the ON position and the exterior lighting is turned ON.

The hard wired circuits for the instrument panel switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp leveling switch or the electronic controls and communication between other modules and devices that provide some features of the headlamp leveling system. The most reliable, efficient, and accurate means to diagnose the headlamp leveling switch or the electronic controls and communication related to headlamp leveling system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, MULTIFUNCTION, LEFT

DESCRIPTION

DESCRIPTION

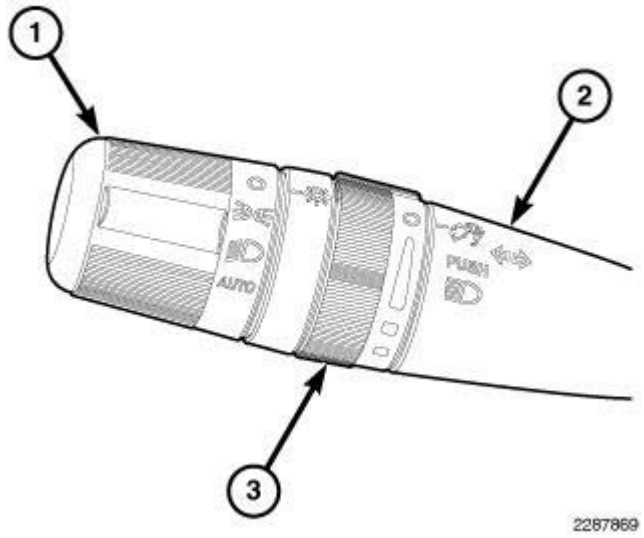

Fig. 46: Left Multifunction Switch
Courtesy of CHRYSLER LLC

The left (lighting) multi-function switch is located on the left side of the steering column, just below the

steering wheel. This switch is the primary control for the interior and exterior lighting systems. The only visible components of the switch are the control stalk (2), control knob (1) and control sleeve (3) that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connection, and the turn signal cancel actuator are concealed beneath the shrouds.

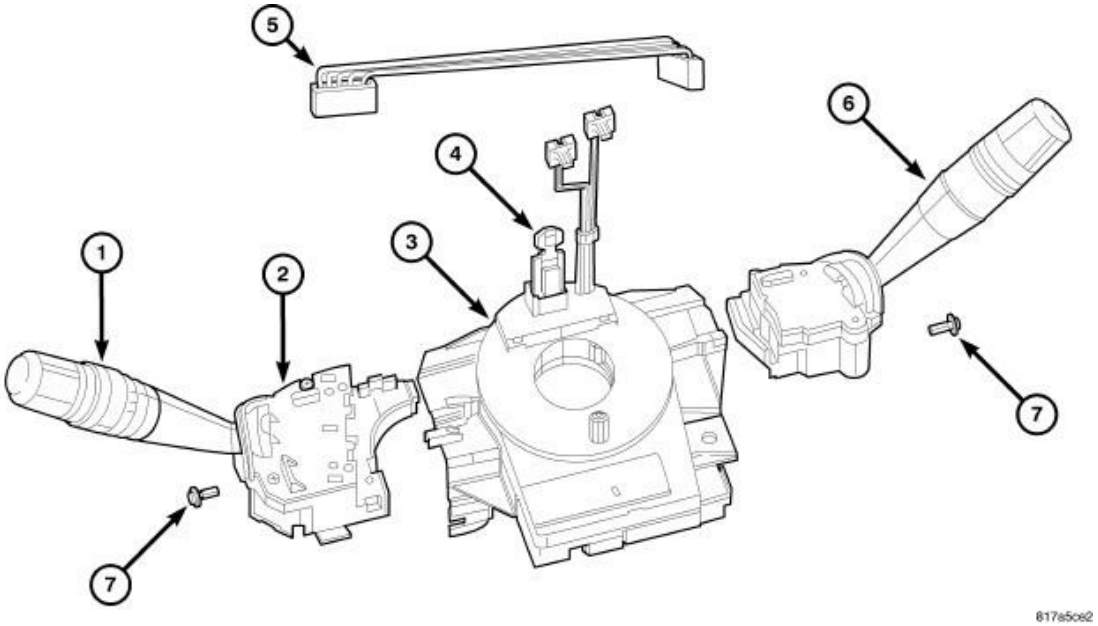

Fig. 47: Steering Control Module
Courtesy of CHRYSLER LLC

The switch housing (2) and controls (1) are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. A single screw (7) through a mounting tab integral to the back of the switch housing, and a slide tab integral to the bottom of the switch housing secure the switch to the mounting bracket integral to the clockspring (3).

The Steering Control Module (SCM) is internal to the switch housing. The switch outputs are internally connected directly to the SCM. A single connector receptacle containing seven terminal pins is integral to the inboard end of the switch housing and connects the right multi-function switch (6) through a jumper wire harness (5) directly to the SCM. An integral connector receptacle on the back of the switch housing connects the SCM to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The left multi-function switch provides the vehicle operator with a control interface for the following exterior lighting functions:

- **Automatic Headlamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional automatic headlamps.
- **Front Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional front fog lamps.
- **Headlamps** - The left multi-function switch control knob provides detent switching for the headlamps.

- **Headlamp Beam Selection** - The left multi-function switch control stalk provides detent switching for selection of the headlamp high or low beams.
- **Headlamp Optical Horn** - The left multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Park Lamps** - The left multi-function switch control knob provides detent switching for the park lamps.
- **Rear Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional rear fog lamps. Rear fog lamps are optional only for vehicles manufactured for certain export markets, where they are required.
- **Turn Signal Control** - The left multi-function switch control stalk provides both momentary non-detent switching and detent switching with automatic cancellation for both the left and right turn signal lamps.

The left multi-function switch also provides the vehicle operator with a control interface for the following interior lighting functions:

- **Interior Lamps Defeat** - The left multi-function switch control ring provides detent switching to defeat the illumination of all interior courtesy lamps when a door or the liftgate is opened.
- **Interior Lamps On** - The left multi-function switch control ring provides detent switching to illuminate all interior courtesy lamps simultaneously.
- **Panel Lamps Dimming** - The left multi-function switch control ring provides simultaneous adjustable control of the illumination intensity of all instrument panel lighting at one of six available illumination intensity levels.
- **Parade Mode** - The left multi-function switch control ring provides detent switching for a parade mode that maximizes the illumination intensity of all instrument panel lighting for visibility when driving in daylight with the exterior lamps turned on.

The left multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire switch unit must be replaced. The clockspring (with the multi-function switch mounting bracket), the left multi-function switch (with the SCM), the right multi-function switch and the jumper wire harness are each available for separate service replacement.

OPERATION

OPERATION

The left (lighting) multi-function switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Control Module (SCM), then provides resistor multiplexed return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over a Local Interface Network (LIN) data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), and the EMIC relays electronic **switch request** messages over the Controller Area Network (CAN) data bus to other electronic modules in the vehicle.

If the SCM detects no inputs from the left multi-function switch, it transmits an electronic **Signal Not Available**

(SNA) status message over the LIN data bus. The SNA status signals the EMIC to request other electronic modules to implement a fail-safe mode of operation for the exterior lighting system. The fail-safe mode automatically turns the exterior lighting ON when the ignition switch is in the ON position, and OFF when the ignition switch is in the OFF position.

The hard wired inputs and outputs of the left multi-function switch and SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

EXTERIOR LIGHTING

Following are descriptions of how the left multi-function switch is operated to control the many exterior lighting functions and features it provides:

- **Automatic Headlamps** - The optional automatic headlamps feature is requested when the left multi-function switch control knob is rotated to the automatic (AUTO) detent position with the ignition switch in the ON position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Front Fog Lamps** - The optional front fog lamps are requested when the left multi-function switch control knob is pulled outward to the front fog lamps detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle. The switch control knob incorporates an internal cam mechanism that will only allow the front fog lamps to be selected while the headlamp ON position is also selected, and will automatically move the control knob to the front fog lamps OFF position when the control knob is rotated to deselect the headlamps.
- **Headlamps** - The headlamps are requested when the left multi-function switch control knob is rotated to the headlamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp high beams are selected when the left multi-function switch control stalk is pushed forward to the high beam selection detent position. The low beams are selected when the control stalk is pulled rearward to the low beam selection detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **beam select switch status** message over the LIN data bus to the EMIC, which relays an electronic **beam select switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the left multi-function switch control stalk is pulled fully rearward to a momentary position. The headlamp high beams will remain illuminated for as long as the control stalk is held in this momentary position and the low beams will be restored when the control stalk is released. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **beam select switch status** message over the LIN data bus to the EMIC, which relays an electronic **beam select switch request** message over the CAN data bus to other electronic modules in the vehicle.

- **Park Lamps** - The headlamps are requested when the left multi-function switch control knob is rotated to the park lamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Fog Lamps** - The optional rear fog lamps are requested when the left multi-function switch control knob is pulled outward to the front fog lamps detent position and then rotated to the rear fog lamps detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle. The switch control knob incorporates an internal cam mechanism that will only allow the rear fog lamps to be selected while the front fog lamps ON position is also selected, and will automatically move the control knob to the rear fog lamp OFF position when the control knob is pushed in to deselect the front fog lamps.
- **Turn Signal Control** - The turn signals are requested when the left multi-function switch control stalk is moved downward (left signal) or upward (right signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that automatically provides three turn signal blinks as a LANE CHANGE feature when the control stalk is tapped or will energize the turn signals for as long as the control stalk is held in the momentary position. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends through an opening in the side of the clockspring case toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotor rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the left multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the left turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral OFF position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.

INTERIOR LIGHTING

Following are descriptions of the how the left multi-function switch is operated to control the many interior lighting functions and features it provides:

- **Interior Lamps Defeat** - The interior lamps defeat feature is requested when the left multi-function switch control sleeve is rotated to the interior lamps DEFEAT detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Interior Lamps On** - The interior lamps ON feature is requested when the left multi-function switch control sleeve is rotated to the interior lamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message

over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.

- **Panel Lamps Dimming** - The panel lamps dimming function is active only when the left multi-function switch control knob is in any exterior lighting ON position. With the exterior lighting ON, the panel lamps dimming level is requested when the left multi-function switch control sleeve is rotated to any one of five minor detent positions. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Parade Mode** - The PARADE (or funeral) mode is active only when the left multi-function switch control knob is in any exterior lighting ON position. With the exterior lighting ON, the PARADE mode is requested when the left multi-function switch control sleeve is rotated to the PARADE mode detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

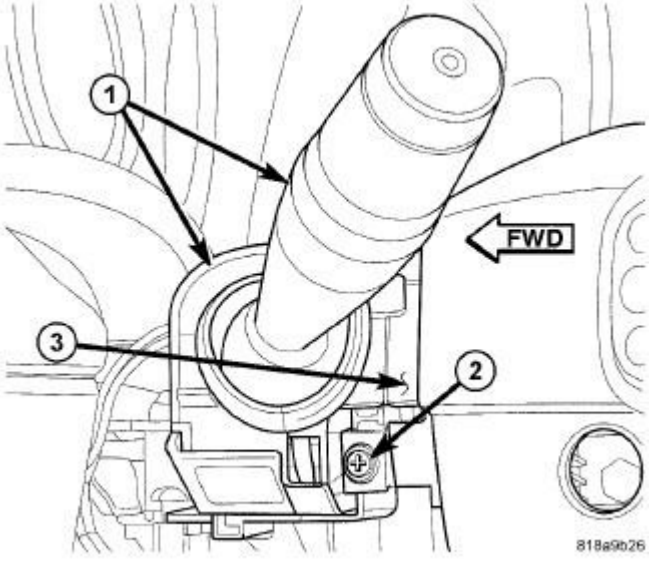

Fig. 48: Identifying Left Multi-Function Switch, Screw & Clockspring
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove both the upper and lower shrouds from the steering column. Refer to **Steering/Column/SHROUD, Steering Column - Removal** .
3. Disconnect the instrument panel wire harness connector from the connector receptacle on the back of the left multi-function switch.
4. Remove the screw (2) that secures the left multi-function switch (1) to the mounting bracket integral to the left side of the clockspring (3) on the steering column.

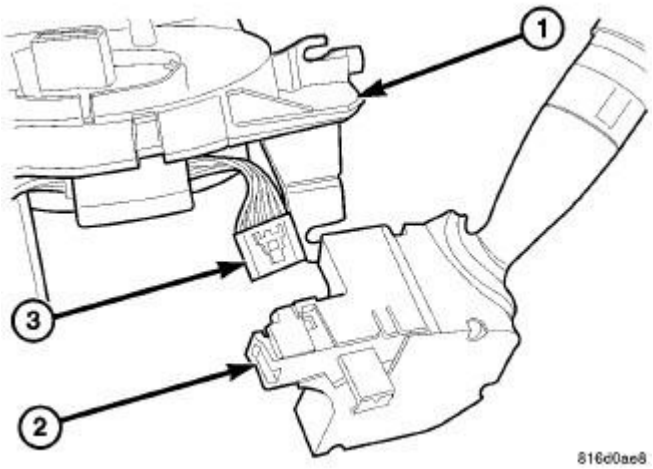

Fig. 49: Left Stalk Electrical Connector
Courtesy of CHRYSLER LLC

5. Slide the switch (2) away from the clockspring (1) far enough to disengage the slide tabs on the switch housing from the channel formations in the mounting bracket.
6. Disconnect the jumper wire harness connector (3) from the connector receptacle on the inboard end of the left multi-function switch.
7. Remove the switch from the clockspring.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper

precautions could result in accidental airbag deployment.

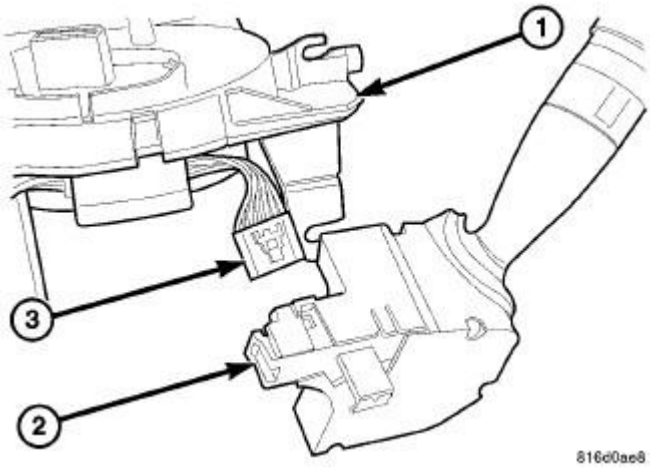

Fig. 50: Left Stalk Electrical Connector
Courtesy of CHRYSLER LLC

1. Position the left multi-function switch (2) close enough to the mounting bracket (1) integral to the left side of the clockspring to reconnect the jumper wire harness connector (3) to the connector receptacle on the inboard side of the switch housing.
2. Align the slide tabs on the switch housing with the channel formations integral to the clockspring mounting bracket, then slide the switch into the bracket until it is firmly seated.

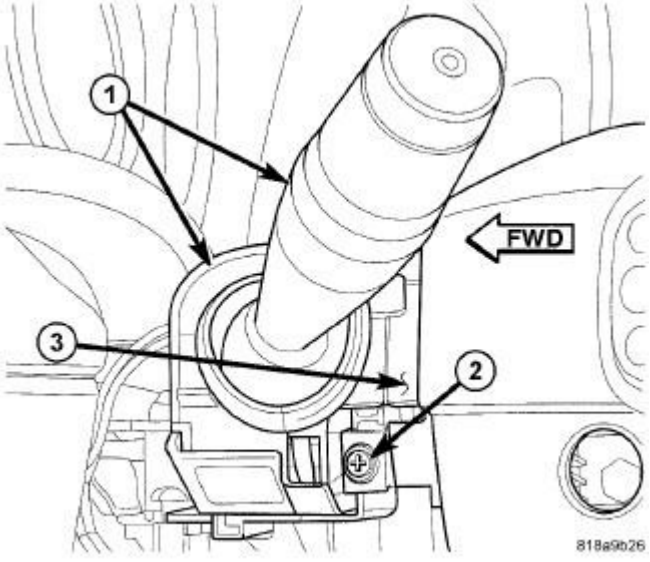

Fig. 51: Identifying Left Multi-Function Switch, Screw & Clockspring
Courtesy of CHRYSLER LLC

3. Install and tighten the screw (2) that secures the mounting tab on the front of the left multi-function switch (1) to the mounting bracket (3) on the clockspring. Tighten the screw to 1 N.m (10 in. lbs.).

4. Reconnect the instrument panel wiring harness connector to the back of the left multi-function switch.
5. Reinstall the upper and lower shrouds onto the steering column. Refer to **Steering/Column/SHROUD, Steering Column - Installation** .
6. Reconnect the battery negative cable.

SWITCH, PARKING BRAKE

DESCRIPTION

DESCRIPTION

There are two unique park brake switches used on this vehicle, depending upon whether the vehicle has a foot-operated or hand-operated park brake lever mechanism.

FOOT-OPERATED

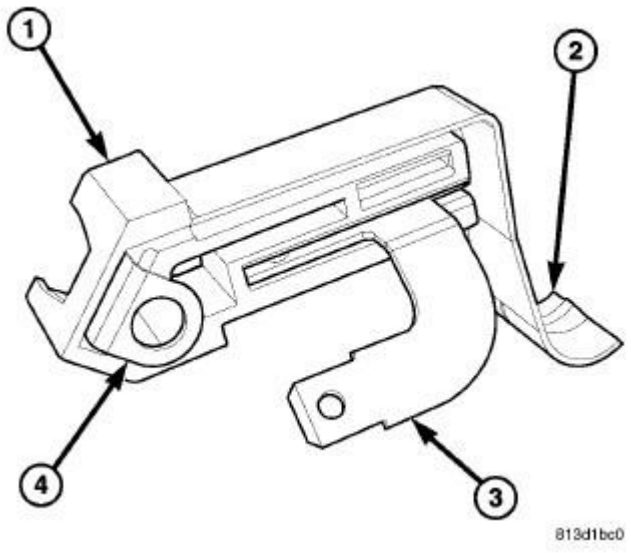

Fig. 52: Foot-Operated Park Brake Switch
Courtesy of CHRYSLER LLC

The foot-operated park brake switch (1) is located on the park brake lever mechanism on the cowl side inner panel below the instrument panel, outboard of the steering column. This switch includes a spade-type output terminal (3) that connects the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness. The output terminal is integral to the stationary contact within a molded plastic insulator.

A locating tab on the insulator engages a slot in the park brake lever mechanism for positive switch location. External to the insulator is a movable leaf contact with an integral grounding lug (4) on one end and an integral actuating lever and follower (2) on the opposite end. The switch is secured to and grounded by a single screw to the park brake lever mechanism.

The foot-operated park brake switch cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

HAND-OPERATED

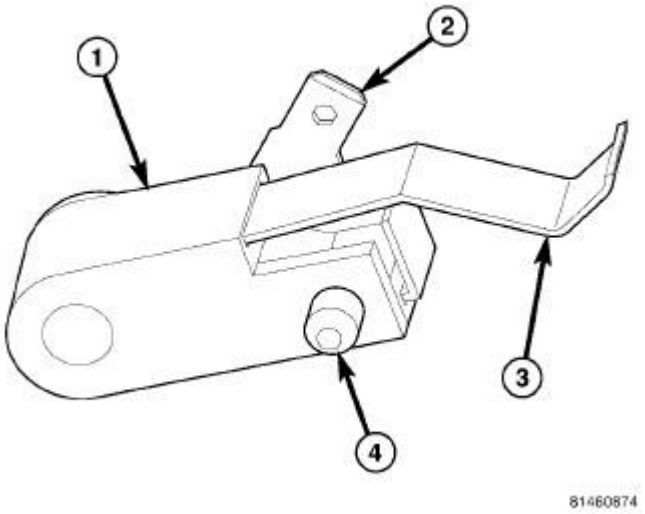

Fig. 53: Hand-Operated Park Brake Switch
Courtesy of CHRYSLER LLC

The hand-operated park brake switch (1) is located on the park brake lever mechanism on the floor panel transmission tunnel below the center floor console. This switch includes a spade-type output terminal (2) that connects the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness. The output terminal is integral to the stationary contact within a molded plastic insulator.

A locating tab (4) on the insulator engages a slot in the park brake lever mechanism for positive switch location. External to the insulator is a movable leaf contact (3) with an integral grounding lug on one end and an integral actuating lever and follower on the opposite end. The switch is secured to and grounded by a single screw to the park brake lever mechanism.

The hand-operated park brake switch cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

Both the foot-operated and hand-operated park brake switch are normally closed, mechanically actuated leaf contact switches that are operated by the foot or hand park brake lever mechanism. The switch is grounded through its mounting to the park brake lever mechanism and provides a ground input to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) on a park brake switch sense circuit whenever the park brake is applied, and opens this circuit whenever the park brake is released. The park brake switch sense input to the EMIC is used as a logic input by the EMIC for control of the brake indicator and

may also be used as a logic input for other electronic features in the vehicle.

The park brake switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that rely upon inputs from the park brake switch. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to park brake switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

PARK BRAKE SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: If the brake indicator stays ON with the ignition switch in the ON position and the park brake released, or comes ON while driving, the brake system must be diagnosed and repaired prior to performing the following tests. Refer to Brakes - Diagnosis and Testing . If no brake system problem is found, the following procedures will help to locate a shorted or open park brake switch sense circuit, or an ineffective park brake switch.

INDICATOR ILLUMINATES DURING BULB TEST, BUT DOES NOT WHEN PARK BRAKE APPLIED

1. Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the park brake switch from the switch terminal. Apply the parking brake. Check for continuity between the park brake switch terminal and a good ground. There should be continuity. If OK, go to 2. If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavities of the body wire harness connector for the park brake switch and the instrument panel wire harness connector for the instrument cluster. There should be continuity. If not OK, repair the open park brake switch sense circuit between the park brake switch and the instrument cluster as required.

INDICATOR REMAINS ILLUMINATED - BRAKE SYSTEM CHECKS OKAY

1. Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the park brake switch from the switch terminal. Check for continuity between the terminal of the park brake switch and a good ground. There should be no continuity with the park brake released, and continuity

with the park brake applied. If OK, go to 2. If not OK, replace the ineffective park brake switch.

2. Disconnect the instrument panel wire harness connector (Connector C2) for the instrument cluster from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavity of the body wire harness connector for the park brake switch and a good ground. There should be no continuity. If not OK, repair the shorted park brake switch sense circuit between the park brake switch and the instrument cluster as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

FOOT-OPERATED

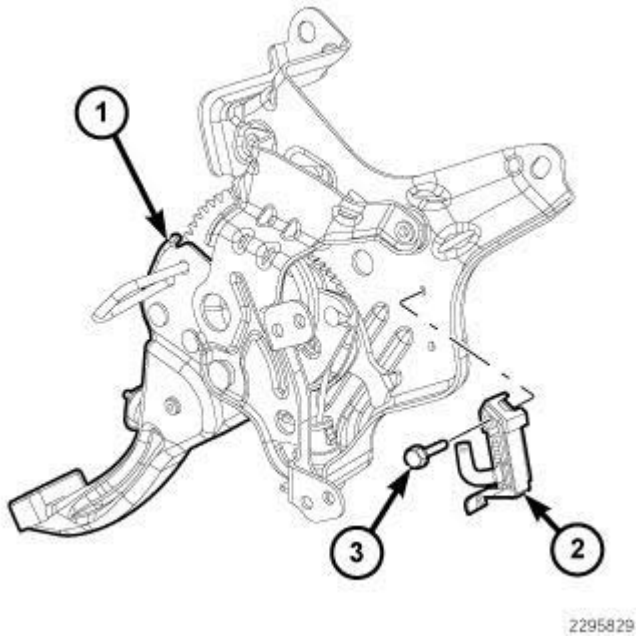

Fig. 54: Park Brake Lever Mechanism
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Apply the parking brake.
3. Reach under the left end of the instrument panel to access and disconnect the wire harness connector from

the terminal of the park brake switch (2) located on the park brake lever mechanism (1) on the left cowl side inner panel.

4. Remove the screw (3) that secures the park brake switch to the park brake lever mechanism.
5. Remove the switch from the park brake lever mechanism.

HAND-OPERATED

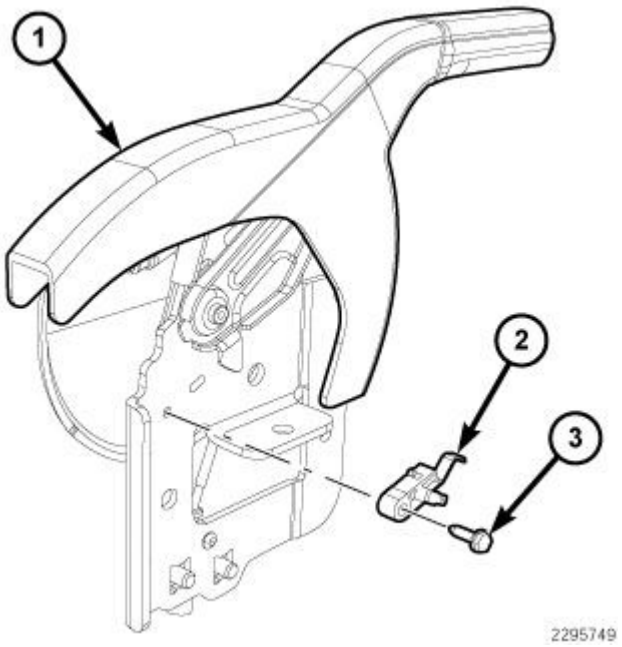

Fig. 55: Parking Brake Lever
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the console from the floor panel transmission tunnel. Refer to **Body/Interior/CONSOLE, Center - Removal**
3. Pull the parking brake lever (1) upward to apply the parking brake.
4. Disconnect the wire harness connector from the terminal of the park brake switch (2) located on the right side of the park brake lever mechanism.
5. Remove the screw (3) that secures the switch to the park brake lever bracket.
6. Remove the switch from the park brake lever bracket.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate

the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

FOOT-OPERATED

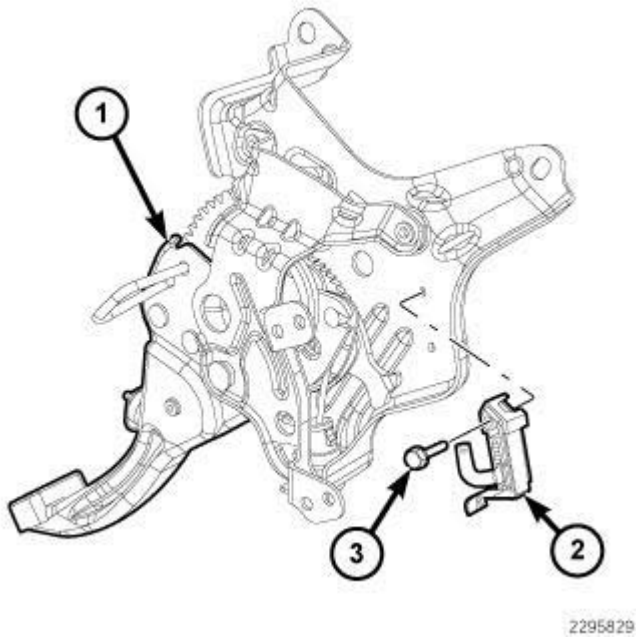

Fig. 56: Park Brake Lever Mechanism
Courtesy of CHRYSLER LLC

1. Reach under the left end of the instrument panel to position the park brake switch (2) onto the park brake lever mechanism (1) on the left cowl side inner panel. Be certain to engage the locating pin on the back of the switch insulator into the locating slot in the lever mechanism bracket.
2. Install and tighten the screw (3) that secures the park brake switch to the park brake lever mechanism. Tighten the screw to 2.5 N.m (24 in. lbs.).
3. Reconnect the wire harness connector to the terminal of the park brake switch.
4. Reconnect the battery negative cable.
5. Turn the ignition switch to the ON position and check for proper brake indicator operation with the parking brake applied, then release the parking brake and check that the brake indicator extinguishes.

HAND-OPERATED

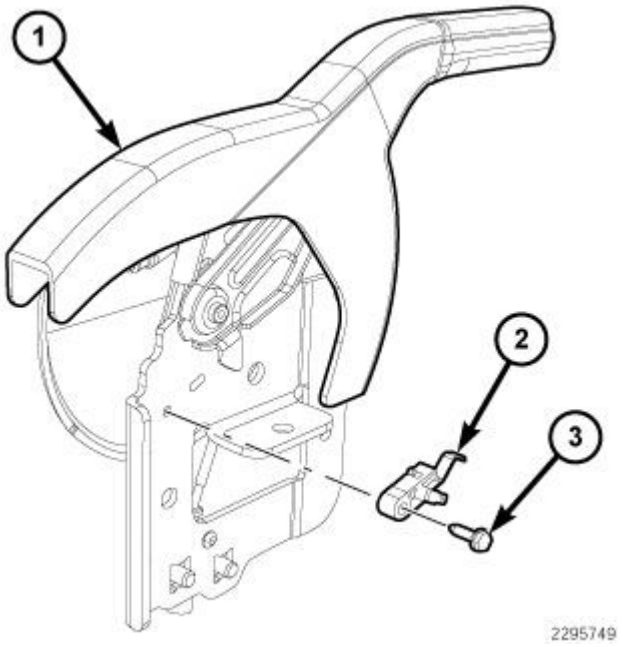

Fig. 57: Parking Brake Lever
Courtesy of CHRYSLER LLC

1. Position park brake switch (2) onto the right side of the park brake lever (1) bracket. Be certain to engage the locating pin on the back of the switch insulator into the locating slot in the lever bracket.
2. Install and tighten the screw (3) that secures the switch to the lever bracket. Tighten the screw to 2.5 N.m (24 in. lbs.).
3. Reconnect the wire harness connector to the terminal of the switch.
4. Reinstall the console onto the floor panel transmission tunnel. Refer to **Body/Interior/CONSOLE, Center - Installation**
5. Reconnect the battery negative cable.
6. Turn the ignition switch to the ON position and check for proper brake indicator operation with the parking brake applied, then release the parking brake and check that the brake indicator extinguishes.

SWITCH, STOP LAMP

DESCRIPTION

DESCRIPTION

Two unique brake lamp switches are used in this vehicle, depending upon whether the vehicle was built during early or late production. These switches are not interchangeable and both are illustrated and described in the paragraphs that follow.

EARLY PRODUCTION

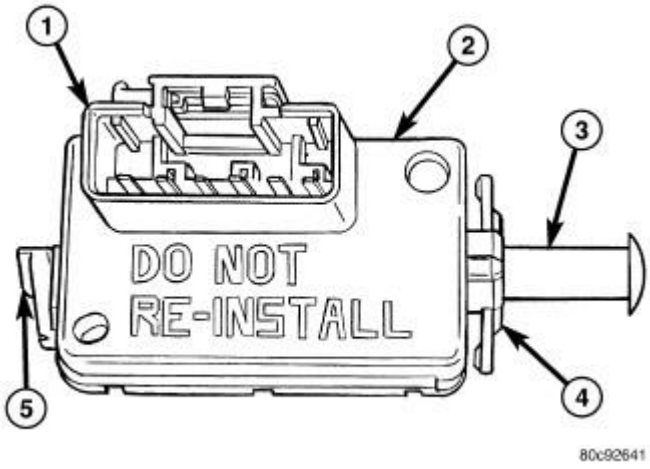

Fig. 58: Brake Lamp Switch
Courtesy of CHRYSLER LLC

This brake lamp switch (2) is a three circuit, spring-loaded plunger actuated switch that is secured to the brake pedal support bracket on the dash panel under the instrument panel on the driver side of the vehicle. The molded plastic switch housing has an integral connector receptacle (1) containing six terminal pins and featuring a Connector Position Assurance (CPA) lock. The switch is connected to the vehicle electrical system through a dedicated take out of the body wire harness.

The switch plunger (3) extends through a mounting collar (4) on one end of the switch housing. The plunger has a one time telescoping self-adjustment feature that is activated after the switch is installed by moving an adjustment release lever (5) on the opposite end of the switch housing clockwise, until it locks into a position that is horizontal and parallel to the connector receptacle.

This brake lamp switch cannot be readjusted or repaired. If the switch is damaged, ineffective, or removed from its mounting position for any reason, it must be replaced with a new unit.

LATE PRODUCTION

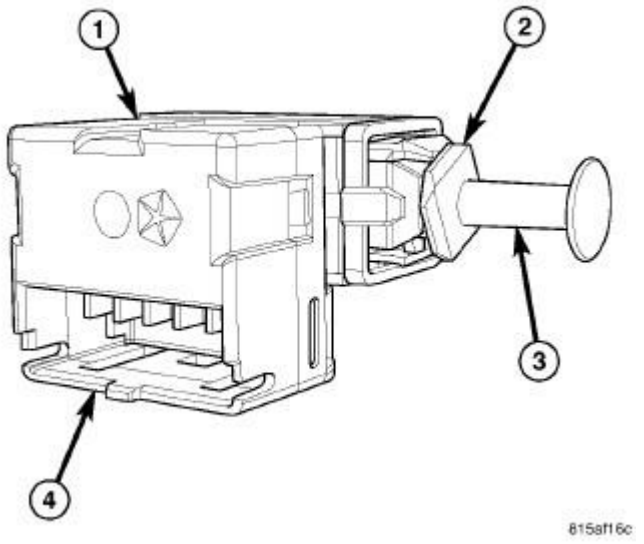

Fig. 59: Brake Lamp Switch
Courtesy of CHRYSLER LLC

This brake lamp switch (1) is a three circuit, spring-loaded plunger actuated switch that is secured to the brake pedal support bracket under the instrument panel on the driver side of the vehicle. The molded plastic switch housing has an integral connector receptacle (4) containing six terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the body wire harness.

The switch plunger (3) extends through a mounting collar (2) on one end of the switch housing. The plunger has a telescoping self-adjustment feature that is activated after the switch is installed by pulling the brake pedal upward to its normal at-rest position. The telescoping plunger can be pulled outward from the switch housing to repeat the self-adjustment procedure if necessary.

This brake lamp switch cannot be repaired. If the switch is damaged or ineffective it must be replaced with a new unit.

OPERATION

OPERATION

Both the early and late production brake lamp switches control three independent circuits. These circuits are described as follows:

- **Brake Lamp Switch Circuit** - A normally open brake lamp switch circuit receives a battery voltage input, and supplies this battery voltage to the Center High Mounted Stop Lamp (CHMSL) and the Totally Integrated Power Module (TIPM) on a brake lamp switch output circuit only when the brake pedal is depressed (brake lamp switch plunger released).
- **Brake Lamp Switch Signal Circuit** - A normally closed brake lamp switch signal circuit receives a direct path to ground, and supplies this ground input to the Powertrain Control Module (PCM) on a brake signal 1 circuit only when the brake pedal is released (brake lamp switch plunger is depressed).

- **Speed Control Circuit** - A normally closed speed control circuit receives a battery voltage input from the Totally Integrated Power Module (TIPM) on an ignition run/start control output circuit, and supplies this battery voltage to the PCM on a brake signal 2 circuit only when the brake pedal is released (brake lamp switch plunger is depressed).

The PCM sends electronic **brake lamp switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus for use as an additional logic input for controlling many other vehicle functions and features.

The brake lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication that provide some features related to brake lamp switch operation. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to brake lamp switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

BRAKE LAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

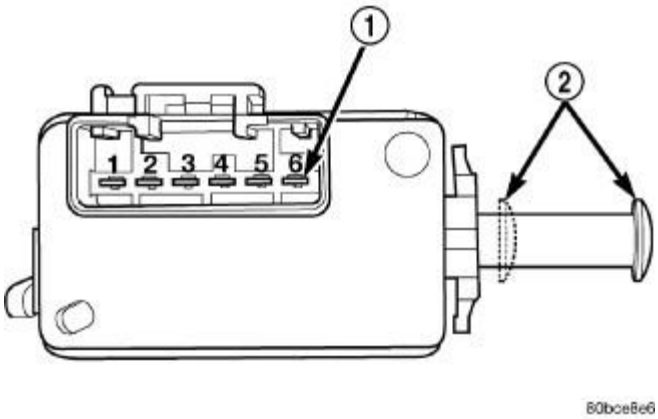

Fig. 60: Brake Lamp Switch - Early Production
Courtesy of CHRYSLER LLC

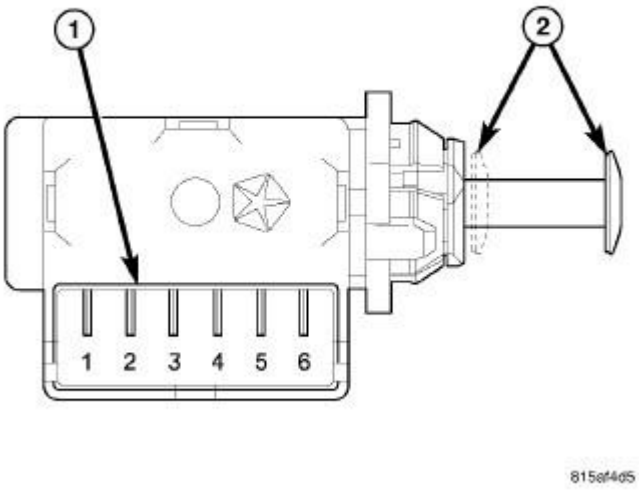

Fig. 61: Brake Lamp Switch - Late Production
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

CAUTION: Do not remove the Eary Production-type brake lamp switch from the mounting bracket. The self-adjusting plunger of this switch is a one time only feature. If the switch is removed from the mounting bracket, it MUST be replaced with a new switch.

2. Disconnect the wire harness connector from the brake lamp switch.
3. Using an ohmmeter, perform the continuity tests at the terminal pins (1) in the brake lamp switch connector receptacle as shown in the Brake Lamp Switch Tests table below.

BRAKE LAMP SWITCH TESTS	
PLUNGER POSITION (2)	**CONTINUITY BETWEEN**
Released (Extended)	Pins 1 and 2
Compressed (Depressed)	Pins 3 and 4, 5 and 6

4. If the switch fails any of the continuity tests, replace the ineffective brake lamp switch as required.

REMOVAL

REMOVAL

Two unique brake lamp switches are used in this vehicle, depending upon whether the vehicle was built during early or late production. These switches are not interchangeable. Both switches are illustrated and described elsewhere in this service information to assist in positive identification. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Description**.

EARLY PRODUCTION

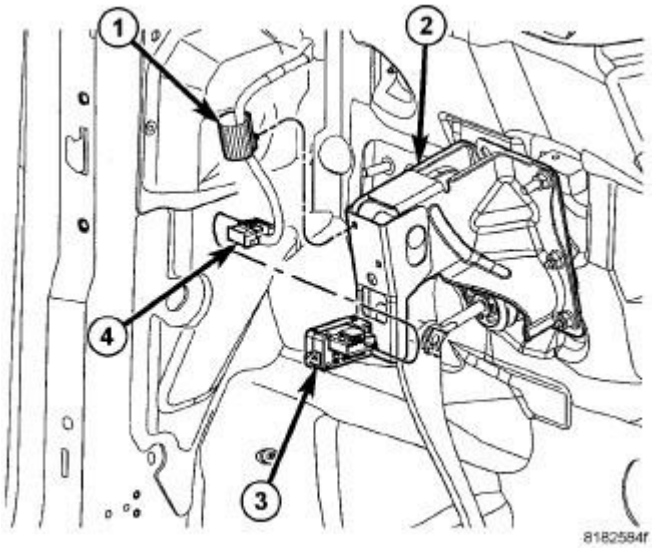

Fig. 62: Stop Lamp Switch Wiring Routing Clip, Brake Pedal Bracket, Stop Lamp Switch & Wiring Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. If equipped, remove the silencer pad from below the steering column. Refer to **Body/Instrument Panel/PANEL, Silencer - Removal** .
3. Locate the brake lamp switch (3) on the brake pedal support bracket (2) under the instrument panel.
4. Disconnect the wire harness connector (4) from the switch.

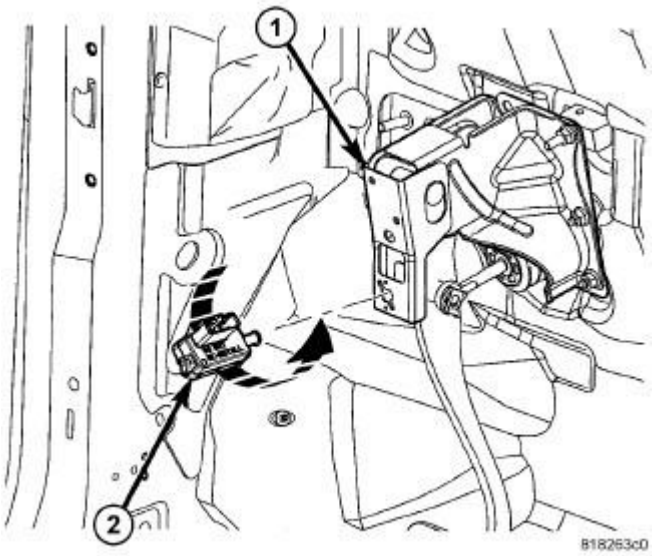

Fig. 63: STOP LAMP SWITCH REMOVAL
Courtesy of CHRYSLER LLC

1. Rotate the brake lamp switch housing (2) counterclockwise about 30 degrees to align the tabs on the switch locking collar with the keyed hole in the brake pedal support bracket (1).
2. Pull the switch straight rearward from the keyed hole to remove it from the bracket.
3. Discard the removed brake lamp switch. **The brake lamp switch self-adjusting plunger is a one time only feature. If the switch is removed from the bracket, it MUST be replaced with a new switch.**

LATE PRODUCTION

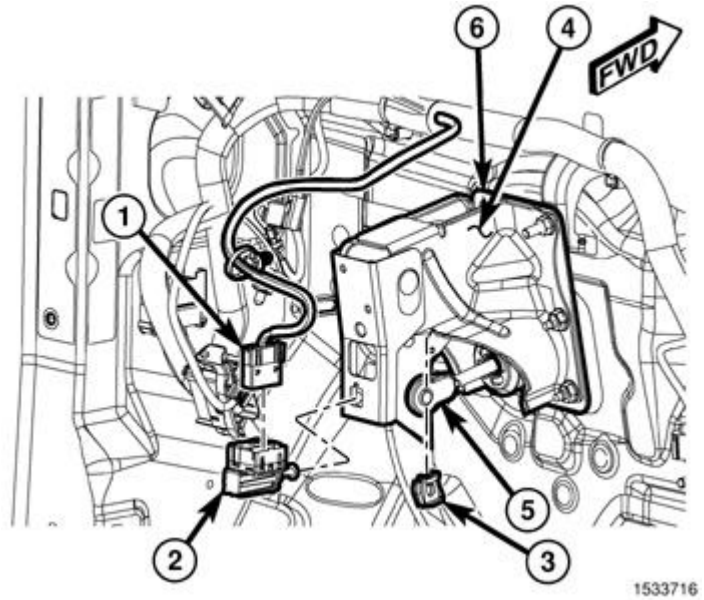

Fig. 64: Brake Lamp Switch On Brake Pedal Support Bracket
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. If equipped, remove the silencer pad from below the steering column. Refer to **Body/Instrument Panel/PANEL, Silencer - Removal** .
3. Locate the brake lamp switch (2) on the brake pedal support bracket (4) under the instrument panel.
4. Depress and hold the brake pedal in the depressed position.
5. Rotate the brake lamp switch housing (2) counterclockwise about 30 degrees to align the tabs on the switch locking collar with the keyed hole in the brake pedal support bracket.
6. Pull the switch straight rearward from the keyed hole to remove it from the bracket.
7. Release the brake pedal.
8. Disconnect the wire harness connector (1) from the switch.

INSTALLATION

INSTALLATION

Two unique brake lamp switches are used in this vehicle, depending upon whether the vehicle was built during early or late production. These switches are not interchangeable. Both switches are illustrated and described elsewhere in this service information to assist in positive identification. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Description**.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

EARLY PRODUCTION

CAUTION: The brake lamp switch self-adjusting switch plunger is a one time only feature. If the switch is removed from the mounting bracket, it MUST be replaced with a new switch.

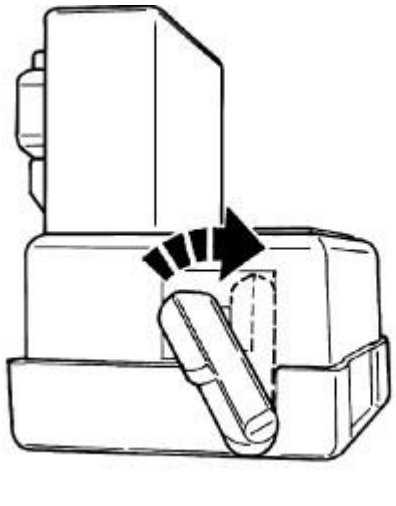

Fig. 65: Switch Adjustment Lever
Courtesy of CHRYSLER LLC

1. Obtain a new brake lamp switch. The adjustment lever on the new switch should be at about a 45 degree angle to the switch connector receptacle. If the adjustment lever is parallel with the connector receptacle, the switch adjustment has already been set and the switch must be scrapped.**DO NOT ATTEMPT TO RESET OR READJUST THE BRAKE LAMP SWITCH.**

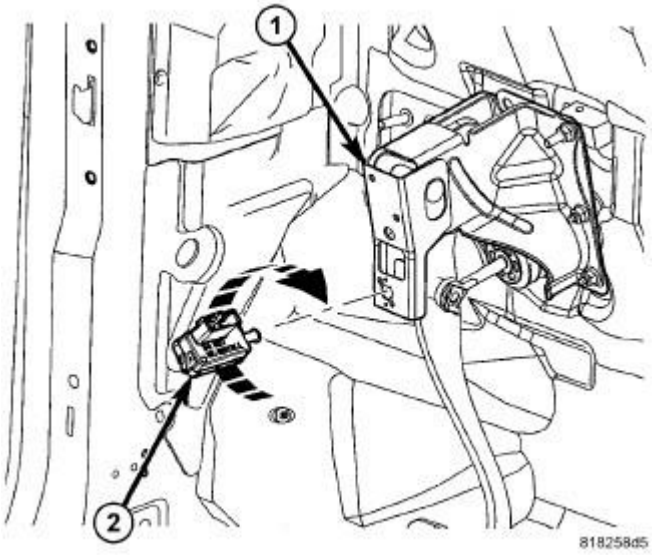

Fig. 66: Identifying Stop Lamp Switch & Pedal Clip
Courtesy of CHRYSLER LLC

2. Depress and hold the brake pedal in the depressed position.
3. Align the tabs on the brake lamp switch (2) locking collar with the keyed hole in the brake pedal support bracket (1) below the instrument panel.
4. Insert the tabs on the brake lamp switch locking collar through the keyed hole in the brake pedal support bracket until the switch housing is firmly seated against the bracket.

5. Rotate the switch housing clockwise about 30 degrees to engage the tabs on the locking collar with the bracket.

CAUTION: Release, but do not pull up on the brake pedal before the switch plunger adjustment has been completed.

6. Release the brake pedal, but do not pull it upward.
7. Rotate the plunger adjustment release lever (2) clockwise until it locks into place. The lever should be parallel to the brake lamp switch connector receptacle. This action will set the switch plunger length to a final adjustment position and cannot be undone. If not performed properly the first time, a new brake lamp switch **MUST** be installed.

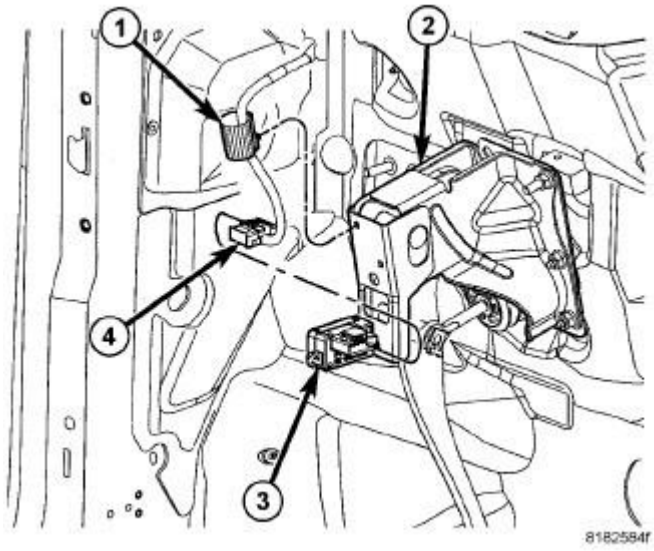

Fig. 67: Stop Lamp Switch Wiring Routing Clip, Brake Pedal Bracket, Stop Lamp Switch & Wiring Connector
Courtesy of CHRYSLER LLC

8. Reconnect the wire harness connector (4) to the brake lamp switch (3).
9. If equipped, reinstall the silencer pad below the steering column. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .
10. Reconnect the battery negative cable.

LATE PRODUCTION

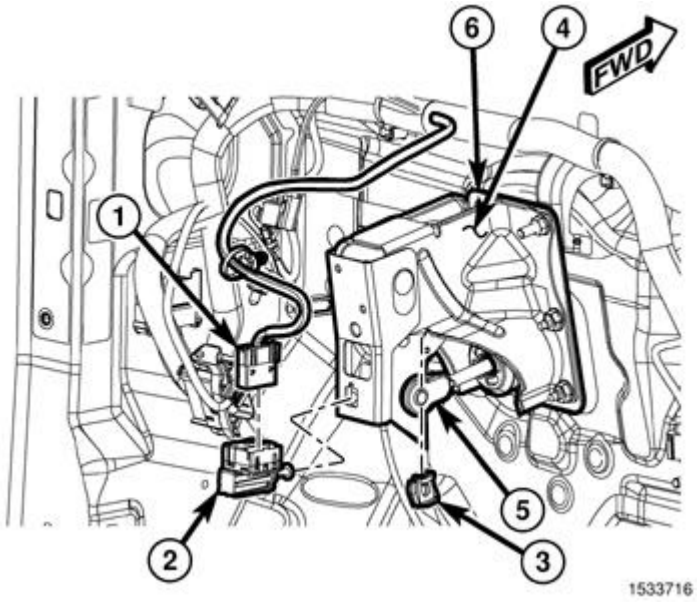

Fig. 68: Brake Lamp Switch On Brake Pedal Support Bracket
Courtesy of CHRYSLER LLC

1. Be certain that the brake lamp switch (2) plunger is pulled all the way out of the switch housing to its fully extended position.
2. Reconnect the wire harness connector (1) to the connector receptacle on the switch.
3. Depress and hold the brake pedal in the depressed position.
4. Align the tabs on the brake lamp switch locking collar with the keyed hole in the brake pedal support bracket (2).
5. Insert the tab on the brake lamp switch locking collar through the keyed hole in the support bracket until the switch housing is firmly seated against the bracket.
6. Rotate the switch housing clockwise about 30 degrees to engage the tabs on the locking collar with the support bracket.

CAUTION: Brake booster damage may occur if the brake pedal pull exceeds about 9 kilograms (20 pounds).

7. Release the brake pedal. Then pull the pedal lightly upward to its normal at-rest position. The pedal will set the plunger to the correct position as the pedal pushes the plunger into the switch housing. The switch plunger will make a light audible ratcheting noise as it self-adjusts.
8. If equipped, reinstall the silencer pad below the steering column. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .
9. Reconnect the battery negative cable.

ADJUSTMENTS

ADJUSTMENT - LATE PRODUCTION TYPE ONLY

Two unique brake lamp switches are used in this vehicle, depending upon whether the vehicle was built during early or late production. These switches are not interchangeable and, only the late production type switch can be readjusted following initial installation using this adjustment procedure. If the early production type switch requires readjustment for any reason, it **must** be replaced with a new switch. Both switches are illustrated and described elsewhere in this service information to assist in positive identification. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Description**.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. If equipped, remove the silencer pad from below the steering column. Refer to **Body/Instrument Panel/PANEL, Silencer - Removal** .
3. Depress and hold the brake pedal in the depressed position.
4. Pull the brake lamp switch plunger all the way out of the switch housing to its fully extended position.

CAUTION: Brake booster damage may occur if the brake pedal pull exceeds about 9 kilograms (20 pounds).

5. Release the brake pedal. Then pull the pedal lightly upward to its normal at-rest position. The pedal will set the plunger to the correct position as the pedal pushes the plunger into the switch housing. The switch plunger will make a light audible ratcheting noise as it self-adjusts.
6. If equipped, reinstall the silencer pad below the steering column. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .
7. Reconnect the battery negative cable.

UNIT, FRONT LAMP

STANDARD PROCEDURE

FRONT LAMP UNIT MOISTURE CLEARING

Some occasional moisture accumulation inside a vented front lamp unit is normal and appears as a fogging on the inside of the lamp lens, similar to the fog that sometimes appears on the inside of a windshield. This condition is caused by rapidly changing temperature and humidity levels between the air internal and external to the lamp, and will usually dissipate once the temperature and humidity conditions have been allowed to stabilize. Accelerated removal of such moisture may be accomplished by activating the headlamps on HIGH beam for about 15 minutes.

However, water droplets larger than 1 millimeter (0.039 inch) in size accumulated on the inside of the lamp lens, water droplets visible on most internal lamp surfaces or large quantities of water within the lamp indicates a problem with the lamp sealing that has allowed excessive amounts of water to enter the lamp. Once such excessive moisture has entered the lamp, it will always be present and will never disappear. A lamp with permanent internal moisture should be replaced.

REMOVAL

BULBS

HEADLAMP HIGH BEAM

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

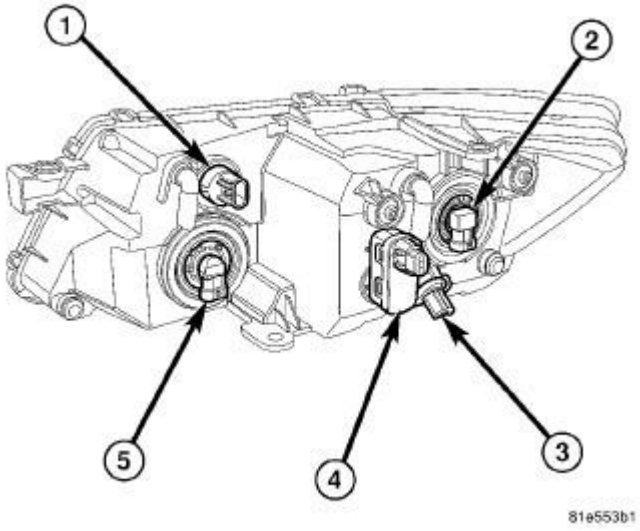

Fig. 69: Headlamp Bulb
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the connector receptacle integral to the headlamp bulb (5) on the back of the front lamp unit housing.
3. Firmly grasp the bulb base and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the bulb and base straight out from the keyed opening in the reflector.

HEADLAMP LOW BEAM

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the connector receptacle integral to the headlamp bulb (2) on the back of the front lamp unit housing.
3. Firmly grasp the bulb base and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the bulb and base straight out from the keyed opening in the reflector.

POSITION LAMP

NOTE: The following procedure applies only to vehicles manufactured for certain export markets. Vehicles manufactured for domestic markets do not have a position lamp bulb, socket or wiring provided in the front lamp unit.

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the connector receptacle integral to the position lamp bulb socket (3) on the back of the front lamp unit housing.
3. Firmly grasp the position lamp bulb socket on the back of the housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

TURN SIGNAL/SIDE MARKER LAMP

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the connector receptacle integral to the turn signal/side marker lamp bulb socket (1) on the back of the front lamp unit housing.
3. Firmly grasp the turn signal/side marker lamp bulb socket on the back of the housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

LAMP

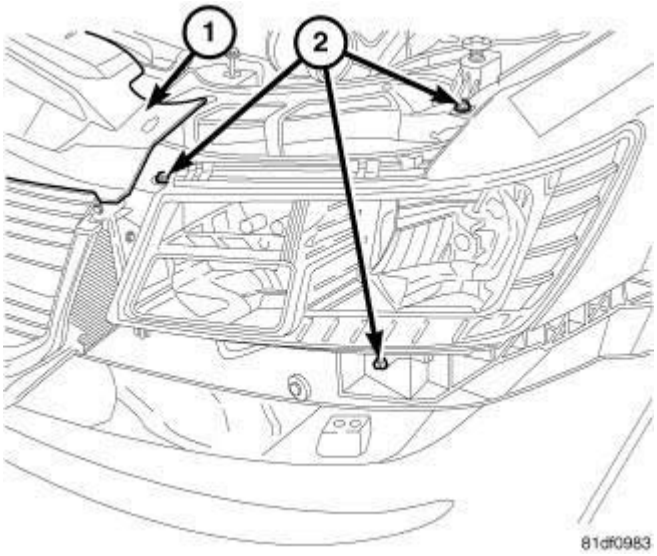

Fig. 70: Fascia & Grille
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Loosen the front fascia on the same side of the vehicle as the front lamp unit being removed. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Removal** .
3. Remove the four plastic push-pin fasteners that secure the upper grille to the Front End Module (FEM).
4. Flex the fascia and grille (1) outward far enough to access and remove the three screws (2) that secure the front lamp unit to the FEM.
5. Pull the front lamp unit away from the FEM far enough to access and disconnect the headlamp and dash wire harness connectors from the back of the lamp housing.
6. Remove the front lamp unit from the vehicle.

INSTALLATION

BULBS

HEADLAMP HIGH BEAM

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

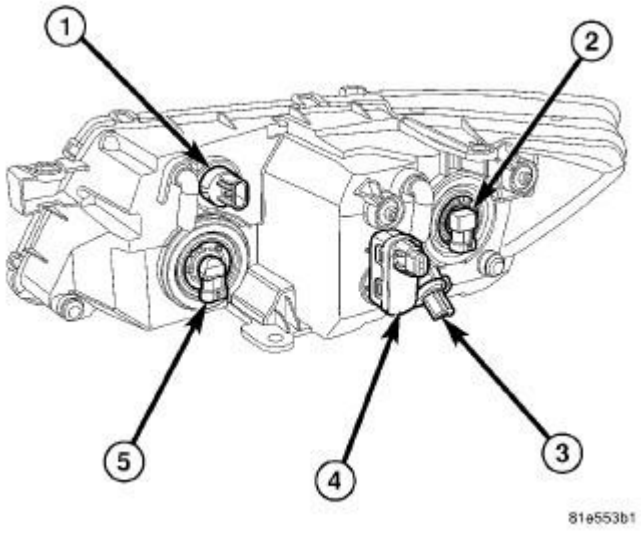

Fig. 71: Headlamp Bulb
Courtesy of CHRYSLER LLC

1. Align the headlamp bulb and base (5) with the keyed opening on the back of the front lamp unit reflector.
2. Insert the bulb into the reflector until the base is firmly seated.
3. Rotate the bulb base clockwise about 30 degrees to lock it into place.
4. Reconnect the wire harness connector to the connector receptacle integral to the headlamp bulb base.
5. Reconnect the battery negative cable.

HEADLAMP LOW BEAM

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Align the headlamp bulb and base (2) with the keyed opening on the back of the front lamp unit reflector.
2. Insert the bulb into the reflector until the base is firmly seated.
3. Rotate the bulb base clockwise about 30 degrees to lock it into place.
4. Reconnect the wire harness connector to the connector receptacle integral to the headlamp bulb base.
5. Reconnect the battery negative cable.

POSITION LAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect

bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The following procedure applies only to vehicles manufactured for certain export markets. Vehicles manufactured for domestic markets do not have a position lamp bulb, socket or wiring provided in the front lamp unit.

1. Align the base of the bulb with the position lamp bulb socket (3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the front lamp unit housing.
4. Insert the socket and bulb straight into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reconnect the wire harness connector to the connector receptacle integral to the position lamp bulb socket.
7. Reconnect the battery negative cable.

TURN SIGNAL/SIDE MARKER LAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

1. Align the base of the bulb with the park/turn signal lamp bulb socket (1).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the front lamp unit housing.
4. Insert the socket and bulb straight into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reconnect the wire harness connector to the connector receptacle integral to the park/turn signal lamp bulb socket.
7. Reconnect the battery negative cable.

LAMP

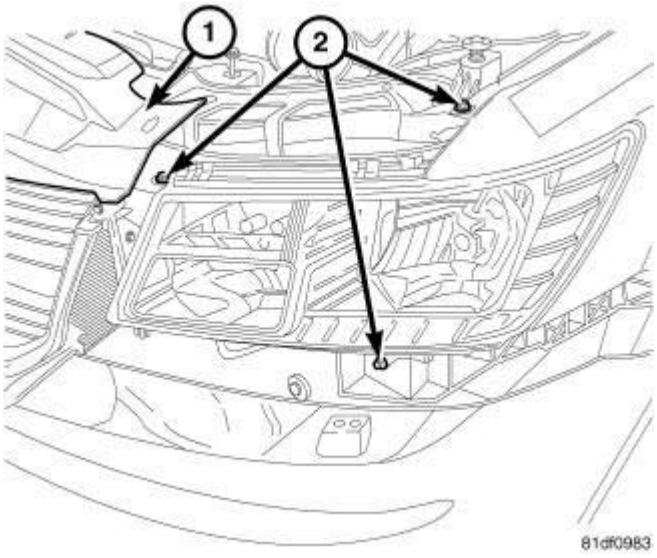

Fig. 72: Fascia & Grille
Courtesy of CHRYSLER LLC

NOTE: If the front lamp is being replaced with a new unit, the bulbs and sockets must be transferred from the unit being replaced.

1. Position the front lamp unit to the front of the vehicle.
2. Reconnect the headlamp and dash wire harness connectors to the back of the lamp housing.
3. Position the front lamp unit into the Front End Module (FEM).
4. Flex the fascia and grille (1) outward far enough to install and tighten the three screws (2) that secure the front lamp unit to the FEM. Tighten the screws securely.
5. Reinstall the four plastic push-pin fasteners that secure the upper grille to the FEM.
6. Reinstall the front fascia on the same side of the vehicle as the front lamp unit being installed. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Installation**
7. Reconnect the battery negative cable.
8. Confirm proper headlamp alignment. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior - Standard Procedure**.

WIRING, TRAILER TOW

DESCRIPTION

DESCRIPTION

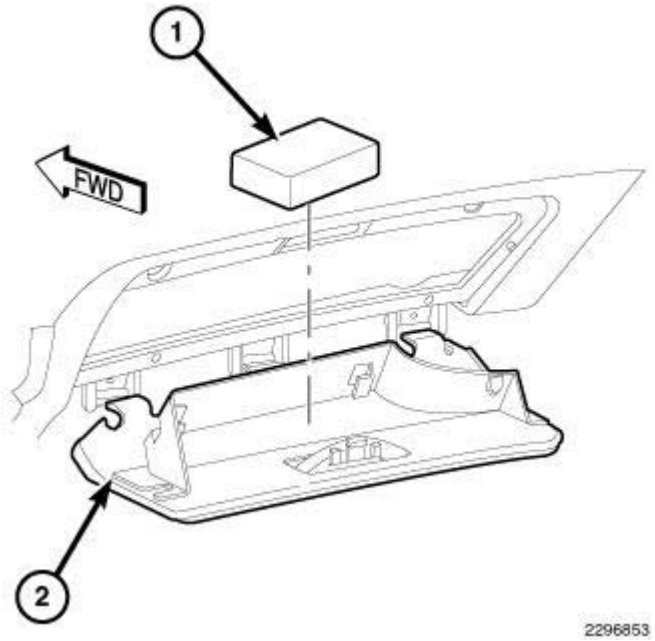

Fig. 73: Instruction Sheet Are Placed In Glove Box
Courtesy of CHRYSLER LLC

Vehicles equipped with an optional Trailer Tow Preparation package have a trailer tow wiring harness and an instruction sheet (1) that are placed in the glove box (2) of the vehicle when it is shipped from the factory. This package also includes four relays to isolate the trailer lighting from the vehicle lighting and a four-way trailer tow wiring connector that are all concealed behind the rear bumper fascia after installation is complete.

OPERATION

OPERATION

The trailer tow preparation wiring harness is connected to the body wire harness at the right and left outer rear lamp unit connections. After installation is complete, a trailer tow stop/turn relay is secured to the harness behind the rear bumper fascia just below each outer rear lamp unit, while a trailer tow stop lamp relay is located on the underside of each outboard end of the rear bumper reinforcement behind the rear fascia. The four-way trailer tow connector is located near the center of the rear fascia.

Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds. Also refer to the Instruction Sheet packaged with the harness for additional details.

CENTER, ELECTRONIC VEHICLE INFORMATION

DESCRIPTION

DESCRIPTION

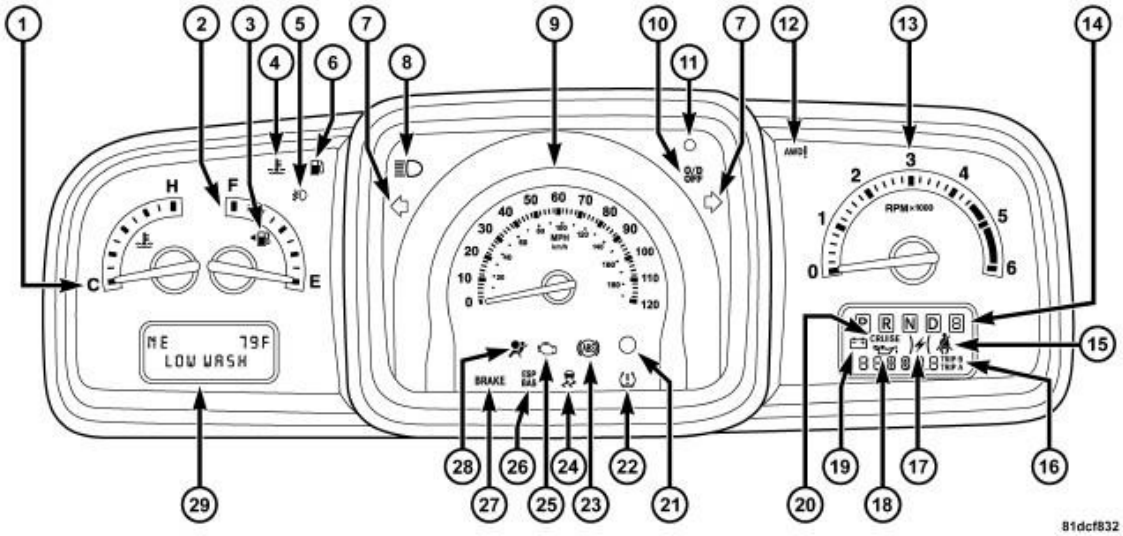

Fig. 3: Electronic Vehicle Information Center
Courtesy of CHRYSLER LLC

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display (29). The display is located in the lower left part of the instrument cluster below the fuel (2) and engine temperature (1) gauges.

The display in the lower right part of the instrument cluster (15) below the tachometer (13) shows the vehicle odometer related functions. These functions include Trip Odometer (ODO), Trip A and Trip B readouts. The instrument cluster push-button (21) can be used to scroll through the different odometer functions. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** for additional information on the instrument cluster and related functions.

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display. It is located in the instrument cluster below the fuel and temperature gauges. Vehicles equipped with steering wheel-mounted buttons (described in this information) are also equipped with the EVIC. The EVIC consists of the following:

- System Status
- Vehicle information warning message displays
- Tire Pressure Monitor System (TPM) - If Equipped
- Personal Settings (customer programmable features)
- Compass display
- Outside temperature display
- Trip computer functions

The EVIC system is comprised of several different components. Those components are:

- Instrument Cluster (sometimes referred to as Cab Compartment Node [CCN])
- ASBM EVIC Function Buttons
- Ambient Temperature Sensor

- Remote Compass Module (RCM)
- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus

The EVIC display is part of the Instrument Cluster assembly and is not serviced as a separate component. If the display is inoperative the complete Instrument Cluster assembly must be replaced. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Removal** .

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the "ON" position. When the ignition switch is turned to the "ON" position, the EVIC display will return to the last function being displayed before the ignition was turned to the "OFF" position.

The EVIC system is comprised of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) Data Buses. **If the system is inoperative a scan tool and the appropriate diagnostic information must be used to diagnose the system.**

The EVIC function buttons are used to operate the different functions of the EVIC system. Pressing and releasing the **MENU** button allows the driver to select the Compass/Temperature, Trip Computer, Personal Settings or System Status functions. The **STEP** button is used to toggle through options or features of the Trip Computer, Personal Settings or System Status functions. Pressing and releasing the **RESET** button allows the selection of setting or resetting of the function currently displayed at that time. Pressing and releasing the **C/T** (compass/temperature) button will cause the EVIC to return to the compass/temperature display mode from any other mode.

EVIC DISPLAY MODES

SYSTEM STATUS MODE

System display mode displays warnings and user interaction messages on the EVIC display. The driver can scroll to view multiple messages by using the **STEP** button.

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn Signal On (with a continuous warning chime if the vehicle is driven more than 1 mile [1.6 km] with either turn signal on)
- Left Front Turn Signal Lamp Out (with a single chime)
- Left Rear Turn Signal Lamp Out (with a single chime)
- Right Front Turn Signal Lamp Out (with a single chime)
- Right Rear Turn Signal Lamp Out (with a single chime)
- RKE (Remote Keyless Entry) Battery Low (with a single chime)

- Channel # Transmit.
- Channel # Training.
- Channel # Trained.
- Clearing Channels.
- Channels Cleared.
- Did Not Train.
- Left Front Low Pressure (with a single chime).
- Left Rear Low Pressure (with a single chime).
- Right Front Low Pressure (with a single chime).
- Right Rear Low Pressure (with a single chime).
- Check TPM System (with a single chime).
- Low Fuel
- Cal
- Oil Change Required (with a single chime)
- Low Washer Fluid
- Coolant Low
- Key in Ignition
- Lights On

PERSONAL SETTINGS MODE (CUSTOMER PROGRAMMABLE FEATURES)

Allows the driver to set and recall features when the transmission is in Park by pressing and releasing the **MENU** button until Personal Settings is displayed in the EVIC. Pressing and releasing the **STEP** button will scroll through the following personal settings choices:

- **Language** When in this display you may select one of three languages for all display nomenclature, including the trip functions and the navigation system (if equipped). Press the **RESET** button while in this display to select English, Espanola, or French. Then, as you continue, the information will display in the selected language.

NOTE: The EVIC will not change the UConnect™ language selection.

- **Unlock Doors Automatically on Exit** When ON is selected, all doors will unlock when the vehicle is stopped and the transmission is in the P (Park) or N (Neutral) position and the driver's door is opened. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Remote Key Unlock** When DRIVER DOOR 1ST PRESS is selected, only the driver's door will unlock on the first press of the remote keyless entry unlock button. When Driver Door 1st Press is selected, you must press of the remote keyless entry unlock button twice to unlock the passenger's doors. When ALL DOORS 1ST PRESS is selected, all of the doors will unlock on the first press of the remote keyless entry unlock button. To make your selection, press and release the **RESET** button until "Driver Door 1st Press" or "All Doors 1st Press" appears.
- **Sound Horn with Remote Key Lock** When ON is selected, a short horn sound will occur when the

remote keyless entry "Lock" button is pressed. This feature may be selected with or without the flash lights on lock/unlock feature. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.

- **Flash Lights with Remote Key Lock** When ON is selected, the front and rear turn signals will flash when the doors are locked or unlocked with the remote keyless entry transmitter. This feature may be selected with or without the sound horn on lock feature selected. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Delay Turning Headlights Off** When this feature is selected, the driver can choose to have the headlights remain on for 0, 30, 60, or 90 seconds when exiting the vehicle. To make your selection, press and release the **RESET** button until "0," "30," "60," or "90" appears.
- **Headlights On with Wipers (Available with Auto Headlights Only)** When this feature is selected and the headlight switch is in the AUTO position, the headlights will activate approximately 10 seconds after the wipers are turned on. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Delay Power Off to Accessories Until Exit** When this feature is selected, the power window switches, radio, hands-free system (if equipped), DVD video system (if equipped), power sunroof (if equipped), and power outlets will remain active for up to 10 minutes after the ignition switch is turned off. Opening a vehicle door will cancel this feature. To make your selection, press and release the **RESET** button until "Off," "45 sec.," "5 min.," or "10 min." appears.
- **Confirmation of Voice Commands - If Equipped** When ON is selected, all voice commands from the UConnect™ system are confirmed. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Display Units of Measure in** The EVIC, odometer, and navigation system (if equipped) can be changed between English and Metric units of measure. To make your selection, press and release the **RESET** button until "US" or "METRIC" appears.

COMPASS/TEMPERATURE

Compass heading and outside temperature are displayed on the EVIC display screen. One of eight compass headings to indicate the direction the vehicle is facing (N, S, E, W, NE, NW, SE, SW) and one of 15 compass variance settings can be programmed. Outside temperature is displayed in °C (degrees Celsius) or °F (degrees Fahrenheit).

For additional information regarding the compass, refer to Personal Settings (Customer Programmable Features) in this information.

TRIP COMPUTER

Press and release the **MENU** button until one of the following Trip Functions displays in the EVIC:

- Average Fuel Economy
- Distance To Empty
- Elapsed Time
- Display Units of Measure in

Press the **STEP** button to cycle through all the Trip Computer functions.

The Trip Functions mode displays the following information:

- **Average Fuel Economy** Shows the average fuel economy since the last reset. When the fuel economy is reset, the display will read "RESET" or show dashes for two seconds. Then, the history information will be erased, and the averaging will continue from the last fuel average reading before the reset.
- **Distance To Empty (DTE)** Shows the estimated distance that can be traveled with the fuel remaining in the tank. This estimated distance is determined by a weighted average of the instantaneous and average fuel economy, according to the current fuel tank level. DTE cannot be reset through the **RESET** button. When the DTE value is less than 30 miles (48 km) estimated driving distance, the DTE display will change to a text display of "LOW FUEL." This display will continue until the vehicle runs out of fuel. Adding a significant amount of fuel to the vehicle will turn off the "LOW FUEL" text and a new DTE value will display.
- **Elapsed Time** Shows the total elapsed time of travel since the last reset when the ignition switch is in the ACC position. Elapsed time will increment when the ignition switch is in the ON or START position.
- **Display Units of Measure in:** To make your selection, press and release the **RESET** button until "US" or "METRIC" appears.

To Reset The Display Reset will only occur while a resettable function is being displayed. Press and release the **RESET** button once to clear the resettable function being displayed. To reset all resettable functions, press and release the **RESET** button a second time within 3 seconds of resetting the currently displayed function (>Reset ALL will display during this 3 second window).

DIAGNOSIS AND TESTING

ELECTRONIC VEHICLE INFORMATION CENTER

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not place any electronic devices (cell phones, laptop computers, PDAs, portable DVD players, etc), on or near the instrument panel as the Remote Compass Module (RCM) performance may be effected. Do not use magnetic tools when servicing the RCM.

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) and Local Interface Network (LIN) Data Bus circuits. The EVIC will not function properly if the bus messages from any of these components is not receive. If no EVIC data is displayed or the display indicates dashes "- -", check the CAN and LIN Data Bus circuit communications, the Instrument Cluster functions, the Remote Compass Module (RCM) and the Totally Integrated Power Module (TIPM). Should the RCM become disconnected, the instrument cluster display will go blank.

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the Instrument Cluster, the RCM, the CAN Data Bus and the LIN Data Bus circuits. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

STANDARD PROCEDURE

MANUAL COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not place any electronic devices (cell phones, laptop computers, PDAs, portable DVD players, etc), on or near the instrument panel as the Remote Compass Module (RCM) performance may be effected. Do not use magnetic tools when servicing the RCM.

NOTE: Calibration is required anytime a new RCM is installed. Upon installation of the new RCM the "CAL" message will appear in the Electronic Vehicle Information Center (EVIC) display. The RCM will automatically calibrate if the vehicle is driven in two or more circles, slowly, and away from large metal objects. The RCM can also be calibrated by performing the following procedure.

NOTE: Confirmation that the proper variance zone is programmed, is recommended whenever manual compass calibration is performed. See Standard Procedure for the appropriate procedure.

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or the Electronic Vehicle Information Center (EVIC) displays "CAL", perform the following manual calibration procedure. Also, any time EVIC service replacement components are installed, they must be calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

Calibrate the compass manually as follows:

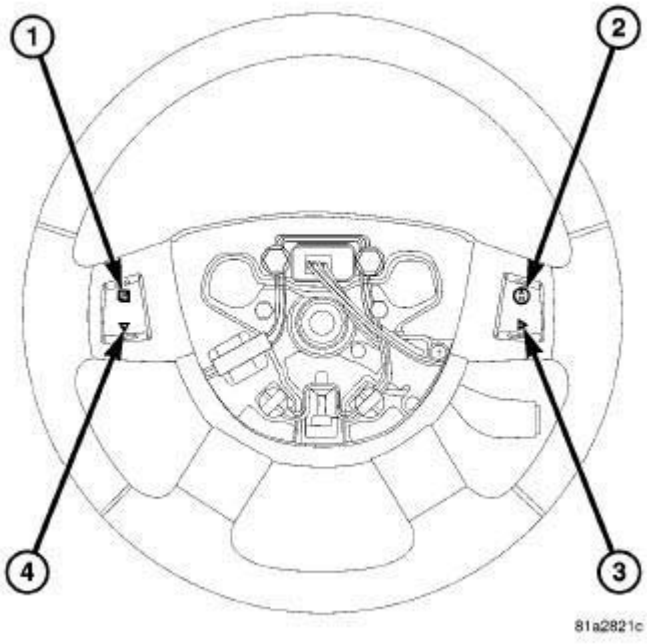

Fig. 4: EVIC Function Buttons
Courtesy of CHRYSLER LLC

NOTE: Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

1. Start the engine but leave the vehicle in "PARK".
2. Press and release the **MENU** push button (1) until "Personal Settings" is displayed.
3. Once in the "Personal Settings" menu depress and release the **STEP** button (4) several times until "Calibrate Compass (Yes)" is displayed.
4. Momentarily depress and release the **RESET** push button (3) to initiate the calibration procedure. The "CAL" symbol will come on solid in the EVIC display.
5. Slowly drive the vehicle on a level surface, away from large metal objects and power lines, through one or two **complete** circles not exceeding 8 km/h (5 mph). The "CAL" symbol will disappear from the display to indicate successful compass calibration.

NOTE: A blank compass display indicates that vehicle degaussing (demagnetizing) may be necessary.

NOTE: If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the EVIC is inoperative. Attempt the calibration procedure at least one more time before performing EVIC diagnosis.

NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the manual calibration procedure in another location.

COMPASS DEMAGNETIZING

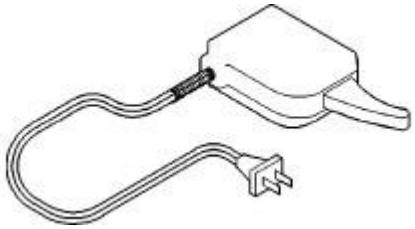

Fig. 5: Degaussing Tool #6029
Courtesy of CHRYSLER LLC

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the roof panel of the vehicle. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

To demagnetize the roof panel proceed as follows:

1. Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.

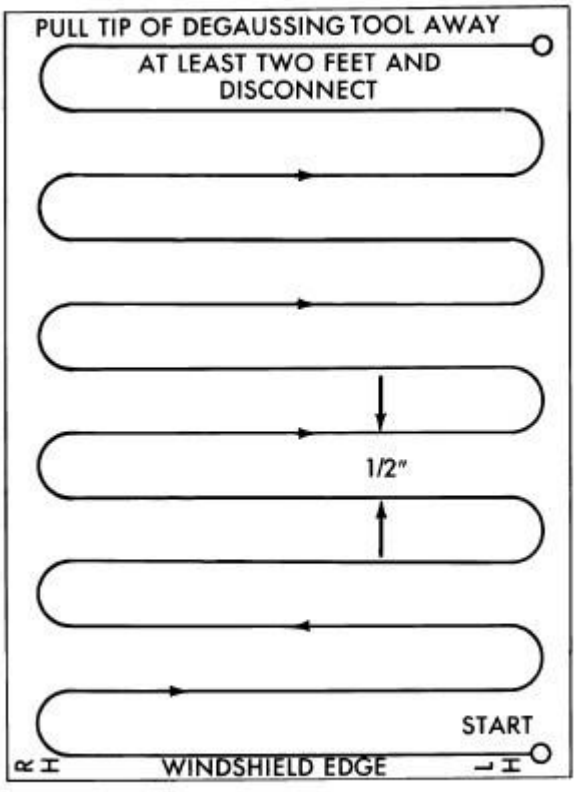

Fig. 6: View Of Roof Panel Grid
Courtesy of CHRYSLER LLC

2. Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header. The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.
3. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the vehicle.
4. Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.
5. Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) back from the windshield header.
6. With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.
7. Calibrate the compass and adjust the compass variance. See **Standard Procedure**. .

COMPASS VARIANCE ADJUSTMENT

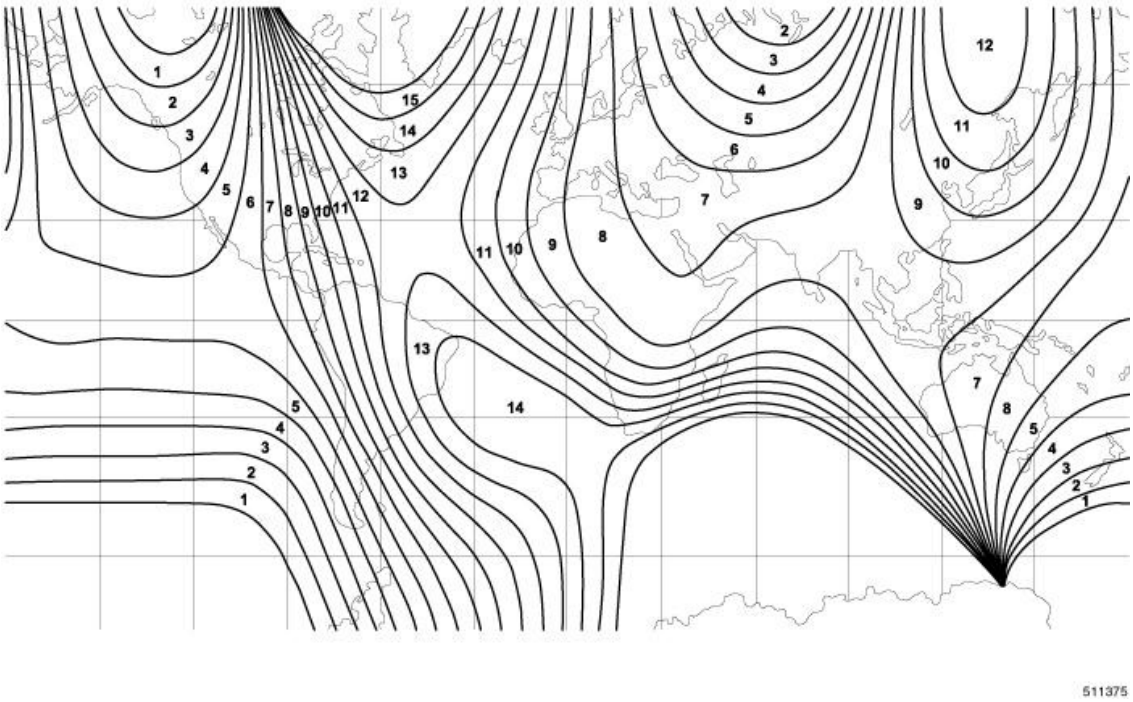

Fig. 7: Magnetic And Geographic North Map
Courtesy of CHRYSLER LLC

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance must be set.

NOTE: If the vehicle is taken on long trips into a new variance zone the compass function may be effected. Compass variance will need to be updated to the new zone number to function properly.

NOTE: The default for the compass variance from the factory is 8.

To set the compass variance:

1. Using the Variance Settings Map, find your geographic location and note the zone number.

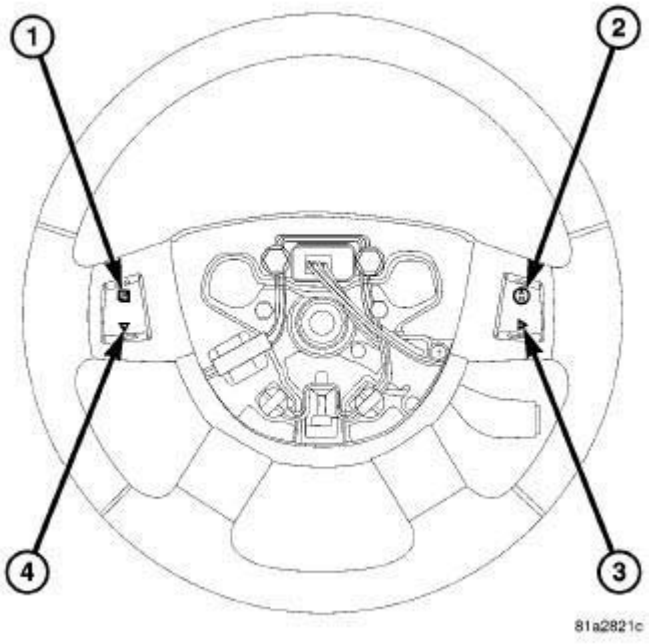

Fig. 8: EVIC Function Buttons
Courtesy of CHRYSLER LLC

2. Turn the ignition switch to the ON/RUN position. Press and release the **MENU** push button (1) until "Personal Settings" is displayed.
3. Press the **STEP** push button (4) until "Compass Variance" is displayed. The "Compass Variance" message and the current variance zone number will be displayed.
4. Press and release the **RESET** push button (3) to toggle through the zone numbers (1-15), until the zone number for your geographic location appears in the display.

NOTE: The default for the compass variance from the factory is 8. During programming, the Zone value will wrap around from Zone 15 to Zone 1.

5. Press and release the Compass Temperature **(C/T)** push button (2) to enter the displayed zone number into the compass unit memory.
6. Confirm that the correct directions are now indicated by the compass.

MODULE

DESCRIPTION

DESCRIPTION

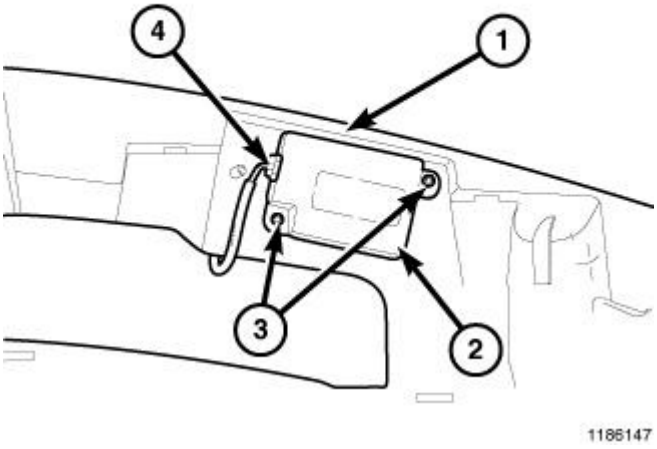

Fig. 9: Remote Compass Module
Courtesy of CHRYSLER LLC

The Remote Compass Module (RCM) (2) is a separate stand alone module mounted to the top of the instrument panel (1). The RCM can be accessed by removing the defroster grille. Refer to **Body/Instrument Panel/GRILLE, Defroster - Removal** .

If the compass position sensor (Remote Compass Module) is inoperative and requires replacement. See **Removal** for the appropriate procedure.

DIAGNOSIS AND TESTING

REMOTE COMPASS MODULE

The Remote Compass Module (RCM) data is transferred on the Controller Area Network (CAN) Data Bus circuit. The RCM and Electronic Vehicle Information Center (EVIC) will not function properly if the bus messages are not properly received. If no EVIC data is displayed, check the CAN Data Bus circuit communications, the RCM, the Instrument Cluster functions and the Totally Integrated Power Module (TIPM). **Any diagnosis of the RCM and EVIC display should begin with the use of a scan tool and the appropriate diagnostic service information.**

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

REMOVAL

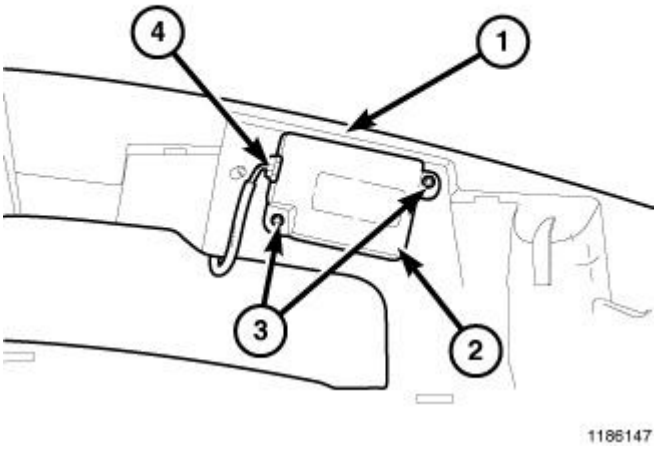

Fig. 10: Remote Compass Module
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the defroster grille. Refer to **Body/Instrument Panel/GRILLE, Defroster - Removal**
3. Remove the retaining screw (3) securing the Remote Compass Module (RCM) (2) to the instrument panel (1).
4. Disconnect the RCM electrical connector (4).
5. Remove the RCM from the vehicle.

INSTALLATION

INSTALLATION

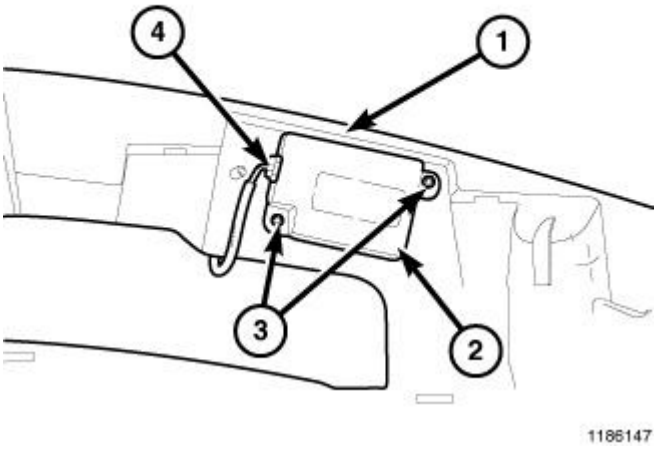

Fig. 11: Remote Compass Module

Courtesy of CHRYSLER LLC

1. Position the Remote Compass Module (RCM) (2) onto the top of the Instrument Panel (IP) (1).
2. Connect the electrical connector (4).
3. Install the RCM retaining screws (3).
4. Install the defroster grille. Refer to **Body/Instrument Panel/GRILLE, Defroster - Installation**
5. Connect the battery negative cable.
6. Perform the Compass Variance Adjustment. See **Standard Procedure** .
7. Perform the Manual Compass Calibration. See **Standard Procedure** .
8. Verify proper compass operation.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

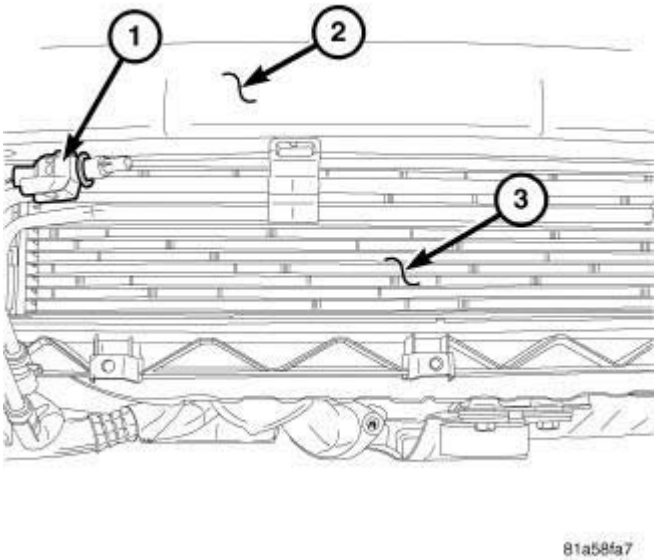

Fig. 12: Locating Ambient Temperature Sensor
Courtesy of CHRYSLER LLC

The ambient temperature sensor (1) is a variable resistor located under the bottom right side of the front bumper reinforcement (2). The sensor is attached to the power steering line bracket with a pushpin style retainer and can be accessed through the right opening in the front fascia assembly.

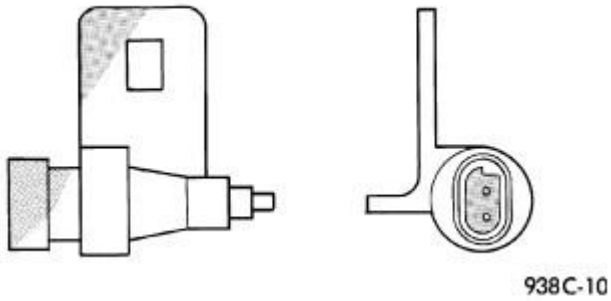

Fig. 13: Ambient Temperature Sensor
Courtesy of CHRYSLER LLC

The ambient temperature sensor cannot be adjusted or repaired and, if inoperative or damaged, must be replaced.

OPERATION

OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal. The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the Totally Integrated Power Module (TIPM). Based upon the resistance in the sensor, the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN), display senses a specific voltage on the Controller Area Network (CAN) data bus circuit, which corresponds to a specific temperature. The applicable instrument cluster display then displays the proper ambient temperature.

DIAGNOSIS AND TESTING

AMBIENT TEMPERATURE SENSOR

The temperature function is supported by the ambient temperature sensor, a wiring circuit, the Controller Area Network (CAN) data bus, the Local Area Network (LIN) data bus and the Totally Integrated Power Module (TIPM). When the sensor is exposed to temperatures above 60° C (130° F), or if the sensor circuit is shorted, 60° C (130° F) will appear in the display in place of the temperature. When the sensor is exposed to temperatures below - 40° C (- 40° F) or if the sensor circuit is open, - 40° C (- 40° F) will appear in the display.

The ambient temperature sensor circuit can be diagnosed using the following Temperature System Test, and Sensor Test. If the temperature sensor and circuit are confirmed to be OK, but the temperature display is inoperative or incorrect, further testing of the instrument cluster may be necessary. Refer to **Electrical/Instrument Cluster - Diagnosis and Testing** for the appropriate procedure.

SENSOR TEST

1. Turn the ignition switch to the Off position. Disconnect the ambient temperature sensor harness connector.
2. Measure the resistance of the ambient temperature sensor. At - 40° C (- 40° F), the sensor resistance is

336 kilohms. At 55° C (130° F), the sensor resistance is 2.488 kilohms. The sensor resistance should read between these two values. If OK, further testing of the instrument cluster may be necessary. Refer to **Electrical/Instrument Cluster - Diagnosis and Testing** for the appropriate procedure. If not OK, replace the inoperative ambient temperature sensor.

SENSOR CIRCUIT TEST

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

NOTE: Temperature readings do not update immediately. Allow up to 60 seconds after the ignition switch is turned to the "ON" position for readings to meet test specifications.

1. Turn the ignition switch to the "OFF" position. Disconnect the wire harness connector from the ambient temperature sensor.
2. Turn the ignition switch to the "ON" position. The display should now read - 40° C (- 40° F). If OK, go to step 3. If not OK, repair the shorted sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.
3. Turn the ignition switch to the "OFF" position. Taking care not to damage the wire terminals, connect a jumper wire between the two terminals in the body half of the ambient temperature sensor harness connector.
4. Turn the ignition switch to the "ON" position. The display should now read 60° C (130 F). If OK, go to step 5. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.

NOTE: If the EVIC display does not show the ambient temperature in step 4, the vehicle may need to be driven several miles at a speed greater than 32 km/h (20 mph) for the temperature to update.

5. Turn the ignition switch to the "OFF" position. Remove the jumper wire. Turn the ignition switch to the "ON" position and wait until the display again reads - 40° C (- 40° F). Turn the ignition switch to the "OFF" position. Reconnect the ambient temperature sensor. Turn the ignition switch to the "ON" position. The display should now read the ambient temperature. If OK, the problem is intermittent. Perform further diagnosis while manipulating the related wire harnesses and components. If not OK, go to step 6.
6. Clear any Diagnostic Trouble Codes that may have been set while performing the test. Perform further diagnosis of the CAN data bus circuit, the LIN data bus circuit, the TIPM and the ambient temperature sensor (refer to **SENSOR TEST**).

REMOVAL

REMOVAL

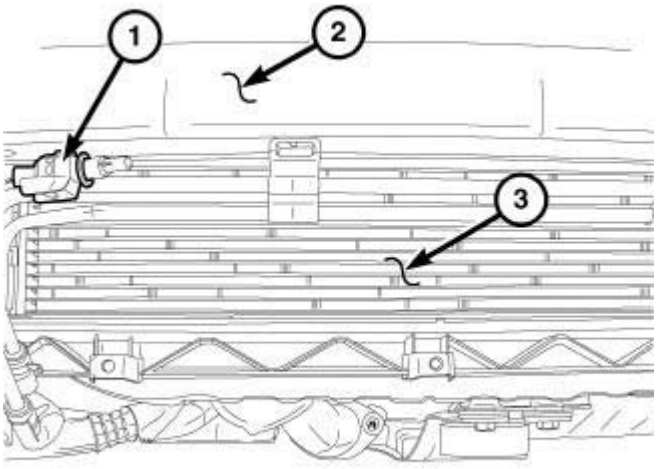

Fig. 14: Locating Ambient Temperature Sensor
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Working through the opening in the right side of the front fascia, disconnect the wire harness connector from the ambient temperature sensor (1).
3. Remove the fastener that secures the ambient temperature sensor to the power steering line bracket.
4. Remove the ambient temperature sensor from the vehicle.

INSTALLATION

INSTALLATION

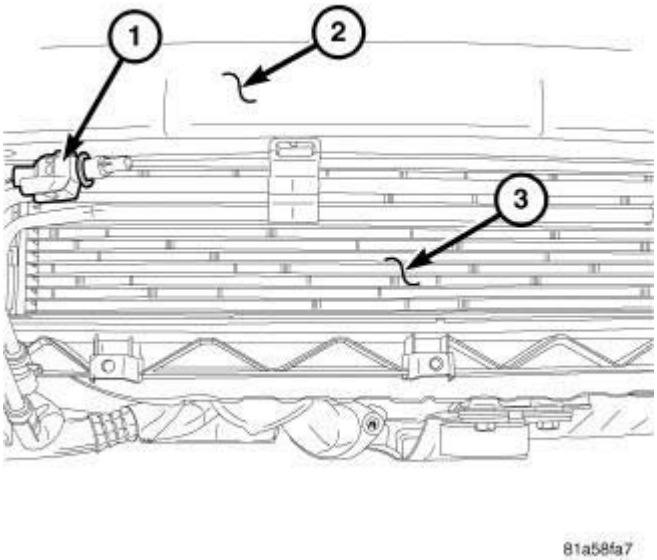

Fig. 15: Locating Ambient Temperature Sensor
Courtesy of CHRYSLER LLC

1. Working through the opening in the right side of the front fascia, position the ambient temperature sensor (1) in the vehicle.
2. Install the fastener that secures the ambient temperature sensor (1) to the power steering line bracket.
3. Connect the wire harness connector to the ambient temperature sensor.
4. Connect the battery negative cable.

SWITCH, EVIC CONTROL

REMOVAL

REMOVAL

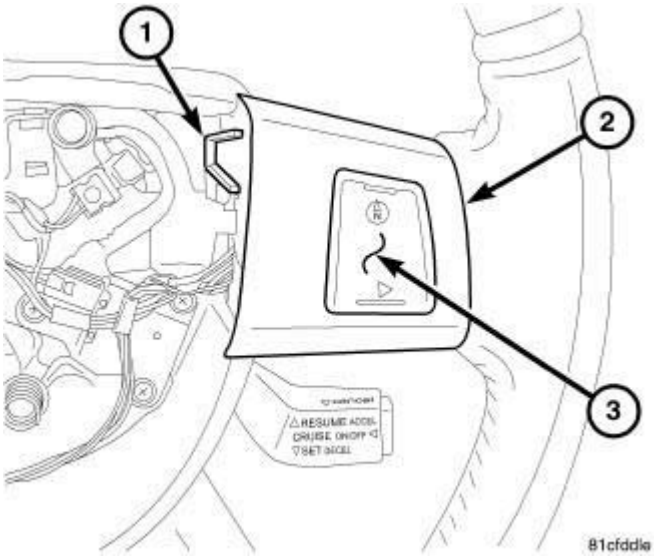

Fig. 16: Removing/Installing EVIC Switch And Bezel Assembly
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag. Refer to **Restraints/AIR BAG, Driver - Removal** .
3. Using a trim stick (special tool # C-4755) or equivalent, gently pry the switch and bezel assembly (3) away from the steering wheel at the inner retaining tab (1) and the outer bezel edge (2).
4. With the switch and bezel assembly free from the steering wheel, lift the assembly up and disconnect the switch electrical connector.

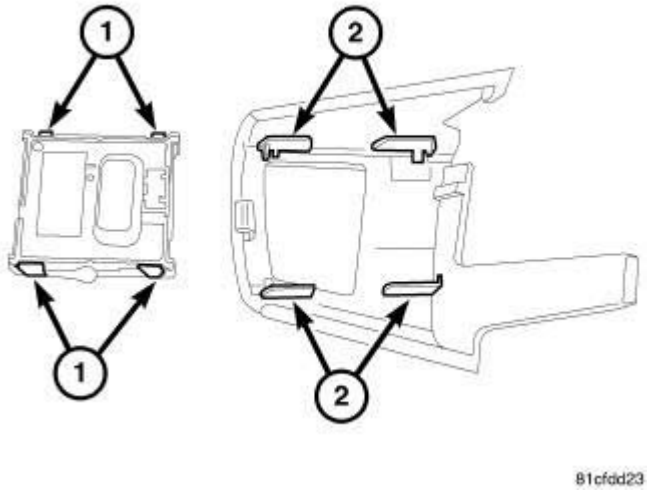

Fig. 17: EVIC Switch Separated From Bezel
Courtesy of CHRYSLER LLC

5. Using trim stick (special tool # C-4755) or equivalent, gently pry the switch bezel retainers (2) away from the switch tabs (1), while applying pressure to the back side of the switch. Remove the switch from the

bezel.

INSTALLATION

INSTALLATION

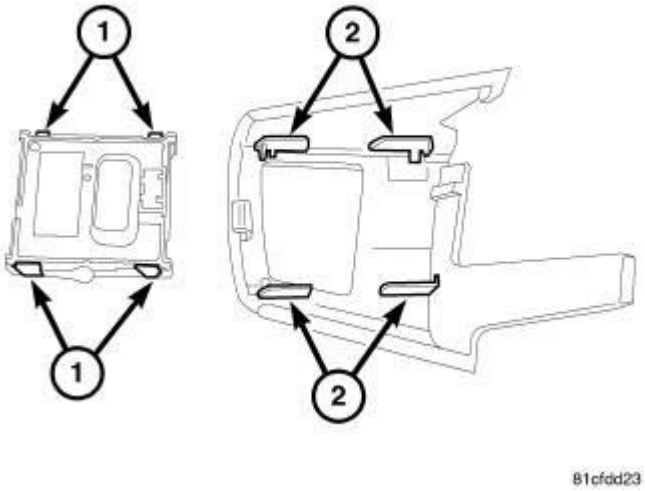

Fig. 18: EVIC Switch Separated From Bezel
Courtesy of CHRYSLER LLC

1. Position the steering wheel switch onto the switch bezel aligning the switch tabs (1) with the bezel retainers (2).
2. Press the switch into the bezel, until the switch is held in place by all four retainers.

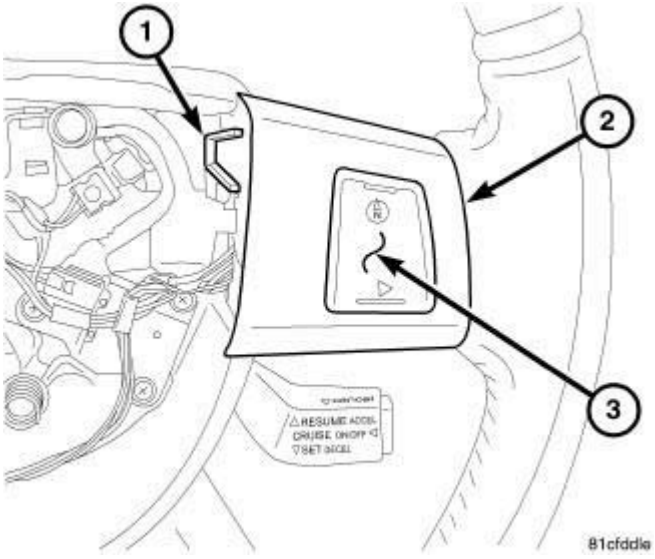

Fig. 19: Removing/Installing EVIC Switch And Bezel Assembly
Courtesy of CHRYSLER LLC

3. Position the switch and bezel assembly (3) over the steering wheel and connect the switch electrical connector.
4. Align the switch bezel tab (1) with the slot in the steering wheel and press the switch and bezel assembly (3) into the steering wheel until it is secured in place.
5. Install the driver airbag. Refer to **Restraints/AIR BAG, Driver - Installation** .
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. Refer to **DTC-Based Diagnostics/CONTROLLER, Occupant Restraint (ORC) - Standard Procedure** .
7. Connect the battery negative cable.

2009 ACCESSORIES AND EQUIPMENT

Overhead Console - Service Information - Journey

DESCRIPTION

DESCRIPTION

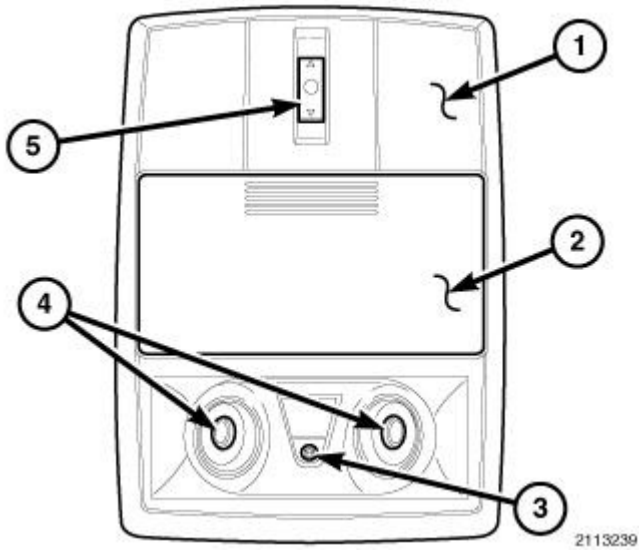

Fig. 1: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

There are two different style's of overhead console (1) available on this vehicle, High line and Mid or Low line. All overhead consoles are equipped with a sunglasses storage bin (2) and two reading and courtesy lamps (4). On High line models, the reading lamps are a Light Emitting Diode (LED) multi directional design, and on the Mid or Low line design the lamps are fixed with a replaceable incandescent bulb. The sunglasses storage bin also has a conversation mirror that is visible when the bin is locked in the partial open position. On vehicles equipped with a power sunroof, the sunroof switch (5) is located behind the sunglasses bin. On vehicles equipped with automatic climate control an infrared temperature sensor (3) is located between the reading and courtesy lamps. Both overhead console designs are mounted with six snap clips into a molded plastic retainer bracket located above the headliner to provide secure overhead console attachment.

REMOVAL

SUNGLASSES BIN

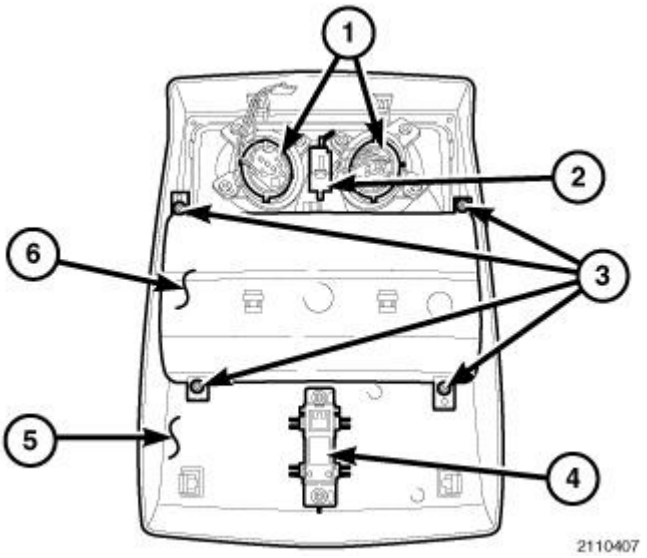

Fig. 2: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

1. Remove the overhead console (5). See **Removal** .
2. Remove the four fasteners (3) that secure the sunglasses bin (6) to the console.
3. Remove the bin from the console.

CONSOLE ASSEMBLY

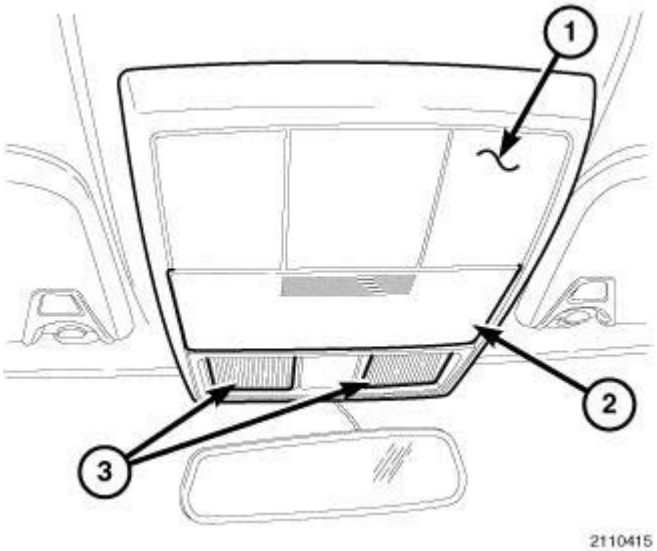

Fig. 3: Console Assembly
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Using your fingertips, grasp the sides of the overhead console (1) and pull straight down evenly to disengage the snap clips from the mounting bracket.

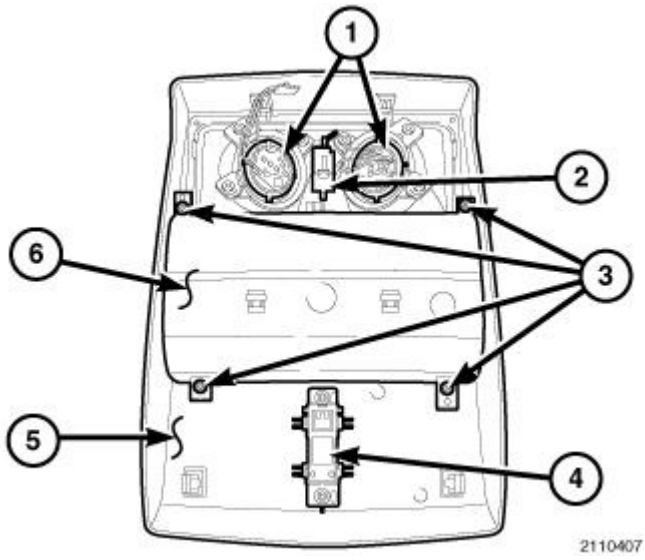

Fig. 4: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

3. Lower the overhead console (5) far enough to access the wire harness connectors.
4. If equipped, disconnect the courtesy lamps (1), infrared temperature sensor (2) and power sunroof switch (4) electrical connectors.
5. Remove the overhead console assembly from the vehicle.

INSTALLATION

SUNGLASSES BIN

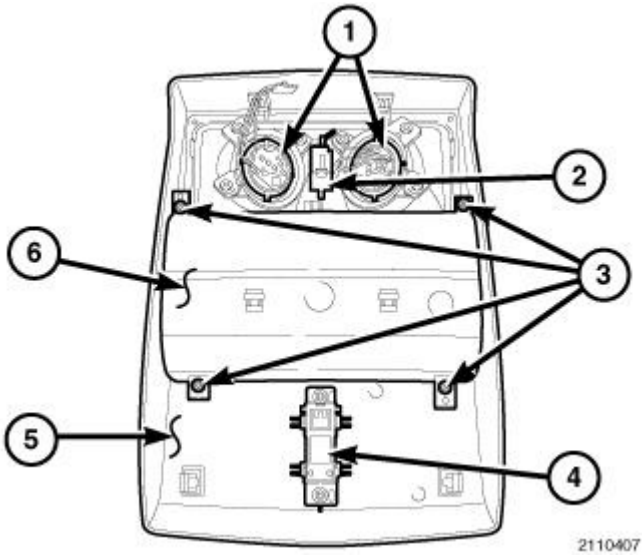

Fig. 5: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

1. Install the sunglasses bin (6) into the overhead console (5).
2. Install the four fasteners (3) that secure the bin to the console.
3. Install the overhead console. See **Installation** .

CONSOLE ASSEMBLY

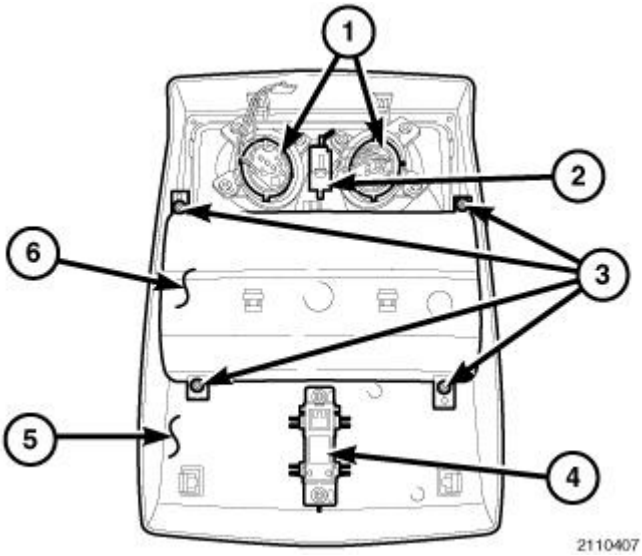

Fig. 6: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

1. Position the overhead console (5) in the vehicle near the headliner assembly.
2. If equipped, connect the courtesy lamps (1), infrared temperature sensor (2) and power sunroof switch (4) electrical connectors.
3. Position the overhead console so that the six retaining clips are lined up properly with the bracket.

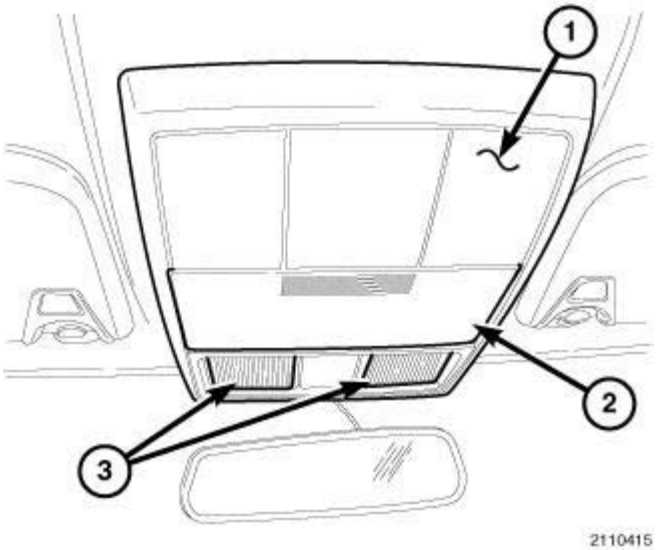

Fig. 7: Console Assembly
Courtesy of CHRYSLER LLC

4. Applying pressure to the overhead console (1), push straight up evenly to engage the snap clips into the mounting bracket.
5. Connect the battery negative cable.

2009 ACCESSORIES AND EQUIPMENT

Power Distribution - Journey

OPERATION

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, centralized and convenient access to distribution of the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, comfort and convenience systems. At the same time, these systems were designed to provide centralized locations for conducting diagnosis of faulty circuits and for sourcing the additional current requirements of many aftermarket vehicle accessory and convenience items.

These power distribution systems also incorporate various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Cartridge fuses
- Fusible links
- Mini and standard fuses
- Relays

The power distribution system for this vehicle may consist of the following components:

- Accessory power outlet
- Junction Block (JB)
- Power Distribution Center (PDC)
- Totally Integrated Power Module (TIPM)

SPECIAL TOOLS

SPECIAL TOOLS

FUSE, IOD

DESCRIPTION

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Totally Integrated Power Module (TIPM) when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the TIPM as part of the preparation procedures performed just prior to new vehicle delivery.

OPERATION

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the OFF position, including the clock. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to

restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged.

REMOVAL

REMOVAL

NOTE: When removing or installing the Ignition Off Draw (IOD) fuse, it is important that the ignition switch be in the OFF position. Failure to place the ignition switch in the OFF position can cause the radio display to become scrambled when the IOD fuse is installed. Removing and installing the IOD fuse again with the ignition switch in the OFF position will usually correct the scrambled radio display condition.

1. Turn the ignition switch to the OFF position.
2. Remove the cover from the Totally Integrated Power Module (TIPM).
3. Pull on IOD fuse (J13) holder until it reaches the first detent.

INSTALLATION

INSTALLATION

1. Push on IOD fuse until completely seated.
2. Install the cover to the Totally Integrated Power Module (TIPM).

JUNCTION BLOCK

DESCRIPTION

DESCRIPTION

An electrical Junction Block (JB) is located next to the Totally Integrated Power Module (TIPM). The JB combines the functions previously provided by a separate relay center. It also serves to simplify and centralize numerous electrical components, as well as to distribute electrical current to many of the accessory systems in the vehicle. It eliminates the need for numerous splice connections and serves in place of a bulkhead connector between many of the engine compartment, instrument panel, and body wire harnesses. The junction block is replaced as part of the engine harness.

MODULE, POWER INVERTER

DIAGNOSIS AND TESTING

INVERTER MODULE

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

110 VOLT POWER OUTLET DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO POWER AT THE 110 VOLT POWER OUTLET	1. Fuse inoperative.	1. Check Totally Integrated Power Module (TIPM) fuse number 37. Replace fuse, if required.
	2. Power outlet connector damaged.	2. Check for loose or corroded power outlet connector. Repair, if required.
	3. Inverter module connector damaged.	3. Check for loose or corroded inverter module connector. Repair, if required.
	4. Wiring damaged.	4. Check for shorted or open wires. Repair wiring, if required.
	5. Inverter module ground damaged.	5. Check for continuity between the inverter module and a known good ground. There should be continuity. Repair ground, if required.
	6. Power outlet inoperative.	6. Replace the power outlet.
	7. Inverter module inoperative.	7. Replace the inverter module.

REMOVAL

REMOVAL

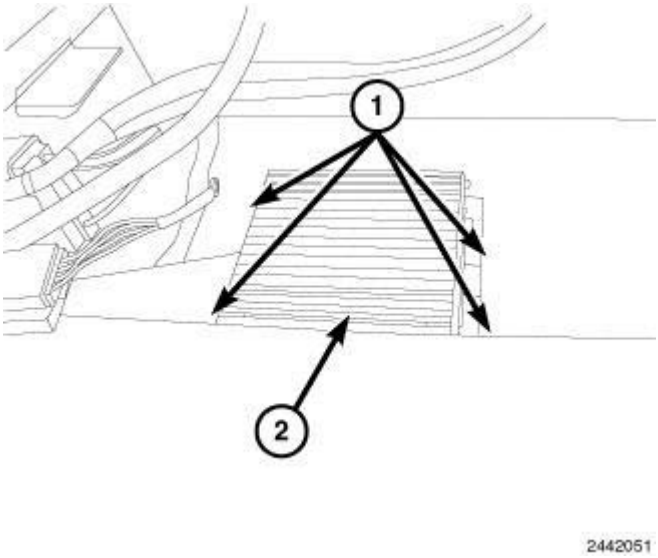

Fig. 2: Removing / Installing Power Inverter And Mounting Retainers
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Position the front drivers seat to the full rearward position.
3. Remove the power inverter (2) mounting retainers (1) located under the carpet.
4. Disconnect the electrical connectors.
5. Remove the power inverter module from the vehicle.

INSTALLATION

INSTALLATION

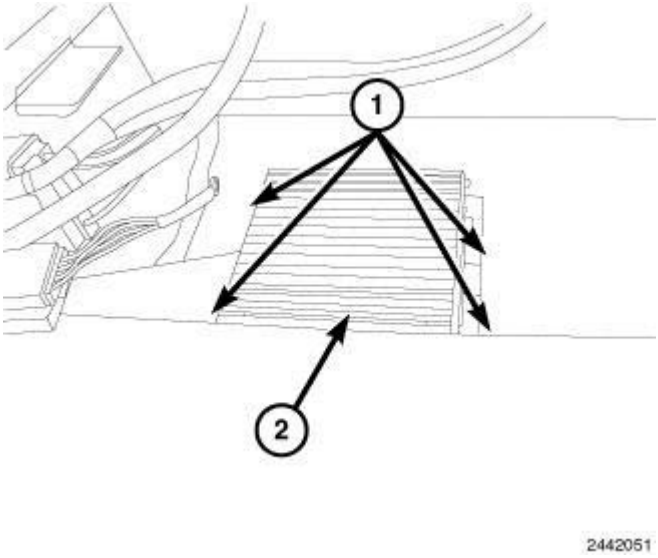

Fig. 3: Removing / Installing Power Inverter And Mounting Retainers
Courtesy of CHRYSLER LLC

1. Position the inverter into the vehicle and install mounting fasteners.
2. Connect the electrical connectors.
3. Connect the battery negative cable.
4. Position the front drivers seat back to the original position.

MODULE, TOTALLY INTEGRATED POWER (TIPM)

DESCRIPTION

DESCRIPTION

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Totally Integrated Power Module (TIPM). The molded plastic TIPM housing is located on the right side of the engine compartment. The TIPM housing has a molded plastic cover. The TIPM cover is easily removed for service access and has a convenient fuse layout label affixed to the inside surface of the cover to ensure proper component identification.

The TIPM housing is secured to the TIPM mounting bracket by four clips integral to the TIPM housing. All of the TIPM outputs are through the integral engine compartment wire harness.

OPERATION

OPERATION

All of the current to the Totally Integrated Power Module (TIPM) comes directly from the positive battery cable to a stud located on the bottom of the TIPM. The cable is secured to the TIPM stud with a nut. Internal connection of all the TIPM circuits is accomplished by an intricate network of hard wiring and bus bars. Refer to appropriate wiring information for complete circuit diagrams.

The fuses, relays and TIPM housing assembly are available for service replacement.

STANDARD PROCEDURE

PROGRAMMING

1. Install a battery charger.
2. Verify that the charging rate provides approximately 13.5 volts.

NOTE: Do not allow the charger to time out during the reconfiguration process. Set the battery charger timer (if so equipped) to continuous charge.

3. Connect the CH9410 StarSCAN ethernet cable to the StarSCAN and the dealer's network drop.
4. Connect the CH9404 StarSCAN vehicle cable to the StarSCAN and the vehicle.
5. Place the Ignition in the "RUN" position, then Power "ON" the StarSCAN.

6. Select "ECU View".
7. Select "TIPMCGW" or "FCMCGW".
8. Select "MISC".
9. Select "Restore Vehicle Configuration".
10. Follow prompts on StarSCAN to complete the reconfigure procedure.
11. Once complete, Wait one minute and turn the ignition key to the "OFF" position.
12. Remove the StarSCAN unit, cable and charger from the vehicle.
13. Verify proper operation.

REMOVAL

REMOVAL

1. Open hood.
2. Disconnect and isolate the battery negative cable.
3. Release the Totally Integrated Power Module (TIPM) cover retaining clips and open the TIPM cover.
4. Remove the TIPM positive cable retaining nut and remove the cable from the stud.
5. Depress the four mounting clips to disengage and remove the TIPM housing from its mounting bracket.
6. Disconnect each of the seven TIPM wire harness connectors.
7. Remove the TIPM from the vehicle.

INSTALLATION

INSTALLATION

CAUTION: The original Cabin Compartment Node (CCN) and Powertrain Control Module (PCM) must be installed and functioning properly prior to powering up the new Totally Integrated Power Module (TIPM). The TIPM receives vehicle configuration data from the CCN and Vehicle Identification Number (VIN) information from the PCM. If configuration information becomes lost or corrupted, the data can be obtained from DealerCONNECT

1. Position the TIPM into the engine compartment.
2. Connect each of the seven TIPM wire harness connectors.
3. Position the TIPM onto the mounting bracket and push down until the mounting clips are fully seated.
4. Position the TIPM positive cable onto the mounting stud and install the retaining nut. Tighten the nut to 9 - 11 N.m (80 - 100 in. lbs.).
5. Open the TIPM cover and fully seat the airbag fuse holder (two fuses in one yellow carrier) and the Ignition Off Draw (IOD) fuse.
6. Connect the battery negative cable.
7. Close the hood.

8. Insert the ignition key and turn it to the RUN position and wait twelve seconds. The TIPM will collect the necessary vehicle configuration and VIN data from the CCN and PCM at this time. After twelve seconds turn the ignition key to the OFF position and then back to the ON position and verify proper vehicle systems operation.

OUTLET, POWER, 12 V

REMOVAL

REMOVAL

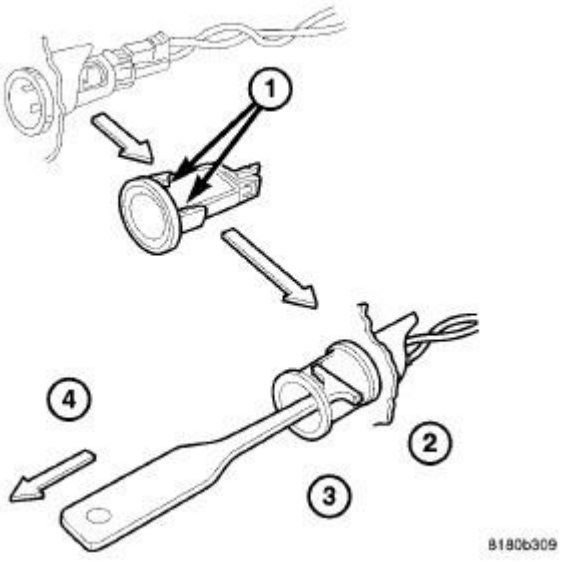

Fig. 4: Removing Cigar Lighter/Power Outlet
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Using Power Outlet Remover 9857 (4). Insert the tool with tips against bosses (1).
3. Pull out the base (3) through mounting ring by gently rocking power outlet remover.
4. Disconnect the base wires (2).

INSTALLATION

INSTALLATION

1. Connect wire harness connectors.
2. Install power outlet to instrument panel.
3. Connect battery negative cable.

2009 ACCESSORIES AND EQUIPMENT

Power Locks - Service Information - Journey

DESCRIPTION

DESCRIPTION

POWER DOOR LOCKS

The power lock system allows all doors to be locked or unlocked electrically by operating the switch on either front door trim panel. The power lock system operates on non-switched battery current supplied through a fuse in the junction block so that the system remains functional, regardless of the ignition switch position.

AUTOMATIC DOOR LOCKS

The system includes an automatic door locking feature actuated by the Cab Compartment Node (CCN). **The vehicle is built with the system enabled.** The system can be enabled/disabled by the customer. Refer to the owner's manual for information.

The CCN will automatically lock all doors when all of the conditions below are met:

- All doors are closed
- The vehicle speed exceeds 15 ± 1 M.P.H. (24km/h)
- The throttle position sensor tip-in is greater than 10 ± 2 degrees

When the system is disabled the door locks will work by use of the door lock switches only. When this system is enabled the automatic door locks will work automatically.

CHILD PROTECTION LOCK

The child protection locks are on the rear doors only. When enabled, they render the inside remote door release handles inoperative.

DOOR LOCK INHIBIT

The door lock inhibit feature is designed to prevent the locking of keys in a vehicle. The doors cannot be locked with either front door open unless the keys are removed from the ignition switch.

REMOTE KEYLESS ENTRY

The system allows locking and unlocking of vehicle door(s), deck lid release, and panic by remote control using a hand held radio frequency transmitter. The vehicle must be in PARK before the trunk lid can be unlatched with the transmitter.

The receiver may receive signals from up to four transmitters. Each transmitter has its own code, and the code is programmed and stored into receiver memory. If a transmitter is replaced or additional transmitters are added,

the codes for all units have to be reprogrammed into the receiver memory. If a receiver module is replaced, the transmitter codes must be stored in the new receiver memory.

HORN CHIRP TOGGLE

Once the transmitters have been programmed, the horn chirp can be enabled/disabled by sending the horn chirp toggle operation code to the CCN.

OPERATION

OPERATION

POWER DOOR LOCKS

All doors can be locked or unlocked electrically by operating the switch on either front door panel.

The rear doors can be locked or unlocked by actuation of the front door switch, or can be locked or unlocked mechanically and independently with their respective locking knobs.

The front doors can be locked or unlocked mechanically with the locking knob regardless of electrical locking and unlocking actuation with the front door knobs.

The left front door on all vehicles can be locked or unlocked mechanically from the outside with the key or electrically as described above. The left and right front doors can also be unlocked by actuation of the inside remote door handle.

AUTOMATIC DOOR LOCKS

The CCN controls the power locks when the door lock switch is activated. If the door lock switch is pressed for longer than eight consecutive seconds, the CCN will de-energize the door lock relay.

The automatic door lock system can be enabled/disabled either by the customer or with the scan tool. Refer to the scan tool or the vehicle owners manual for enabling/disabling procedures.

The CCN will automatically re-lock all doors if the above conditions are met and if any of the doors become ajar and then closes again.

The power latches are also equipped with a thermal protection system which prevents the latches from burning out.

CHILD PROTECTION LOCK

The lock when engaged, will disable the inside door handle from opening the door. The lock is part of the latch/lock assembly. The lock is engaged by moving a lever that is located on the rearward inside edge of the door.

DOOR LOCK INHIBIT

With the key in the ignition switch in the ON or OFF position and the driver's door open the CCN will ignore the command to lock the power door locks. Once the key is removed, or the driver's door is closed, the CCN will allow the power door locks to lock.

REMOTE KEYLESS ENTRY

The transmitter has four buttons for operation. They are LOCK, UNLOCK, DECK LID RELEASE, and PANIC.

- The **UNLOCK** button will unlock the driver's door and enable illuminated entry. Pushing and releasing the button once will unlock the driver's door. Pushing and releasing the button two times, within a five second interval, will unlock all doors.

  The unlock sequence can be toggled between driver door first and all door unlock functions.

- Upon pressing the **LOCK** button, the horn will sound a short CHIRP (if enabled) and flash the park lamps to notify that the all door lock signal was received and set. Illuminated entry is cancelled and the interior lamps are faded to off.
- **DECK LID RELEASE** - The Deck Lid release button changes from a default "press twice" actuation to a "press and hold" (for approximately one third of a second) default. Note that this is customer programmable to "no delay" if so desired.
- Pushing and holding the **PANIC** button will cause the panic alarm to sound for three minutes, until the panic button is pressed and held a second time, or the vehicle reaches a speed of 15 mph.

The receiver is capable of retaining a Vehicle Access Code (VAC) even when power is removed.

Each Remote Keyless Entry (RKE) module must have at least one and no more than four transmitters.

HORN CHIRP TOGGLE

This can be done using a scan tool or by the customer. The horn chirp will enter the opposite state of its current programmed state by receiving this operation code. The CCN is responsible for keeping track of the horn chirp status.

DIAGNOSIS AND TESTING

REMOTE KEYLESS ENTRY

When trouble shooting problems with the Remote Keyless Entry System, always verify that the power door lock/unlock switches are functional. If the doors do not lock/unlock with the power switches, the following components should be analyzed:

- Door Lock Switches
- Door lock/unlock motors
- Fuses
- Lock and unlock relays

- Radio/clock
- Remote keyless entry system

MOTOR, DOOR LOCK

DIAGNOSIS AND TESTING

DOOR LOCK MOTOR

Make certain battery is in normal condition before circuits are tested.

To determine which motor is faulty, check each individual door for electrical lock and unlock or disconnect the motor connectors one at a time, while operating the door lock switch. In the event that none of the motors work, the problem maybe caused by a shorted motor, a bad switch, or a bad relay. Disconnecting a defective motor will allow the others to work.

To test an individual door lock motor, disconnect the electrical connector from the motor. To lock the door, connect a 12 volt power source to the positive pin of the lock motor and a ground wire to the other pin. To unlock the door reverse the wire connections at the motor pin terminals. If these results are NOT obtained, replace the motor.

The door lock motor is integral to the door latch. If faulty, the entire door latch must be replaced.

SOLENOID, RELEASE, LIFTGATE

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the liftgate latch assembly. Refer to **Body/Decklid/Hatch/Liftgate/Tailgate/LATCH - Removal** .
3. Remove the liftgate release solenoid.

INSTALLATION

INSTALLATION

1. Install the liftgate latch. Refer to **Body/Decklid/Hatch/Liftgate/Tailgate/LATCH - Installation** .
2. Install the liftgate trim panel. Refer to **Body/Decklid/Hatch/Liftgate/Tailgate/PANEL, Trim - Installation** .
3. Connect the battery negative cable.

SWITCH, DOOR LOCK CYLINDER

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Removal** .
3. Disconnect the wiring clip and pigtail wire connector.
4. Remove the Door Cylinder Lock Switch from door lock cylinder.

INSTALLATION

INSTALLATION

1. Install the Door Cylinder Lock Switch onto the door lock cylinder.
2. Connect the wiring clip and pigtail wire connector.
3. Install door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Installation** .
4. Connect the battery negative cable.

SWITCH, LOCK

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

VOLTAGE

The following wiring test sequence determines whether or not voltage is continuous through the body harness to switch.

1. Remove switch from door trim panel.
2. Carefully separate multiple terminal block on wiring harness from switch body.
3. Connect one lead of test light to a ground terminal:

- Touch other test light lead to battery feed B+ terminal.
- If test light comes on, the wiring circuit between the battery and switch is functional.
- If test light does not come on, check for a blown fuse. Refer to **SYSTEM WIRING DIAGRAMS** for circuit information.

DOOR LOCK SWITCH

NOTE: Vehicles equipped with the auto-express feature for power windows, the local interface network (LIN) controls the lock, mirror and window features.

Remove the non-express switch from its mounting location. Using an ohmmeter, refer to the **DOOR LOCK**

SWITCH CONTINUITY table to determine if the continuity is correct in the LOCK and UNLOCK switch positions. If these results are not obtained, replace the switch.

DOOR LOCK SWITCH CONTINUITY

-	SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
MASTER DOOR LOCK	LOCK	3 AND 4	330 ohms ± 10%
MASTER DOOR LOCK	UNLOCK	3 AND 4	102 ohms ± 10%
PASSENGER DOOR LOCK	LOCK	4 AND 8	330 ohms ± 10%
PASSENGER DOOR LOCK	UNLOCK	4 AND 8	102 ohms ± 10%

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative remote cable.
2. Using a trim tool, or equivalent, carefully pry up on the window switch until it disengages from the door trim panel.
3. Disconnect switch wire connector.

INSTALLATION

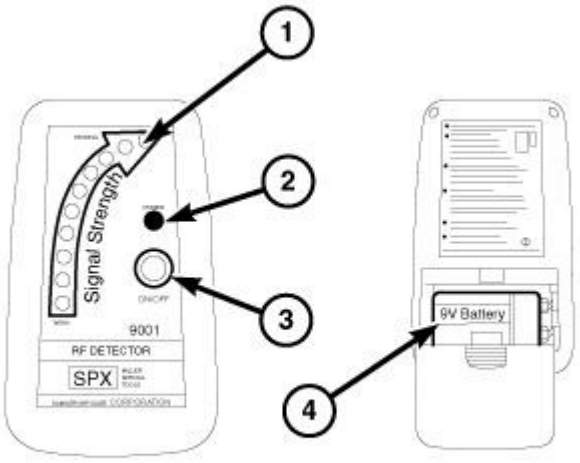
INSTALLATION

1. Connect switch wire connector.
2. Install the switch by snapping into place.
3. Connect the battery negative remote cable.

TRANSMITTER, INTEGRATED KEY FOB

DIAGNOSIS AND TESTING

REMOTE KEYLESS ENTRY TRANSMITTER



114508

Fig. 1: Radio Frequency Detector 9001
Courtesy of CHRYSLER LLC

Using special tool 9001, first test to ensure that the transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for Asian transmitters and 30.5 centimeters (12 inches) for all others. To test, position the transmitter as shown in illustration. Press any transmitter button, then test each button individually. The tool will beep if a radio signal strength that lights five or more LEDs is detected. Repeat this test three times. If transmitter fails any of the test refer to the proper Diagnostic Procedures information.

FOBIK TRAPPED IN WIN

The Fob with Integrated Key (FOBIK) cannot be rotated to the LOCK position, allowing it to be removed from the ignition switch also referred to as the Wireless Ignition Node/WIN. The automatic transmission or transaxle is shifted mechanically through a cable from the gearshift lever mechanism to the transmission or transaxle valve body. A gated park switch is physically located on and integral to the gearshift lever mechanism and is hard wired directly to the WIN. The gated park switch is a simple plunger-like actuated open or closed contact switch that could be considered redundant to the Transmission Range Sensor (TRS) except that it monitors the position selected with the gearshift lever, while the TRS monitors the position or gear of the transmission or transaxle that is actually engaged. A damaged or improperly adjusted gearshift cable could result in a different gear being engaged than that which is selected. The WIN uses the gated park switch input to control an internal key lock solenoid, which controls whether the FOBIK can be rotated to the LOCK position. When the gearshift lever is not in the PARK position, the gated park switch is a closed circuit, the key lock solenoid is energized and the FOBIK cannot be rotated to the LOCK position for removal.

CONDITION	POSSIBLE CAUSES	CORRECTION
	1. Damaged, binding or improperly adjusted gearshift cable.	1. Inspect and replace or adjust gearshift cable, if required.

CANNOT TURN FOBIK TO LOCK POSITION	2. Damaged or binding gearshift lever mechanism.	2. Inspect and replace or adjust gearshift lever mechanism.
	3. No gated park switch input to WIN.	3. Use a diagnostic scan tool with software release version 8.05 or greater to read and confirm no gated park switch input to the WIN. Refer to the appropriate CONDITION that follows.
	4. Key lock solenoid (WIN) unresponsive to gated park switch input.	4. Use a diagnostic scan tool with software release version 8.05 or greater to read and confirm gated park switch input to the WIN. Refer to the appropriate CONDITION that follows.
NO GATED PARK SWITCH INPUT	1. Open TRS park signal circuit.	1. Repair the open TRS park signal circuit between the gated park switch (gearshift lever mechanism) and the WIN, if required
	2. Damaged or ineffective gated park switch.	2. Replace the damaged or ineffective gated park switch (gearshift lever mechanism), if required.
KEY LOCK SOLENOID UNRESPONSIVE TO GATED PARK SWITCH INPUT	1. Damaged or ineffective key lock solenoid.	1. Replace the damaged or ineffective key lock solenoid (WIN), if required.

STANDARD PROCEDURE

FOBIK TRANSMITTER BATTERY REPLACEMENT

FOBIK WITH BATTERY COVER

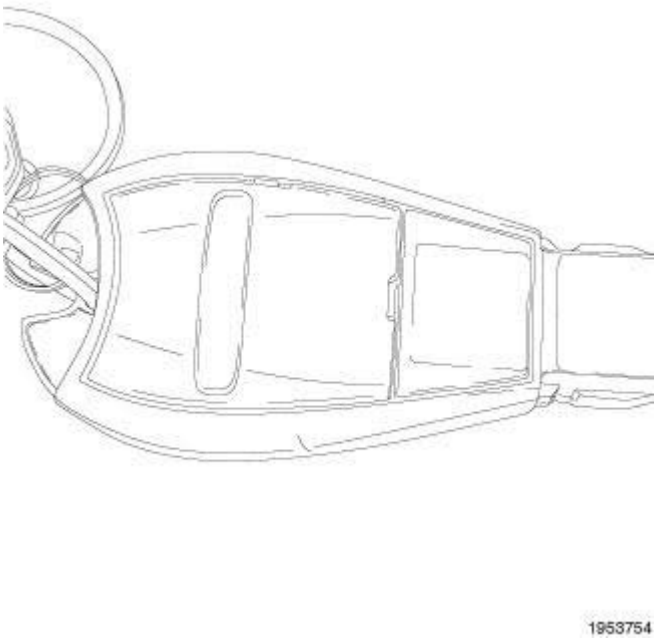


Fig. 2: FOBIK With Battery Cover
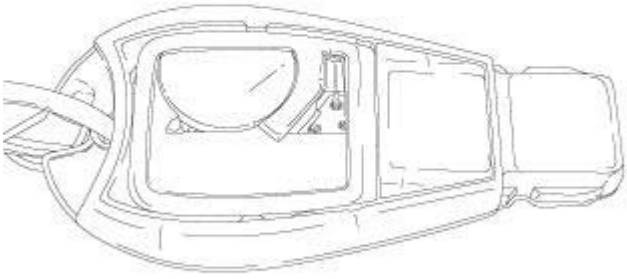
Courtesy of CHRYSLER LLC

NOTE: Do not disturb the metal terminal near the battery. Avoid touching the new battery. Skin oils may cause battery deterioration. If battery are touched, clean with rubbing alcohol.

To replace the FOBIK transmitter battery:

1. Using a small flat bladed tool, carefully remove the battery cover on the back of the FOBIK.



1953797

Fig. 3: FOBIK With Battery Cover Removed
Courtesy of CHRYSLER LLC

2. Remove the battery one at a time by slightly lifting up and sliding out from the FOBIK.
3. Replace the battery with the same type of battery cell.
4. Install the battery with the positive terminal up.
5. Install battery cover and snap into place.
6. Test FOBIK operation.

FOBIK WITHOUT BATTERY COVER

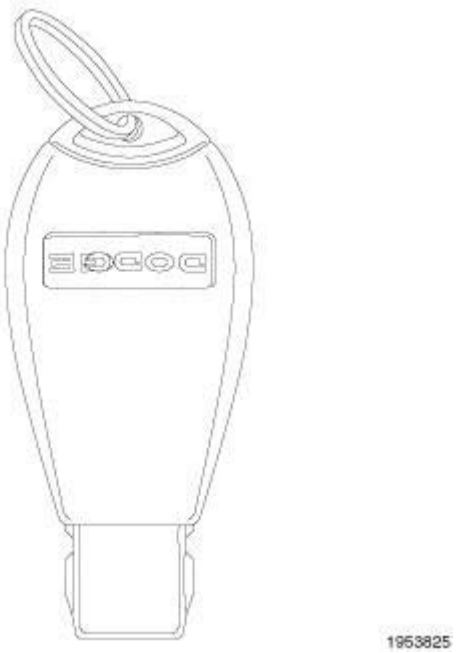


Fig. 4: FOBIK Without Battery Cover
Courtesy of CHRYSLER LLC

NOTE: Do not disturb the metal terminal near the battery. Avoid touching the new battery. Skin oils may cause battery deterioration. If battery are touched, clean with rubbing alcohol.

This design is a clam shell design whereby both halves are split apart.

1. Remove the valet/spare key from the FOBIK if present.
2. Using a trim stick C-4755 or equivalent, carefully separate the top half from the bottom half.

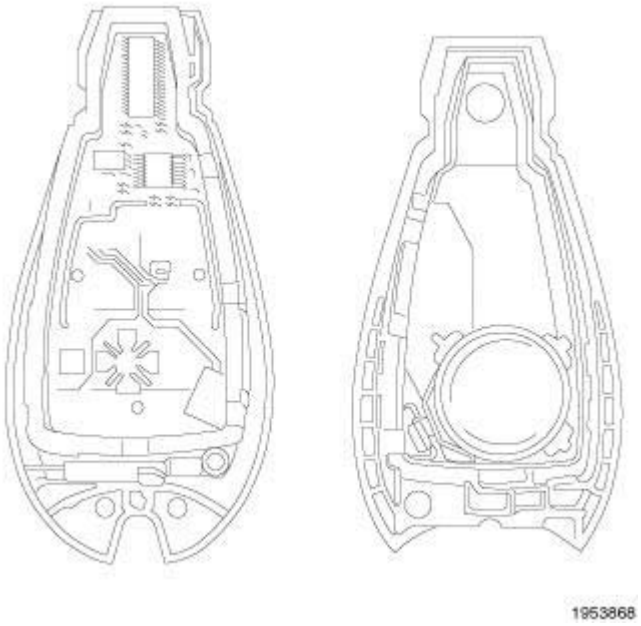

Fig. 5: FOBIK Without Battery Cover Separated
Courtesy of CHRYSLER LLC

3. Lift up on the battery to remove.
4. Replace battery with the same type of cell.
5. Install new battery negative side up.
6. Snap the top and bottom halves together.
7. Test FOBIK operation.

FOBIK PROGRAMING

Make sure instructions are followed in order. Refer to **MODULE PROGRAMMING** . .

SPECIFICATIONS

SPECIFICATIONS

BATTERY

The transmitter has two 3 volt batteries, which can be removed and replaced without special tools. Insert a dime in the side slot of the transmitter case and twist. The halves should separate and the batteries are stacked on top of each other. The batteries are available at local retail stores. Recommended batteries are Duracell DL 2016 or equivalent. Typical battery life is about two years.

CAUTION: Do not handle the batteries any more than necessary. Hands must be clean and dry.

RANGE

Normal Remote Keyless Entry (RKE) transmitter operation range for vehicles manufactured for domestic markets is up to 20 meters (66 feet) away from the vehicle. On vehicles manufactured for export markets, normal RKE transmitter range is up to 10 meters (33 feet) away from the vehicle. If a domestic market vehicle is equipped with the optional factory-installed Remote Start System, the normal transmitter range is increased to up to 91 meters (300 feet). Please note that the actual RKE transmitter range values may be better or worse than specified above, depending upon many possible variables in the environment at the specific time and location that any RKE transmission is attempted.

2009 ACCESSORIES AND EQUIPMENT

Power Mirrors - Service Information - Journey

DESCRIPTION

DESCRIPTION

AUTOMATIC DAY/NIGHT MIRROR

The automatic day/night mirror system is able to automatically change the reflectance of the inside rear view mirror in order to reduce the glare of headlamps approaching the vehicle from the rear. The automatic day/night rear view mirror receives battery current through a fuse in the junction block only when the ignition switch is in the ON position.

OUTSIDE REAR VIEW MIRROR

The power operated outside rear view mirrors allow the driver to adjust both outside mirrors electrically from the driver side front seat position by operating a switch on the door panel above the window switches. Vehicles equipped with the auto-express feature for power windows, the local interface network (LIN) controls the lock, mirror and window features.

OPERATION

OPERATION

AUTOMATIC DAY/NIGHT MIRROR

A switch located on the bottom of the automatic day/night mirror housing allows the vehicle operator to select whether the automatic dimming feature is operational. When the automatic day/night mirror is turned on, the mirror switch is lighted by an integral Light-Emitting Diode (LED). The mirror will automatically disable its self-dimming feature whenever the vehicle is being driven in reverse.

OUTSIDE REAR VIEW MIRROR

The power mirrors receive a non-switched battery feed through a fuse in the junction block so that the system will remain operational, regardless of the ignition switch position.

DIAGNOSIS AND TESTING

POWER MIRRORS

For complete circuit diagrams, refer to the appropriate wiring information.

1. Disconnect and isolate the battery negative cable.
2. Remove the power mirror switch. See **Removal** .

3. Disconnect wire connector from the switch.
4. Using two jumper wires, one connected to a 12 volt battery source, and the other connected to a good body ground. Refer to **MIRROR MOTOR TEST** for appropriate mirror response, using the mirror switch wiring harness connector.
5. If test results are not obtained as shown in the MIRROR MOTOR TEST table, check for open or shorted circuit, or replace mirror assembly as necessary.

If mirror motor tests OK, go to Mirror Switch Test.

MIRROR MOTOR TEST

MIRROR REACTION			
12 VOLT	**GROUND**	**LEFT**	**RIGHT**
6	7	-	UP
2	7	UP	-

8	7	RIGHT	-
7	1	-	LEFT
7	8	LEFT	-

MIRROR, AUTOMATIC DAY AND NIGHT

DESCRIPTION

DESCRIPTION

The automatic day/night mirror uses a thin layer of electrochromatic material between two pieces of conductive glass to make up the face of the mirror. When the mirror switch is in the On position, two photocell sensors are used by the mirror circuitry to monitor external light levels and adjust the reflectance of the mirror.

OPERATION

OPERATION

The ambient photocell sensor is located on the forward-facing (windshield side) of the rear view mirror housing, and detects the ambient light levels outside of the vehicle. The headlamp photocell sensor is located inside the rear view mirror housing behind the mirror glass and faces rearward, to detect the level of the light being received at the rear window side of the mirror. When the circuitry of the automatic day/night mirror detects that the difference between the two light levels is too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), it begins to darken the mirror.

The automatic day/night mirror circuitry also monitors the transmission using an input from the backup lamp circuit. The mirror circuitry is programmed to automatically disable its self-dimming feature whenever it senses

that the transmission backup lamp circuit is energized.

The automatic day/night mirror is a completely self-contained unit and cannot be repaired. If faulty or damaged, the entire mirror assembly must be replaced.

DIAGNOSIS AND TESTING

AUTOMATIC DAY/NIGHT INSIDE MIRROR

For complete circuit diagrams, refer to the appropriate wiring information.

1. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the automatic day/night mirror. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to step 2. If not OK, repair the open circuit as required.
2. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the automatic day/night mirror wire harness connector and a good ground. There should be continuity. If OK, go to step 3. If not OK, repair the circuit to ground as required.
3. Connect the battery negative cable. Turn the ignition switch to the On position. Set the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to step 4. If not OK, repair the open circuit as required.
4. Turn the ignition switch to the Off position. Disconnect the battery negative cable. Plug in the automatic day/night mirror wire harness connector. Connect the battery negative cable. Turn the ignition switch to the On position. Place the transmission gear selector lever in the Neutral position. Place the mirror switch in the On (the LED in the mirror switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

   NOTE: The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.

5. Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. If OK, go to step 6. If not OK, replace the faulty automatic day/night mirror unit.
6. With the mirror glass darkened, place the transmission gear selector lever in the Reverse position. The mirror should return to its normal reflectance. If not OK, replace the faulty automatic day/night mirror unit.

MIRROR, OUTSIDE REARVIEW

REMOVAL

REMOVAL

For service procedures. Refer to **Body/Exterior/MIRROR, Outside Rearview - Removal** .

SWITCH, MIRROR

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Using a trim tool, or equivalent, carefully pry up on the window switch until it disengages from the door trim panel.
3. Disconnect switch wire connector.
4. Remove switch assembly.

INSTALLATION

INSTALLATION

1. Connect switch wire connector.
2. Install the switch to the door trim panel.
3. Connect the battery negative cable.

2009 ACCESSORIES AND EQUIPMENT

Power Seats - Service Information - Journey

DESCRIPTION

DESCRIPTION

POWER SEAT SYSTEM

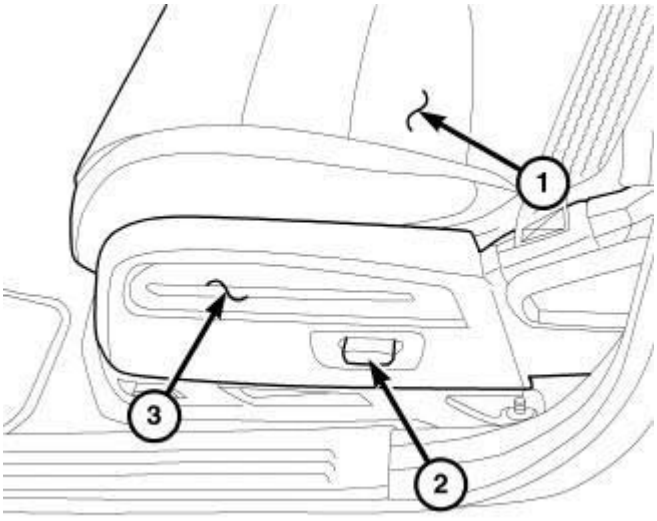

Fig. 1: Identifying Power Seat Switch, Seat Cushion & Seat Cushion Side Shield
Courtesy of CHRYSLER LLC

The driver six-way power seat is available on this vehicle. The power seat system allows the seat occupant to electrically adjust the seating position using the power seat switch assembly (2) located on the outboard seat cushion side shield (3).

The six-way power seat includes a six-way adjustable seat cushion track (1). The power seat can be adjusted up, down, front up, front down, forward, rearward. The power seat system is also available with the heated seat option. Refer to **Electrical - Heated/Cooled Systems/Heated Seats - Description** for additional information on the heated seats.

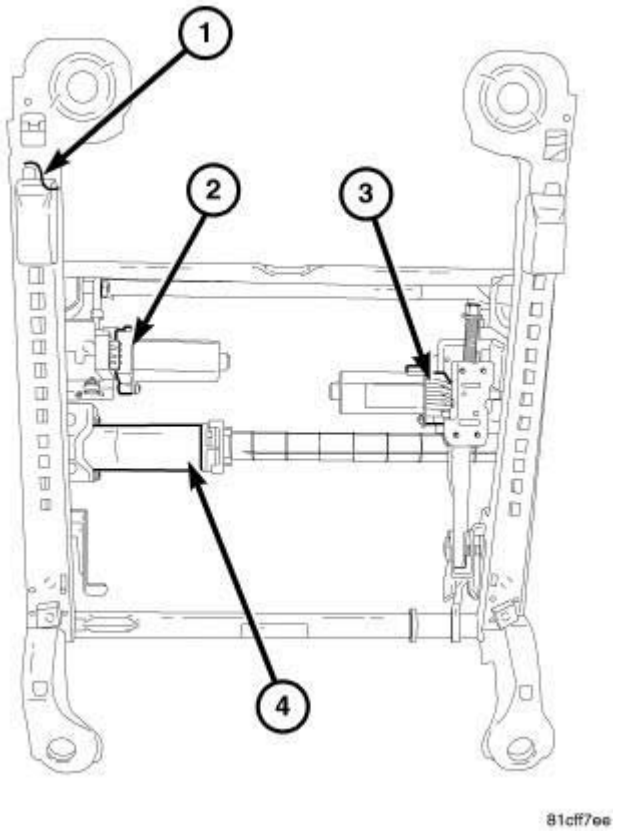

Fig. 2: Identifying Power Seat Adjuster
Courtesy of CHRYSLER LLC

The power seat adjuster (1) contains two reversible motors that are connected to worm-drive gearboxes that move the seat adjusters through screw-type drive units. These motors are the height adjust motor (3) and the front tilt motor (2). The third motor on the power seat adjuster is responsible for the fore and aft movement of the power seat. The fore/aft motor (4) is a reversible motor that is connected through two flex drive cables to a worm-drive gearbox that moves the seat adjuster through a screw-type drive unit. Each motor contains a self-resetting circuit breaker to protect it from overload. Consecutive or frequent resetting of the circuit breakers may damaged the motors.

The power seat adjuster assembly (1) includes the following major components:

The **Front Tilt Motor (2)** is located on the upper power seat adjuster assembly and controls the up and down movement of the seat front only. The front tilt motor is available as a service part and if found to be inoperative or damaged should be replaced. See **Removal** .

The **Height Adjust Motor (3)** is located on the rear of the lower power seat adjuster assembly and controls the up and down movement of the entire seat. The height adjust motor is available as a service part and if found to be inoperative or damaged should be replaced. See **Removal** .

The **Fore/Aft Motor (4)** is a reversible motor that is connected through two flex drive cables to a worm-drive gearbox that moves the seat adjuster through a screw-type drive unit. This motor is responsible for the fore and

aft movement of the power seat. The fore/aft motor is available as a service kit that includes the flex drive cables. If the motor is found to be inoperative or damaged it should be replaced. See **Removal**

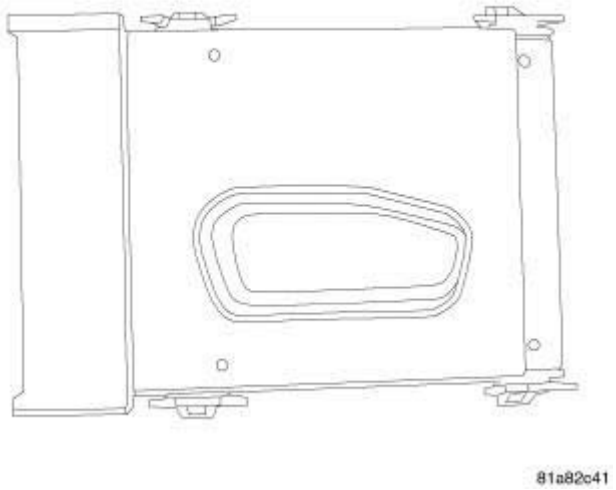

Fig. 3: Power Seat Switch
Courtesy of CHRYSLER LLC

Power Seat Switch - Vehicles may be equipped with a driver side six-way power seat switch. The power seat switches are paddle-type levers mounted on the outboard seat side shields. Movement of the seat cushions mimics the action of the switch paddles.

OPERATION

OPERATION

The power seat system receives battery current through a fuse in the Totally Integrated Power Module (TIPM) so that the power seats remain operational, regardless of the ignition switch position.

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat in the selected direction until the switch is released, or until the travel limit of the power seat track is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through the switch contacts. This causes the motor to run in the opposite direction.

DIAGNOSIS AND TESTING

POWER SEAT SYSTEM

Operate the power seat switch and move the seat in all directions. The seat should move in each of the selected directions.

If the power seat adjuster fails to operate in more than one direction, proceed as follows:

1. Inspect the power seat adjuster motors to ensure the electrical connectors are fully seated to the motors. If OK, go to 2. If not OK, connect the electrical connector to the fully seated position.
2. Check the power seat fuse in the Totally Integrated Power Module (TIPM). If OK, go to 3. If not OK, replace the inoperative fuse.
3. Remove the power seat switch from the seat cushion side panel. Check for battery voltage at the fused B (+) circuit cavity of the power seat switch wire harness connector. If OK, go to 4. If not OK, repair the open circuit to the TIPM as required.
4. Check for continuity between the ground circuit cavity of the power seat switch wire harness connector and a good ground. There should be continuity. If OK, go to 5. If not OK, repair the open circuit to ground as required.
5. See **Diagnosis and Testing** . If the switch tests OK, check the wire harness between the power seat switch and the motor. If the circuits check OK, replace the faulty power seat motor, track or seat back frame assembly. If the circuits are not OK, repair the wire harness as required.

POWER SEAT DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE	CORRECTION
Power seat inoperative in all directions	Blown Fuse or inoperative circuit breaker	Check for damaged wiring and possible circuit short, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
-	Power seat switch	Perform appropriate power seat switch test. See **Diagnosis and Testing** . Replace switch as necessary
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Fore/aft seat movement completely inoperative	Power seat switch	Perform appropriate power seat switch test. See **Diagnosis and Testing** . Replace switch as necessary
-	Fore aft motor or flex drive cable.	Replace the fore aft motor assembly.
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Up/down seat movement completely inoperative	Power seat switch	Perform appropriate power seat switch test. See **Diagnosis and Testing** . Replace switch as necessary
-	Height adjust motor or drive assembly	Replace the height adjust motor and drive assembly.

-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Seat tilt movement completely inoperative	Power seat switch	Perform appropriate power seat switch test. See **Diagnosis and Testing** . Replace switch as necessary
-	Front tilt motor or drive assembly	Replace the front tilt motor and drive assembly.
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Seat motion chattering or vibrating during fore/aft movement	Foreign material under seat or in seat track	Remove foreign material. Clean and lubricate seat tracks as necessary
-	Poor seat track lubrication	Lubricate the lower portion of the effected seat tracks
-	Loose components	Check and tighten loose components as necessary
-	Binding or sticking of components	Loosen seat track to vehicle mounting bolts. Using the power seat switch, move the effected seat reward to the track stops. Tighten track bolts to proper torque and recheck seat operation. If seat motion is still abnormal, replace the fore aft motor assembly.
-	Fore aft motor or flex drive cable.	Replace the fore aft motor assembly.
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Seat motion chattering or vibrating during up/down movement	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
-	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
-	Poor height adjust motor drive assembly lubrication	Lubricate the height adjust motor drive assembly
-	Loose components	Check and tighten loose components as necessary

-	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
-	height adjust motor or drive assembly	Replace the height adjust motor and drive assembly.
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Seat motion chattering or vibrating during seat tilt movement	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
-	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
-	Poor front tilt motor drive assembly lubrication	Lubricate the front tilt motor drive assembly
-	Loose components	Check and tighten loose components as necessary
-	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
-	Front tilt motor or drive assembly	Replace the front tilt motor and drive assembly.
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Slow seat motion during fore/aft movement	Battery voltage low	Check vehicle charging system operation. Repair charging system and charge battery as necessary
-	Poor power seat system ground	Check for loose ground connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
-	Foreign material under seat or in seat track	Remove foreign material. Clean and lubricate seat tracks as necessary
-	Poor seat track lubrication	Lubricate the lower portion of the effected seat tracks
-	Loose components	Check and tighten loose components as necessary

-	Binding or sticking of components	Loosen seat track to vehicle mounting bolts. Using the power seat switch, move the effected seat reward to the track stops. Tighten track bolts to proper torque and recheck seat operation. If seat motion is still abnormal, replace the fore aft motor assembly.
-	Fore aft motor or flex drive cable.	Replace the fore aft motor assembly.
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Slow seat motion during up/down movement	Battery voltage low	Check vehicle charging system operation. Repair charging system and charge battery as necessary
-	Poor power seat system ground	Check for loose ground connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
-	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
-	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
-	Poor height adjust motor drive assembly lubrication	Lubricate the height adjust motor drive assembly
-	Loose components	Check and tighten loose components as necessary
-	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
-	Height adjust motor or drive assembly	Replace the height adjust motor and drive assembly.
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Slow seat motion during seat tilt movement	Battery voltage low	Check vehicle charging system operation. Repair charging system and charge battery as necessary

-	Poor power seat system ground	Check for loose ground connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
-	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
-	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
-	Poor front tilt motor drive assembly lubrication	Lubricate the front tilt motor drive assembly
-	Loose components	Check and tighten loose components as necessary
-	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
-	Front tilt motor or drive assembly	Replace the front tilt motor and drive assembly.
-	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information. Repair as necessary
Squeaks, noises and rattles during fore/aft movement	Foreign material under seat or in seat track	Remove foreign material. Clean and lubricate seat tracks as necessary
-	Poor seat track lubrication	Lubricate the lower portion of the effected seat tracks
-	Loose components	Check and tighten loose components as necessary
-	Binding or sticking of components	Loosen seat track to vehicle mounting bolts. Using the power seat switch, move the effected seat reward to the track stops. Tighten track bolts to proper torque and recheck seat operation. If seat motion is still abnormal, replace the fore aft motor assembly.
-	Fore aft motor or flex drive cable.	Replace the fore aft motor assembly.
Squeaks, noises and rattles during up/down movement	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
-	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots

-	Poor height adjust motor drive assembly lubrication	Lubricate the height adjust motor drive assembly
-	Loose components	Check and tighten loose components as necessary
-	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
-	height adjust motor or drive assembly	Replace the power seat track assembly.
Squeaks, noises and rattles during seat tilt movement	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
-	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
-	Poor front tilt motor drive assembly lubrication	Lubricate the front tilt motor drive assembly
-	Loose components	Check and tighten loose components as necessary
-	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
-	Front tilt motor or drive assembly	Replace the power seat track assembly.

MOTOR, SEAT, FORE AFT

REMOVAL

REMOVAL

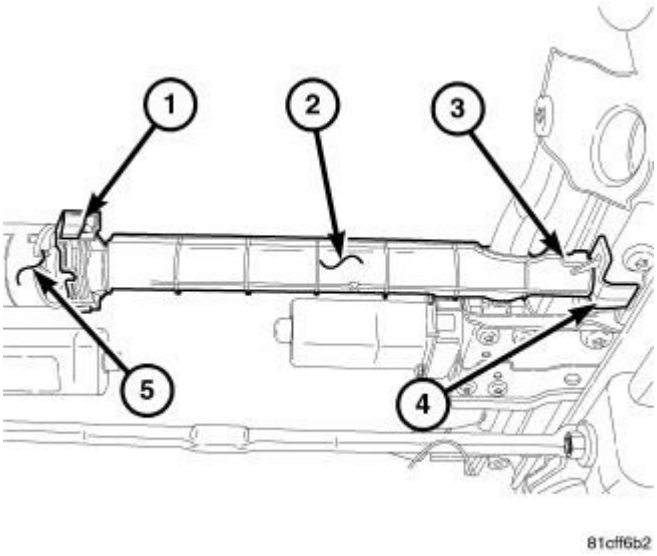

Fig. 4: Identifying Power Seat Fore/Aft Motor
Courtesy of CHRYSLER LLC

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the battery negative cable.
2. Remove the inoperative front seat assembly. Refer to **Body/Seats/SEAT - Removal** .
3. Remove the flex drive cable cover (2).

a. Using a small flat bladed tool, release the mounting strap (1) that secures the flex drive cable cover (2) to the fore/aft motor (5).
b. Pivot the cover away from the cable and pull it away from the seat frame (4) to disengage the cover slot from the mounting tab (3).

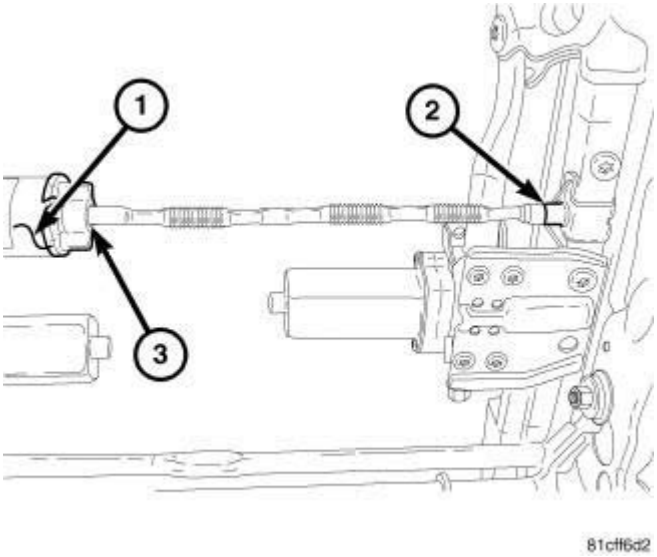

Fig. 5: Flex Drive Cable
Courtesy of CHRYSLER LLC

4. Remove the flex drive cable.
   a. Carefully bend the flex drive cable at the center and pull the motor end (3) away from the fore/aft motor (1) to disengage.
   b. Pull the cable out of the screw drive assembly (2) and remove from seat track.

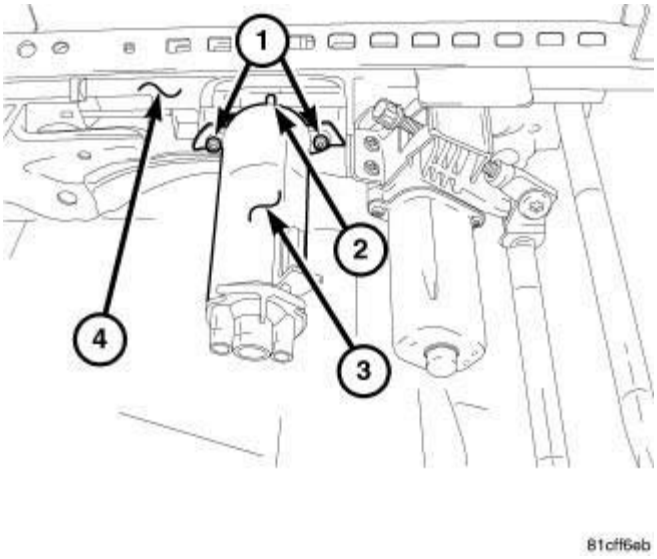

Fig. 6: Seat Frame Assembly
Courtesy of CHRYSLER LLC

5. Disconnect the fore aft motor electrical connector.
6. Remove the fore/aft motor to mounting bracket retaining screws (1).
7. Remove the fore/aft motor (3).
8. Remove the short flex drive cable (2) from the seat frame assembly (4).

INSTALLATION

INSTALLATION

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

CAUTION: Seat track side to side timing may be off if the fore aft motor was completely inoperative prior to removal. In the event the track timing is in question, proceed to 1 for track timing procedure. If track timing is not in question proceed to 2.

1. Using the square drive end of the old flex drive cable and a variable speed drill motor, drive the seat track screw drive assemblies reward until they reach the rear stops.
   a. Clamp one end of the old cable into the drill motor chuck.
   b. Put the other cable end into the seat track screw drive cable slot and slowly drive the seat track assembly reward until it reaches the rear stops. Take care not to bind the cable when the drive reaches the stop.
   c. Repeat this procedure for the other seat track.

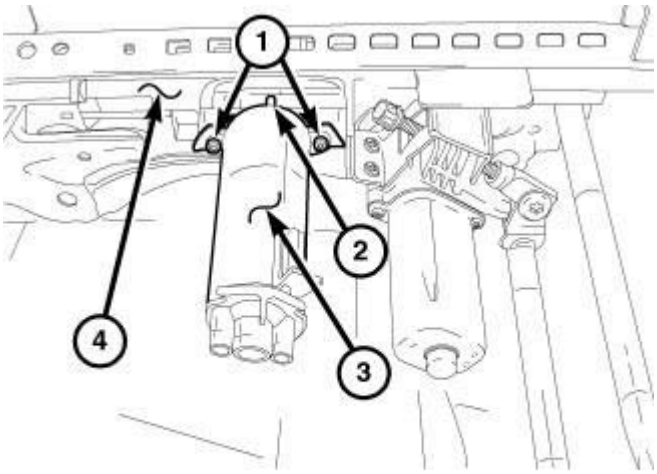

Fig. 7: Seat Frame Assembly
Courtesy of CHRYSLER LLC

2. Install the short flex drive cable (2) into the seat frame assembly (4). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the screw drive assembly.
3. Install the fore/aft motor (3) ensuring the square cable end is properly aligned and fully inserted into the square drive slot of the motor.
4. Install the motor retaining screws (1). Tighten the screws to 5 N.m (45 in. lbs.).

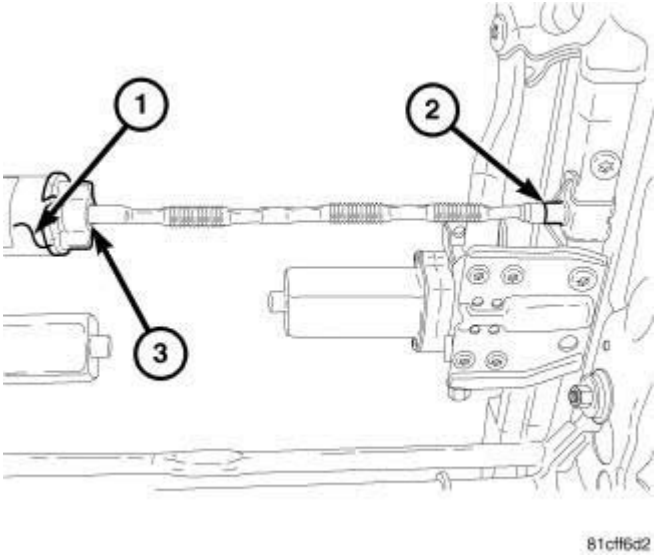

Fig. 8: Flex Drive Cable
Courtesy of CHRYSLER LLC

5. Install the flex drive cable.
   a. Install the flex drive cable into the seat frame assembly (2). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the screw drive assembly.

b. Install the flex drive cable into the fore/aft motor (1). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the motor assembly (3).

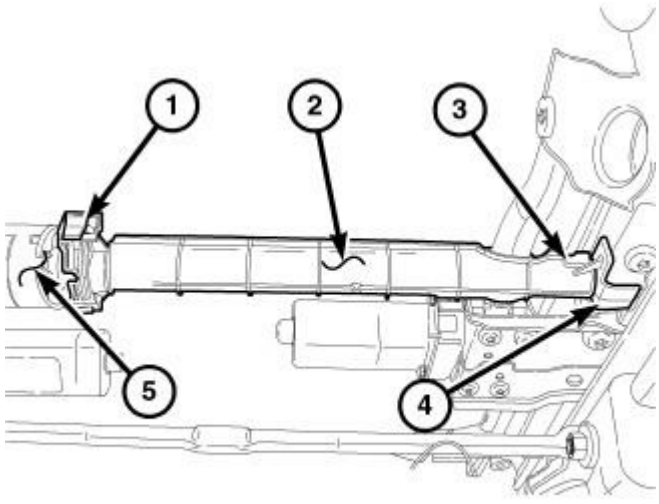

Fig. 9: Identifying Power Seat Fore/Aft Motor
Courtesy of CHRYSLER LLC

6. Position the flex drive cable cover (2) onto the seat track assembly (4). Ensure the cover slots are properly aligned and fully inserted onto the mounting tabs (3).
7. Pivot the cable cover towards the cable and onto the fore/aft motor (5).
8. Secure the cover to the motor with the retaining strap (1).
9. Connect the fore/aft motor electrical connector.
10. Install the power seat. Refer to **Body/Seats/SEAT - Installation** .
11. Verify proper power seat operation.

MOTOR, SEAT, HEIGHT ADJUST

REMOVAL

REMOVAL

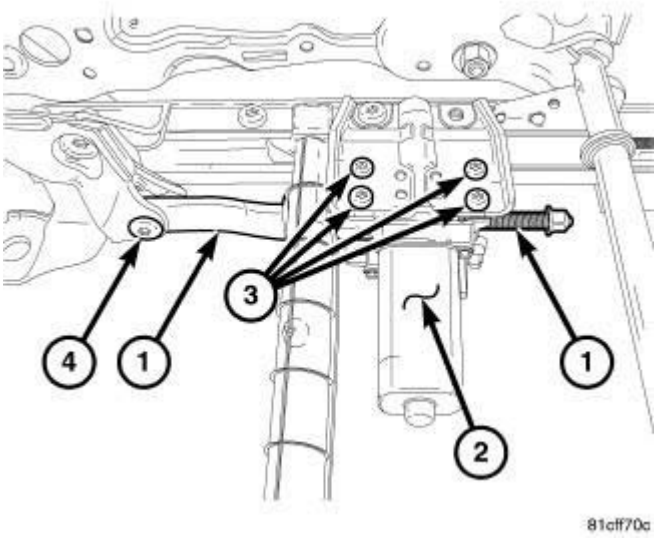

Fig. 10: Height Adjust Motor And Gearbox Assembly
Courtesy of CHRYSLER LLC

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Use caution when removing the height adjust motor and gearbox assembly (2) if the motor is inoperative, and the power seat is not in the full up position. The seat adjuster assembly is under load from the height adjust assist spring and may cause the motor to rotate under pressure when the fasteners are removed. The seat adjuster assembly also may spring upward when the motor is removed. If the height adjust motor is operative, move the power seat to the full up position prior to disconnecting the battery.

1. Disconnect and isolate the battery negative cable.
2. Remove the inoperative front seat assembly. Refer to **Body/Seats/SEAT - Removal** .
3. Disconnect the height adjust motor electrical connector.
4. Remove the height adjust motor gearbox spindle (1) retaining screw (4).
5. Remove the motor retaining screws (3).
6. Remove the height adjust motor and gearbox assembly (2) from the seat track.

INSTALLATION

INSTALLATION

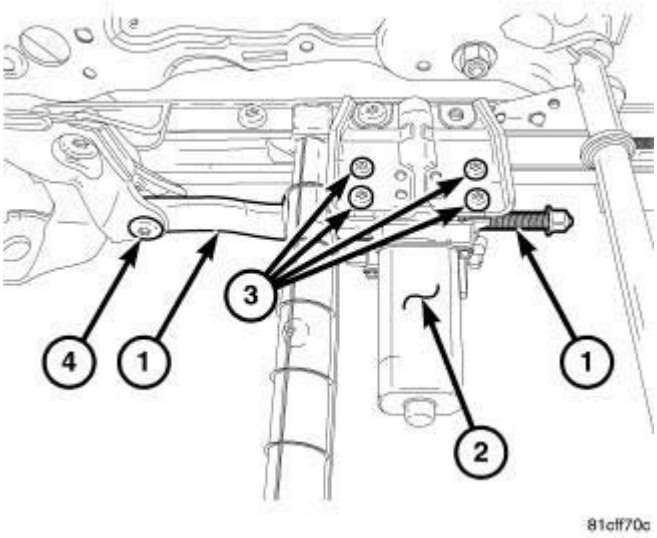

Fig. 11: Height Adjust Motor And Gearbox Assembly
Courtesy of CHRYSLER LLC

1. Screw the height adjust motor gearbox spindle (1) in or out as necessary until the motor retaining screws (3) and spindle screw (4) holes are aligned and all fasteners can be installed.
2. Position the height adjust motor and gearbox assembly (2) onto the seat track.
3. Install the motor retaining screws (3). Tighten the screws to 12 N.m (106 in. lbs.).
4. Install the height adjust motor gearbox spindle (1) retaining screw (4). Tighten the screw to 17 N.m (150 in. lbs.).
5. Connect the motor electrical connector.
6. Install the power seat. Refer to **Body/Seats/SEAT - Installation** .
7. Verify proper power seat operation.

MOTOR, SEAT, TILT

REMOVAL

REMOVAL

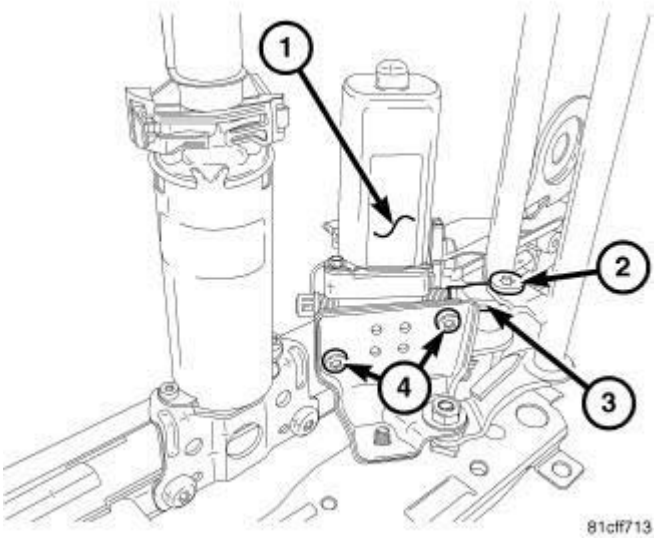

Fig. 12: Power Seat Tilt Motor And Drive Assembly
Courtesy of CHRYSLER LLC

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the battery negative cable.
2. Remove the inoperative front seat assembly. Refer to **Body/Seats/SEAT - Removal** .
3. Disconnect the front tilt motor electrical connector.
4. Remove the front tilt motor gearbox spindle (3) retaining screw (2).
5. Remove the motor retaining screws (4).
6. Remove the front tilt motor and gearbox assembly (1) from the seat track.

INSTALLATION

INSTALLATION

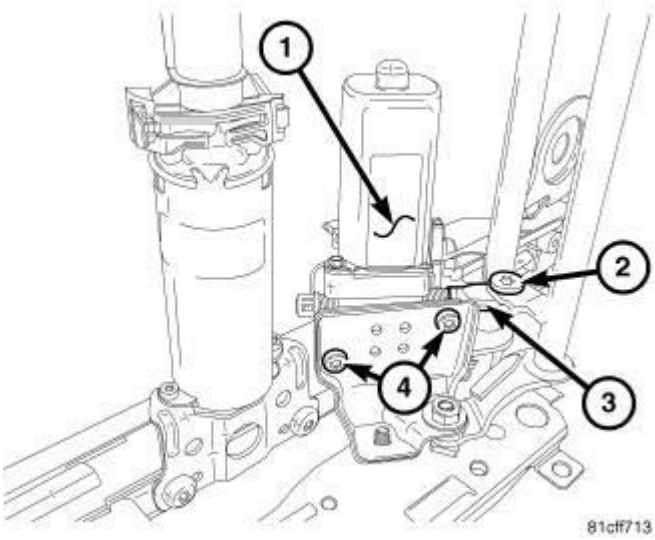

Fig. 13: Power Seat Tilt Motor And Drive Assembly
Courtesy of CHRYSLER LLC

1. Screw the front tilt motor gearbox spindle (3) in or out as necessary until the motor retaining screws (4) and spindle screw (2) holes are aligned and all fasteners can be installed.
2. Position the front tilt motor and gearbox assembly (1) onto the seat track.
3. Install the motor retaining screws (4). Tighten the screws to 12 N.m (106 in. lbs.).
4. Install the front tilt motor gearbox spindle (3) retaining screw (2). Tighten the screw to 17 N.m (150 in. lbs.).
5. Connect the motor electrical connector.
6. Install the power seat. Refer to **Body/Seats/SEAT - Installation** .
7. Verify proper power seat operation.

SWITCH, SEAT

DESCRIPTION

DESCRIPTION

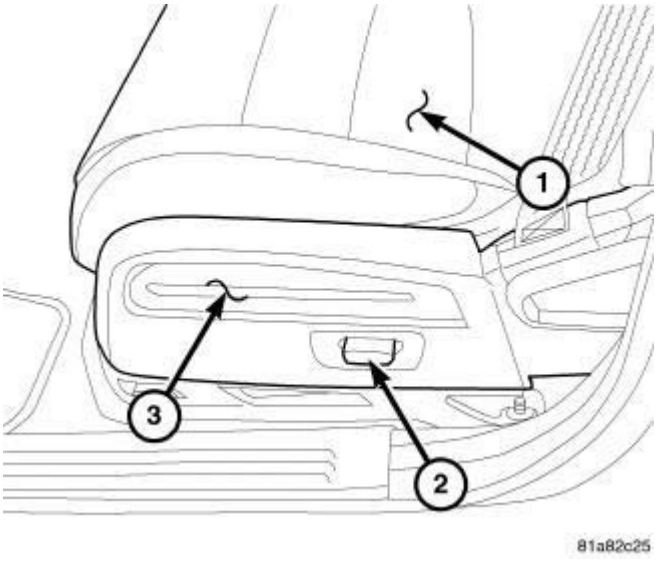

Fig. 14: Identifying Power Seat Switch, Seat Cushion & Seat Cushion Side Shield
Courtesy of CHRYSLER LLC

The driver power seat can be adjusted in six different ways using the power seat switch. The power seat switch (2) is located on the lower outboard side of the seat cushion (1) on the seat cushion side shield (3). The power seat system incorporates a seat switch with a seat cushion control paddle.

The individual components in the power seat switch assembly cannot be repaired. If the switch is damaged or inoperative, the entire power seat switch must be replaced.

OPERATION

OPERATION

When a power seat switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track adjuster motor. The selected adjuster motor operates to move the seat through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

DIAGNOSIS AND TESTING

POWER SEAT SWITCH

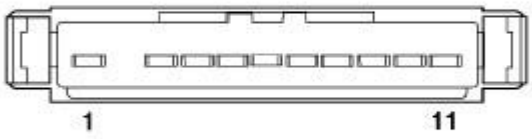

Fig. 15: Power Seat Switch Terminals
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat. See **Removal** .
3. Use an ohmmeter to test the continuity of the power seat switch. Refer to **POWER SEAT SWITCH CONTINUITY** table. If not OK, replace the faulty power seat switch. If switch tests OK. See **Diagnosis and Testing** .

POWER SEAT SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-4, 7-5, 7-8, 7-9, 7-10

REMOVAL

REMOVAL

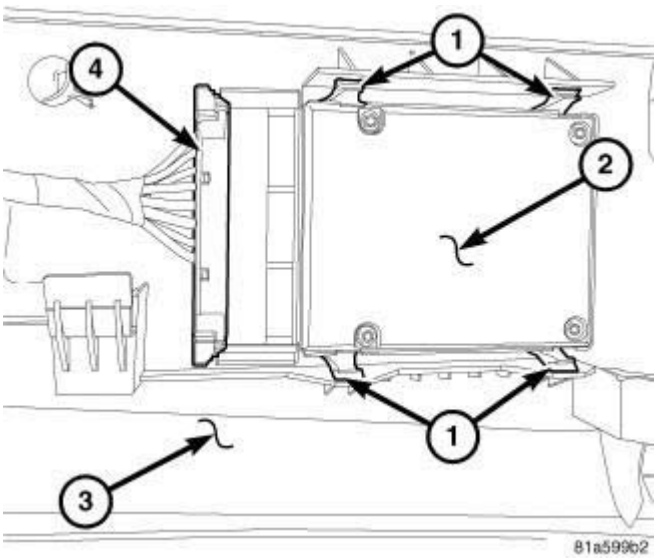

Fig. 16: Power Seat Switch
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the outboard seat cushion side shield (3).
3. Disconnect the power seat switch electrical harness connector (4).
4. Using a small flat bladed tool, gently release the four mounting tabs (1) that secure the power seat switch (2) and separate switch from side shield (3).

INSTALLATION

INSTALLATION

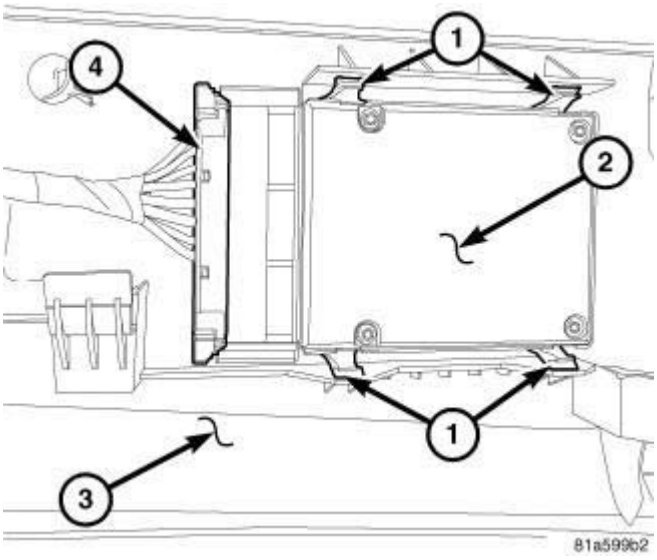

Fig. 17: Power Seat Switch
Courtesy of CHRYSLER LLC

1. Position the power seat switch (2) onto the seat cushion side shield (3). Gently apply pressure to the switch until the four mounting tabs (1) are fully seated into place.
2. Connect the power seat switch electrical connector (4).
3. Install the seat cushion outboard side shield.
4. Connect the battery negative cable.
5. Verify normal operation of the power seat assembly.

TRACK, SEAT

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Driver seat shown in illustrations. Passenger seat similar.

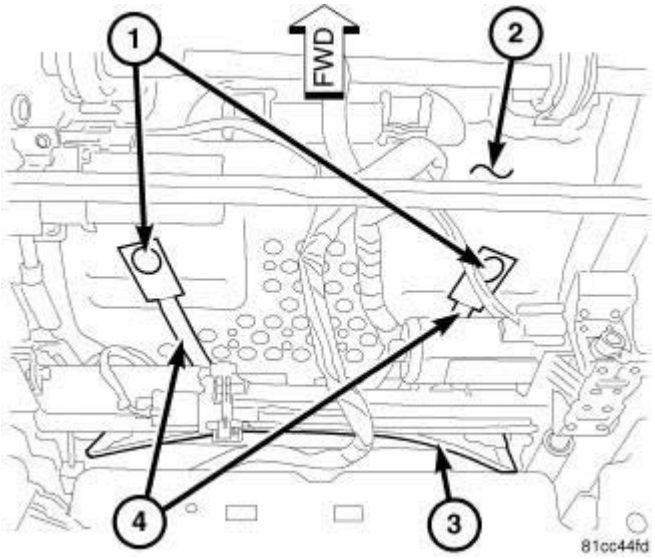

Fig. 18: Front Seat Bottom Closeout
Courtesy of CHRYSLER LLC

1. Position the seat so that the heads of the bolts which secure the rear of the seat riser to the track can be accessed.
2. Remove the seat from the vehicle and place it on a workbench. Refer to **Body/Seats/SEAT - Removal** .

3. Remove the inboard seat cushion side shield. Refer to **Body/Seats/SIDE SHIELDS, Seat Cushion - Removal** .
4. Remove the push-pin retainers (1) that secure the two elastic straps (4) of the seat bottom closeout (3) to the bottom of the seat cushion frame (2) and remove the closeout.

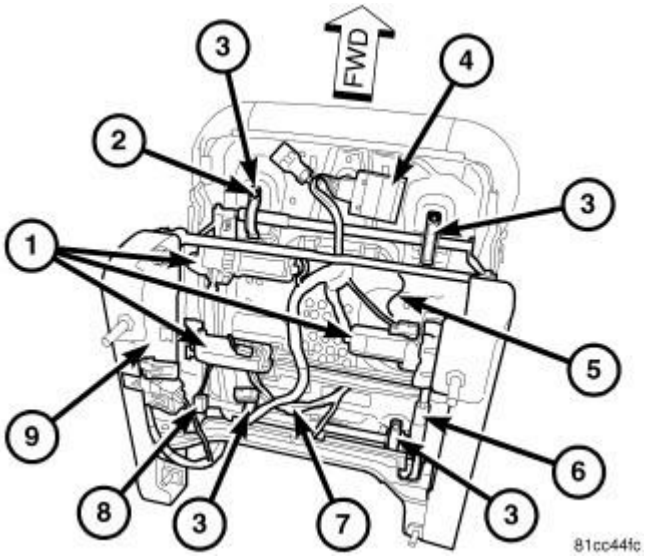

Fig. 19: Seat Cushion Frame
Courtesy of CHRYSLER LLC

NOTE: Heated seat shown in illustration. Non-heated seat similar.

5. If equipped, remove the heated seat module (4) from the bottom of the seat cushion frame (3).
6. Disconnect the wire harness connectors from the power seat motors (1) and the seat track position sensor (8) and remove the wire harness (7) from the bottom of the seat cushion frame and the seat riser (9).
7. If required, remove the seat track position sensor from the seat track.
8. Remove the bolt (2) that secures the four seat track mounting brackets (3) to the bottom of the seat cushion frame.
9. Disengage the seat track mounting brackets from the bottom of the seat cushion frame and remove the seat track assembly (6) from the frame.

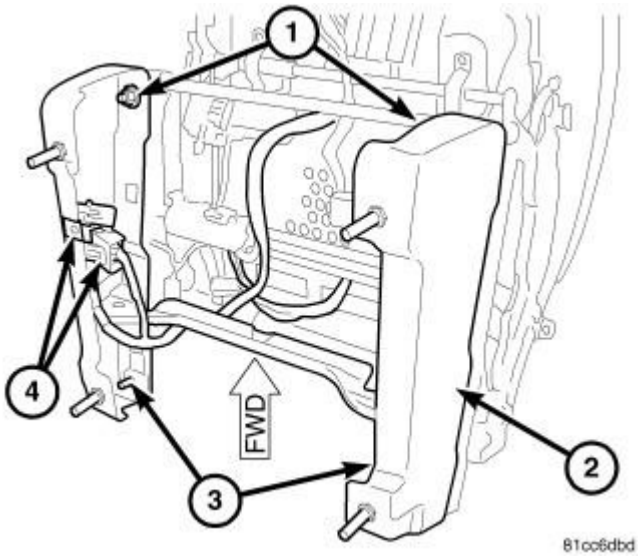

Fig. 20: Seat Riser
Courtesy of CHRYSLER LLC

10. If required, remove the wire harness retaining bracket (4) from the bottom of the seat riser (2).
11. Remove the two nuts (1) and the two bolts (3) that secure the seat riser to the seat track and remove the riser.

INSTALLATION

INSTALLATION

NOTE: Driver seat shown in illustrations. Passenger seat similar.

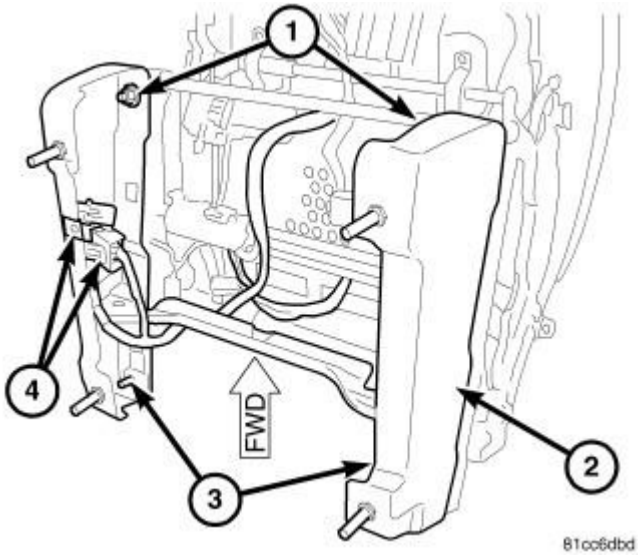

Fig. 21: Seat Riser
Courtesy of CHRYSLER LLC

1. Position the seat riser (2) to the seat track and install the retaining two nuts (1) and bolts (3). Tighten the nuts and bolts to 48 N.m (35 ft. lbs.).
2. Install the wire harness retaining bracket (4) onto the seat riser.

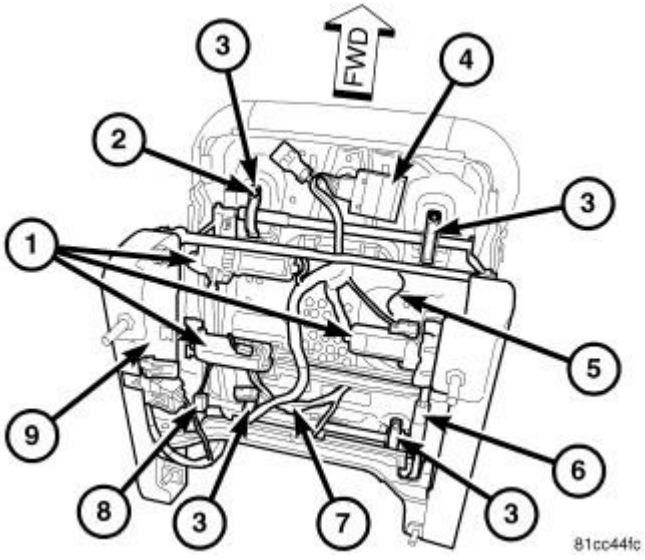

Fig. 22: Seat Track
Courtesy of CHRYSLER LLC

NOTE: Heated seat shown in illustration. Non-heated seat similar.

3. If removed, install the seat track position sensor (8).
4. Position the seat track assembly (6) to the bottom of the seat cushion frame (5). Make sure the seat track is properly located and that the plastic isolators are correctly installed.
5. Engage the four seat track mounting brackets (3) to the bottom of the seat cushion frame and install the retaining bolts (2). Tighten the bolts to 28 N.m (21 ft. lbs.).
6. Install the wire harness (7) to the bottom of the seat cushion frame and to the seat riser (9) and connect the wire harness connectors to the power seat motors (1) and the seat track position sensor.
7. If equipped, install the heated seat module (4) onto the bottom of the seat cushion frame.

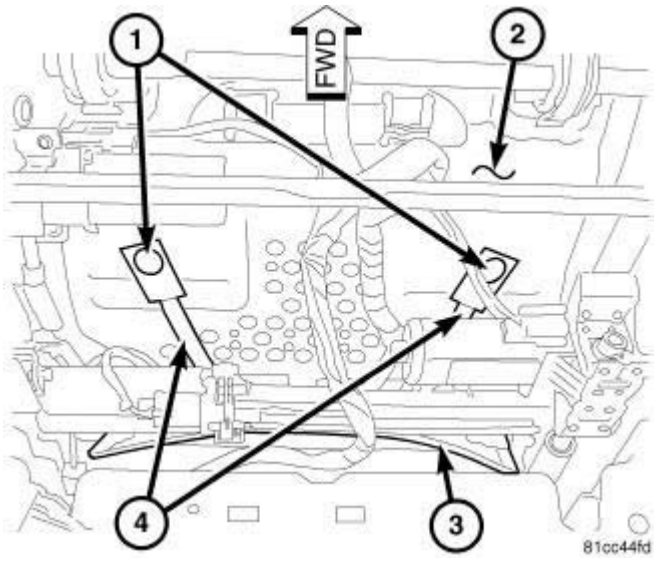

Fig. 23: Front Seat Bottom Closeout
Courtesy of CHRYSLER LLC

8. Position the seat bottom closeout (3) to the rear of the seat and install the push-pin retainers (1) that secure the two elastic straps (4) to the bottom of the seat cushion frame (2).
9. Install the inboard seat cushion side shield. Refer to **Body/Seats/SIDE SHIELDS, Seat Cushion - Installation** .
10. Install the seat into the vehicle. Refer to **Body/Seats/SEAT - Installation** .

2009 STEERING

Steering - [redacted]

DESCRIPTION

POWER STEERING SYSTEM

This vehicle comes with power steering as standard equipment. The power steering system consists of these major components:

- POWER STEERING GEAR
- POWER STEERING PUMP
- POWER STEERING PRESSURE HOSE
- POWER STEERING RETURN HOSE
- POWER STEERING SUPPLY HOSE
- POWER STEERING RESERVOIR

For information on the Power Steering Gear , refer to **Gear** . For information on the Power Steering Pump and all other components listed above, refer to **Pump** .

OPERATION

OPERATION

Turning of the steering wheel is converted into linear (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth within the steering gear. The lateral travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist steering is provided by a belt driven rotary type pump. It directs fluid through power steering fluid hoses to the power steering gear where it is used to assist the driver's turning effort.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

WARNING

WARNINGS AND CAUTIONS

WARNING: Power steering fluid, engine parts and exhaust system may be extremely hot if engine has been running. Do not start engine with any loose or disconnected hoses. Do not allow hoses to touch hot exhaust manifold or catalyst.

WARNING: Fluid level should be checked with the engine off to prevent personal injury from moving parts.

CAUTION: When the system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

CAUTION: When servicing power steering components, do not pinch off power steering hoses in an any way to stop fluid flow. Damage to hoses may result.

DIAGNOSIS AND TESTING

HYDRAULIC FLOW AND PRESSURE TEST

The following procedure is used to test the operation of the power steering system on this vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform this test anytime a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following test is performed using the Power Steering Analyzer Kit 6815 (with appropriate hoses) and Adapters from Power Steering Analyzer Adapter Kit 6893A. See **Steering - Special Tools**.

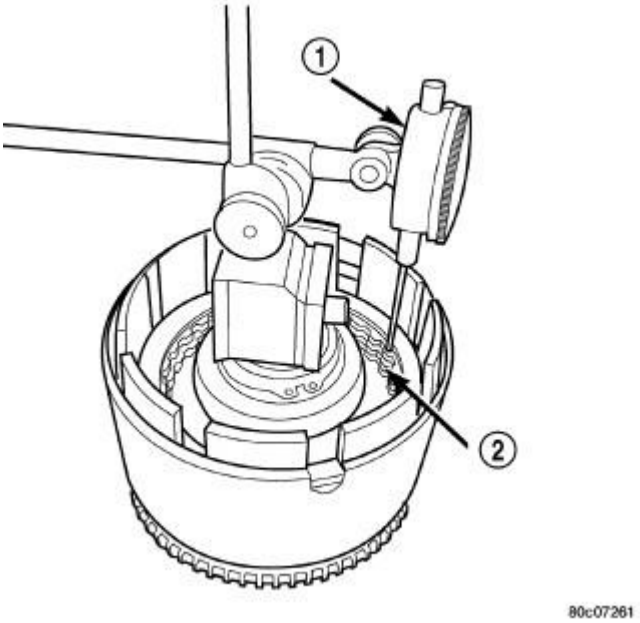

Fig. 1: Assembling Power Steering Analyzer
Courtesy of CHRYSLER LLC

1. Check power steering belt to ensure it is in good condition and adjusted properly.
2. Assemble Power Steering Analyzer as follows:

a. Gauge end (inlet) of Flow Meter And Gauge 6800 (3) - Hose 6905 (6), Hose 6713 (4), Adapter Tube 6844 (5)
b. Valve end (outlet) of Flow Meter And Gauge 6800 (3) - Hose 6959 (1), Adapter Fitting 6826 (2)

3. Un-thread pressure hose tube nut at power steering pump.
4. Connect Adapter Tube 6844 to pressure fitting on power steering pump. Tighten tube nut to specifications. See **Steering - Specifications**.
5. Connect power steering pressure hose to Adapter Fitting 6826. Tighten tube nut to specifications. See **Steering - Specifications**.
6. Open Analyzer test valve completely.
7. Start engine and allow to idle long enough to circulate power steering fluid through Analyzer flow meter and hoses.
8. Shut off engine and check fluid level; add fluid as necessary. Repeat 7 and 8 until air is bled from system.
9. Start engine and allow to idle.
10. The Analyzer gauge should read below 300 psi (2068 kPa). If above, inspect hoses for restrictions and repair as necessary. The initial pressure should be in range of 100-175 psi (689-1896 kPa). The flow meter should read above 1.5 GPM (5.7 LPM).

CAUTION: The following test procedure step involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

NOTE: The power steering pump maximum relief pressure specification for all pumps is 1640 - 1740 psi (11,307 - 11,997 kPa).

11. Close flow meter valve fully three times and record highest pressure indicated each time. **All three readings must be within specifications and within 100 psi (690 kPa) of each other.**

CAUTION: During the next step, do not force the pump to operate against the stops for more than 5 seconds at a time as pump damage may result.

- If power steering pump pressures are within specifications, but not within 100 psi (690 kPa) of each other, replace power steering pump.
- If pressures are within 100 psi (690 kPa) of each other, but are outside of specifications, replace power steering pump.

If the power steering pump requires replacement, see **Steering/Pump - Removal**.

12. Completely open the valve on the Power Steering Analyzer flow meter. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest output pressure reading against one stop is not within 100 psi (690 kPa) of the highest reading at the other stop, the steering gear is leaking internally and must be replaced.

If the power steering gear requires replacement, see **Steering/Gear - Removal**.

STEERING SYSTEM DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES, PERFORMANCE ISSUES, and FLUID ISSUES.

NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
OBJECTIONABLE HISS OR WHISTLE WHILE TURNING STEERING WHEEL WHEN STATIONARY OR MOVING SLOWLY*	1. Damaged or mispositioned steering column shaft/coupling dash boot seal.	1. Check to ensure boot is properly installed and seals against sheet metal. Reposition or replace steering column shaft/coupling dash boot seal as necessary.
-	2. Mis-routed power steering hose.	2. Check routing of power steering hoses. Ensure hoses do not come in unwanted contact with other components and objects.
-	3. Restriction in pressure or return hose.	3. Using an electronic listening tool, determine if noise is coming from either pressure or return hose. Replace hose that noise is present within.
-	4. Noisy valve in power steering gear.	4. For evaluation and correction, see **Steering/Gear - Diagnosis and Testing**.
RATTLE OR EXCESSIVE CLUNK**	1. Power steering gear loose on engine cradle/crossmember.	1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair.
-	2. Loose strut assembly mounting fasteners at tower or knuckle.	2. Check fastener torque and tighten to specifications.
-	3. Excessive play in outer tie rod.	3. For evaluation and correction, see **Steering/Gear/TIE ROD, Steering - Diagnosis and Testing**.
-	4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn.	4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary.
-	5. Wheel Mounting (Lug) nuts loose.	5. Inspect wheel mounting (Lug) nuts and studs and repair as necessary. Tighten nuts to specifications.
-	6. Power steering hose touching the body or frame of vehicle.	6. For evaluation and correction, see **Steering/Pump - Diagnosis and Testing**.
-	7. Stabilizer bar link joints	7. At park, jounce only one side of

	worn (occurs with steering input only when moving, not stationary).	vehicle front to exercise stabilizer bar. Replace stabilizer bar link.
-	8. Loose lower control arm mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when moving, not stationary).	8. Check control arm mounting bolts and tighten to specified torque.
-	9. Loose intermediate shaft or column.	9. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary.
-	10. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary).	10. Inspect bushings for wear and replace lower control arm as necessary.
-	11. Internal power steering gear noise.	11. Drive vehicle on rough road, then steer rapidly back and forth when stopped. Replace power steering gear as necessary.
-	12. Loose inner tie rod.	12. For evaluation and correction, see **Steering/Gear/TIE ROD, Steering - Diagnosis and Testing**.
-	13. Damaged engine cradle/crossmember.	13. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE	1. Loose steering gear mounting fasteners.	1. Check fasteners for proper torque and retighten as necessary.
-	2. Loose outer tie rod mounting nut or jam nut.	2. Check fastener torque. Replace nuts as necessary and tighten to specifications.
-	3. Loose intermediate (steering) shaft coupling at gear input shaft.	3. Make sure coupling is fully seated on gear input shaft. Retighten or re-seat as necessary.
-	4. Worn tie rod (outer or inner).	4. For evaluation and correction, see **Steering/Gear/TIE ROD, Steering - Diagnosis and Testing**.
-	5. Worn axle half-shaft.	5. For evaluation and correction, refer to **Differential and Driveline/Half Shaft - Diagnosis and Testing** .
CHIRP OR SQUEAL (POWER STEERING PUMP)	1. Loose power steering pump drive belt.	1. Inspect belt. Replace belt if worn or glazed. Tighten/adjust power steering pump drive belt if equipped with a manual tensioner.
-	2. Pulley alignment incorrect.	2. Realign accessory drives.

-	3. Malfunctioning belt auto-tensioner	3. Verify belt tension. Replace belt auto-tensioner.
-	4. Power steering pump noisy (worn bearing/bushing noise).	4. Using an electronic listening tool, determine if noise is coming from pump. Replace power steering pump as required.
-	5. Generator or water pump noisy.	5. Using an electronic listening tool, determine if noise is coming from Generator or water pump. Replace faulty component.
WHINE, GROWL, MOAN OR GROAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
-	2. Air in power steering fluid.	2. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. See **Steering - Standard Procedure**.
-	3. Power steering hose touching body or frame of vehicle.	3. For evaluation and correction, see **Steering/Pump - Diagnosis and Testing**.
-	4. Wear of power steering pump internal components.	4. For evaluation and correction, see **Steering/Pump - Diagnosis and Testing**.
COLD START WHINE OR MOAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
-	2. Extremely low ambient temperature (near 0 F° (-18 C°) or below)	2. Some noise is expected as pump attempts to pull cold, thick fluid. Noise should go away as vehicle warms up. Acceptable levels of excessive noise are one second at 0 F° (-18 C°) and 15 seconds at -20 F° (-29 C°). If noise is excessive, look for poor sealing on the return hose or a possible fluid leak.
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem.
-	2. Clockspring inside steering	2. Remove clockspring and reinstall

	column noisy.	steering wheel for testing. If noise is gone, replace clockspring.
-	3. Boot/dash seal lubrication inadequate.	3. Remove boot seal and recheck for noise. Lubricate seal as necessary.
-	4. Steering gear outer tie rod noisy.	4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary.
-	5. Steering gear internally noisy.	5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND.	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with original equipment size.
-	2. Worn motor or transmission mount.	2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary.
-	3. Tires contacting wheel well.	3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear.
-	4. Interference between moving steering components and other components.	4. Check for bent or misaligned components. Correct or replace as necessary.
-	5. Accessory drive pulley rubbing against another component.	5. Check pulleys for wear. Check for worn engine or transmission mount. Reposition components or replace mounts as necessary.

NOTE: * There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: ** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This

movement may be felt in the steering components during steering wheel reversal.

NOTE: * Power steering pump growl/moan/groan results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.**

PERFORMANCE ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
STEERING WHEEL OR COLUMN HAS FREE-PLAY/LASH/LOOSENESS (CLUNKING OR RATTLING)	1. Loose coupling pinch bolt at gear input shaft.	1. Check pinch bolt torque. Replace pinch bolt if equipped with thread locker patch and tighten to specifications.
-	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
-	3. Excessive free-play or noise from steering column bearings.	3. Replace steering column.
-	4. Excessive intermediate (steering) shaft coupling U-joint free-play.	4. Rotate steering wheel back-and-forth while watching coupling. Observe for free-play. Replace intermediate shaft as necessary.
-	5. Loose or worn outer tie rod.	5. For evaluation and correction, see **Steering/Gear/TIE ROD, Steering - Diagnosis and Testing**.
-	6. Lack of lubrication in lower ball joint or ball joint is damaged.	6. For evaluation, refer to **Front Suspension/Front/BALL JOINT, Suspension - Diagnosis and Testing** . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
-	7. Excessive lash inside steering gear.	7. Disconnect intermediate shaft and turn steering gear input shaft. Observe for any movement without a corresponding tire movement. Replace steering gear as necessary.
STEERING WHEEL HAS FORE AND AFT LOOSENESS.	1. Steering wheel retaining bolt loose.	1. Check steering wheel retaining bolt torque and tighten to specifications as necessary.
-	2. Loose steering column to instrument panel fasteners.	2. Check steering column to instrument panel fastener torque and tighten to specifications as necessary.

-	3. Steering column lower bearing spring retainer slipped on steering column shaft.	3. Pull steering wheel fore-and-aft while observing movement. Replace steering column as necessary.
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING STEERING MANEUVERS (ESPECIALLY AT LOW SPEED OR STANDSTILL).	1. Air in power steering fluid.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. See **Steering - Standard Procedure**.
-	2. Tire(s) not properly inflated.	2. Check and inflate tires to the specified pressure.
-	3. Excessive engine vibration.	3. Ensure that the engine is tuned properly.
-	4. Loose tie rod end jam nut.	4. Check torque and tighten the inner to outer tie rod jam nut to specifications.
-	5. Overcharged air conditioning (A/C) system.	5. Turn A/C off and verify issue goes away. Repair A/C as necessary.
-	6. Grounded, damaged or loose engine mount.	6. Visually inspect for damaged or misaligned mounts. Check fastener torque. Replace, realign or retighten as necessary.
-	7. Loose or worn outer tie rod.	7. For evaluation and correction, see **Steering/Gear/TIE ROD, Steering - Diagnosis and Testing**.
-	8. Steering gear noisy.	8. During a parking event at 0 mph, verify there is vibration only with steering. Steer in both directions and verify that the noise follows the steering input. Check TSB's for any known tuning issue. Replace steering gear as necessary.
STEERING CATCHES, SURGES OR STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN.	1. Low power steering fluid level.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system.
-	2. Tire(s) not properly inflated.	2. Check and inflate tires to the specified pressure.
-	3. Loose or slipping power steering/accessory drive belt.	3. Verify belt tension. Replace belt auto-tensioner and belt as necessary.
-	4. Lack of lubrication in lower ball joint or ball joint is damaged.	4. For evaluation, refer to **Front Suspension/Front/BALL JOINT, Suspension - Diagnosis and Testing** . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped

		with a zerk fitting, test and replace ball joint as necessary.
-	5. Lack of lubrication in steering gear outer tie rod end (s).	5. For evaluation and correction, see **Steering/Gear/TIE ROD, Steering - Diagnosis and Testing**.
-	6. Faulty power steering pump.	6. Perform Power Steering Flow and Pressure Test. See **HYDRAULIC FLOW AND PRESSURE TEST**. Look for low or erratic flow or pressure. Replace power steering pump as necessary.
-	7. Excessive friction in intermediate shaft/coupler joint.	7. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.
-	8. Excessive friction in steering column.	8. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.
-	9. Worn or binding seat and bearing in front strut assembly.	9. Disconnect outer tie rod ends from knuckles, then turn tire and wheel assembly checking for smooth operation. Replace front strut assembly seat and bearing.
-	10. Faulty steering gear.	10. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION.	1. Tire(s) not properly inflated.	1. Check and inflate tires to the specified pressure.
-	2. Improper front wheel alignment.	2. Check and adjust wheel alignment as necessary.
-	3. Lack of lubrication in lower ball joint or ball joint is damaged.	3. For evaluation, refer to **Front Suspension/Front/BALL JOINT, Suspension - Diagnosis and Testing** . Lubricate ball joint if equipped with a zerk fitting and

		check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
-	4. Excessive friction in intermediate shaft/coupler joint.	4. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler.
-	5. Excessive friction in steering column.	5. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.
-	6. Worn or binding seat and bearing in front strut assembly.	6. Disconnect steering gear outer tie rod ends at knuckles, then turn tire and wheel assembly in and out checking for smooth operation. Replace seat and bearing as necessary.
-	7. Excessive friction in power steering gear.	7. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
EXCESSIVE STEERING WHEEL KICKBACK FROM ROAD INPUTS	1. Air in power steering fluid.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. See **Steering - Standard Procedure**.
-	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
-	3. Steering column, coupling or intermediate shaft worn or loose.	3. Rotate steering wheel back-and-forth while inspecting intermediate shaft going into steering gear. Look for excessive free-play. Retighten if loose bolt is found. Replace steering column, coupling or intermediate shaft if necessary.
-	4. Power steering pump flow is	4. Perform Power Steering Flow and

	too low.	Pressure Test. See **HYDRAULIC FLOW AND PRESSURE TEST**. Look for low or erratic flow or pressure. Replace power steering pump as necessary.

FLUID ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK.	1. Loose power steering hose fittings or connections.	1. Check torque on all tube nuts (at gear and pump). Inspect clamps at all rubber hose connections for correct position, damage and tension. Tighten tube nuts as required. Reposition or replace clamps at hose connections. Clean joints and reinspect for leaks.
-	2. Damaged or missing O-ring at power steering hose tube nuts.	2. Remove tube nut and inspect O-ring. If damaged or missing, replace O-ring. Clean joints and reinspect for leaks.
-	3. Power steering line or hose failure.	3. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace hoses as necessary.
-	4. Power steering component leaking (reservoir, pump, gear).	4. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace power steering component as necessary.
AERATED FLUID*	1. Low power steering fluid level.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system.
-	2. Air leak at power steering supply hose, reservoir or pump.	2. Inspect components. Place a hand vacuum pump with Adapter 9688 on reservoir and verify that system can sustain vacuum. System should not lose more than 1 psi in 2 minutes (make sure vacuum pump is sealed well to the reservoir). Replace steering component as necessary.
RESERVOIR FLUID OVERFLOW OR FLUID THAT IS MILKY IN COLOR	1. Water contamination of power steering fluid.	1. Inspect fluid for milky appearance. Completely drain power steering fluid. Refill and bleed system. See **Steering - Standard Procedure**.

NOTE: * Extremely cold temperatures may cause power steering fluid aeration. The air should work its way out of the system as the fluid warms.

STANDARD PROCEDURE

POWER STEERING SYSTEM BLEEDING

WARNING: The fluid level should be checked with engine off to prevent injury from moving components.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

CAUTION: If the air is not purged from the power steering system correctly, pump failure could result.

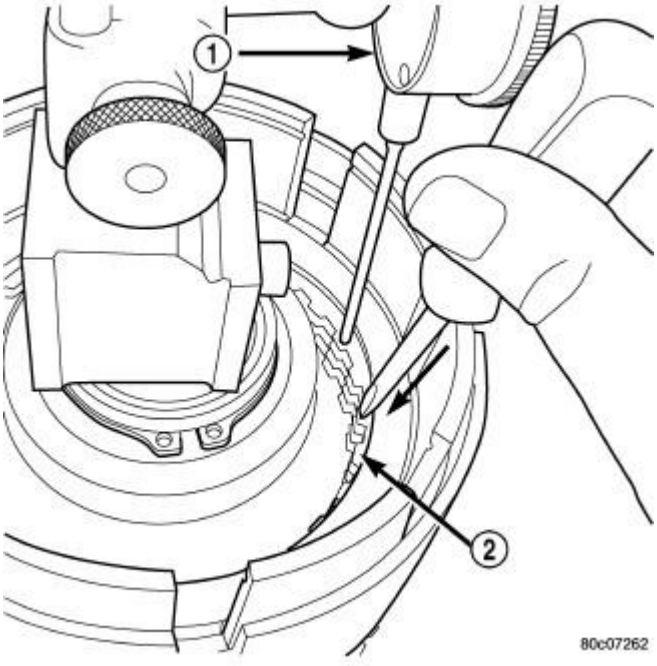

Fig. 2: Connecting Hand Vacuum Pump For Power Steering System Bleeding
Courtesy of CHRYSLER LLC

NOTE: Be sure the vacuum tool used in the following procedure is clean and free of any fluids.

1. Check the fluid level. As measured on the side of the reservoir, the level should indicate between MAX and MIN when the fluid is at normal ambient temperature. Adjust the fluid level as necessary. See

Steering/Pump/FLUID - Standard Procedure.

2. Tightly insert Power Steering Cap Adapter (4), Special Tool 9688, into the mouth of the reservoir (3).

CAUTION: Failure to use a vacuum pump reservoir (1) may allow power steering fluid to be sucked into the hand vacuum pump.

3. Attach Hand Vacuum Pump (2), Special Tool C-4207 or equivalent, with reservoir (1) attached, to the Power Steering Cap Adapter (4).

CAUTION: Do not run the engine while vacuum is applied to the power steering system. Damage to the power steering pump can occur.

NOTE: When performing the following step make sure the vacuum level is maintained during the entire time period.

4. Using Hand Vacuum Pump (2), apply 68-85 kPa (20-25 in. Hg) of vacuum to the system for a minimum of three minutes.
5. Slowly release the vacuum and remove the special tools.
6. Adjust the fluid level as necessary. Refer to Step 1.
7. Repeat Steps1 through 6 until the fluid no longer drops when vacuum is applied.
8. Start the engine and cycle the steering wheel lock-to-lock three times.

NOTE: Do not hold the steering wheel at the stops.

9. Stop the engine and check for leaks at all connections.
10. Check for any signs of air in the reservoir and check the fluid level. If air is present, repeat the procedure as necessary.

COLUMN

DESCRIPTION

DESCRIPTION

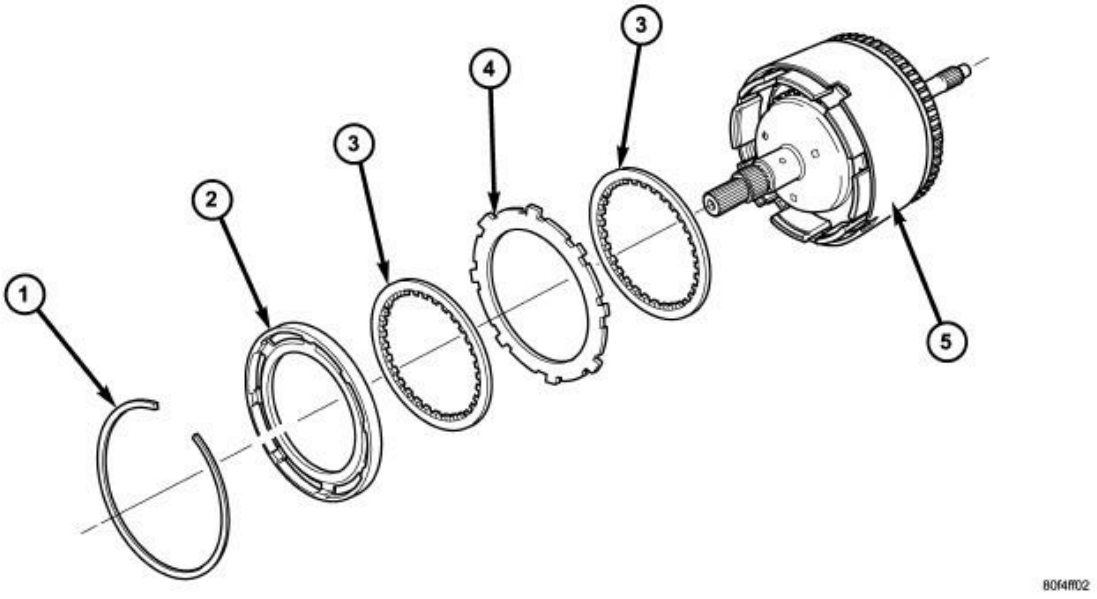

Fig. 10: Identifying Steering Column
Courtesy of CHRYSLER LLC

This vehicle is equipped with a tilt/telescoping type steering column (1). It is of the Corporate Low Pivot Column (CLPC) design family. When the lever is in the released position, the column can be tilted or telescoped manually.

The steering column is designed to be serviced only as a complete assembly if an internal component is found to be defective. The shaft, bearings and intermediate shaft are all serviced with the column.

The major components on the steering column assembly are:

- Clockspring (Integral part of Steering Column Control Module (SCCM))
- Driver Airbag
- Multi-Function Switches (left and right)
- Tilt Lever
- Shrouds
- Steering Wheel

These components can be serviced without removal of the steering column from the vehicle. Refer to the appropriate Service Information for servicing these components separately.

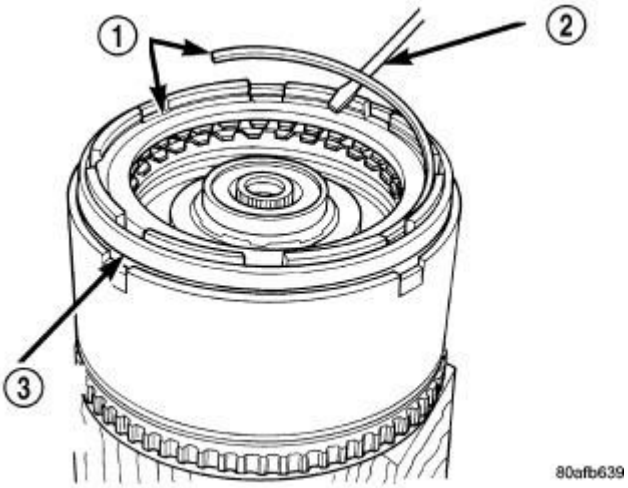

Fig. 11: Identifying Steering Column With Shaft Lock Module
Courtesy of CHRYSLER LLC

A theft deterrent devise, shaft lock module (2), is located on some steering columns (1). The electronically controlled shaft lock module locks the steering column shaft in place when the key is removed from the ignition key cylinder. For more information on the shaft lock module, refer to **MODULE, SHAFT LOCK** .

WARNING

WARNINGS AND CAUTIONS

WARNING: Safety goggles should be worn at all times when working on steering columns.

WARNING: Before beginning any service procedure that involves removing the air bag: Remove and isolate the negative (-) battery cable (ground) from the vehicle battery. This is the only sure way to disable the air bag system. Failure to do this could result in accidental air bag deployment and possible personal injury.

WARNING: The air bag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the air bag system components you must first disconnect and isolate the battery negative (ground) cable. Failure to do so could result in accidental deployment of the air bag and possible personal injury. The fasteners, screws, and bolts, originally used for the air bag components, have special coatings and are specifically designed for the air bag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books. Before servicing a steering column equipped with an air bag, refer to Restraints - Warning .

WARNING: When handling an undeployed air bag during servicing of the steering column, the following precautions should be observed:

- **At no time should any source of electricity be permitted near the inflator on the back of the air bag.**
- **When carrying a live air bag, the trim cover should be pointed away from the body to minimize injury if the air bag should accidently deploy.**
- **If the air bag is placed on a bench or other surface, the plastic cover should be face-up to minimize movement, in case of accidental deployment.**

CAUTION: Disconnect negative (ground) cable from the battery before servicing any column component.

DIAGNOSIS AND TESTING

STEERING COLUMN

The two steering column bracket halves are riveted together above the steering column with raised locator pads under the rivets (when viewed from the top). These rivets and locator pads can help determine if column has been compromised. If the steering column has collapsed, the rivets will slide down the slotted upper half of the bracket with the steering column. A collapse may occur with the tube housing moving into the rear bracket assembly OR the tube may move inside the tube housing. Typically if a collapse happens, the rivets/locator pads should indicate damage. However, if **any** of the following steps indicate a collapse, the steering column will still need replacement.

NOTE: All illustrations within this procedure are typical; however the steering column functionality is the same in all vehicles.

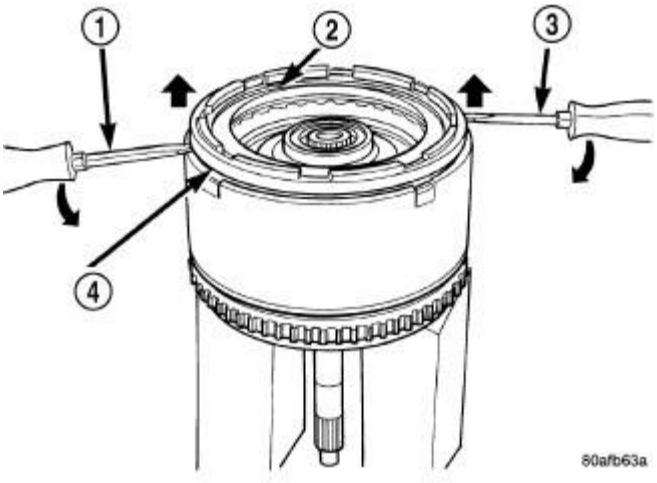

Fig. 12: Identifying Steering Column Opening Cover Reinforcement & Retaining Screws

Courtesy of CHRYSLER LLC

1. Grasp the steering wheel at the 9 and 3 o'clock positions, and again at the 12 and 6 o'clock positions and attempt to rock the steering wheel back and forth and up and down. If there is excessive movement or an audible clunking or grinding sound, replace the steering column. See **Steering/Column - Removal**.
2. Remove the steering column opening cover, and if equipped, remove the retaining screws (1) and the steering column opening cover reinforcement (2).

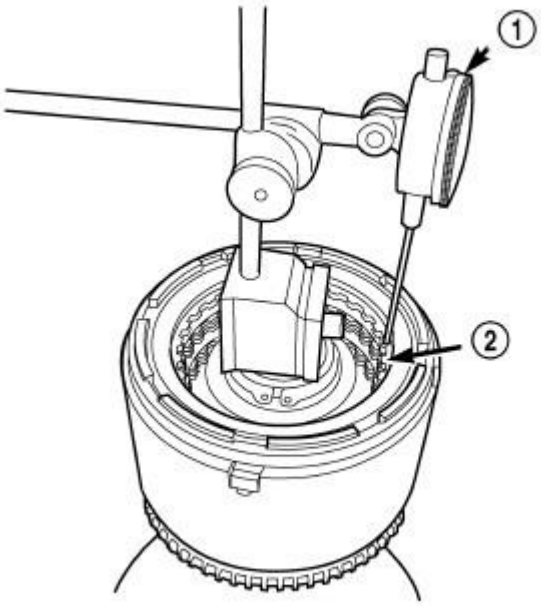

Fig. 13: Removing/Installing Upper & Lower Shrouds
Courtesy of CHRYSLER LLC

3. Remove screws from the lower column shroud (2) and remove both the upper and lower shrouds.

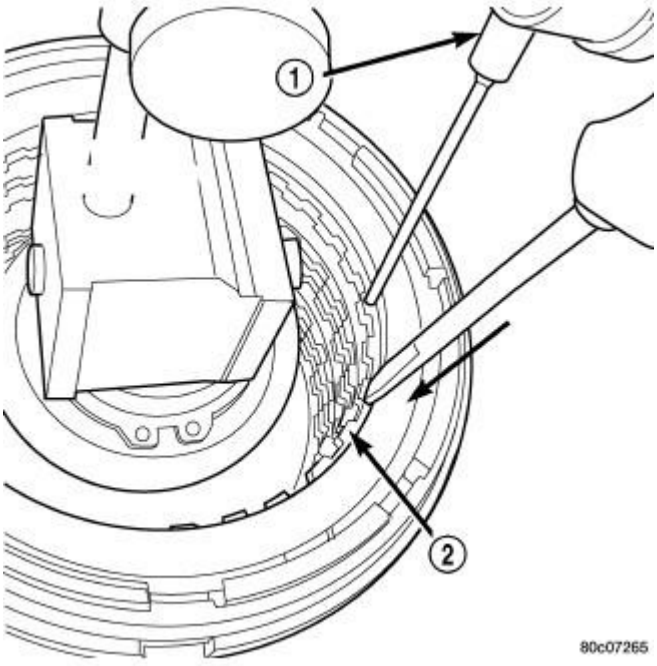

Fig. 14: Removing/Installing Rear Steering Column Mounting Bolts
Courtesy of CHRYSLER LLC

4. Remove the rear steering column mounting bolts (2).

NOTE: This illustration shows two vertical front steering column mounting bolts (3). Some steering column mounting brackets may have only one vertical mounting bolt in this position and another horizontal bolt. The horizontal bolt does not need to be loosened for this procedure.

5. Loosen the front steering column retaining bolts/nuts (3) several turns, but do not remove.

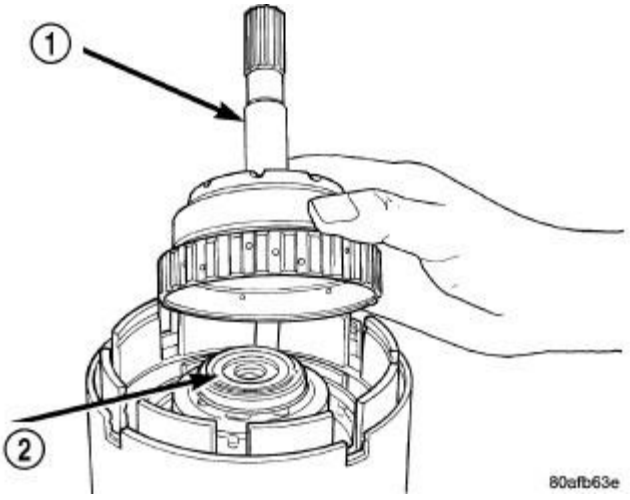

Fig. 15: Identifying Location Of Steering Column Rivets Relating To Steering Column Condition

Courtesy of CHRYSLER LLC

NOTE: A steering column which is in good condition (4) will have the rivets (2) centered on the raised locator pads (3). When a steering column is compromised (1), the rivets (2) should be moved off the locator pads (3).

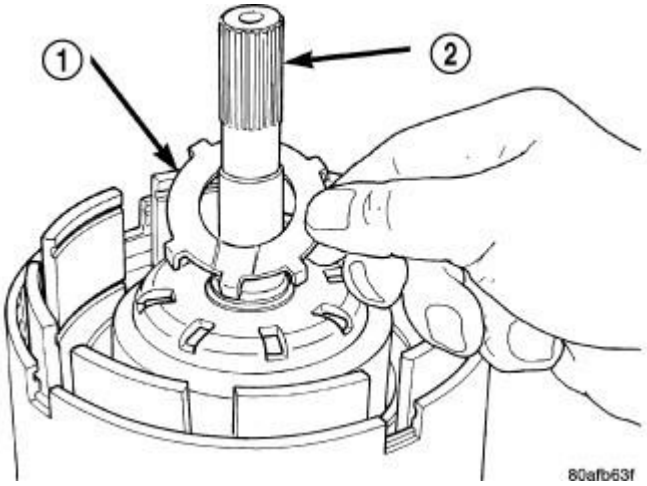

Fig. 16: Identifying Steering Column, Rivets, & Locator Pads
Courtesy of CHRYSLER LLC

6. Move the steering column assembly (1) down to view the rivets (2) in the top of the bracket (between instrument cluster and steering column). Verify that the rivets (2) have not moved off center of the locator pads (3). If the rivets (2) have moved, replace the steering column. See **Steering/Column - Removal**.

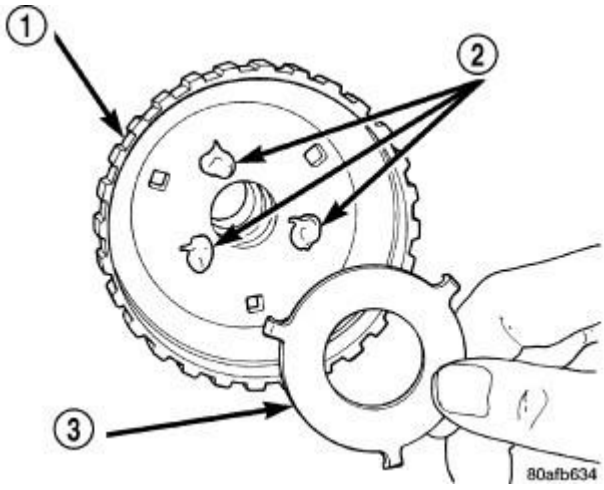

Fig. 17: Measuring Distance From Edge Of Steering Column Housing Tube To Edge Of Splined Shaft
Courtesy of CHRYSLER LLC

7. Remove the clockspring. Refer to **Restraints/CLOCKSPRING - Removal** .
8. Measure the distance from the edge of the steering column housing tube (1) to the edge of the splined

shaft (2). If the measurement (3) is less than 40 mm (1.574 in.), replace the steering column. See **Steering/Column - Removal**.

9. If the steering column passes all tests and measurements above, the steering column is not collapsed and should not need to be replaced.

REMOVAL

STEERING COLUMN

NOTE: Before proceeding, see Steering/Column - Warning.

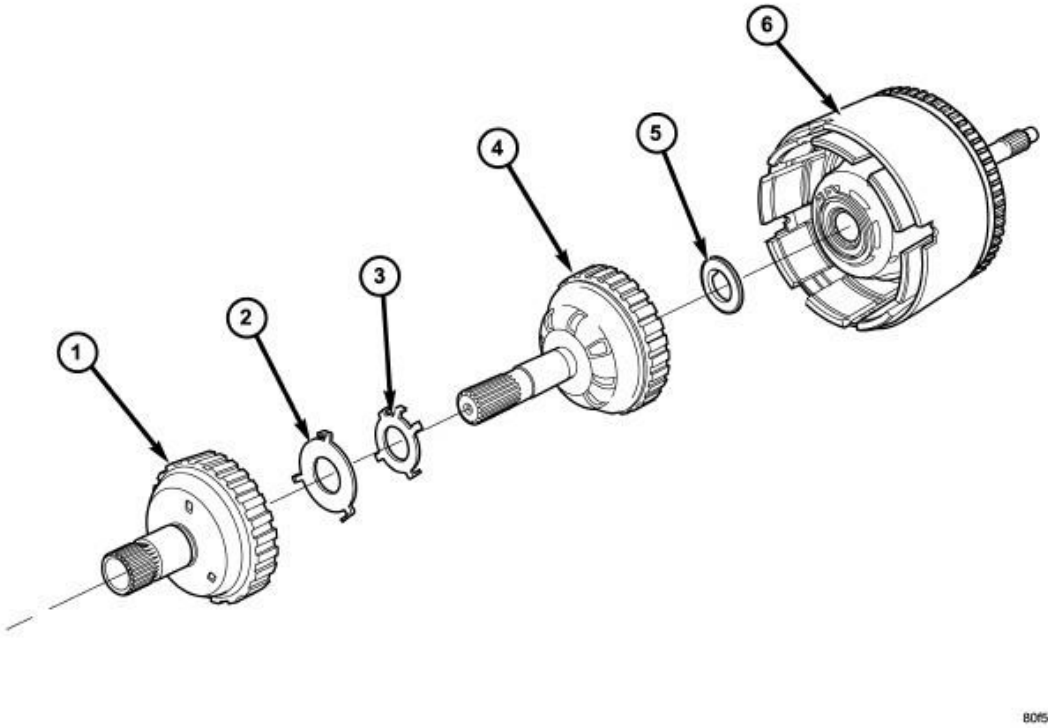

Fig. 18: Removing/Installing Steering Column Opening Cover
Courtesy of CHRYSLER LLC

1. Remove the instrument panel end cap and steering column opening cover (1). Refer to **REMOVAL** .

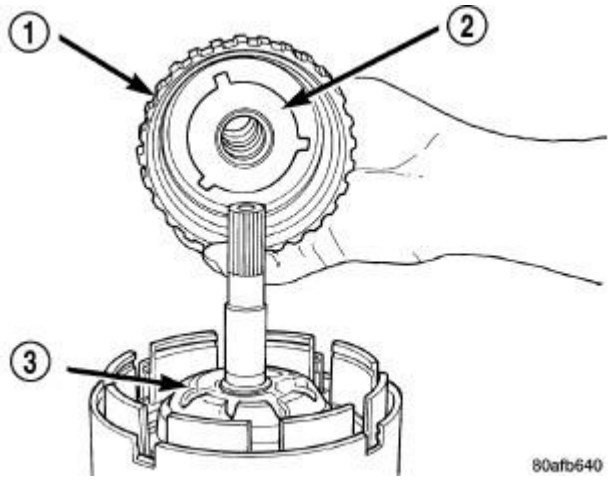

Fig. 19: Removing/Installing Steering Column Opening Reinforcement
Courtesy of CHRYSLER LLC

2. Remove the steering column cover reinforcement mounting screws (3, 4). Remove the steering column cover reinforcement (2).

NOTE: If equipped with a shaft lock module, the module cannot be removed from the steering column while the locking bolt is in the locked position without irreversibly damaging the column. Before attempting service, the ignition key must be inserted into the ignition lock cylinder. Once inserted, rotate the steering wheel from side to side. If the steering wheel can be rotated, the locking bolt is in the unlocked position. Leave the key in the ignition lock cylinder until shaft lock module removal has been completed.

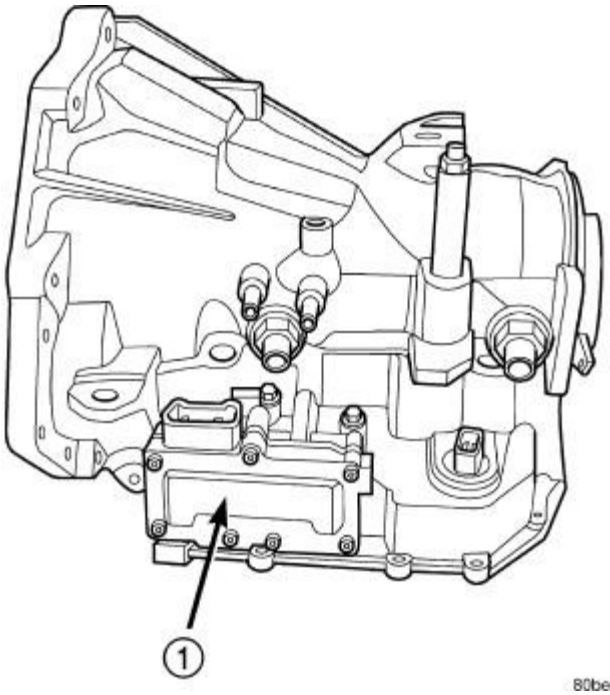

Fig. 20: Identifying Shaft Lock Module
Courtesy of CHRYSLER LLC

3. If equipped with a shaft lock module (2), perform the following steps.
   a. Insert the ignition key into the ignition lock cylinder. This will move the shaft lock module locking bolt to the unlocked position. Leave the key in the lock cylinder while the shaft lock module is being removed.
   b. Insert a suitable drift or pin punch (no more than 4 mm (5/32 in.) in diameter) into each release hole (1) on the module mounting bracket. Insert each drift or punch until it bottoms and leave in place. This will depress the two spring clips that secure the shaft lock module to the mounting bracket.
   c. Slide (and wiggle) the module toward the base of the column far enough to disengage the module from the mounting bracket.
   d. Remove the module from the steering column.
   e. Leave the wiring connector in place, but support the module to keep it away from the column and avoid wiring harness over-extension.

WARNING: When an undeployed airbag module is to be removed from the vehicle, first disconnect the battery ground cable and isolate it. Allow the system capacitor to discharge for a minimum of two minutes before starting any removal.

4. Disconnect the negative (-) cable from the battery and isolate the cable.
5. Position the front wheels of vehicle (and steering wheel) in the STRAIGHT-AHEAD position. This action will help keep the clock spring properly centered for reinstallation.

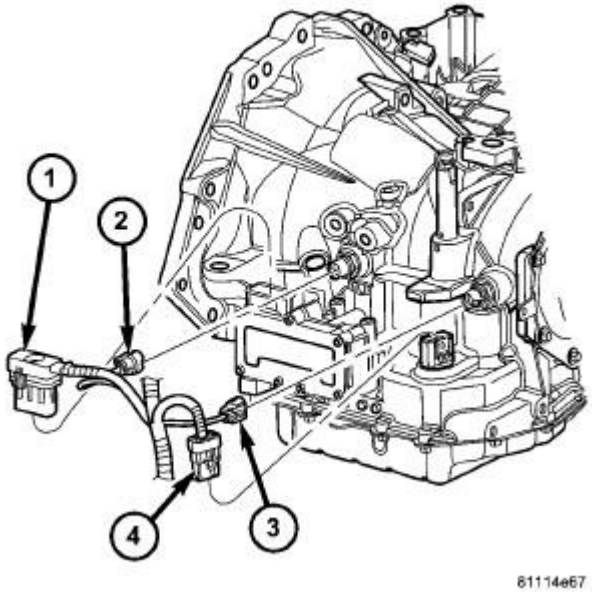

Fig. 21: Removing/Installing Driver Airbag

Courtesy of CHRYSLER LLC

6. Remove the driver airbag (1). Refer to **Restraints/AIR BAG, Driver - Removal** .

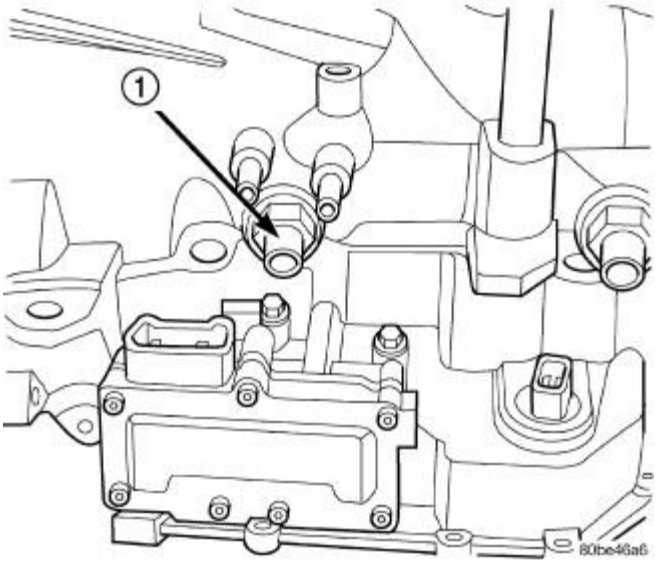

Fig. 22: Identifying Wiring Connector At Clockspring
Courtesy of CHRYSLER LLC

7. Disconnect the wiring connector (2) at the clockspring.

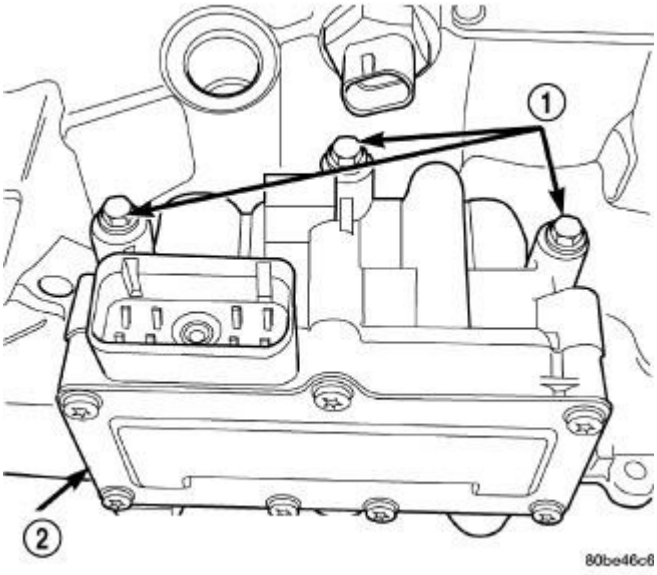

Fig. 23: Removing/Installing Steering Wheel Retaining Bolt
Courtesy of CHRYSLER LLC

8. While holding the steering wheel (4) firmly in place, remove the steering wheel retaining bolt (3) from

the steering column shaft.

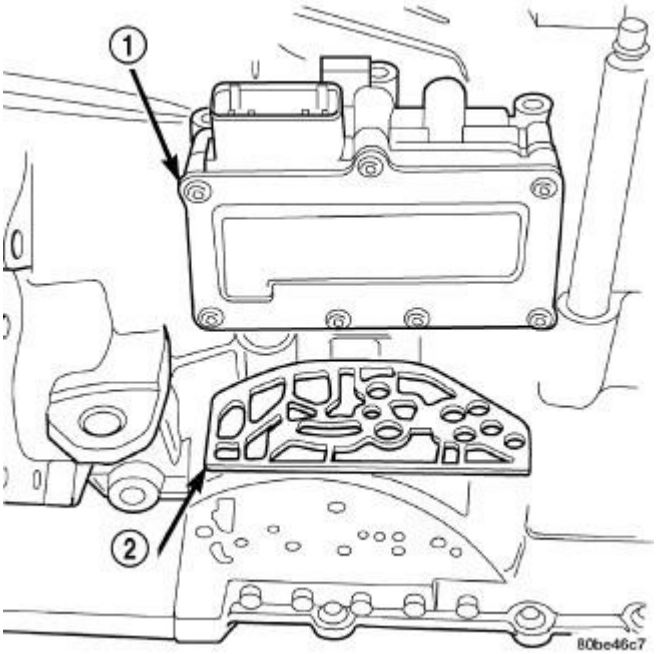

Fig. 24: Identifying Steering Wheel Puller
Courtesy of CHRYSLER LLC

CAUTION: Do not bump or hammer on the steering wheel or steering column shaft when removing the steering wheel.

9. Install an appropriate wheel puller with hooked legs (1) on the steering wheel over the steering shaft. See **Steering/Column/WHEEL, Steering - Removal**.

CAUTION: Do not attempt to rotate the clockspring rotor once the steering wheel is removed. The clockspring must remain centered in its travel to avoid overextending the clockspring inner parts, causing the clockspring to become inoperative. If removed and handled properly using the correct procedures, it should remain in the "centered" position. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the clockspring centering procedure before installing the steering wheel. Refer to Restraints/CLOCKSPRING - Standard Procedure .

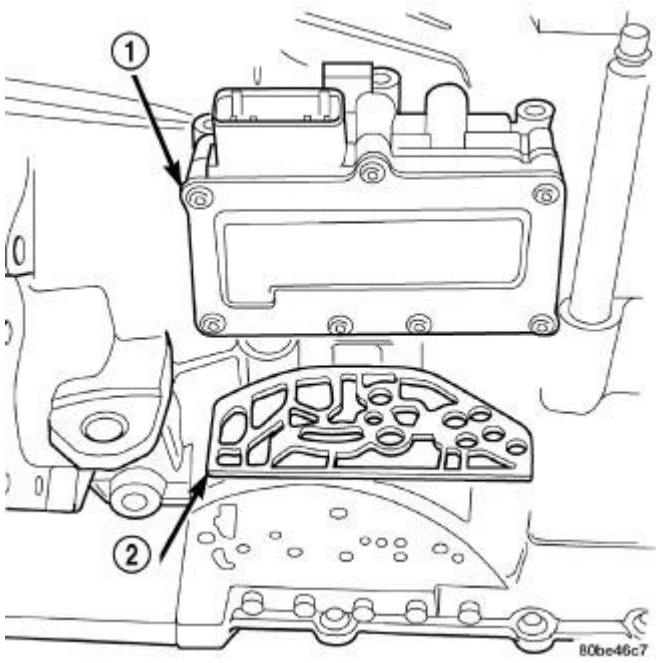

Fig. 25: Identifying Steering Wheel Puller
Courtesy of CHRYSLER LLC

10. While holding the steering wheel firmly in the STRAIGHT-AHEAD position, release the steering wheel from the steering column shaft splines using the wheel puller (1). Remove the steering wheel.

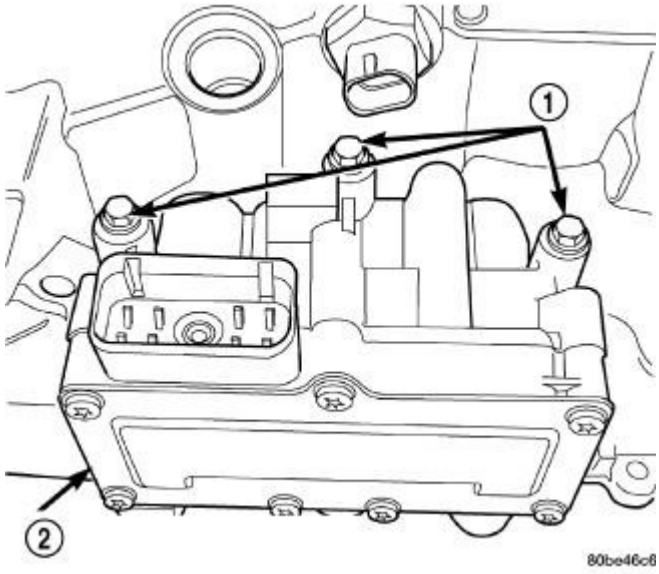

Fig. 26: Removing/Installing Upper & Lower Shrouds
Courtesy of CHRYSLER LLC

11. Push the tilt lever (3) downward to the released position.

12. Remove the two screws (1) attaching the upper shroud to the lower shroud. After removing the screws, un-clip the upper and lower shrouds from one another by applying hand pressure along the seams where the shrouds connect on the sides.
13. Remove the upper shroud.
14. Remove the remaining screw (2) attaching the lower shroud (4) to the column.
15. Remove the lower shroud.
16. Push the tilt lever (3) upward, locking the column in place.
17. Disconnect the wiring harness connectors at the Steering Column Control Module (SCCM).

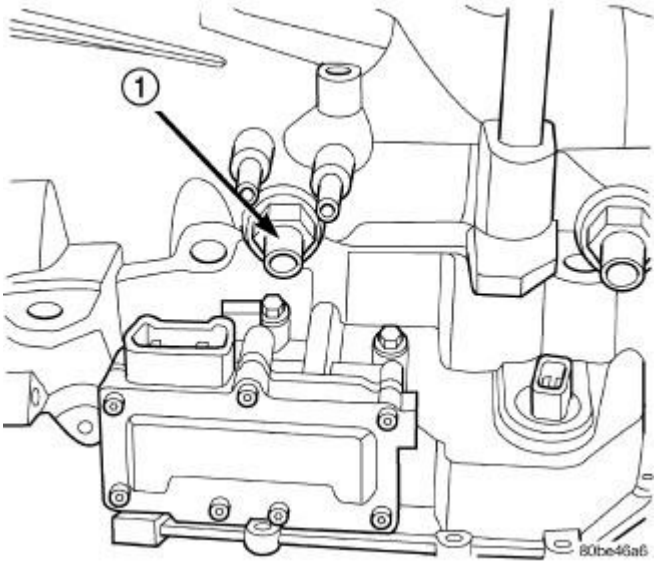

Fig. 27: Identifying Adjustable Pedals Switch
Courtesy of CHRYSLER LLC

18. If equipped, disconnect the wiring harness connector (1) at the adjustable pedals switch (3).

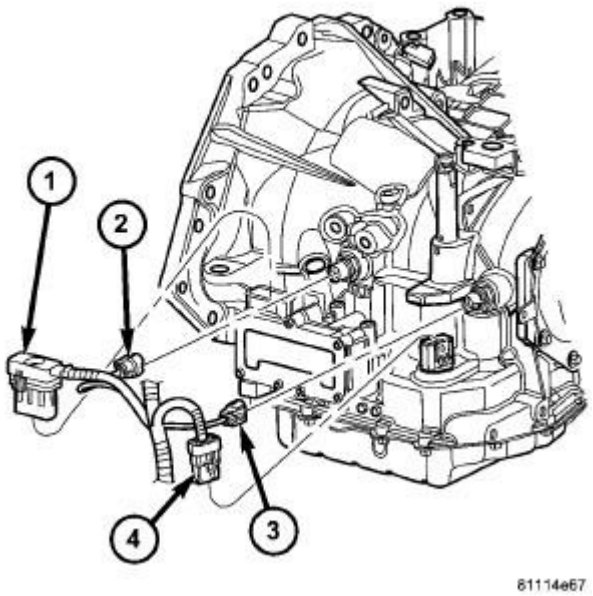

Fig. 28: Identifying Intermediate Shaft & Coupling Bolt
Courtesy of CHRYSLER LLC

19. Remove the intermediate shaft coupling bolt (1).
20. Separate the intermediate shaft (2) at the base of the column from the shaft extension (3).

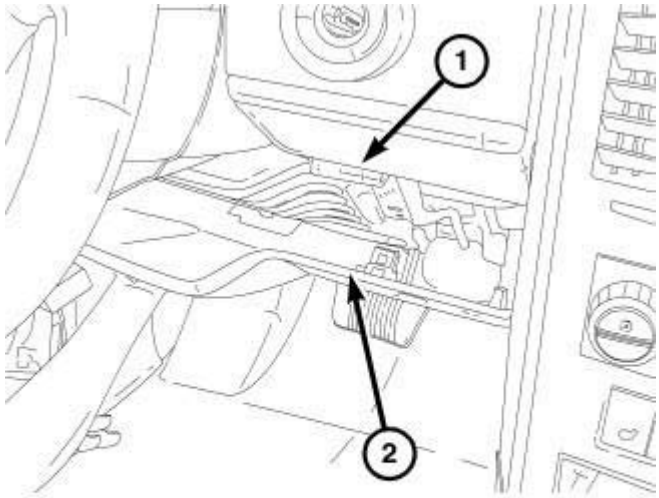

Fig. 29: Removing/Installing Wiring Harness Routing Clips
Courtesy of CHRYSLER LLC

21. Remove the wiring harness routing clips (1) from the bottom of the Steering Column.

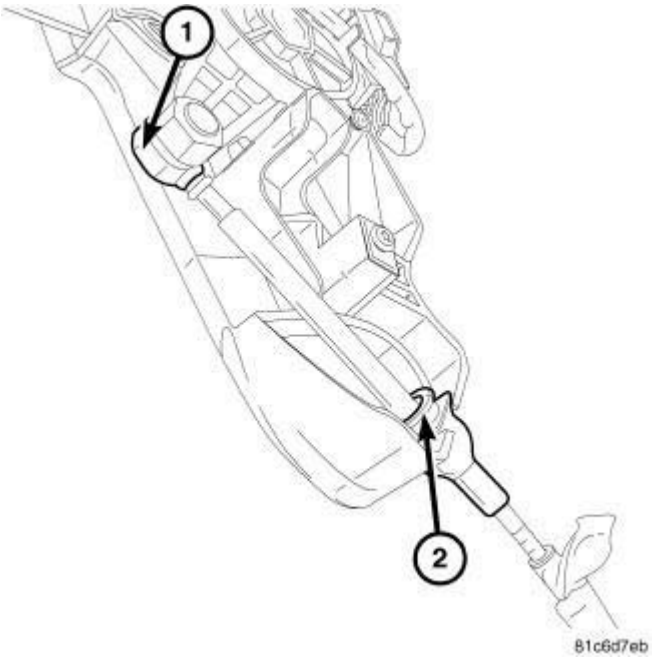

Fig. 30: Identifying Steering Column Mounting Nuts
Courtesy of CHRYSLER LLC

NOTE: If the same steering column is to be reinstalled, clamp the tilt lever to lock the column in place so that it can be easily reinstalled in the same orientation.

22. Remove the mounting nuts (1) attaching the steering column (2) to the instrument panel.
23. Remove the steering column from the vehicle.
24. To remove remaining components from the column, see **Steering/Column - Disassembly**.

RIGHT-HAND DRIVE

Right-Hand Drive steering column is typical of Left-Hand Drive. See **Column**.

DISASSEMBLY

DISASSEMBLY

STEERING COLUMN CONTROL MODULE

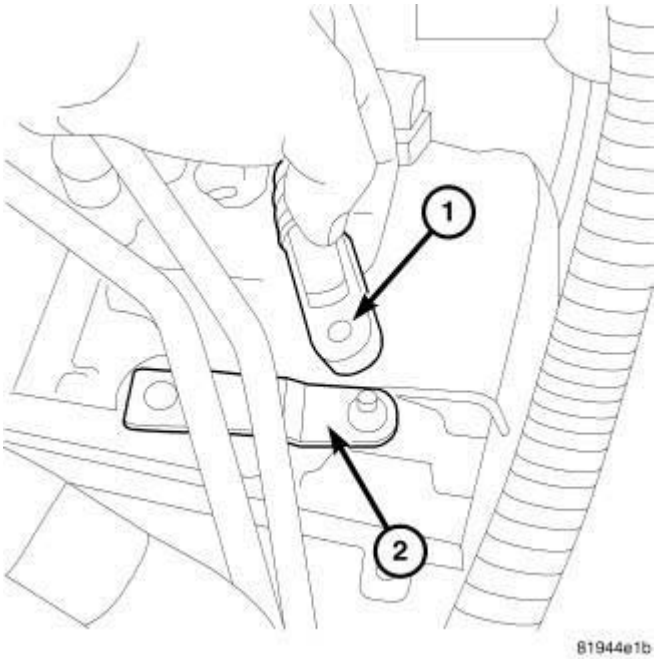

Fig. 31: Identifying SCCM Lower Mounting Screw
Courtesy of CHRYSLER LLC

1. Remove the lower mounting screw (2) attaching the Steering Column Control Module (SCCM) to the steering column.

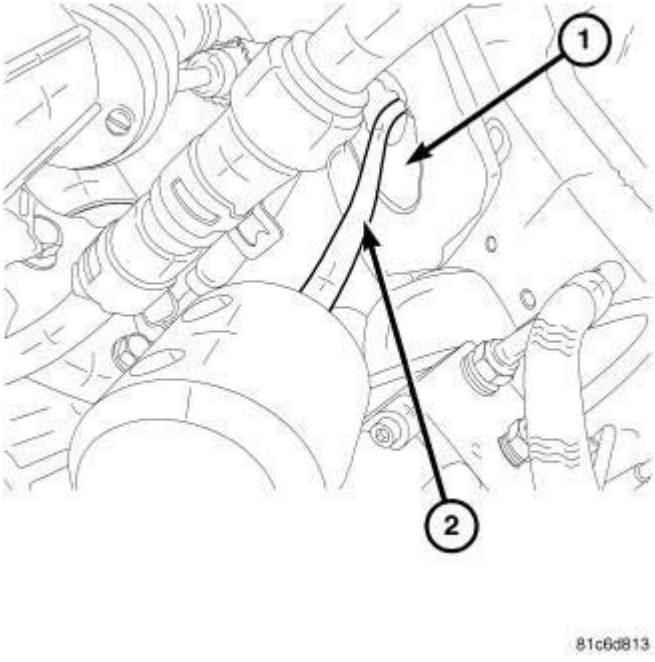

Fig. 32: Identifying SCCM Upper Mounting Screws
Courtesy of CHRYSLER LLC

2. Remove the two upper mounting screws (1) attaching the SCCM to the steering column.

3. Slide the SCCM off the steering column (2).

INSPECTION

INSPECTION

Inspect the column for damage any time the driver airbag has deployed.

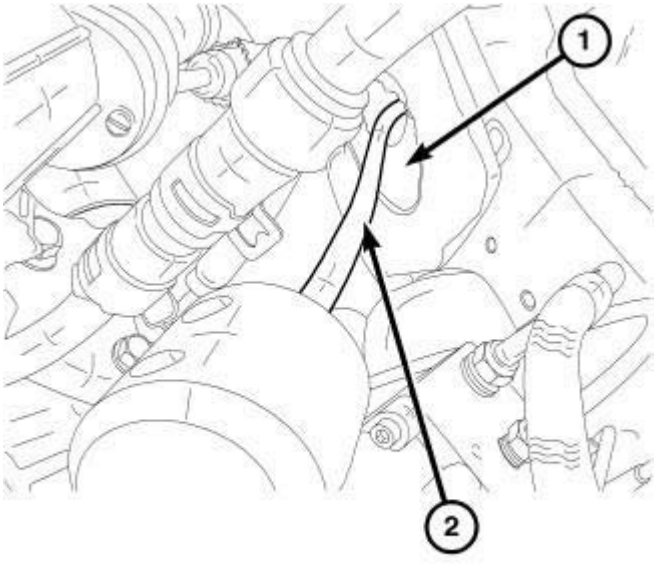

Fig. 33: Identifying Steering Column Rivets At Top Of Mounting Pads
Courtesy of CHRYSLER LLC

Lower the steering column from its mount and inspect the column collapse feature. If the rearmost rivets (1) have dislodged from top of their mounting pads (2), into the mounting bracket slots, the column must be replaced. **NO attempt should be made to return the rivets to the top of the pads.**

If any physical damage or stress cracks are present on the column, the column must be replaced.

ASSEMBLY

ASSEMBLY

STEERING COLUMN CONTROL MODULE

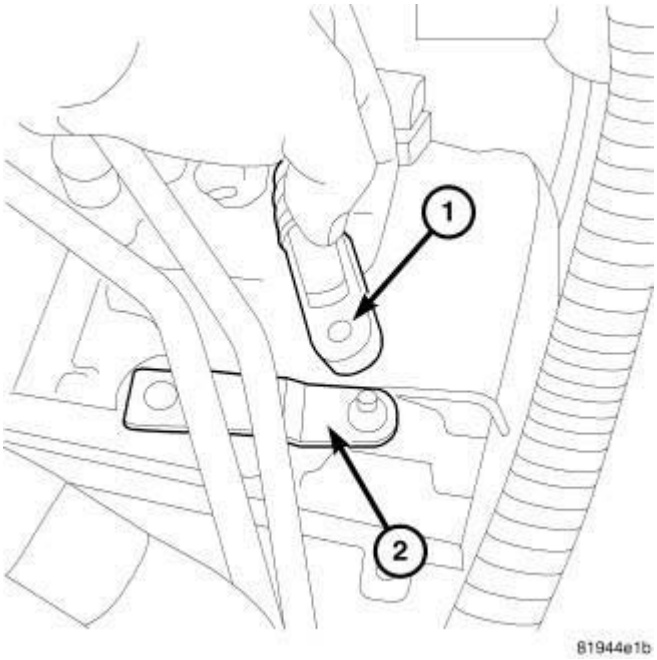

Fig. 34: Identifying SCCM Upper Mounting Screws
Courtesy of CHRYSLER LLC

1. Slide the Steering Column Control Module (SCCM) (with switch stalks) (2) onto the steering column (3).
2. Install the upper mounting screws (1) attaching the SCCM to the steering column. Tighten the screws securely.

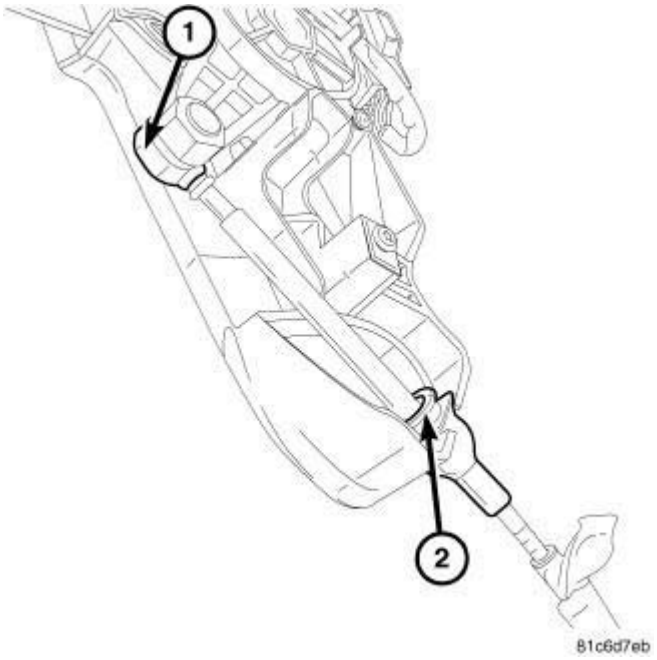

Fig. 35: Identifying SCCM Lower Mounting Screw
Courtesy of CHRYSLER LLC

3. Install the lower mounting screw (2) attaching the SCCM to the steering column. Tighten the screws securely.

INSTALLATION

STEERING COLUMN

1. If the steering column is being replaced, assemble components on the steering column as necessary before column installation. See **Steering/Column - Assembly**.

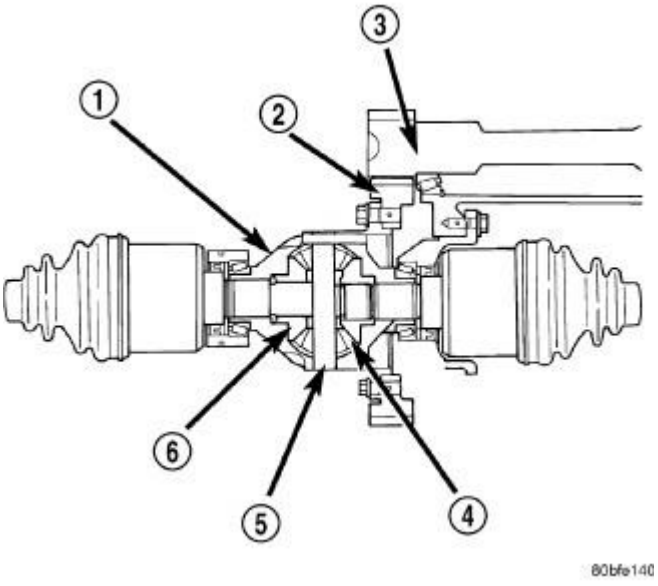

Fig. 36: Identifying Steering Column Mounting Nuts
Courtesy of CHRYSLER LLC

NOTE: When installing a tilt column, do not release the tilt lever from the locked position until after the column is installed on the instrument panel.

2. Install the steering column through the steering column opening.
3. Raise the steering column (2) onto the mounting studs and install the mounting nuts (1) on the studs. Starting with the left upper nut and proceeding in a clockwise tightening sequence, tighten all four mounting nuts to 28 N.m (21 ft. lbs.).

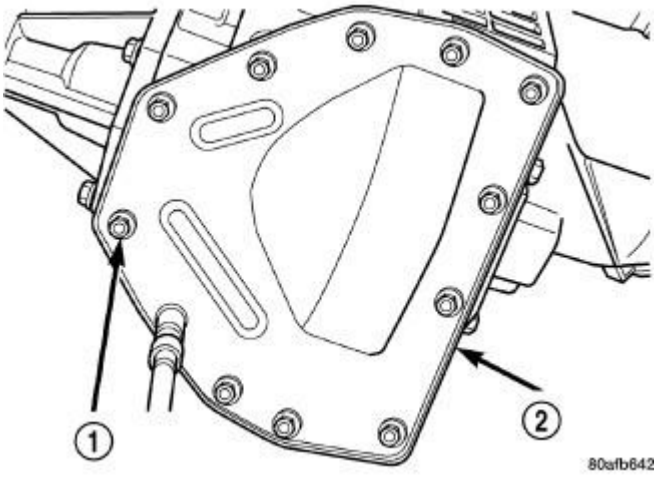

Fig. 37: Identifying Intermediate Shaft & Coupling Bolt
Courtesy of CHRYSLER LLC

4. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
5. Collapse the intermediate shaft (2). Center it over the shaft extension (3), lining up the ends, then slide the intermediate shaft onto the shaft extension.
6. Install the intermediate shaft coupling bolt (1). Tighten the bolt to 42 N.m (31 ft. lbs.).

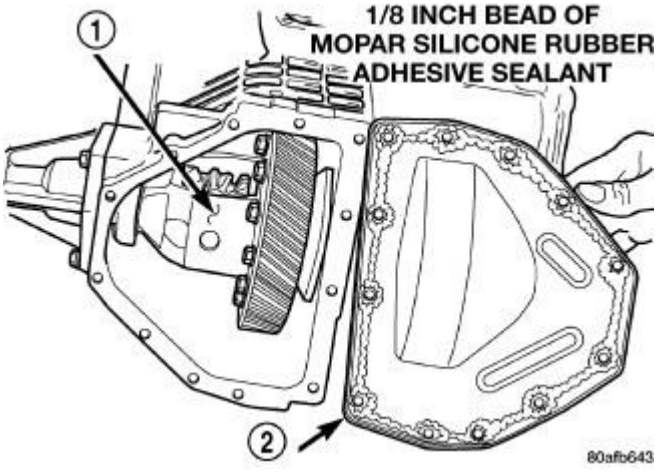

Fig. 38: Removing/Installing Wiring Harness Routing Clips
Courtesy of CHRYSLER LLC

7. Install the wiring harness routing clips (1) on the bottom of the steering column.
8. Connect the wiring harness connectors to the Steering Column Control Module (SCCM).
9. Connect any other the wiring harness connectors.

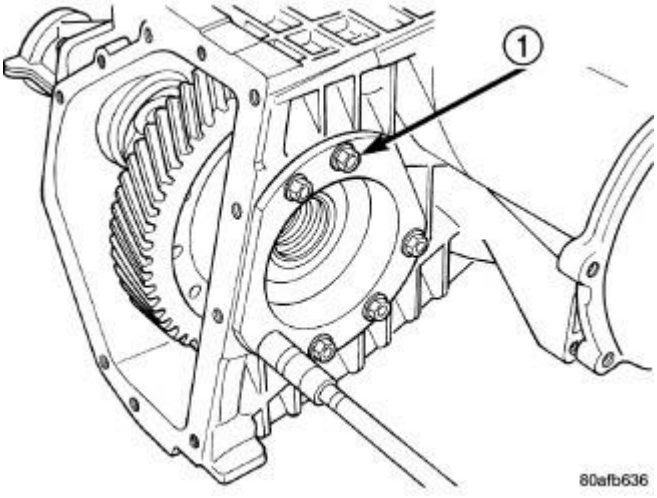

Fig. 39: Identifying Adjustable Pedals Switch
Courtesy of CHRYSLER LLC

10. If equipped, connect the wiring harness connector (1) to the adjustable pedals switch (3).

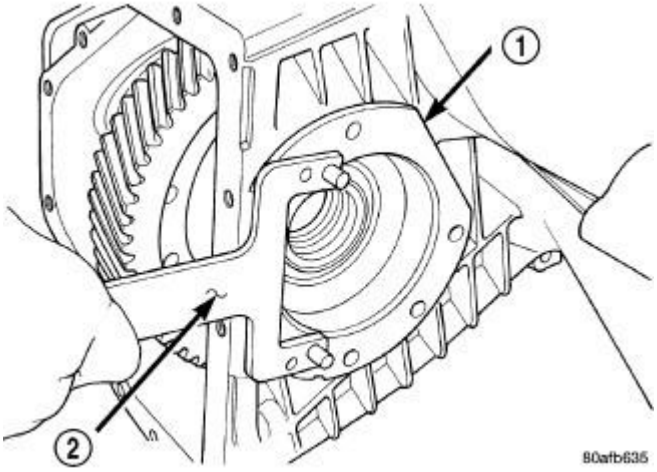

Fig. 40: Removing/Installing Upper & Lower Shrouds
Courtesy of CHRYSLER LLC

11. Push the tilt lever (3) downward (released position).
12. Position the column tilt at the full-upward position.
13. Install the lower shroud (4) over the tilt lever and onto the column.
14. Install the screw (2) attaching the lower shroud (4) to the steering column.
15. Position the upper shroud on the column.
16. Clip the shrouds to one another.
17. Install the two screws (1) attaching the lower shroud to the upper shroud.
18. Push the tilt lever upward, locking the column in place.

CAUTION: When installing the steering wheel, the clockspring must be centered in its travel to avoid overextending the clockspring inner parts, causing the clockspring to become inoperative. If removed and handled properly using the correct procedures, it should be in the "centered" position at this time. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the clockspring centering procedure before proceeding to avoid damaging clockspring. Refer to Restraints/CLOCKSPRING - Standard Procedure .

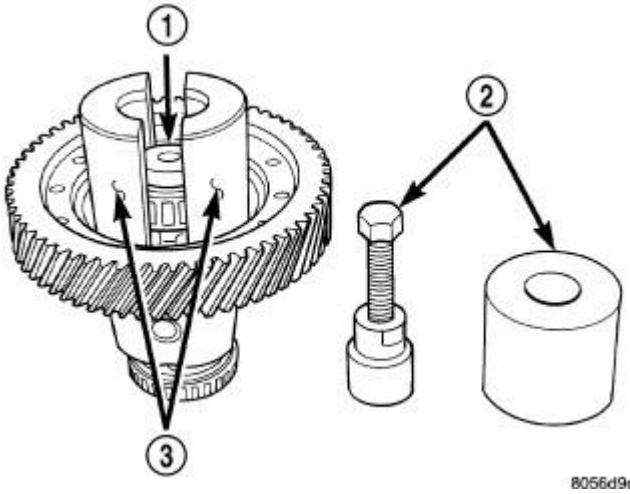

Fig. 41: Removing/Installing Steering Wheel Retaining Bolt
Courtesy of CHRYSLER LLC

19. Line up the steering wheel (4) with the steering shaft and install the steering wheel.
20. Install the steering wheel retaining bolt (3). Tighten the steering wheel retaining bolt to 50 N.m (37 ft. lbs.). See **Steering/Column/WHEEL, Steering - Installation**.

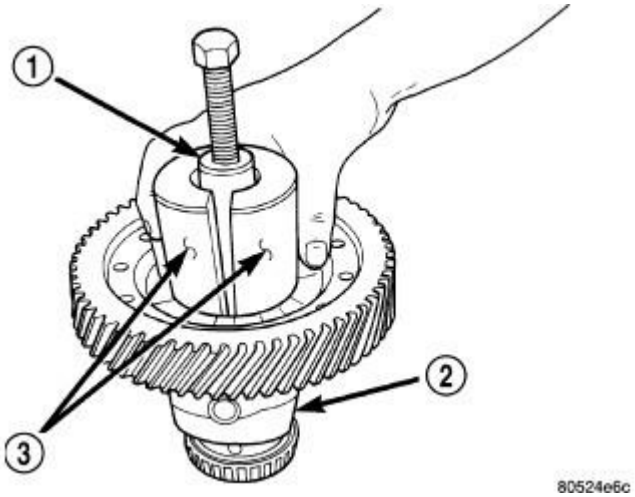

Fig. 42: Identifying Wiring Connector At Clockspring
Courtesy of CHRYSLER LLC

21. Connect the wiring connector (2) at the clockspring.

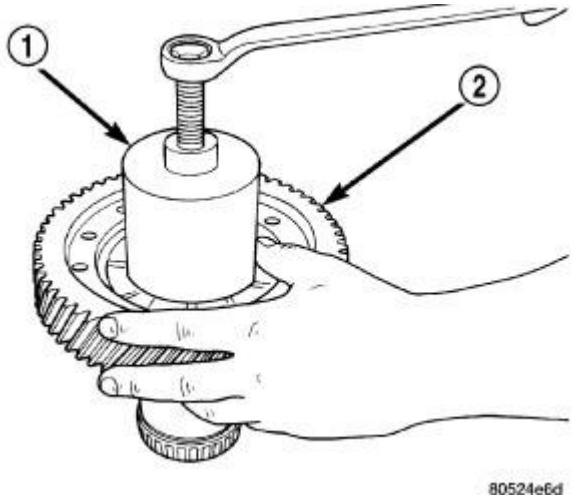

Fig. 43: Removing/Installing Driver Airbag
Courtesy of CHRYSLER LLC

22. Install the driver airbag (1). Refer to **Restraints/AIR BAG, Driver - Installation** .

WARNING: Do not connect the battery ground cable without following the proper procedure as indicated in the following step. Personal injury or death may result if the Airbag System Test is not performed first.

23. Reconnect the battery ground terminal following the Airbag System Test . Refer to **Restraints - Diagnosis and Testing** .

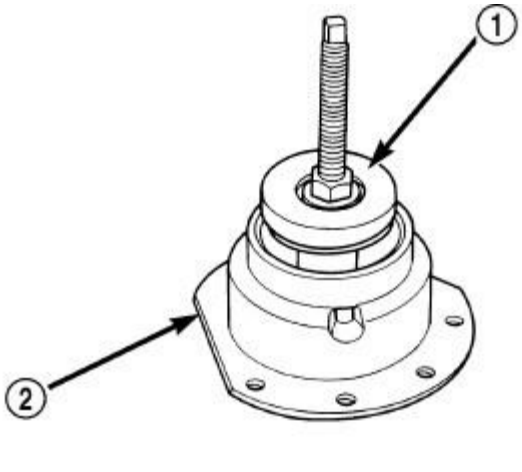

Fig. 44: Identifying Slide Tabs, Mounting Bracket & Shaft Lock Module
Courtesy of CHRYSLER LLC

24. If the steering column being installed requires the installation of a shaft lock module, perform the following:

a. If not present, insert the ignition key into the ignition lock cylinder. This will move the shaft lock module locking bolt to the unlocked position. Leave the key in the lock cylinder while the shaft lock module service is being completed.
b. Make sure the wiring harness connector is properly connected to the module.
c. Align the engagement and slide tabs (2) on the shaft lock module housing (1) with the slots and channels in the mounting bracket (3) on the steering column.
d. Carefully slide the module toward the top (steering wheel end) of the column until it is in mounted position and the spring clips on the module have engaged the bracket, locking it in place.

NOTE: If a NEW module has been installed, a NEW Wireless Ignition Node (WIN) must also be installed, then a diagnostic scan tool MUST be used to initialize the new module before the vehicle can be operated. Refer to Electrical/Vehicle Theft Security - Standard Procedure .

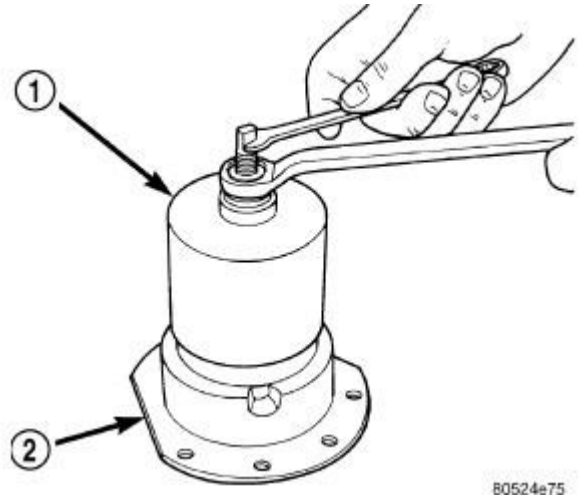

Fig. 45: Removing/Installing Steering Column Opening Reinforcement
Courtesy of CHRYSLER LLC

25. Install the steering column cover reinforcement (2) using the four mounting screws (3, 4).

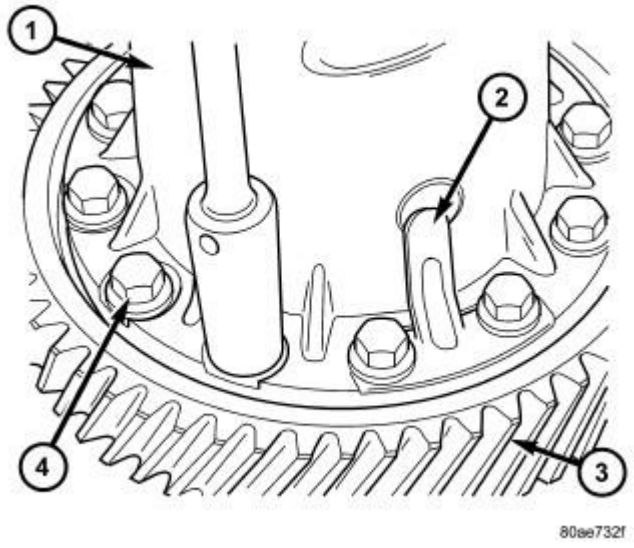

Fig. 46: Removing/Installing Steering Column Opening Cover
Courtesy of CHRYSLER LLC

26. Install the steering column opening cover and instrument panel end cap. Refer to **INSTALLATION** .
27. Test the operation of the all column mounted components. If applicable, reset the radio and the clock as necessary.
28. Road test the vehicle to ensure proper operation of the steering system.

RIGHT-HAND DRIVE

Right-Hand Drive steering column is typical of Left-Hand Drive. See **Column**.

SEAL, SHAFT COVER

Removal

REMOVAL

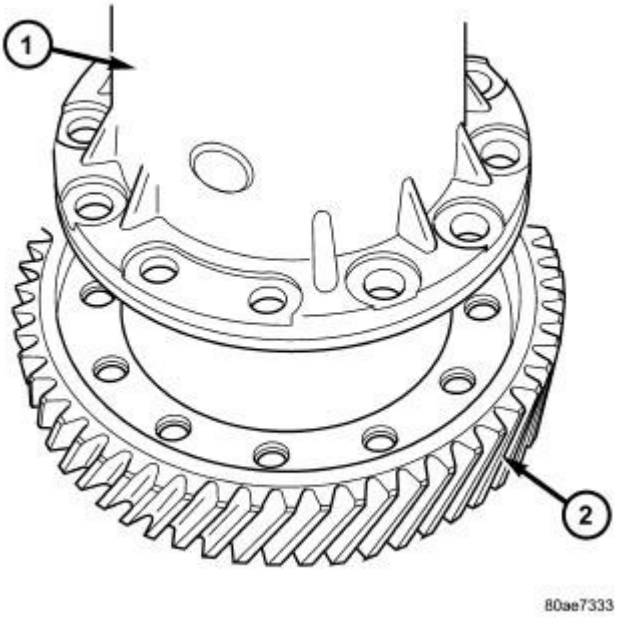

Fig. 47: Identifying Steering Wheel Holder
Courtesy of CHRYSLER LLC

1. Install a steering wheel holder locking the steering wheel in the STRAIGHT-AHEAD position.

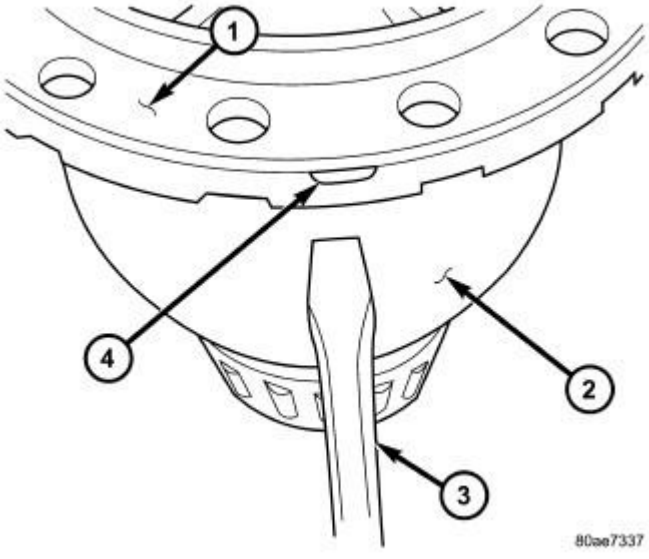

Fig. 48: Identifying Intermediate Shaft & Coupling Bolt
Courtesy of CHRYSLER LLC

2. Reposition the floor carpeting to access the steering column coupling at the base of the column.
3. Remove the intermediate shaft coupling bolt (1).

4. Separate the intermediate shaft (2) at the base of the column from the intermediate shaft extension (3).

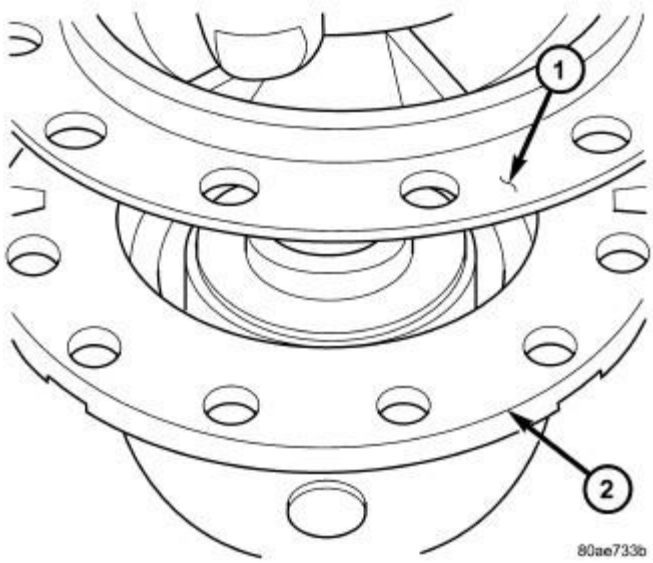

Fig. 49: Removing/Installing Shaft Seal & Cover
Courtesy of CHRYSLER LLC

5. Remove fasteners (1) securing shaft seal and cover (2) in place, then lift shaft seal and cover from intermediate shaft extension (4) and floor pan.

Installation

INSTALLATION

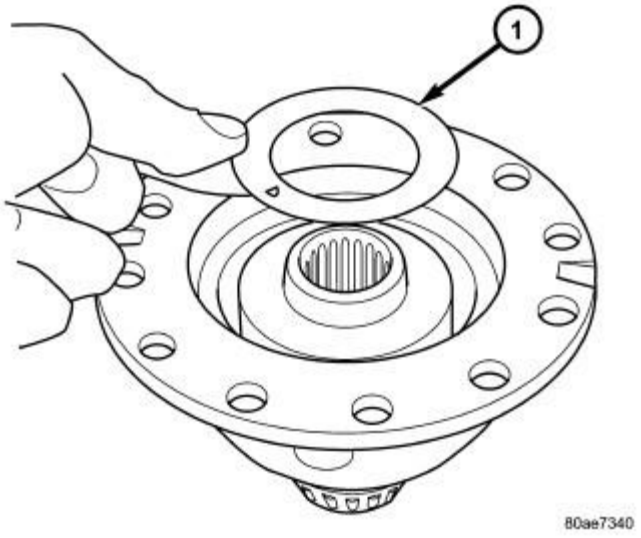

Fig. 50: Removing/Installing Shaft Seal & Cover

Courtesy of CHRYSLER LLC

1. Place shaft seal and cover (2) over mounting studs on floor pan and securely install fasteners. Make sure cover extends down over top of steering gear housing.

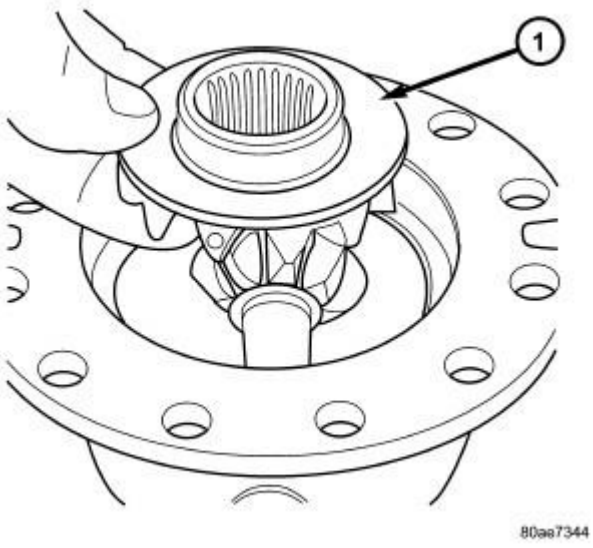

Fig. 51: Identifying Intermediate Shaft & Coupling Bolt
Courtesy of CHRYSLER LLC

2. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
3. Collapse the intermediate shaft (2). Center it over the steering gear pinion shaft (3), lining up the ends, then slide the intermediate shaft onto the shaft extension.
4. Install the intermediate shaft coupling bolt (1). Tighten the bolt to 42 N.m (31 ft. lbs.).
5. Reposition the floor carpet in place.

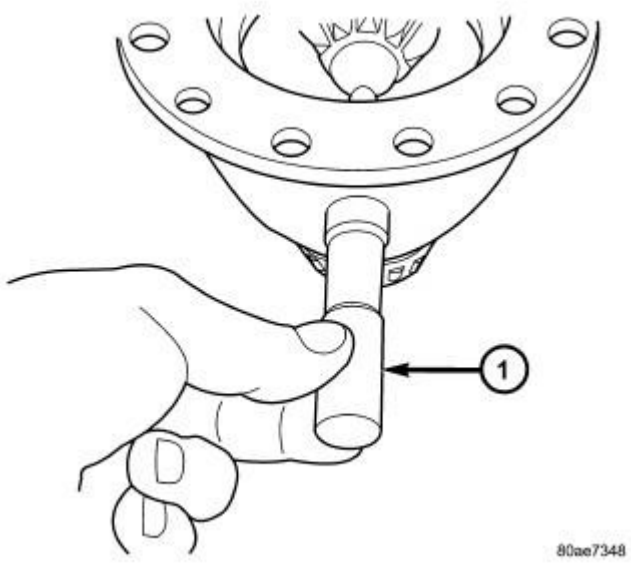

Fig. 52: Identifying Steering Wheel Holder
Courtesy of CHRYSLER LLC

6. Remove steering wheel holder.
7. Road test vehicle to ensure proper operation.

SHAFT, INTERMEDIATE

Removal

REMOVAL

1. Reposition the floor carpeting to access the steering column coupling at the base of the column.

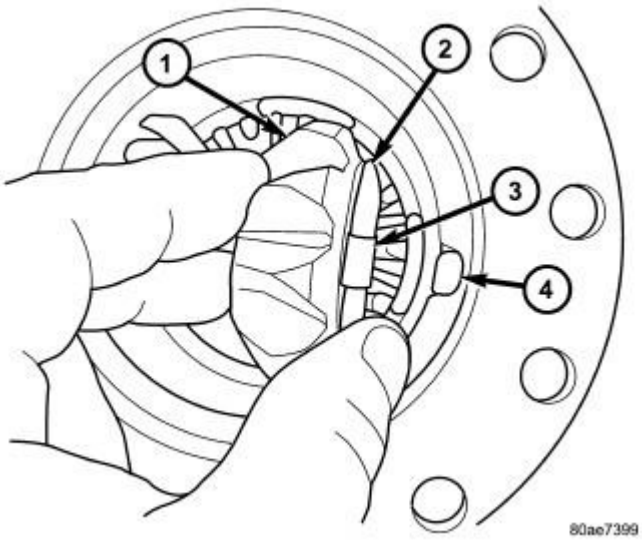

Fig. 53: Identifying Steering Wheel Holder
Courtesy of CHRYSLER LLC

2. Position the front wheels of vehicle (and steering wheel) in the STRAIGHT-AHEAD position.
3. Install steering wheel holder locking steering wheel in STRAIGHT-AHEAD position.

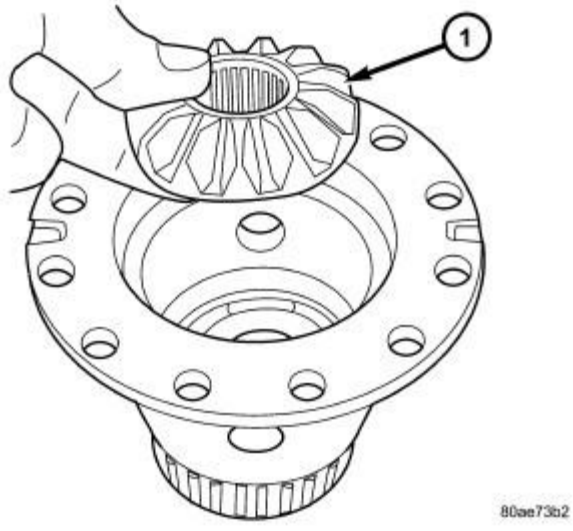

Fig. 54: Identifying Intermediate Shaft & Coupling Bolt
Courtesy of CHRYSLER LLC

4. Remove the intermediate shaft coupling bolt (1).
5. Separate the intermediate shaft (2) at the base of the column from the intermediate shaft extension (3).

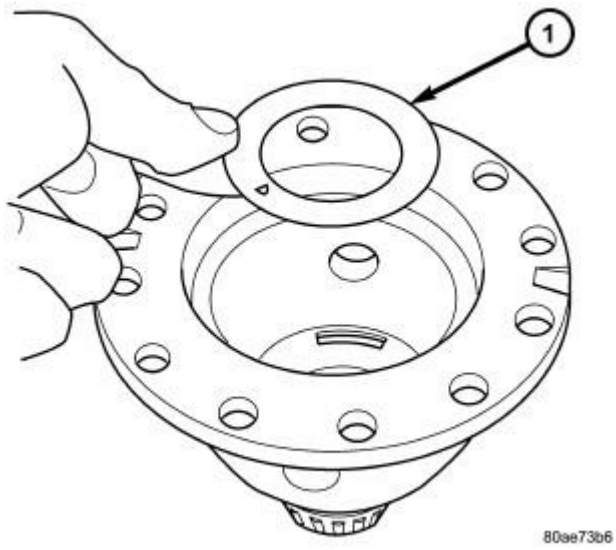

Fig. 55: Removing/Installing Shaft Seal & Cover
Courtesy of CHRYSLER LLC

6. Remove fasteners (1) securing shaft seal and cover (2) in place, then lift shaft seal and cover from intermediate shaft extension (4) and floor pan.
7. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

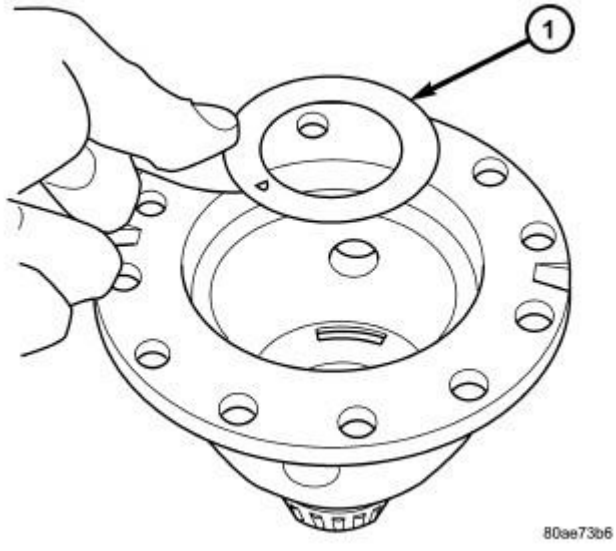

Fig. 56: Removing/Installing Intermediate Shaft Extension
Courtesy of CHRYSLER LLC

8. Remove pinch bolt (1) securing intermediate shaft extension (2) to steering gear shaft (3)
9. Slide intermediate shaft extension (2) off steering gear shaft (3).

Installation

INSTALLATION

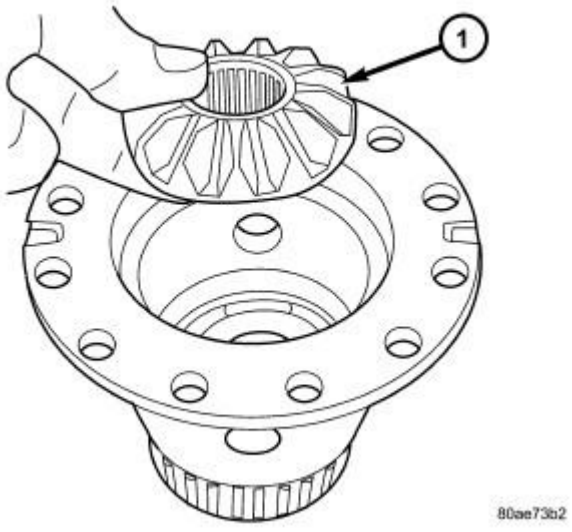

Fig. 57: Removing/Installing Intermediate Shaft Extension
Courtesy of CHRYSLER LLC

1. Match intermediate shaft extension (2) to steering gear shaft (3), then slide extension onto shaft.
2. Install pinch bolt (1) securing intermediate shaft extension (2) to steering gear shaft (3). Tighten pinch bolt to 42 N.m (31 ft. lbs.).
3. Lower vehicle.

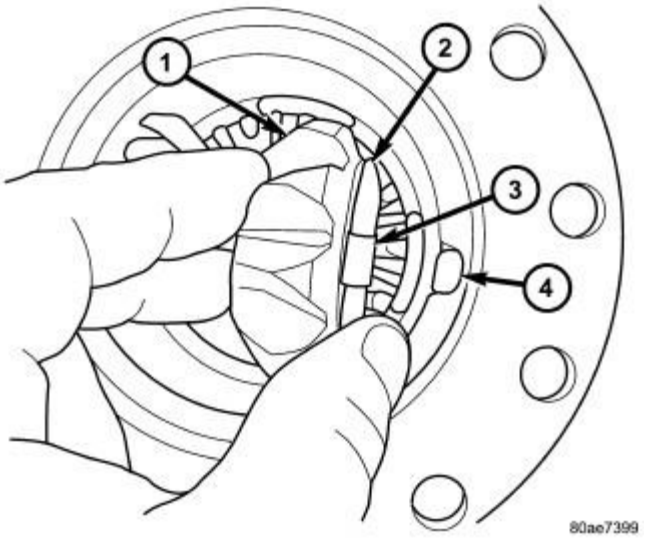

Fig. 58: Removing/Installing Shaft Seal & Cover

Courtesy of CHRYSLER LLC

4. Place shaft seal and cover (2) over mounting studs on floor pan and securely install fasteners. Make sure cover extends down over top of steering gear housing.

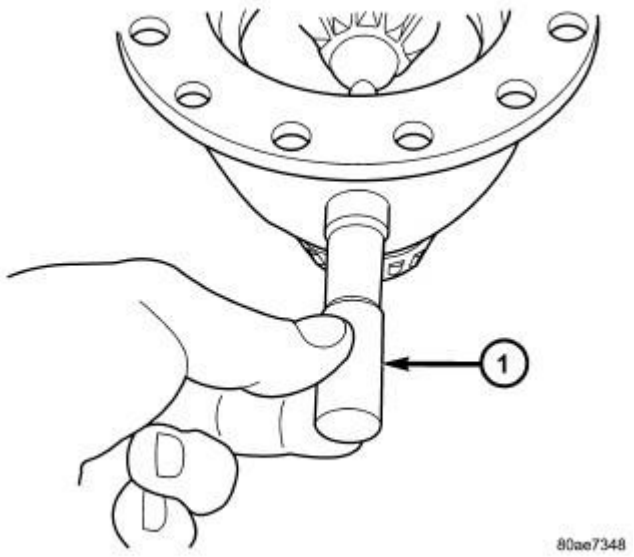

Fig. 59: Identifying Intermediate Shaft & Coupling Bolt
Courtesy of CHRYSLER LLC

5. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
6. Collapse the intermediate shaft (2). Center it over the shaft extension (3), lining up the ends, then slide the intermediate shaft onto the shaft extension.
7. Install the intermediate shaft coupling bolt (1). Tighten the bolt to 42 N.m (31 ft. lbs.).
8. Reposition the floor carpet in place.

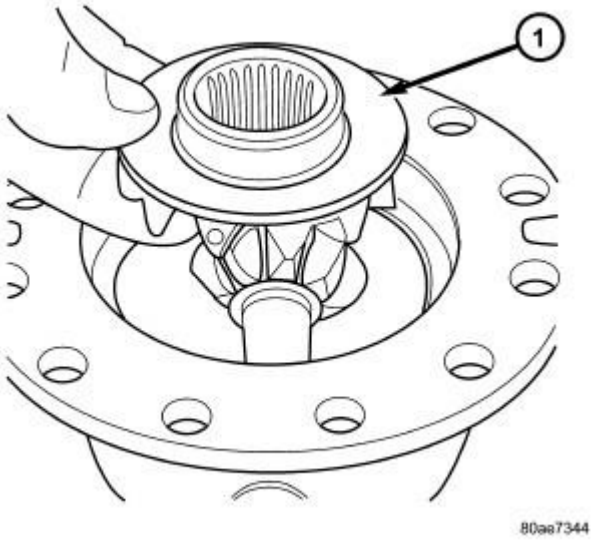

Fig. 60: Identifying Steering Wheel Holder
Courtesy of CHRYSLER LLC

9. Remove steering wheel holder.
10. Road test vehicle to ensure proper operation of steering.

SHROUD, STEERING COLUMN, LOWER

Removal

REMOVAL

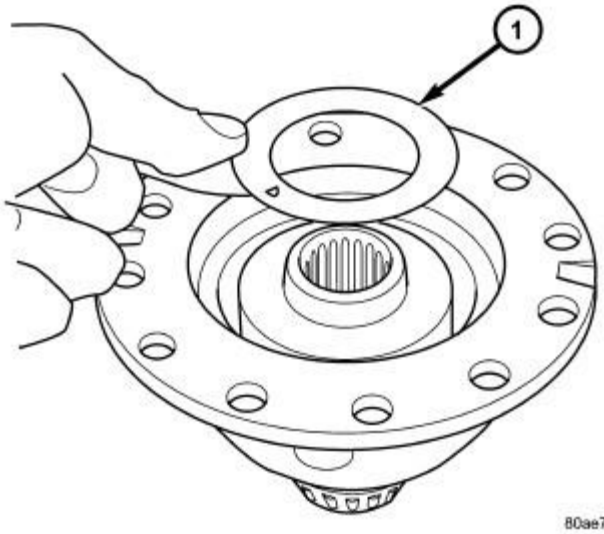

Fig. 61: Removing/Installing Upper & Lower Shrouds

Courtesy of CHRYSLER LLC

1. Push the tilt lever (3) downward to the released position.
2. Remove the two screws (1) attaching the upper shroud to the lower shroud. After removing the screws, un-clip the upper and lower shrouds from one another by applying hand pressure along the seams where the shrouds connect on the sides.
3. Remove the upper shroud.
4. Remove the remaining screw (2) attaching the lower shroud (4) to the column.
5. Remove the lower shroud.

Installation

INSTALLATION

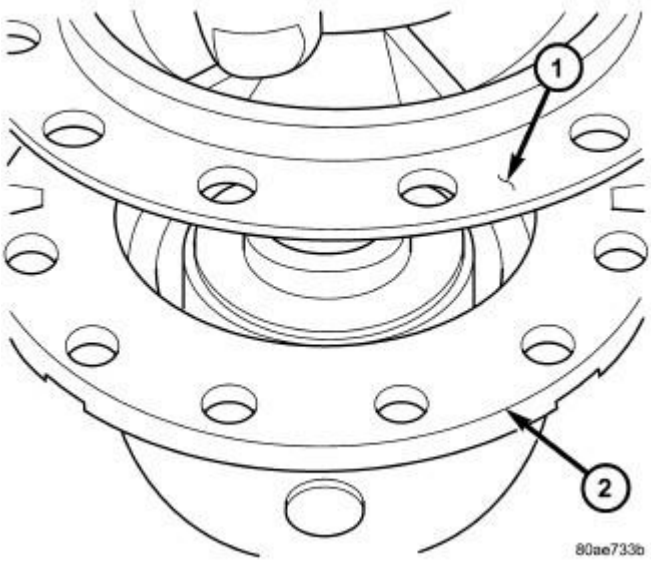

Fig. 62: Removing/Installing Upper & Lower Shrouds
Courtesy of CHRYSLER LLC

1. Push the tilt lever (3) downward (released position).
2. Position the column tilt at the full-upward position.
3. Install the lower shroud (4) over the tilt lever and onto the column.
4. Install the screw (2) attaching the lower shroud (4) to the steering column.
5. Position the upper shroud on the column.
6. Clip the shrouds to one another.
7. Install the two screws (1) attaching the lower shroud to the upper shroud.
8. Push the tilt lever upward, locking the column in place.

SHROUD, STEERING COLUMN, UPPER

Removal

REMOVAL

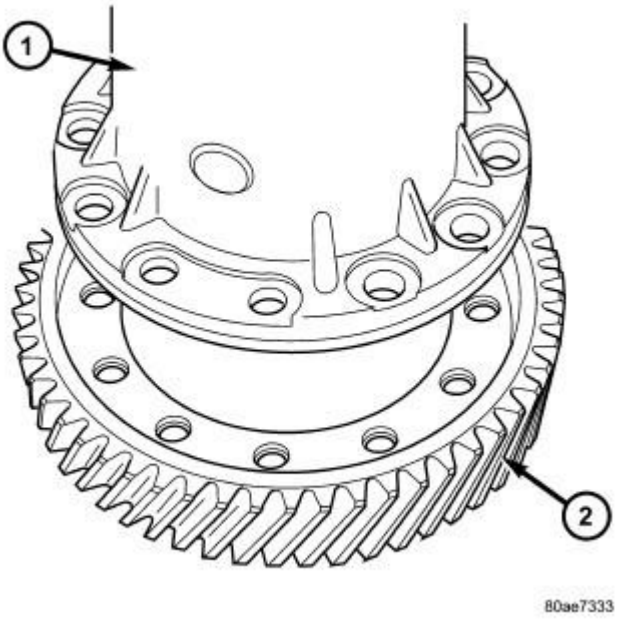

Fig. 63: Removing/Installing Upper & Lower Shrouds
Courtesy of CHRYSLER LLC

1. Remove the two screws (1) attaching the upper shroud to the lower shroud.
2. Un-clip the upper and lower shrouds from one another by applying hand pressure along the seams where the shrouds connect on the sides.
3. Remove the upper shroud.

Installation

INSTALLATION

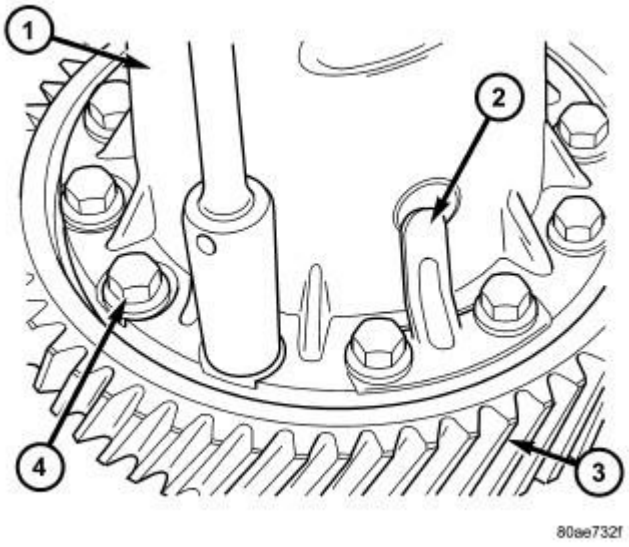

Fig. 64: Removing/Installing Upper & Lower Shrouds
Courtesy of CHRYSLER LLC

1. Position the upper shroud on the column.
2. Clip the upper and lower shrouds to one another.
3. Install the two screws (1) attaching the lower shroud to the upper shroud.

WHEEL, STEERING

Removal

REMOVAL

NOTE: Before proceeding, see Steering/Column - Warning.

1. Place front wheels of vehicle in STRAIGHT-AHEAD position.
2. Disconnect and isolate the battery negative (-) cable. Wait two minutes for the airbag system reserve capacitor to discharge before beginning any steering column, instrument panel, or airbag system/component service.

WARNING: When an undeployed airbag is to be removed from the vehicle, first disconnect and isolate the battery negative (ground) cable. Allow the airbag system reserve capacitor to discharge for two minutes before beginning any airbag system or component service. Personal injury may result if this procedure is not followed.

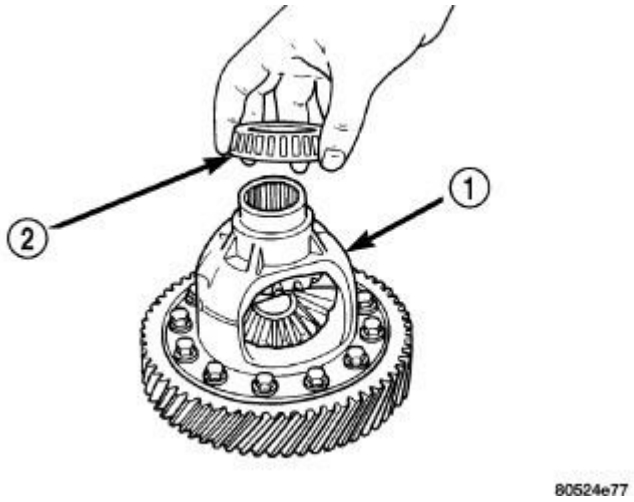

Fig. 65: Removing/Installing Driver Airbag
Courtesy of CHRYSLER LLC

3. Remove the driver airbag (1). Refer to **Restraints/AIR BAG, Driver - Removal** .

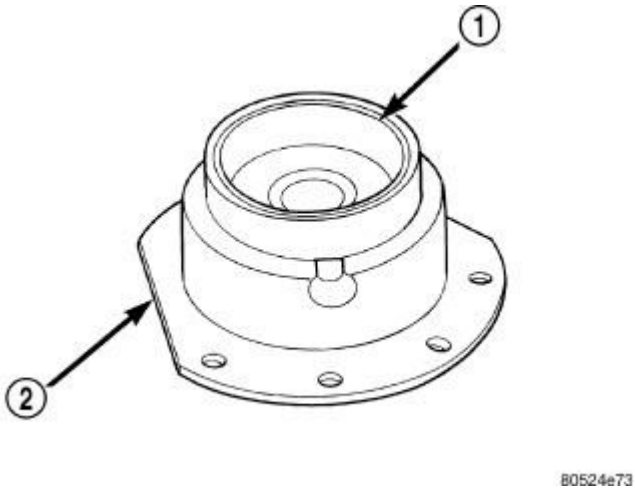

Fig. 66: Identifying Wiring Connector At Clockspring
Courtesy of CHRYSLER LLC

4. Disconnect the wiring connector (2) at the clockspring.

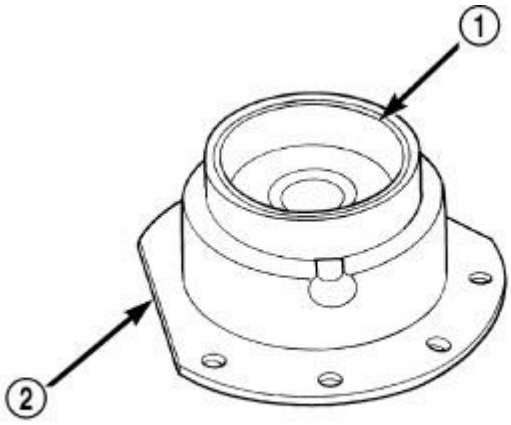

Fig. 67: Removing/Installing Steering Wheel Retaining Bolt
Courtesy of CHRYSLER LLC

5. Holding the steering wheel (4) firmly in place, remove the steering wheel retaining bolt (3) from the steering column shaft.

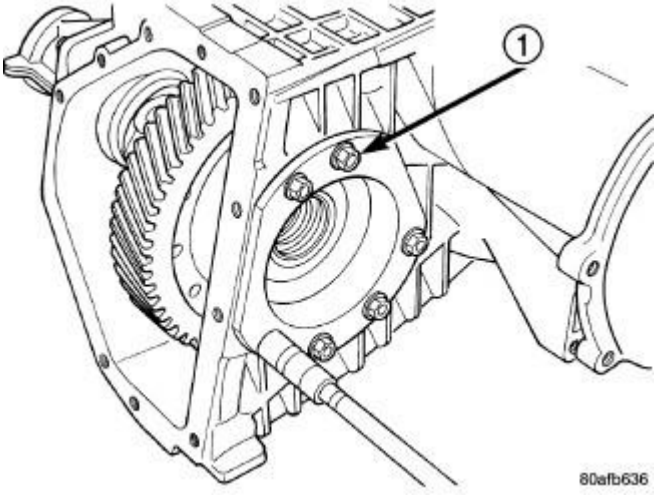

Fig. 68: Identifying Steering Wheel Puller
Courtesy of CHRYSLER LLC

CAUTION: Do not bump or hammer on the steering wheel or steering column shaft when removing the steering wheel.

6. Install an appropriate wheel puller with hooked legs (1) on the steering wheel over the steering shaft. See **Steering/Column/WHEEL, Steering - Removal**.

CAUTION: Do not attempt to rotate the clockspring rotor once the steering wheel is removed. The clockspring must remain centered in its travel to avoid overextending the clockspring inner parts, causing the

clockspring to become inoperative. If removed and handled properly using the correct procedures, it should remain in the "centered" position. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the clockspring centering procedure before installing the steering wheel. Refer to Restraints/CLOCKSPRING - Standard Procedure .

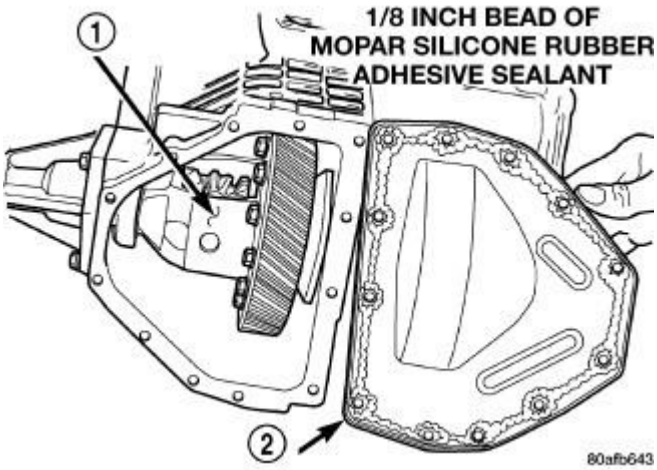

Fig. 69: Identifying Steering Wheel Puller
Courtesy of CHRYSLER LLC

7. Holding the steering wheel firmly in the STRAIGHT-AHEAD position, release the steering wheel from the steering column shaft splines using the wheel puller (1). Remove the steering wheel from the column.
8. Remove speed control switch from steering wheel. Refer to **Electrical/Speed Control/SWITCH, Speed Control - Removal** .
9. Remove remote audio switches from steering wheel. Refer to **Electrical/Audio and Video/SWITCH, Remote Radio - Removal** .

Installation

INSTALLATION

1. Install remote audio control switches on steering wheel. Refer to **Electrical/Audio and Video/SWITCH, Remote Radio - Installation** .
2. Install speed control switches on steering wheel. Refer to **Electrical/Speed Control/SWITCH, Speed Control - Installation** .

CAUTION: When installing the steering wheel, the clockspring must be centered in its travel to avoid overextending the clockspring inner parts, causing the clockspring to become inoperative. If removed and handled properly using the correct procedures, it should be in the "centered" position at this time. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the

clockspring centering procedure before proceeding to avoid damaging clockspring. Refer to Restraints/CLOCKSPRING - Standard Procedure .

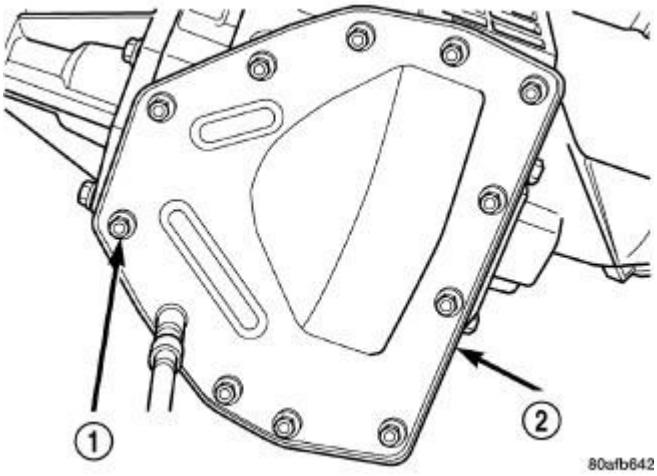

Fig. 70: Removing/Installing Steering Wheel Retaining Bolt
Courtesy of CHRYSLER LLC

3. Line up the steering wheel (4) with the steering shaft and install the steering wheel.
4. Install the steering wheel retaining bolt (3). Tighten the steering wheel retaining bolt to 50 N.m (37 ft. lbs.). See **Steering/Column/WHEEL, Steering - Installation**.

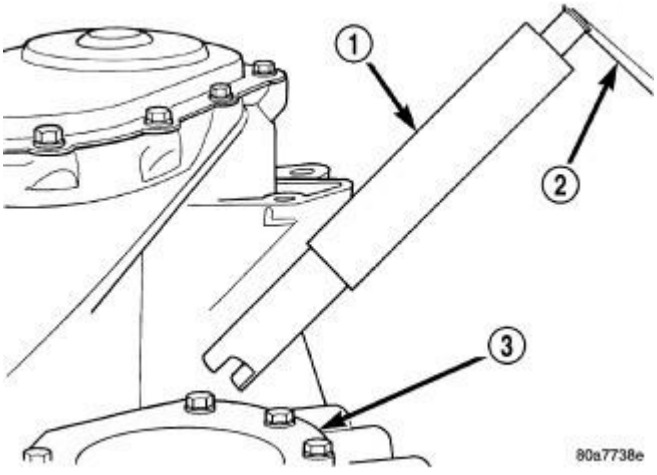

Fig. 71: Identifying Wiring Connector At Clockspring
Courtesy of CHRYSLER LLC

5. Connect the wiring connector (2) at the clockspring.

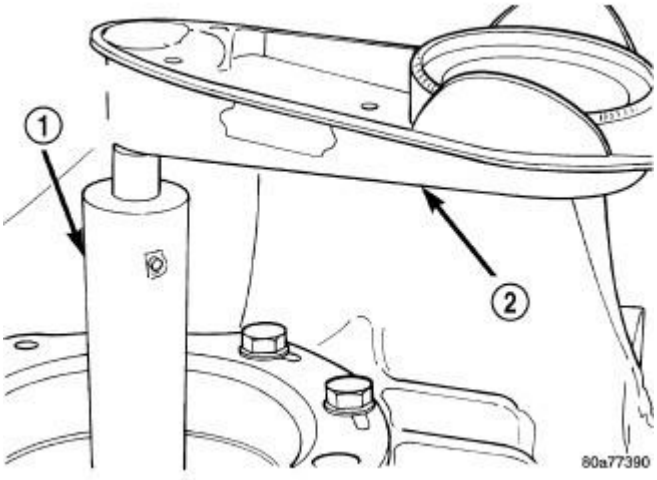

Fig. 72: Removing/Installing Driver Airbag
Courtesy of CHRYSLER LLC

6. Install the driver airbag (1). Refer to **Restraints/AIR BAG, Driver - Installation** .

WARNING: Do not connect the battery ground cable without following the proper procedure as indicated in the following step. Personal injury or death may result if the Airbag System Test is not performed first.

7. Reconnect the battery ground terminal following the Airbag System Test . Refer to **Restraints - Diagnosis and Testing** .
8. Road test the vehicle. Check operation of steering wheel mounted controls.

GEAR

WARNING

WARNINGS AND CAUTIONS

WARNING: Power steering fluid, engine parts and exhaust system may be extremely hot if engine has been running. Do not start engine with any loose or disconnected hoses. Do not allow hoses to touch hot exhaust manifold or catalyst.

WARNING: Fluid level should be checked with the engine off to prevent personal injury from moving parts.

CAUTION: When the system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

CAUTION: When servicing power steering components, do not pinch off power steering hoses in an any way to stop fluid flow. Damage to hoses may result.

DIAGNOSIS AND TESTING

POWER STEERING GEAR

NOTE: This information is designed to be used in conjunction with the diagnostic charts . See STEERING SYSTEM DIAGNOSIS CHARTS.

OBJECTIONABLE HISS OR WHISTLE POSSIBLY CAUSED BY A NOISY STEERING GEAR

1. Check and adjust power steering fluid level in the reservoir as necessary. See **Steering/Pump/FLUID - Standard Procedure**.
2. Start the vehicle and heat system by steering lock-to-lock 5 times with the engine running at 3000 RPM. Do not hold the gear against the stops for more than 15 seconds at a time.
3. Return the engine to idle speed.
4. Listen for the noise when turning the wheel slowly off center during a dry park maneuver.
5. Replace power steering gear if the hiss or whistle is present. See **Steering/Gear - Removal**.

REMOVAL

STEERING GEAR

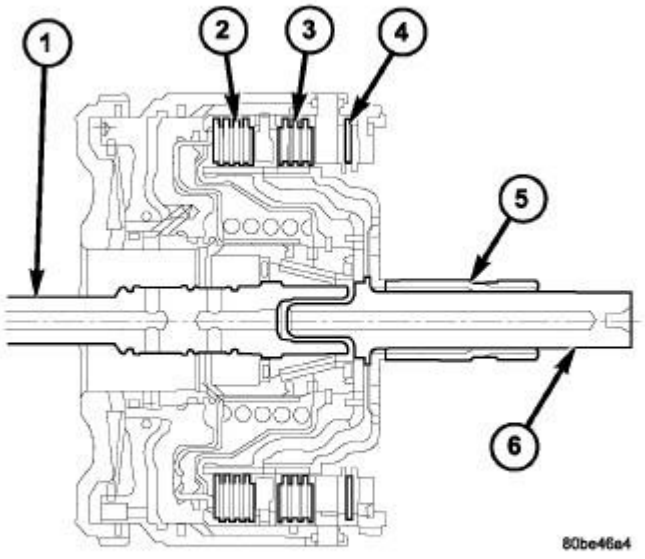

Fig. 73: Identifying Steering Wheel Holder
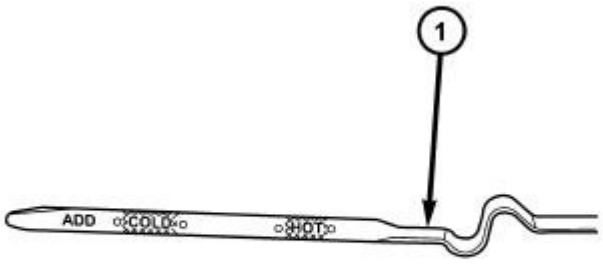
Courtesy of CHRYSLER LLC

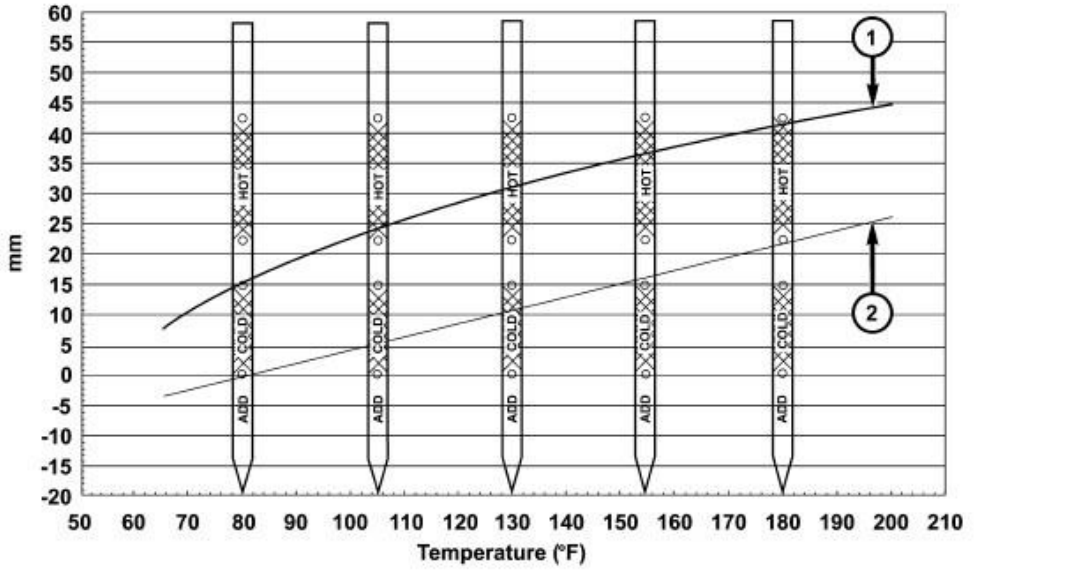
1. Place front wheels of vehicle in STRAIGHT-AHEAD position.
2. Install steering wheel holder locking steering wheel in STRAIGHT-AHEAD position.
3. Remove negative (-) battery cable from battery and isolate cable.
4. Remove cap from power steering fluid reservoir.
5. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.
6. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .



80d64ee0

Fig. 74: Identifying Tire & Wheel Assembly
Courtesy of CHRYSLER LLC

7. On each side of vehicle, remove wheel mounting nuts (3), then tire and wheel assembly (1).



80d64e6e

Fig. 75: Identifying Stabilizer Bar Link, Stabilizer Bar, & Nut
Courtesy of CHRYSLER LLC

8. At each end of stabilizer bar, while holding stabilizer bar link (1) lower stud stationary (wrench placed on machined flats on stud), remove nut (2) securing link to stabilizer bar (3).

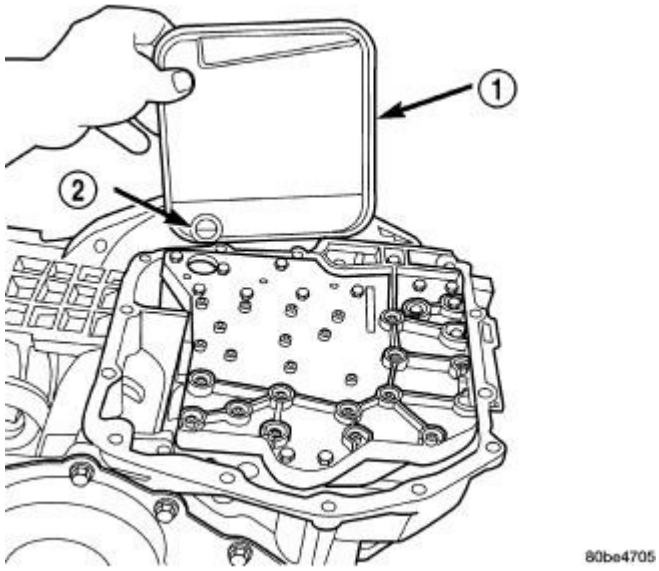


Fig. 76: Removing/Installing Outer Tie Rod Stud At Knuckle Steering Arm
Courtesy of CHRYSLER LLC

9. If outer tie rods (4) need to be transferred to new gear, loosen tie rod jam nut (3) on both sides of vehicle.
10. On both sides of vehicle, remove nut (1) attaching outer tie rod (5) to knuckle (2) by holding rod end stud stationary while loosening and removing nut with a wrench.

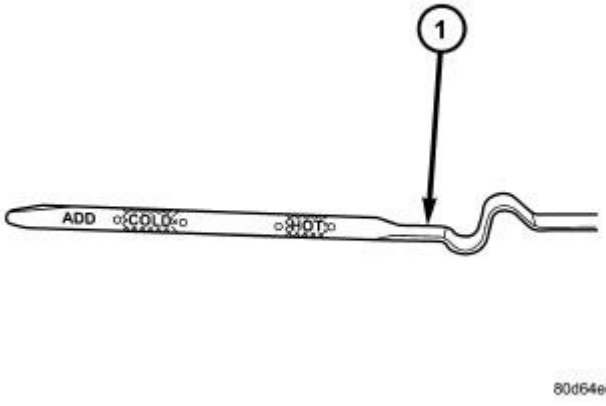

Fig. 77: Removing Outer Tie Rod Stud From Steering Knuckle Using Puller 9360
Courtesy of CHRYSLER LLC

11. Release each outer tie rod end (3) from knuckle (1) using Remover (1), Special Tool 9360.

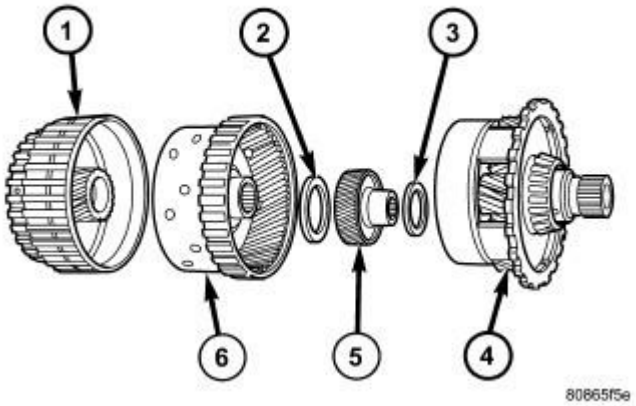

Fig. 78: Removing/Installing Front Engine Mount Thru-Bolt
Courtesy of CHRYSLER LLC

12. Remove front engine mount thru-bolt (4).

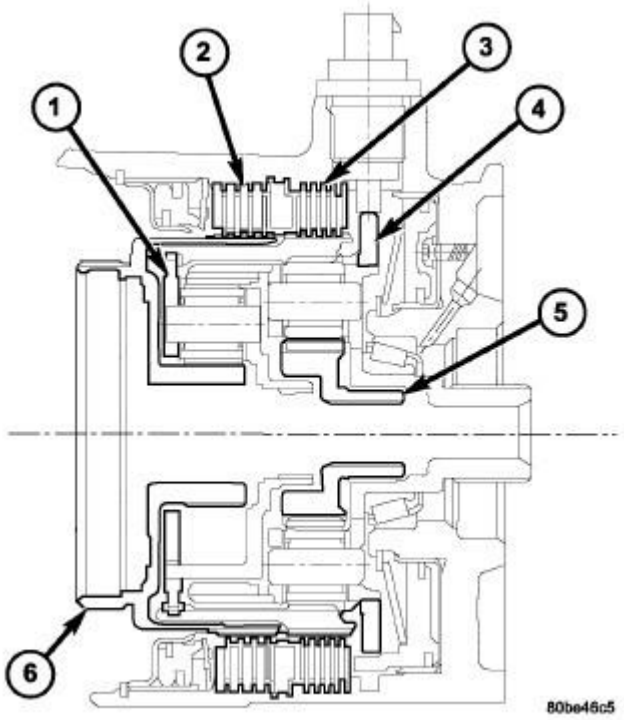

Fig. 79: Removing/Installing Fore-Aft Crossmember
Courtesy of CHRYSLER LLC

13. Remove fore-aft crossmember front mounting bolt (6).
14. Remove four fore-aft crossmember rear mounting bolts (3, 4).

15. Remove the fore-aft crossmember.

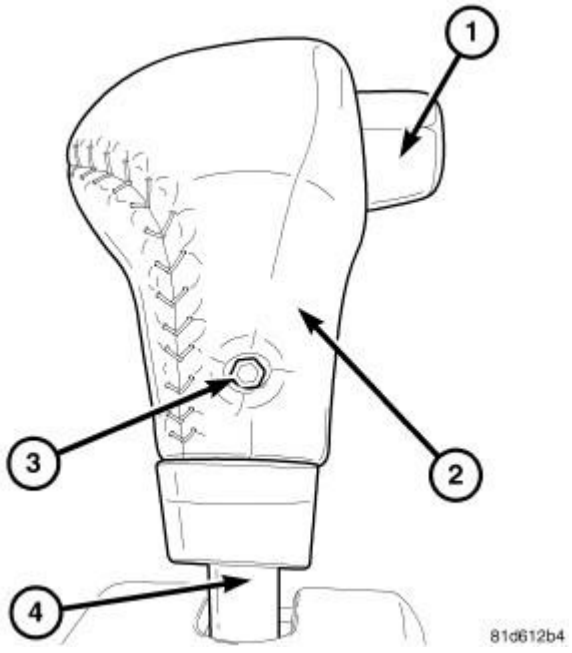

Fig. 80: Removing/Installing Heat Shield
Courtesy of CHRYSLER LLC

16. Remove screws and push-pins securing heat shield (1) over right side of steering gear (2). Remove heat shield.
17. Remove the rear engine mount.
    - For 3.3L / 3.8L engine, refer to **REMOVAL** .
    - For 4.0L engine, refer to **REMOVAL** .
    - For 2.8L Diesel engine, refer to **ENGINE MOUNTING** .

.

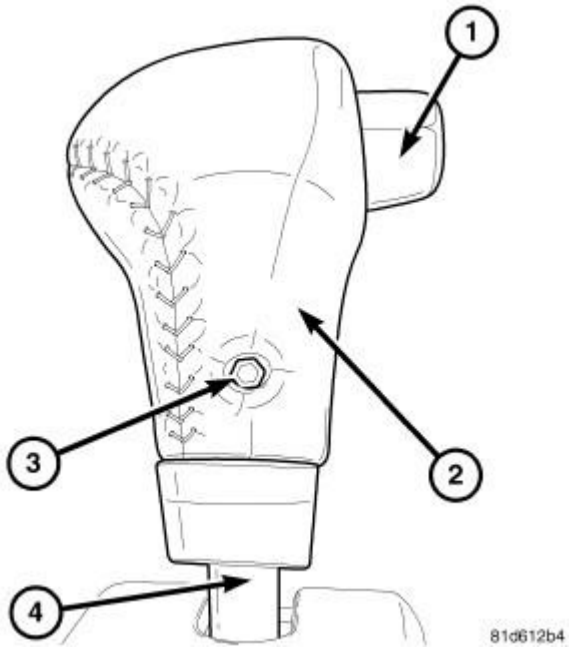

Fig. 81: Removing/Installing Screws At Power Steering Pressure Hose Routing Clamp(s) & Rear Of Crossmember
Courtesy of CHRYSLER LLC

18. Remove screws (3) securing power steering pressure hose routing clamp(s) (4.0L engine only uses one) to rear of crossmember.

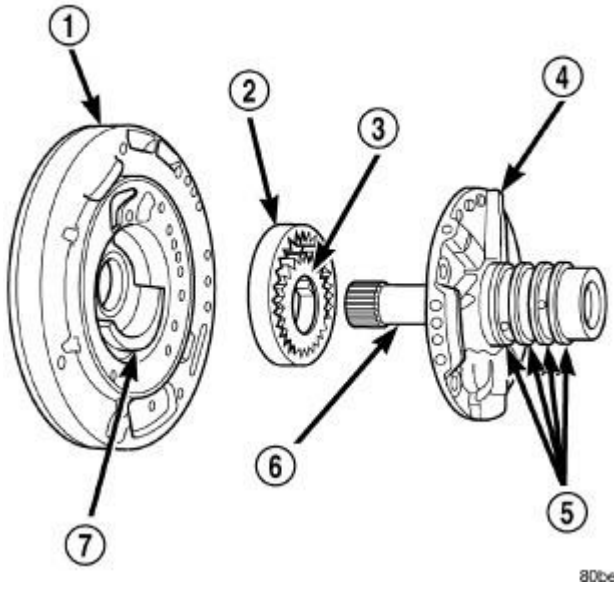

Fig. 82: Removing/Installing Stabilizer Bar At Crossmember
Courtesy of CHRYSLER LLC

19. Remove the screws (1) securing the stabilizer bushing retainers (2) to the crossmember.

20. Remove the two stabilizer bushing retainers (2).
21. Utilizing the slit cut into the cushions (bushings), remove the two cushions from the stabilizer bar.
22. Slowly rotate the stabilizer bar as necessary and remove it out through the driver side wheel opening.

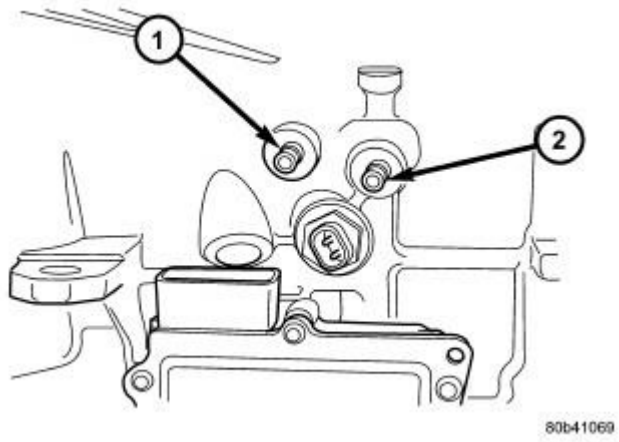

Fig. 83: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

23. Remove tube nut fastening return hose (5) to power steering gear (3). Remove return hose from gear port.
24. Remove tube nut fastening pressure hose (4) to power steering gear (3). Remove pressure hose from gear port.

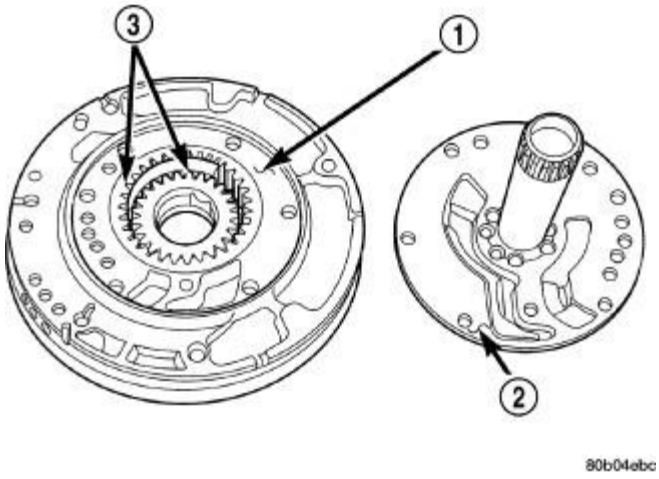

Fig. 84: Identifying Steering Gear & Bolts
Courtesy of CHRYSLER LLC

25. Remove bolts (1) securing steering gear (2) to crossmember.

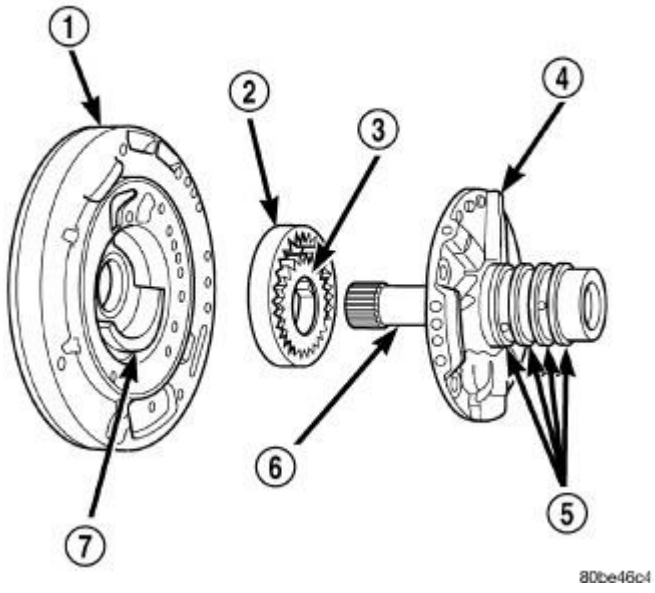

Fig. 85: Removing/Installing Intermediate Shaft Extension
Courtesy of CHRYSLER LLC

26. Slide dust shield upward exposing pinch bolt (1) securing intermediate shaft extension (2) to steering gear shaft (3).
27. Remove pinch bolt (1) securing intermediate shaft extension (2) to steering gear shaft (3)
28. Slide intermediate shaft extension (2) off steering gear shaft (3).

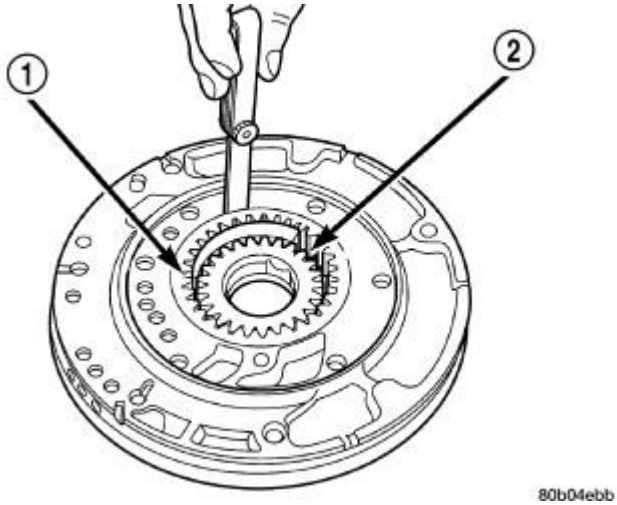

Fig. 86: Removing/Installing Steering Gear
Courtesy of CHRYSLER LLC

29. Rotate steering gear to position shown in **Fig. 86** , then slide steering gear out left wheel opening.
30. If necessary, remove outer tie rods from inner tie rod threads. Count how many rotations it takes to remove each outer tie rod for installation reference.

STEERING GEAR - RIGHT-HAND-DRIVE

Right-Hand-Drive steering gear is typical of Left-Hand-Drive. See **Gear**.

INSTALLATION

STEERING GEAR

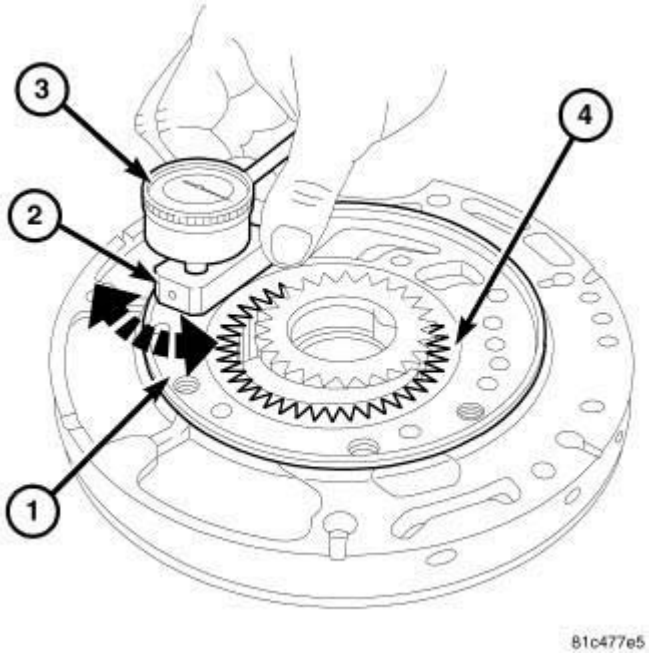

Fig. 87: Removing/Installing Steering Gear
Courtesy of CHRYSLER LLC

1. If necessary, install outer tie rods onto inner tie rod threads. As outer tie rods are installed, count out same number rotations as were counted on tie rod removal. This will get toe setting somewhat close to specification before vehicle is aligned at end of this procedure. Snug tie rod jam nuts on both ends of gear. Do not tighten at this time. Tighten tie rod jam nuts to specification while performing wheel alignment at end of this procedure.
2. Carefully install power steering gear (1) through left wheel opening using the reverse of how it was removed, then set it up into mounted position.

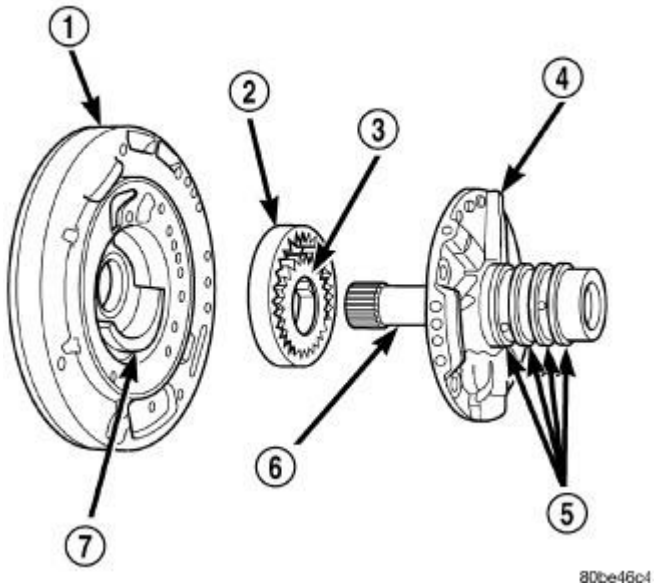

Fig. 88: Removing/Installing Intermediate Shaft Extension
Courtesy of CHRYSLER LLC

3. Find power steering gear's center of travel, then match intermediate shaft extension (2) with that on steering gear shaft (3). Slide extension onto steering gear shaft.
4. Install pinch bolt (1) securing intermediate shaft extension (2) to extension shaft (3). Tighten pinch bolt to 42 N.m (31 ft. lbs.).
5. Slide dust shield down over pinch bolt and steering gear shaft.

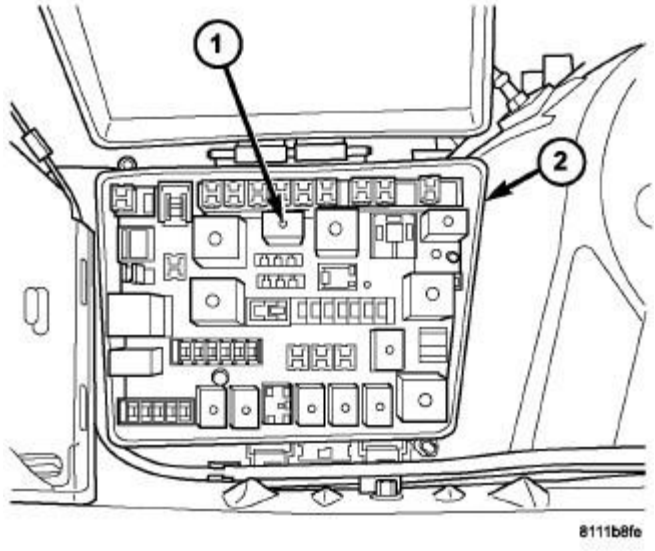

Fig. 89: Identifying Steering Gear & Bolts
Courtesy of CHRYSLER LLC

6. Center steering gear (2) mounting bosses over mounting holes in crossmember and install two steering gear mounting bolts (1). Tighten mounting bolts to 120 N.m (89 ft. lbs.).

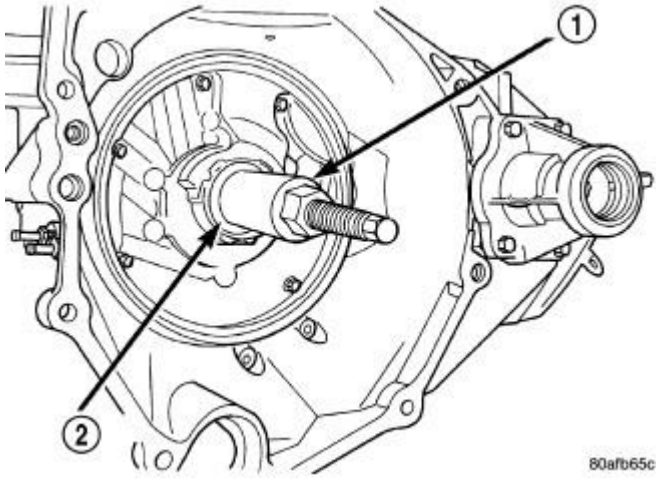

Fig. 90: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

7. Install return hose (5) into power steering gear (3) port. Thread return hose tube nut into gear and tighten to 31 N.m (23 ft. lbs.).
8. Install pressure hose (4) into power steering gear (3) port. Thread pressure hose tube nut into gear and tighten to 31 N.m (23 ft. lbs.).

NOTE: Before stabilizer bar installation, inspect the cushions and links for excessive wear, cracks, damage and distortion. Replace any pieces failing inspection.

NOTE: Before installing the stabilizer bar, make sure the bar is not upside-down. The stabilizer bar must be installed so that when in mounted position, the ends of the bar curve under the steering gear tie rods, up to the links.

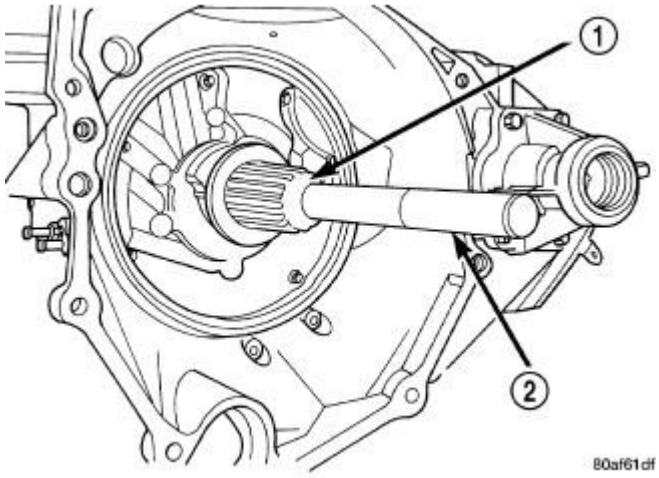

Fig. 91: Removing/Installing Stabilizer Bar At Crossmember
Courtesy of CHRYSLER LLC

9. Install the stabilizer bar through the driver side wheel opening. Rotate the bar as necessary until it is centered over the suspension crossmember and the ends curve upward below the steering gear tie rods.
10. Install the two cushions (bushings) on the stabilizer bar utilizing the slit cut into the cushion sides.
11. Install the two stabilizer bushing retainers (2) over the cushions.
12. Install the four screws (1) securing the stabilizer bushing retainers (2) to the crossmember. Tighten screws to 45 N.m (33 ft. lbs.).

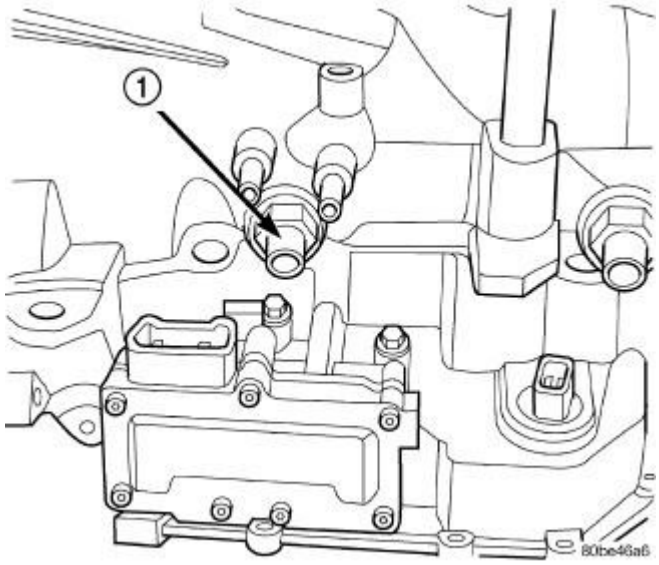

Fig. 92: Removing/Installing Screws At Power Steering Pressure Hose Routing Clamp(s) & Rear Of Crossmember
Courtesy of CHRYSLER LLC

13. Position the power steering pressure hose routing clamp(s) (4.0L engine only uses one) on the rear of the

crossmember. Install and tighten the screw(s) to 8 N.m (71 in. lbs.).

14. Install the rear engine mount.
    - For 3.3L / 3.8L engine, refer to **INSTALLATION** .
    - For 4.0L engine, refer to **INSTALLATION** .
    - For 2.8L Diesel engine, refer to **ENGINE MOUNTING** .

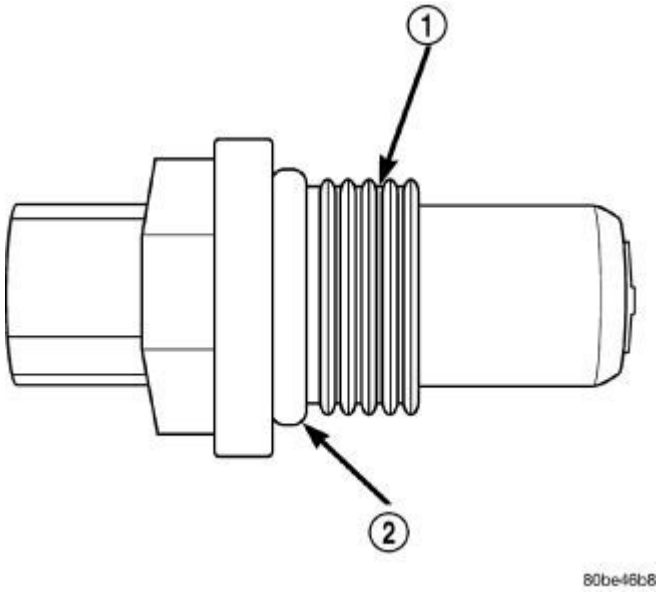

Fig. 93: Removing/Installing Heat Shield
Courtesy of CHRYSLER LLC

15. Position the heat shield (1) over the steering gear (2). Install the mounting screws and push-pins. Tighten the screws to 8 N.m (71 in. lbs.).

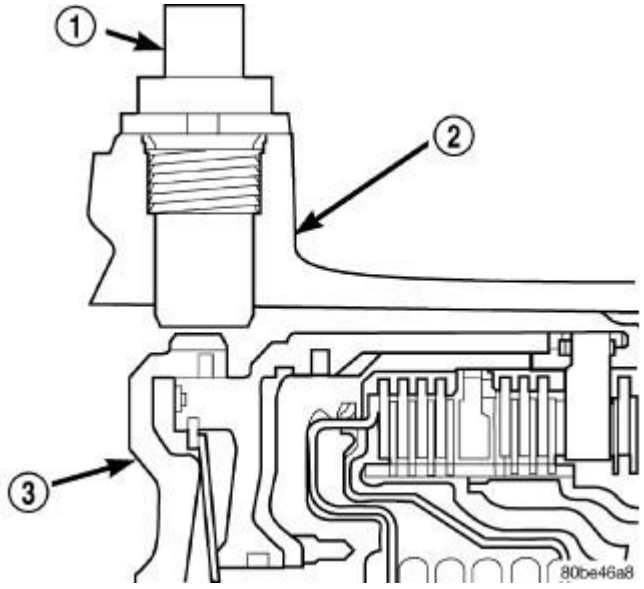

Fig. 94: Removing/Installing Fore-Aft Crossmember

Courtesy of CHRYSLER LLC

16. Position fore-aft crossmember in engine compartment and install mounting bolts (3, 4, 6). Tighten forward mounting bolt (6) to 113 N.m (83 ft. lbs.). Tighten rearward mounting bolts (3, 4) at suspension crossmember (2) to 55 N.m (41 ft. lbs.).

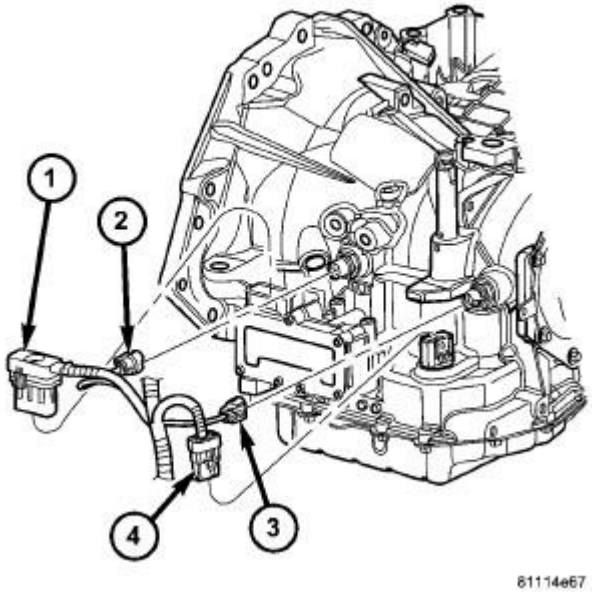

Fig. 95: Removing/Installing Front Engine Mount Thru-Bolt
Courtesy of CHRYSLER LLC

17. Install front engine mount thru-bolt (4). Tighten bolt to 57 N.m (42 ft. lbs.).

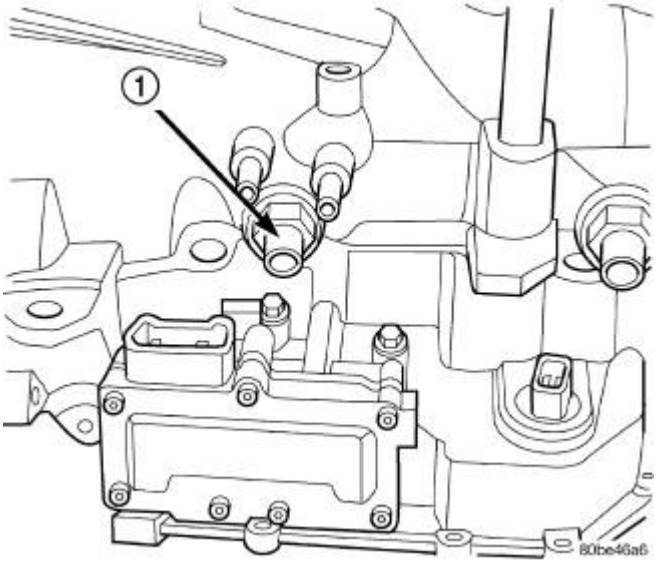

Fig. 96: Removing/Installing Outer Tie Rod Stud At Knuckle Steering Arm
Courtesy of CHRYSLER LLC

18. On each side of vehicle, attach outer tie rod (5) to knuckle (2). Start NEW nut (1) onto outer tie rod stud. While holding stud stationary, tighten nut using a wrench. Using a crowfoot wrench on a torque wrench, tighten nut to 75 N.m (55 ft. lbs.). Then, tighten nut an additional 245° turn after that torque is met.

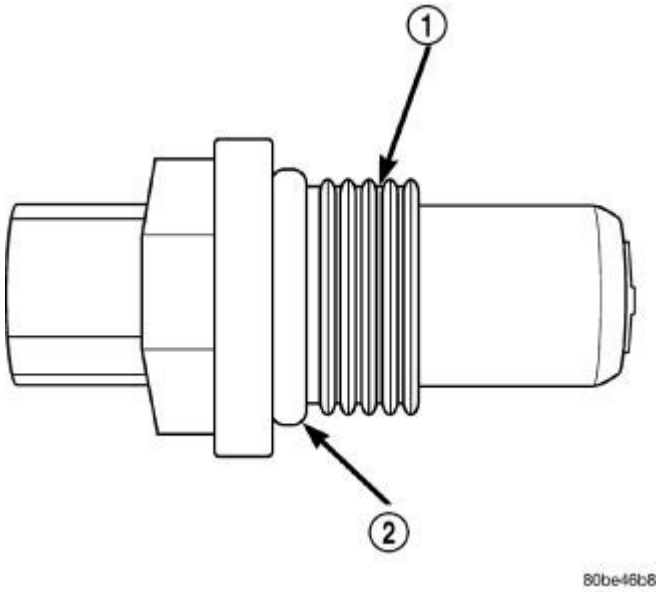

Fig. 97: Identifying Stabilizer Bar Link, Stabilizer Bar, & Nut
Courtesy of CHRYSLER LLC

19. Attach the stabilizer bar link (1) at each end of the stabilizer bar (3). At each link, install and tighten the nut (2) while holding the stabilizer bar link lower stud stationary. Tighten the nuts to 88 N.m (65 ft. lbs.).

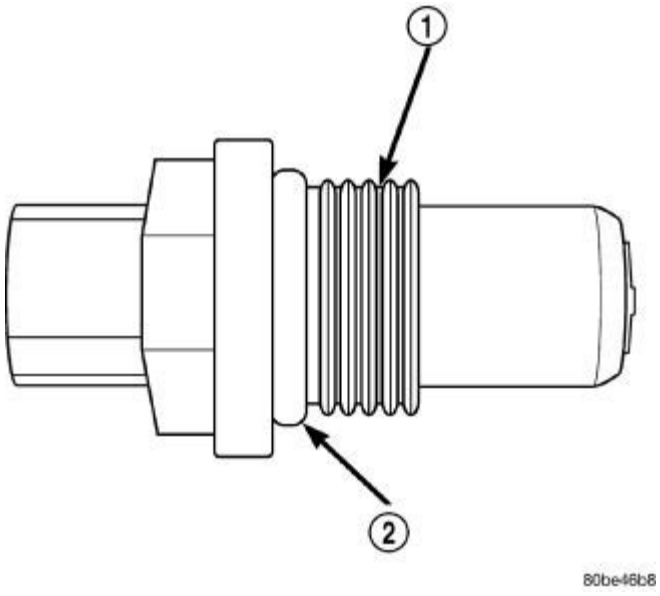

Fig. 98: Identifying Tire & Wheel Assembly

Courtesy of CHRYSLER LLC

20. On each side of vehicle, install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten wheel mounting nuts (3) in proper sequence to 135 N.m (100 ft. lbs.).
21. Lower vehicle.
22. Connect negative (-) battery cable on negative battery post.

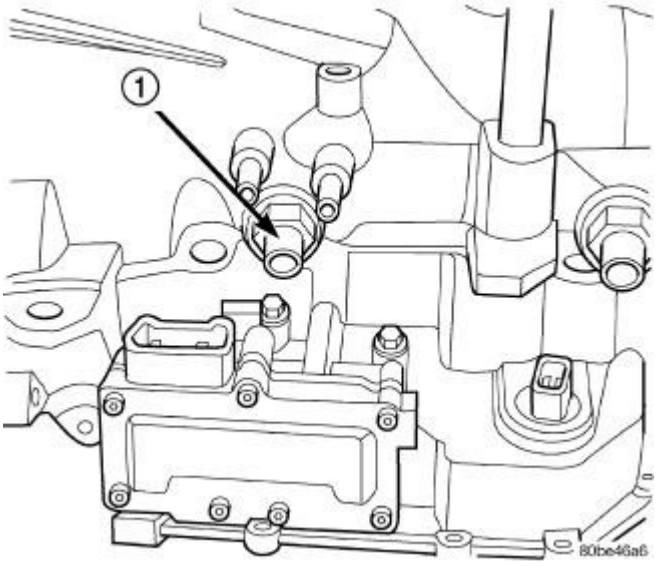

Fig. 99: Identifying Steering Wheel Holder
Courtesy of CHRYSLER LLC

23. Remove steering wheel holder.
24. Fill and bleed power steering system. See **Steering - Standard Procedure**.
25. Inspect for leaks.
26. Perform wheel alignment, setting toe to specifications. Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

STEERING GEAR - RIGHT-HAND-DRIVE

Right-Hand-Drive steering gear is typical of Left-Hand-Drive. See **Gear**.

TIE ROD, STEERING

Diagnosis and Testing

TIE ROD

Tie rod free-play can be measured using the following hand methods:

OUTER TIE ROD

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .
2. Remove the front wheels. Refer to **Tires and Wheels - Removal** .
3. Install two standard wheel mounting nuts, flat side to rotor, diagonally opposite to each on the rotor.

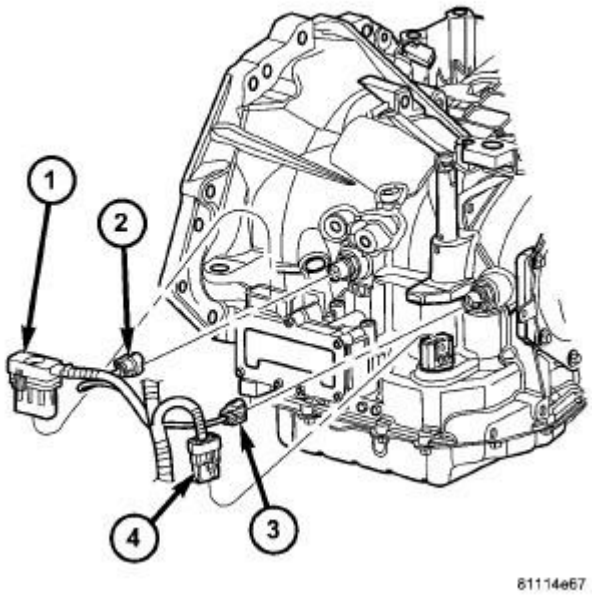

Fig. 100: Attaching Magnetic Dial Indicator To Inside Or Outside Of Brake Rotor
Courtesy of CHRYSLER LLC

4. Attach a magnetic dial indicator (2) to the inside or outside of the brake rotor, then align the dial indicator's contact pointer (1) with the direction of the stud axis and touch the outer tie rod.
5. Zero the dial indicator. (3)

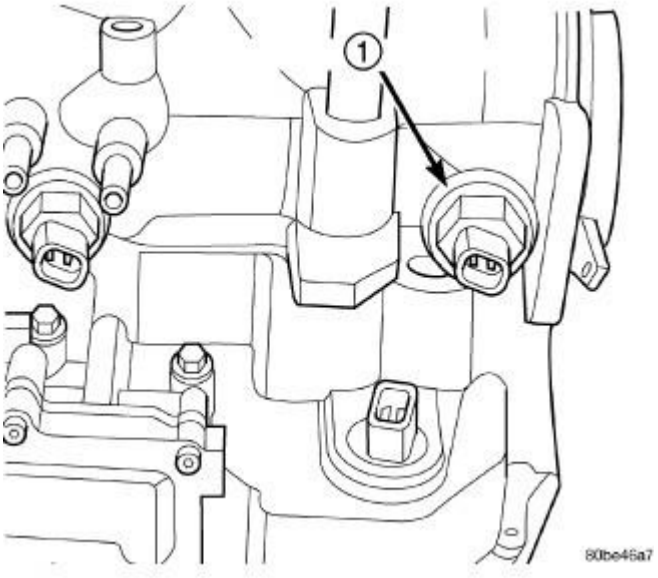

Fig. 101: Checking Outer Tie Rod Free-Play
Courtesy of CHRYSLER LLC

NOTE: When checking free-play, DO NOT rotate the tie rod. Just because a tie rod rotates easily does not mean that it is necessarily faulty. Using more than light hand pressure will result in a false reading.

6. Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down using light hand pressure. (Less than 10 lbs. of force.)
7. Measure and record any tie rod free-play movement.
8. Remove the magnetic dial indicator.
9. Remove the standard wheel mounting nuts from the two studs.

If the free-play in the tie rod exceeds 0.05 mm (.002 in.), replace the outer tie rod. See **OUTER TIE ROD**. If the free-play is less than 0.05 mm (.002 in.) at the outer tie rod check the inner tie rod for free-play. Refer to **INNER TIE ROD**.

INNER TIE ROD

NOTE: Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.

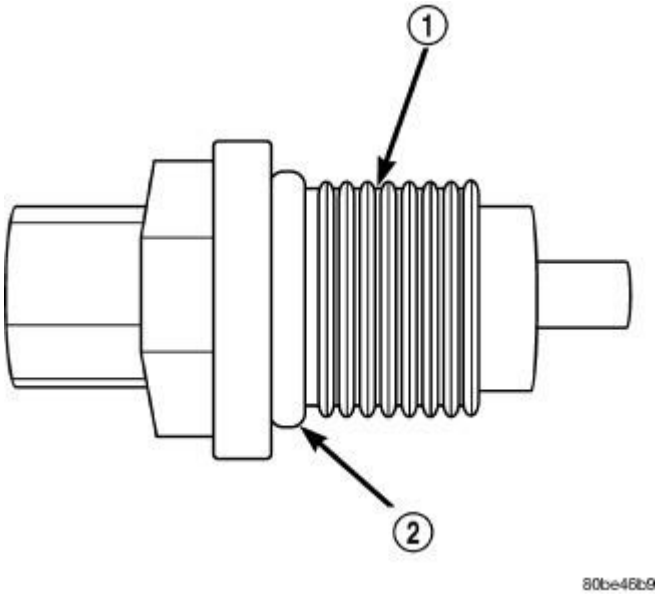

Fig. 102: Checking Inner Tie Rod Free-Play
Courtesy of CHRYSLER LLC

1. Grasp the inner tie rod near the steering gear bellows and attempt to move the tie rod straight up and down. If any free-play is felt, replace the inner tie rod. See **Steering/Gear/TIE ROD, Steering - Removal**.
2. If no free-play is felt, install the front wheels. Refer to **Tires and Wheels - Installation** .
3. Remove support and lower the vehicle.

Removal

INNER TIE ROD

1. Remove outer tie rod. See **OUTER TIE ROD**.
2. Remove tie rod jam nut from inner tie rod.

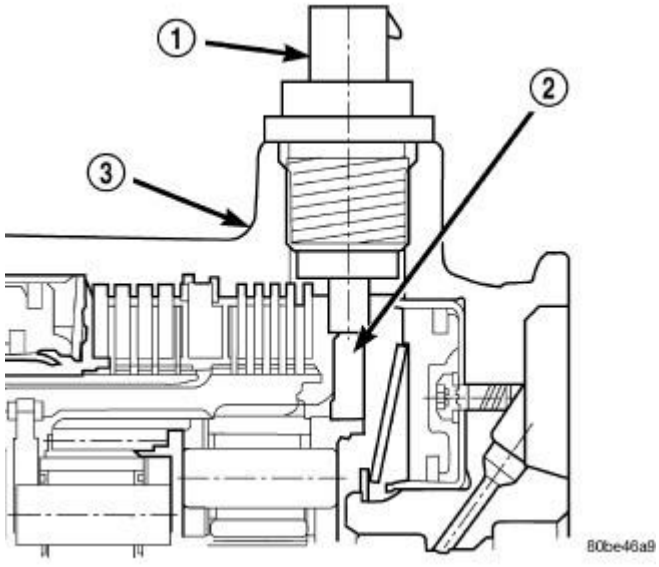

Fig. 103: Removing/Installing Heat Shield
Courtesy of CHRYSLER LLC

3. If servicing right inner tie rod, remove screws and push-pins securing heat shield (1) over right side of steering gear (2). Remove heat shield from over steering gear bellows.

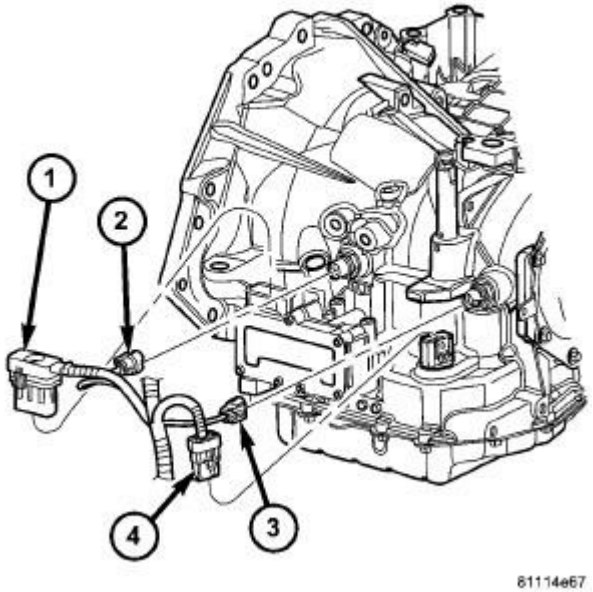

Fig. 104: Removing/Installing Bellows Clamps
Courtesy of CHRYSLER LLC

4. Remove clamp (3) securing bellows (1) to inner tie rod.
5. Remove clamp (2) securing bellows (1) to steering gear body.

6. Remove bellows.

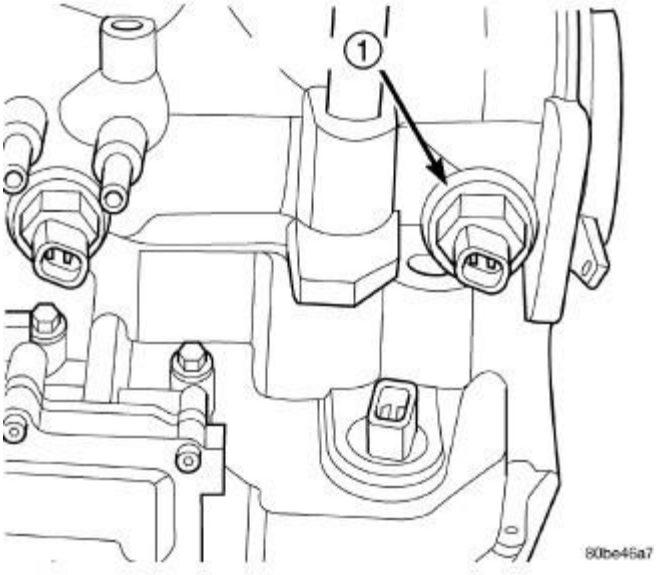

Fig. 105: Identifying Inner Tie Rod At Steering Gear
Courtesy of CHRYSLER LLC

7. Install appropriate inner tie rod removal tool on inner tie rod (1) hex.

CAUTION: If inner tie rod cannot be removed using specified tools, do not use a hammer or heat to loosen. Damage to steering gear will occur. Replace entire steering gear.

8. Un-thread and remove inner tie rod (1) from steering gear (2).

OUTER TIE ROD

1. Place front wheels of vehicle in STRAIGHT-AHEAD position.
2. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

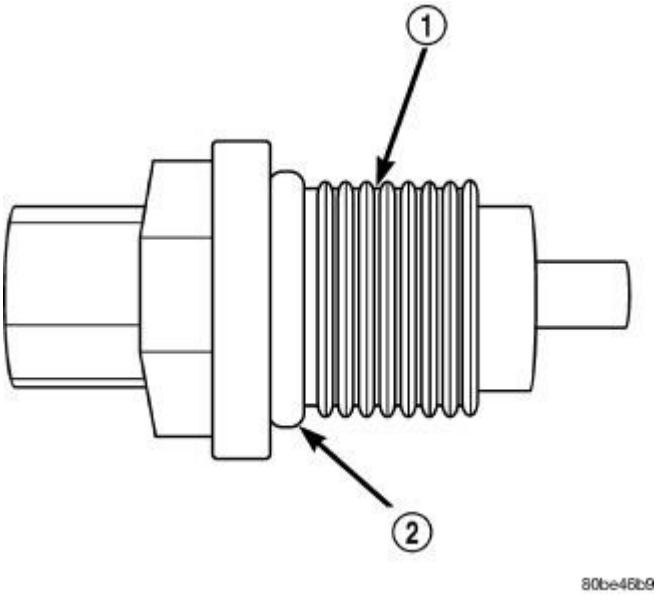

Fig. 106: Identifying Tire & Wheel Assembly
Courtesy of CHRYSLER LLC

3. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

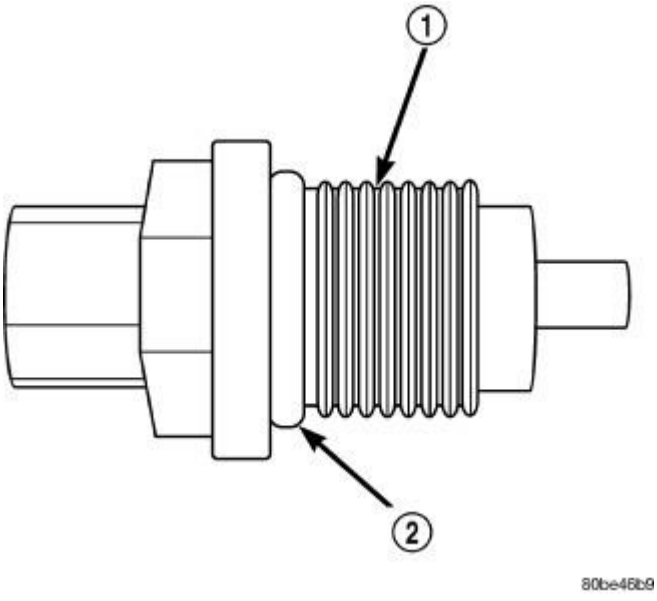

Fig. 107: Removing/Installing Outer Tie Rod Stud At Knuckle Steering Arm
Courtesy of CHRYSLER LLC

4. Loosen tie rod jam nut (3).
5. Remove nut (1) attaching outer tie rod (5) to knuckle (2) by holding rod end stud stationary while loosening and removing nut with a wrench.

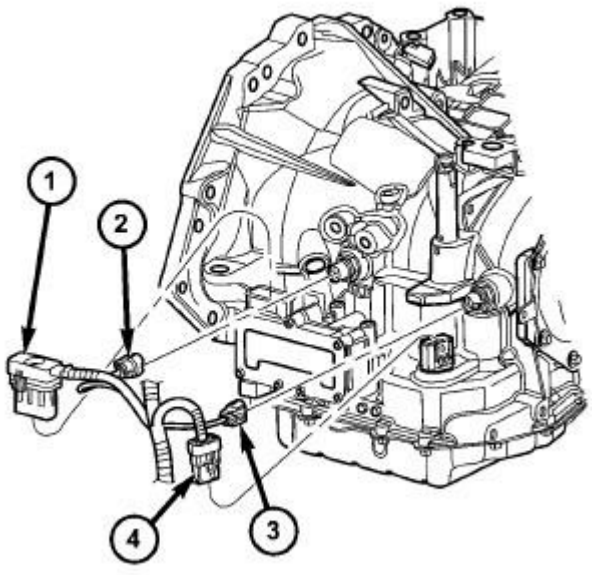

Fig. 108: Removing Outer Tie Rod Stud From Steering Knuckle Using Puller 9360
Courtesy of CHRYSLER LLC

6. Release outer tie rod end (3) from knuckle (1) using Remover (1), Special Tool 9360.
7. Remove outer tie rod from inner tie rod threads. Count how many rotations it takes to remove outer tie rod for installation reference.

Installation

INNER TIE ROD

1. Apply Mopar® Lock AND Seal Adhesive or equivalent medium thread locker adhesive to inboard end threads of inner tie rod.

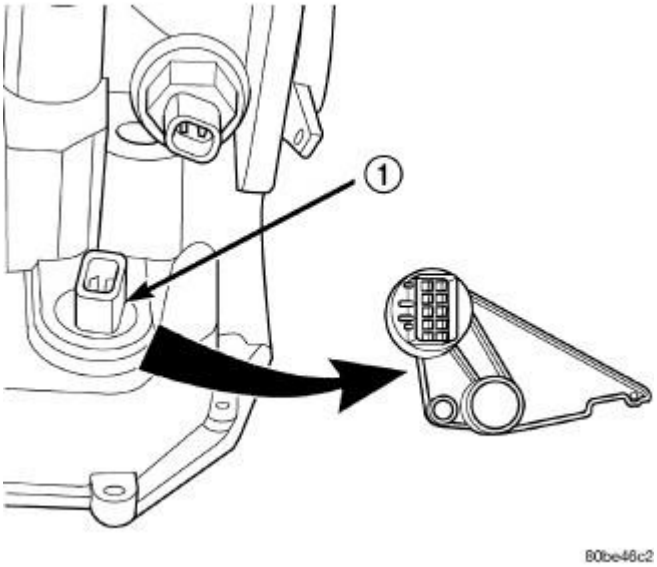

Fig. 109: Identifying Inner Tie Rod At Steering Gear
Courtesy of CHRYSLER LLC

2. Install inner tie rod (1) onto gear (2) using appropriate inner tie rod installer tool or crows foot wrench on hex. Tighten inner tie rod to 78 N.m, (58 ft. lbs.).
3. Loosely place new clamp over large end of bellows.
4. Slide new bellows with clamp over end of inner tie rod and onto gear body.

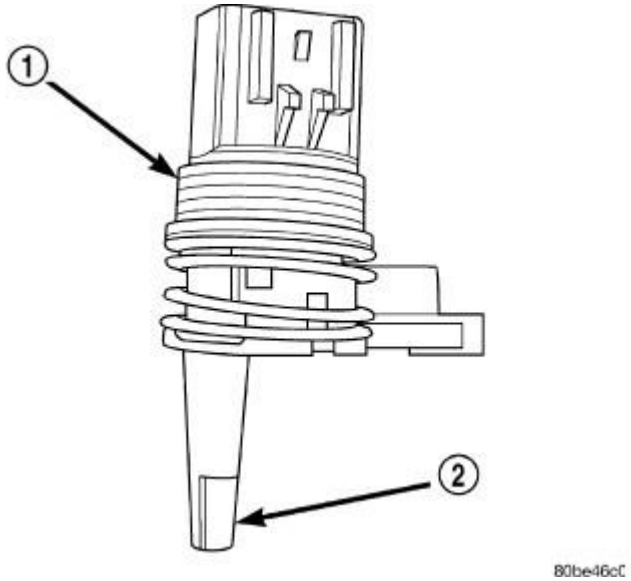

Fig. 110: Identifying Bellows & Groove In Inner Tie Rod Shaft
Courtesy of CHRYSLER LLC

5. Push small end of bellows (2) past groove (1) machined into inner tie rod.
6. Apply a small amount of Mopar® Lubriplate or equivalent uniformly to groove (1) in inner tie rod shaft.

This allows for toe adjustment without twisting bellows.

7. Pull small end of bellows outward until ridge inside bellows engages groove.

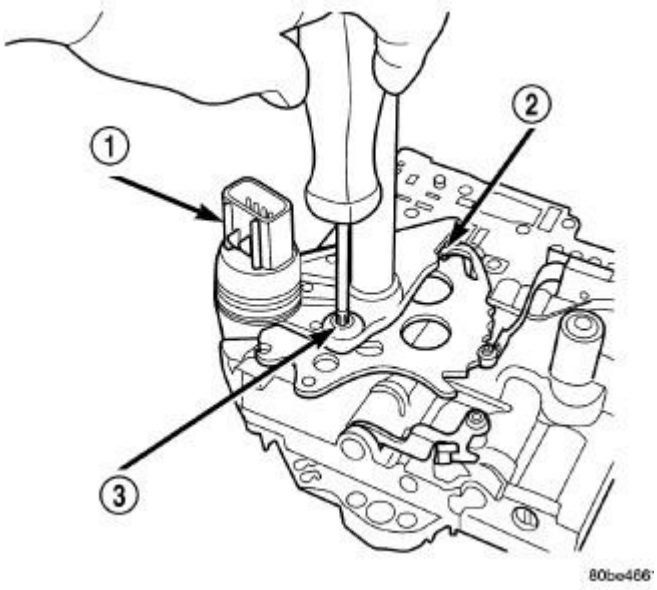

Fig. 111: Removing/Installing Bellows Clamps
Courtesy of CHRYSLER LLC

8. Install new clamp (3) over small end of bellows (1).

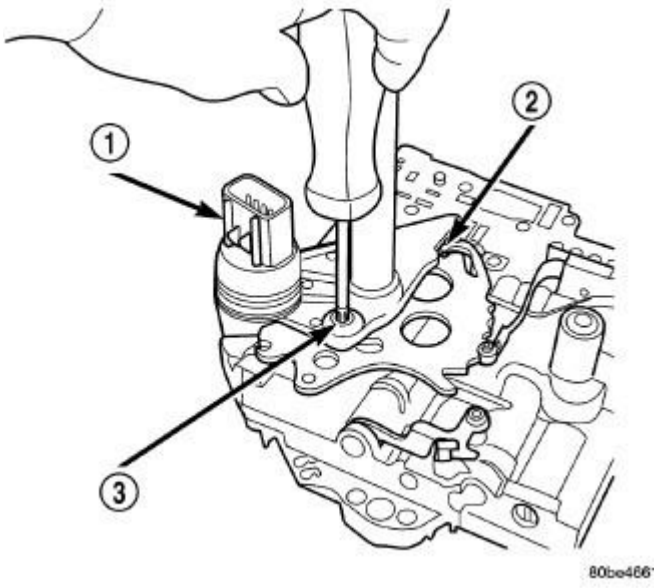

Fig. 112: Crimping Clamp Securing Bellows To Gear Body Using Crimping Pliers
Courtesy of CHRYSLER LLC

9. Using crimping pliers (1), crimp clamp securing bellows to gear body.

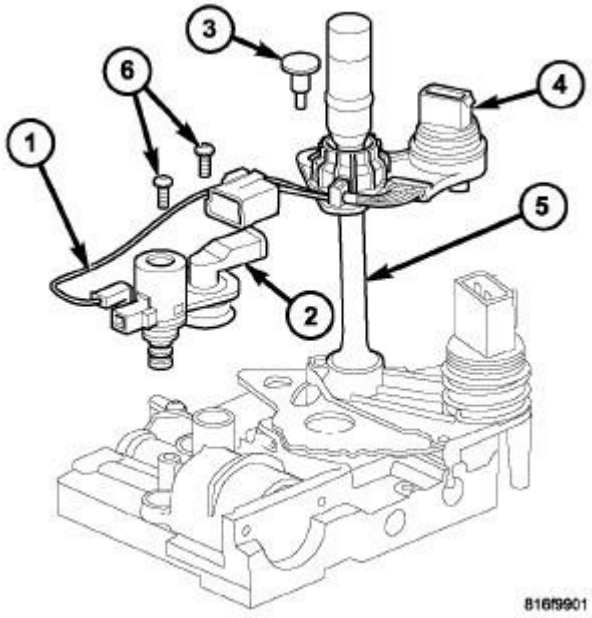

Fig. 113: Removing/Installing Heat Shield
Courtesy of CHRYSLER LLC

10. If servicing right inner tie rod, position heat shield (1) over steering gear (2). Install mounting screws and push-pins. Tighten screws to 8 N.m (71 in. lbs.).

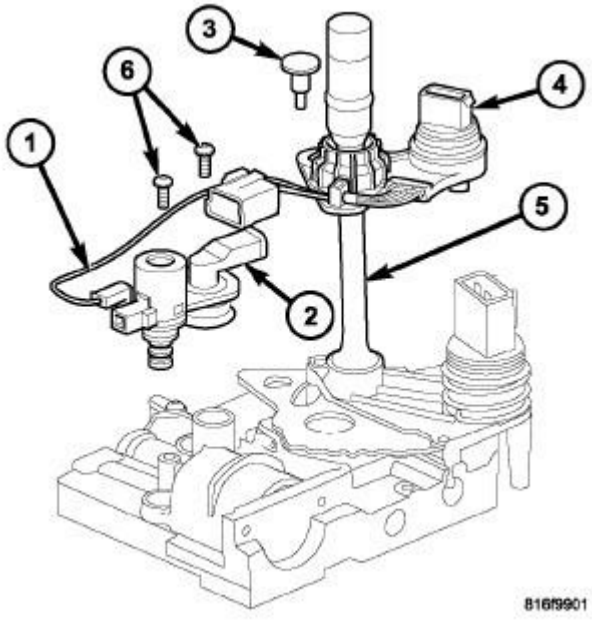

Fig. 114: Removing/Installing Outer Tie Rod Stud At Knuckle Steering Arm
Courtesy of CHRYSLER LLC

11. Thread tie rod jam nut (3) onto inner tie rod (4) far enough to install outer tie rod.
12. Install outer tie rod (5). See **OUTER TIE ROD**.

OUTER TIE ROD

1. Install outer tie rod onto inner tie rod threads. As outer tie rod is installed, count out same number rotations as were counted on tie rod removal. This will get toe setting somewhat close to specifications before vehicle is aligned at end of this procedure.

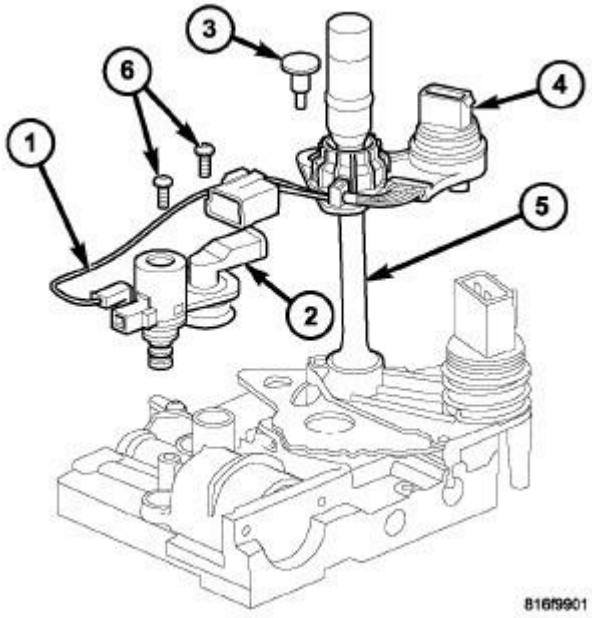

Fig. 115: Removing/Installing Outer Tie Rod Stud At Knuckle Steering Arm
Courtesy of CHRYSLER LLC

2. Attach outer tie rod (5) to knuckle (2). Start NEW nut (1) onto outer tie rod stud. While holding stud stationary, tighten nut using a wrench. Using a crowfoot wrench on a torque wrench, tighten nut to 75 N.m (55 ft. lbs.). Then, tighten nut an additional 245° turn after that torque is met.
3. Snug tie rod jam nut (3). Do not fully tighten at this time. Tighten tie rod jam nuts to specifications while performing wheel alignment at end of this procedure.

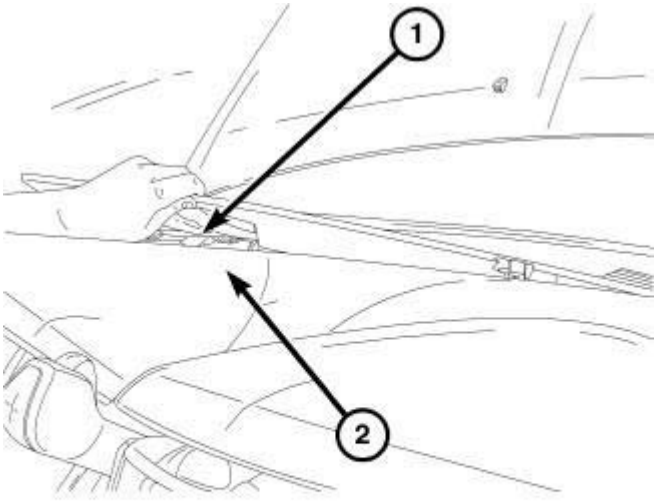

Fig. 116: Identifying Tire & Wheel Assembly
Courtesy of CHRYSLER LLC

4. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
5. Lower vehicle.
6. Perform wheel alignment, setting toe to specifications. Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

PUMP

DESCRIPTION

DESCRIPTION

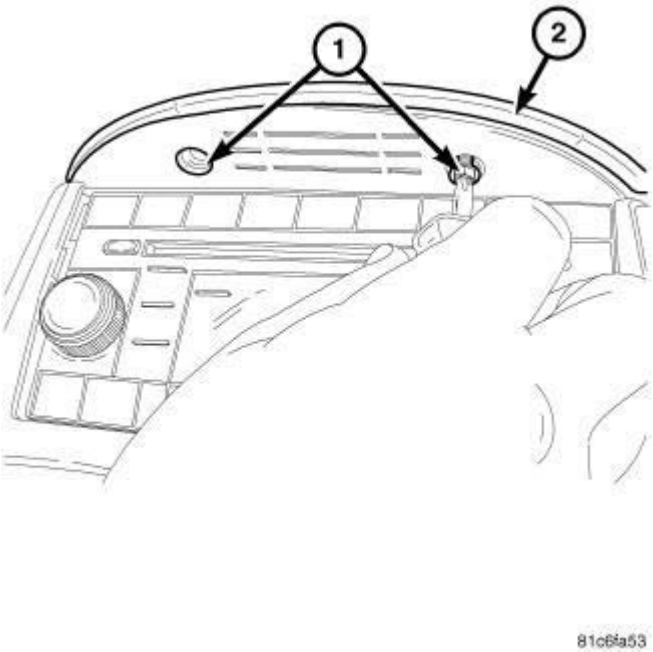

Fig. 117: Identifying Belt Driven Power Steering Pump
Courtesy of CHRYSLER LLC

Hydraulic pressure for operation of the power steering gear is provided by a droop-flow type power steering pump. The pump's output characteristic is called droop-flow because output decreases with speed. The pump provides assistance consistent with demand. It provides less assistance at highway speeds to enhance directional stability and control, while providing more assistance for steering ease in avoidance and parking maneuvers. The pump also responds to increases in system backpressure (such as when the vehicle negotiates a sharp turn) by raising the pump flow rate.

The belt driven power steering pump (2) is mounted to the front of the engine. The pulley can be serviced separately from the pump if damaged.

WARNING

WARNING

WARNING: Power steering fluid, engine parts and exhaust system may be extremely hot if engine has been running. Do not start engine with any loose or disconnected hoses. Do not allow hoses to touch hot exhaust manifold or catalyst.

WARNING: Fluid level should be checked with the engine off to prevent personal injury from moving parts.

CAUTION

CAUTION

CAUTION: When the system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

CAUTION: When servicing power steering components, do not pinch off power steering hoses in an any way to stop fluid flow. Damage to hoses may result.

DIAGNOSIS AND TESTING

POWER STEERING PUMP AND HOSES

NOTE: This information is designed to be used in conjunction with the diagnostic charts . See STEERING SYSTEM DIAGNOSIS CHARTS.

CHECKING FOR WEAR OF POWER STEERING PUMP INTERNAL COMPONENTS

1. Place gear selector in PARK (or NEUTRAL) with wheels chalked.
2. With the engine idling, have a helper turn the steering wheel.
3. Using an electronic listening tool, determine if noise is coming from the pump.
4. Increase the engine speed and have a helper turn the steering wheel. Does the noise change with load?
5. Replace the power steering pump if excessive noise is present. See **Steering/Pump - Removal**.

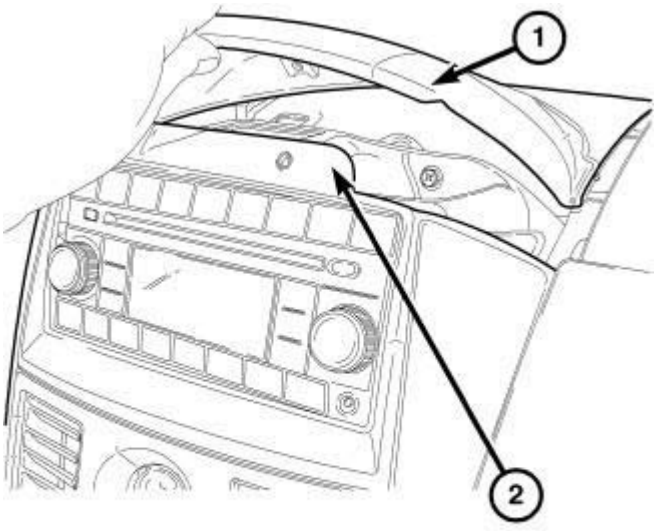
CHECKING FOR POWER STEERING HOSES TOUCHING BODY OR FRAME OF VEHICLE

Check hoses and hose tubes as following:

- Inspect hoses and hose tubes for witness marks. If witness marks are present, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. See **Steering - Specifications**. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.
- Check fastener torque of hose mounting brackets and tube nuts. See **Steering - Specifications**.
- Have a helper bump the steering gear off of the stops to induce pressure fluctuations which may move the hose. If hose contact is made, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. See **Steering - Specifications**. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.

REMOVAL

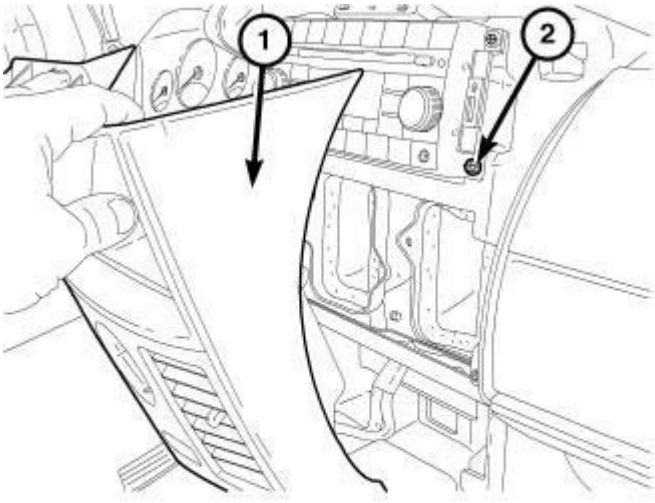
2.8L DIESEL



81c6fad4

Fig. 118: Removing/Installing Supply Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.
4. Remove clamp, then supply hose (3) from pump (4).



81c700c0

Fig. 119: Removing/Installing Pressure Hose At Power Steering Pump

Courtesy of CHRYSLER LLC

5. Un-thread tube nut and remove pressure hose (1) from pump (2).
6. Remove accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .

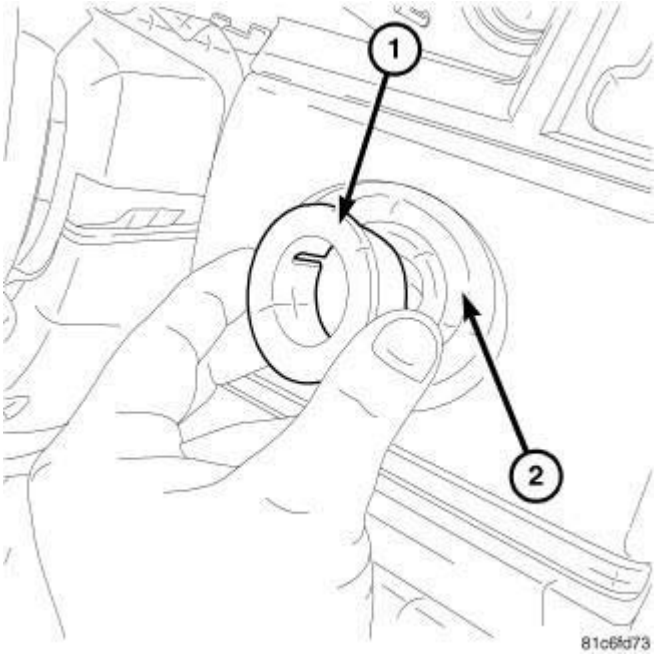


Fig. 120: Removing/Installing Engine Mount Bracket Fasteners
Courtesy of CHRYSLER LLC

7. Remove the engine mount bracket fasteners (1) and (4).
8. Using a floor jack, lift the right side of the engine only high enough to remove the pump mounting bolts in the next step.

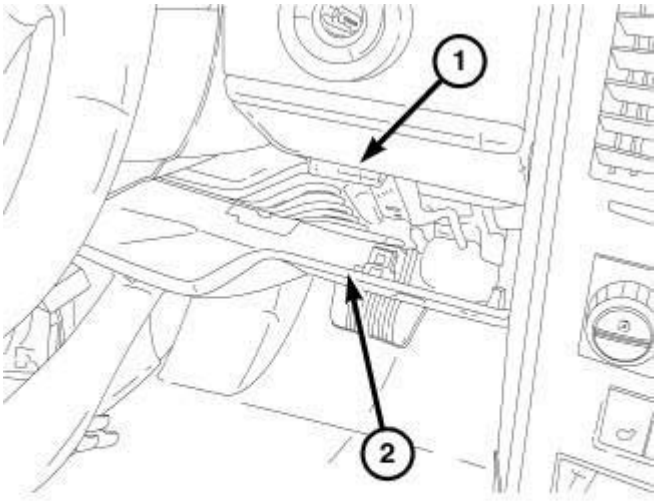

Fig. 121: Removing/Installing Power Steering Pump - 2.8L Diesel
Courtesy of CHRYSLER LLC

9. Remove three pump mounting bolts (1) through pump pulley.
10. Remove pump (2) from engine compartment.
11. If pulley needs removal, see **Steering/Pump/PULLEY, Power Steering Pump - Removal**.

3.3L / 3.8L

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

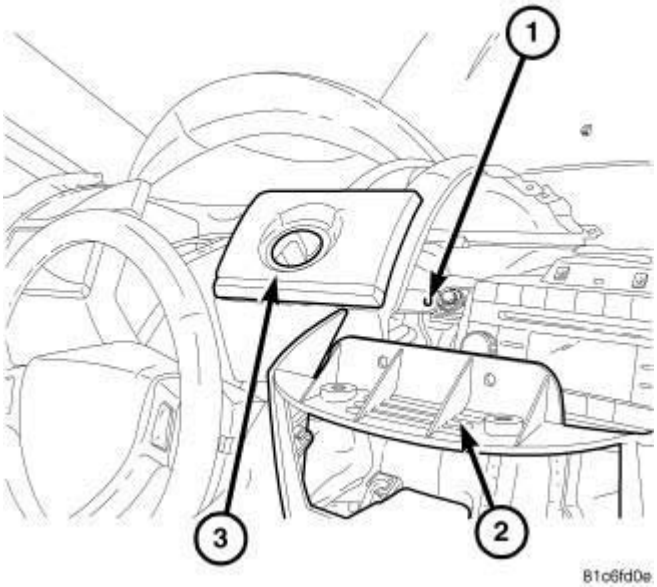

Fig. 122: Removing/Installing Supply Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

4. Remove clamp, then supply hose (3) from pump (4).

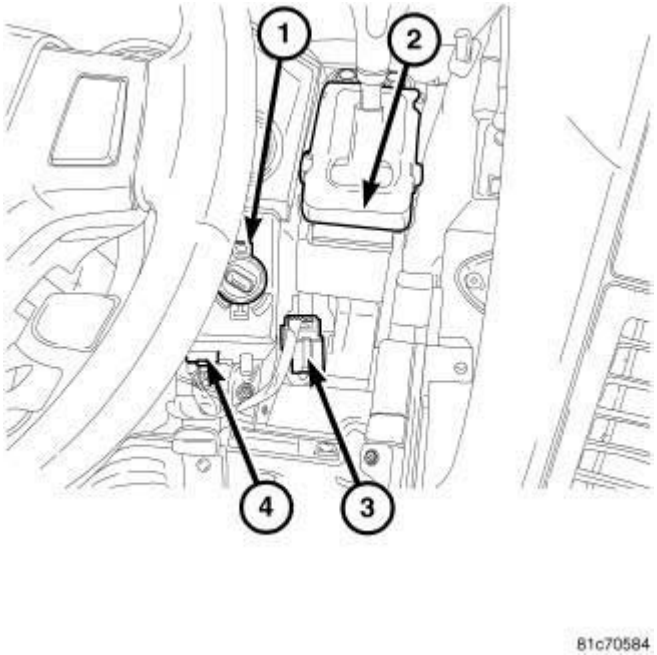

Fig. 123: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

5. Un-thread tube nut and remove pressure hose (1) from pump (2).
6. Remove accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .

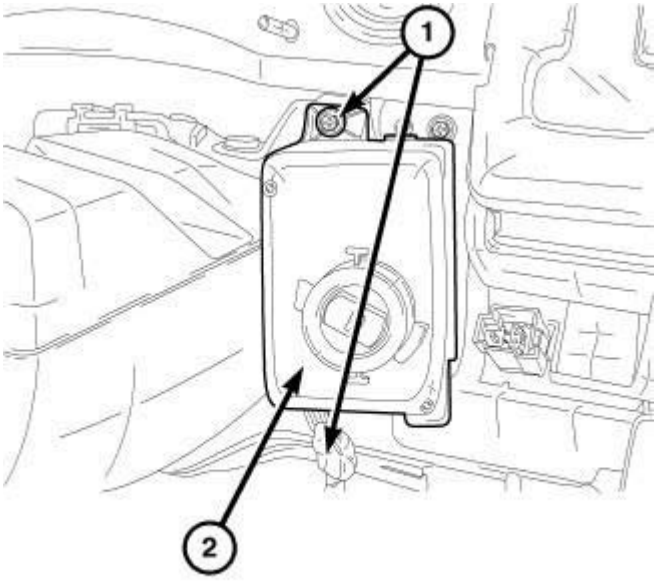

Fig. 124: Identifying Belt Driven Power Steering Pump
Courtesy of CHRYSLER LLC

7. Remove three pump mounting bolts (1) through pump pulley.
8. Remove pump (2) from engine compartment.
9. If pulley needs removal, see **Steering/Pump/PULLEY, Power Steering Pump - Removal**.

4.0L

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

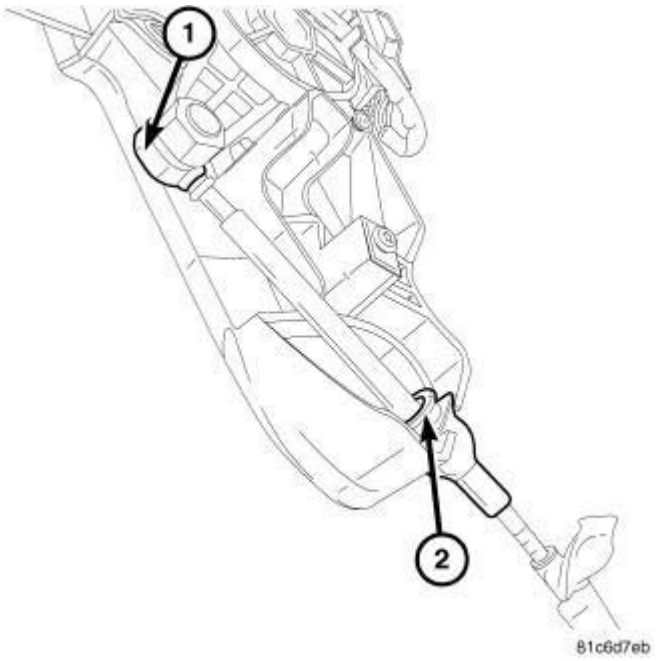

Fig. 125: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

4. Remove nuts (5) securing pressure hose routing clamps to engine (2).
5. Remove pressure hose routing clamps from studs (3).
6. Un-thread tube nut and remove pressure hose (1) from pump (2).

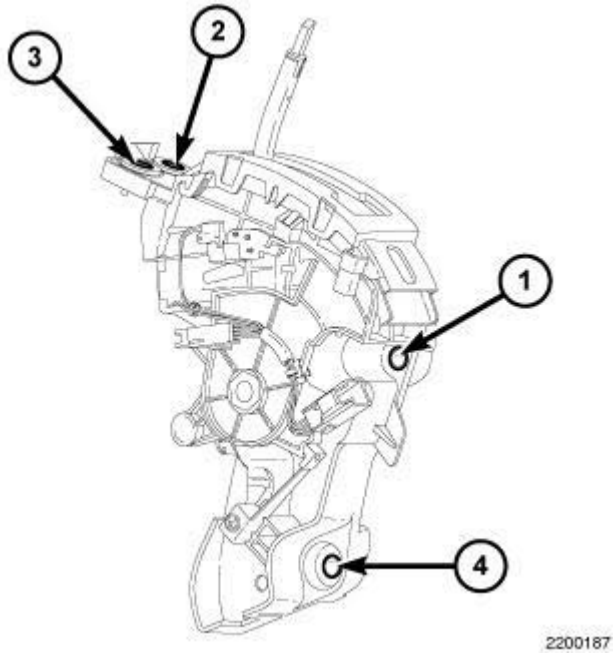

Fig. 126: Removing/Installing Supply Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

7. Remove clamp, then supply hose (3) from pump (4).
8. Remove accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .

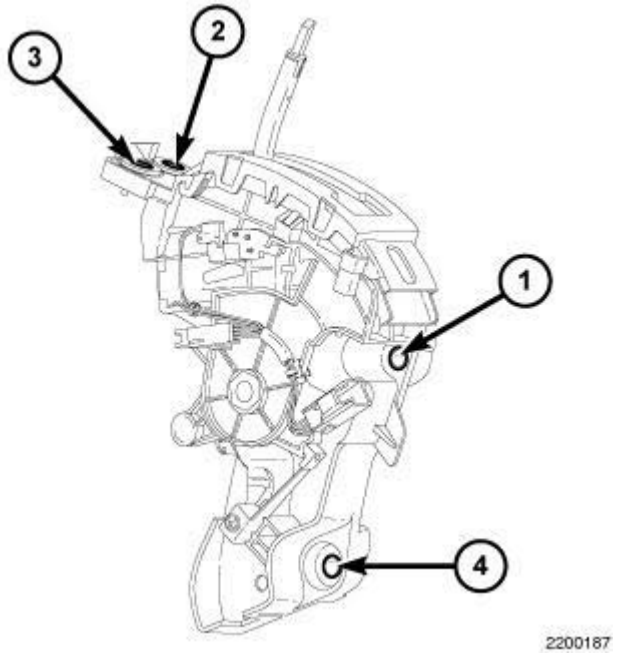

Fig. 127: Removing/Installing Power Steering Pump
Courtesy of CHRYSLER LLC

9. Remove three pump mounting bolts (3) through pump pulley (not shown in **Fig. 127**).
10. Remove pump (2) (with pulley) from engine compartment.
11. If pulley needs removal, see **Steering/Pump/PULLEY, Power Steering Pump - Removal**.

INSTALLATION

2.8L DIESEL

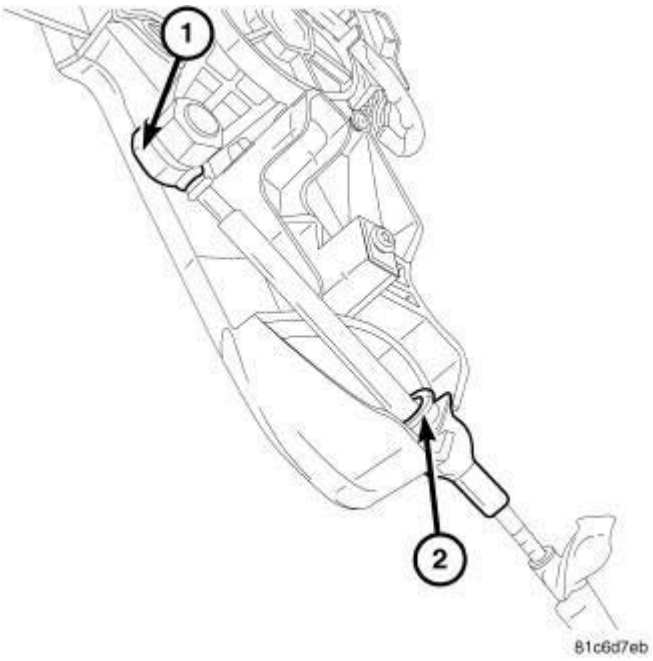

Fig. 128: Removing/Installing Power Steering Pump - 2.8L Diesel
Courtesy of CHRYSLER LLC

1. Position power steering pump (2) on engine.
2. Using a floor jack, lift the right side of the engine only high enough to install the pump mounting bolts in the next step.
3. Install three power steering pump mounting bolts (1) using openings in pulley. Tighten pump mounting bolts to 23 N.m (17 ft. lbs.).

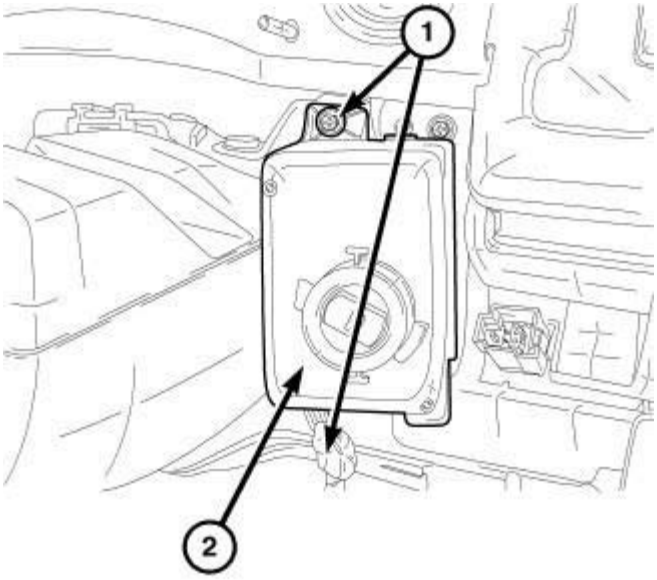

Fig. 129: Removing/Installing Engine Mount Bracket Fasteners

Courtesy of CHRYSLER LLC

4. Install the engine mount bracket fasteners (1) and (4) and tighten to 54 N.m (40 lbs.ft.).
5. Install accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .

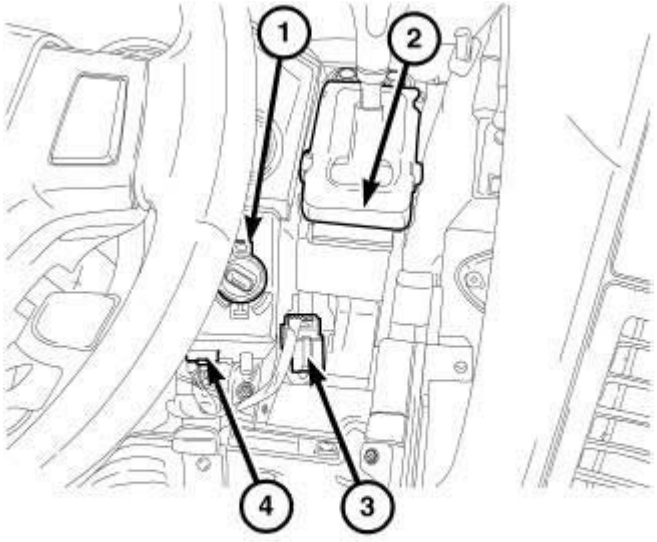

Fig. 130: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

NOTE: Before installing power steering pressure hose on power steering pump, replace O-ring on end of power steering pressure hose. Lubricate O-ring using clean power steering fluid.

6. Install pressure hose (1) into pump (2) fitting. Thread pressure hose tube nut into pump and tighten to 31 N.m (23 ft. lbs.).

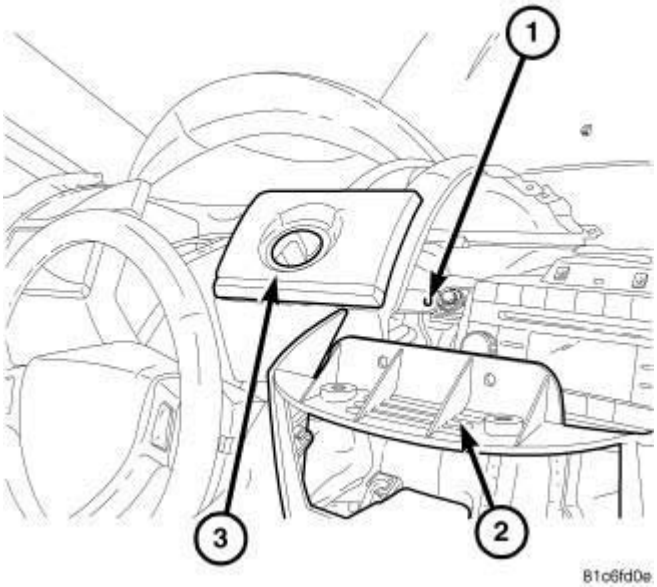

Fig. 131: Removing/Installing Supply Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

7. Slide fluid supply hose (3) onto pump (4) fitting and install clamp securing it in place.
8. Connect negative (-) battery cable on negative battery post.
9. Fill and bleed power steering system. See **Steering - Standard Procedure**.
10. Inspect for leaks.

3.3L / 3.8L

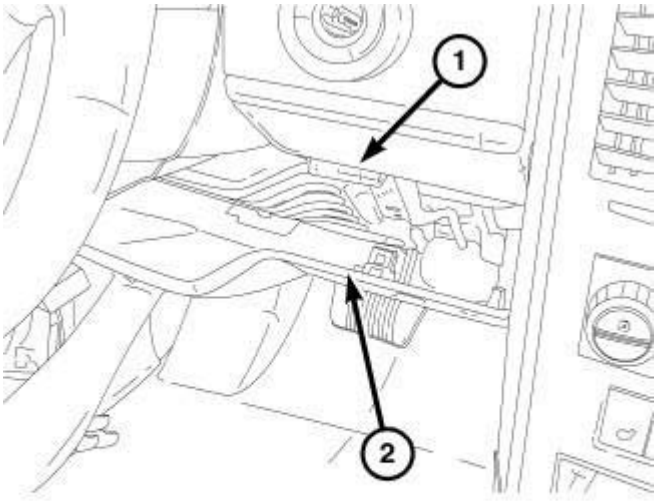

Fig. 132: Identifying Belt Driven Power Steering Pump
Courtesy of CHRYSLER LLC

1. Position power steering pump (2) on engine.
2. Install three power steering pump mounting bolts (1) using openings in pulley. Tighten pump mounting bolts to 23 N.m (17 ft. lbs.).
3. Install accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .

NOTE: Before installing power steering pressure hose on power steering pump, replace O-ring on end of power steering pressure hose. Lubricate O-ring using clean power steering fluid.

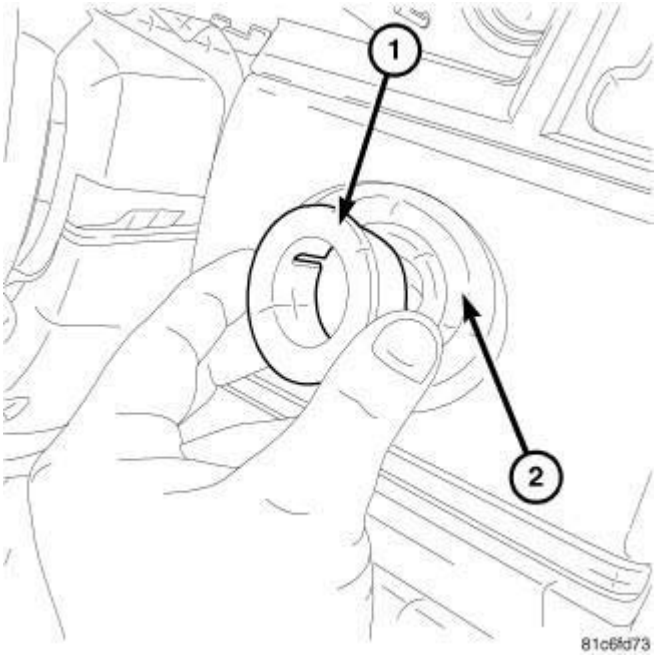

Fig. 133: Removing/Installing Pressure Hose At Power Steering Pump
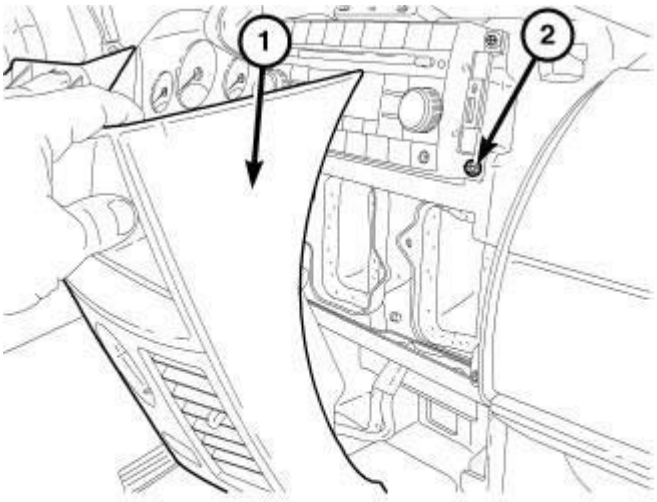
Courtesy of CHRYSLER LLC

4. Install pressure hose (1) into pump (2) fitting. Thread pressure hose tube nut into pump and tighten to 31 N.m (23 ft. lbs.).

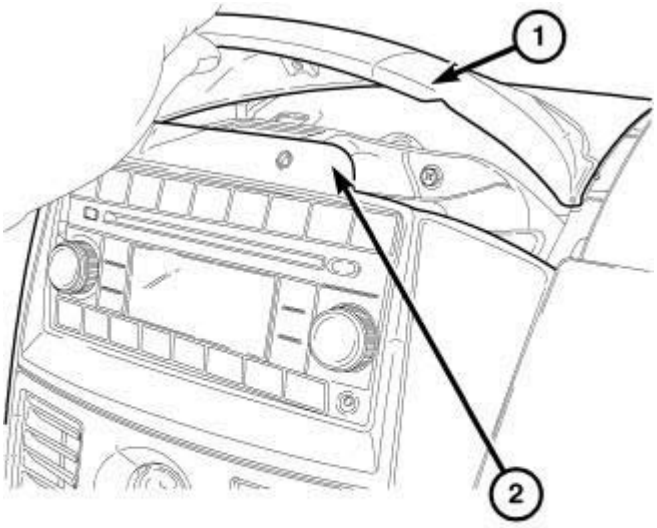


81c700c0

Fig. 134: Removing/Installing Supply Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

5. Slide fluid supply hose (3) onto pump (4) fitting and install clamp securing it in place.
6. Connect negative (-) battery cable on negative battery post.
7. Fill and bleed power steering system. See **Steering - Standard Procedure**.
8. Inspect for leaks.

4.0L



81c6fad4

Fig. 135: Removing/Installing Power Steering Pump
Courtesy of CHRYSLER LLC

1. Install power steering pump back in engine compartment using reverse order of its removal.
2. Install power steering pump onto its mounting bracket (1) cast into the engine cover.
3. Install three power steering pump mounting bolts (3) through pulley (not shown in **Fig. 135**). Tighten pump mounting bolts to 23 N.m (17 ft. lbs.).
4. Install accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .

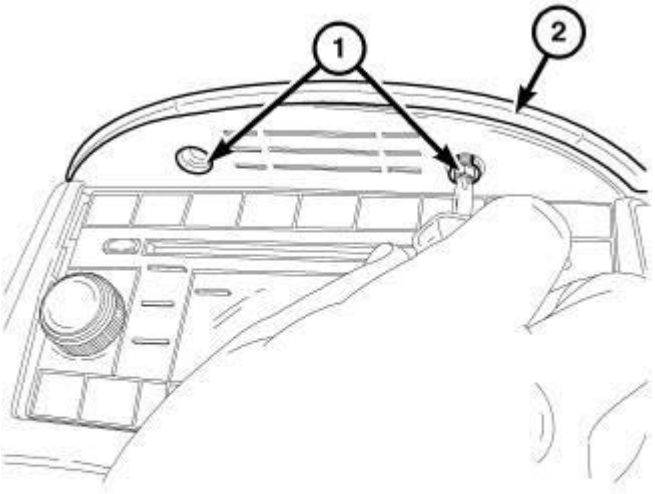


Fig. 136: Removing/Installing Supply Hose At Power Steering Pump
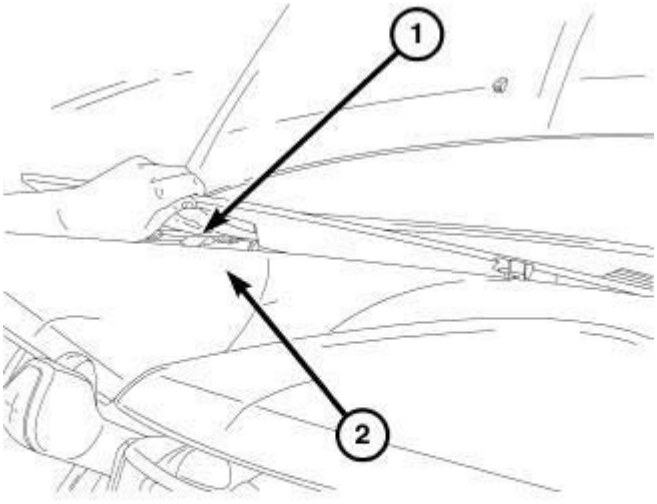
Courtesy of CHRYSLER LLC

5. Slide fluid supply hose (3) onto pump (4) fitting and install clamp securing it in place.

NOTE: Before installing power steering pressure hose on power steering pump, replace O-ring on end of power steering pressure hose. Lubricate O-ring using clean power steering fluid.



81c6fa00

Fig. 137: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

6. Install pressure hose (1) into pump (2) fitting. Thread pressure hose tube nut into pump and tighten to 31 N.m (23 ft. lbs.).
7. Install pressure hose routing clamps over studs (3) on engine mounted bracket and install nuts (5). Tighten nut to 28 N.m (21 ft. lbs.).
8. Connect negative (-) battery cable on negative battery post.
9. Fill and bleed power steering system. See **Steering - Standard Procedure**.
10. Inspect for leaks.

COOLER, POWER STEERING

Removal

REMOVAL

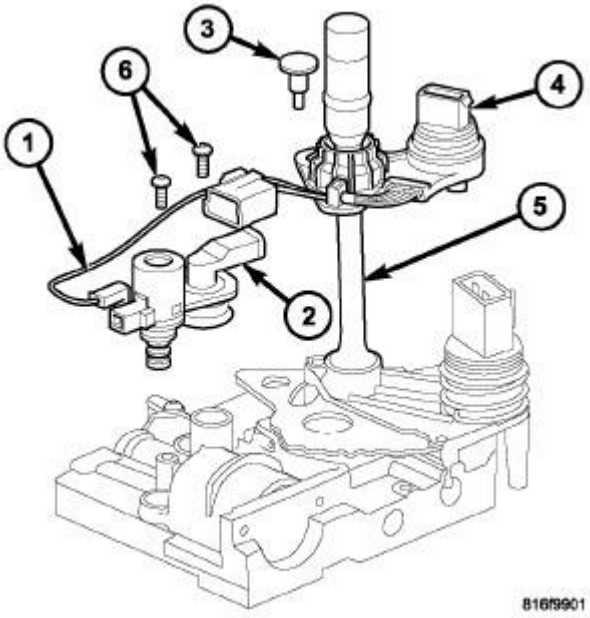


Fig. 138: Identifying Power Steering Cooler Hose & Return Hose
Courtesy of CHRYSLER LLC

NOTE: Before proceeding, see Steering - Warning.

1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Loosen the clamp and remove the return hose (1) from the power steering cooler fitting.
3. Loosen the clamp and remove the power steering cooler hose (2) from the power steering reservoir.

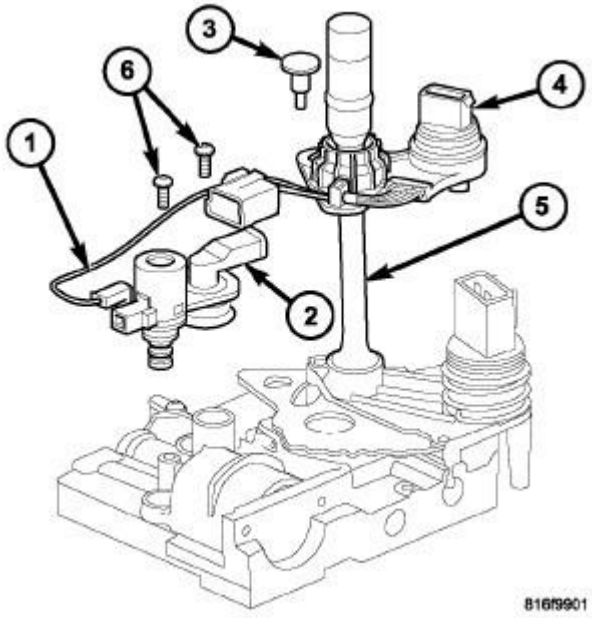

Fig. 139: Removing/Installing Power Steering Cooler Line
Courtesy of CHRYSLER LLC

4. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .
5. If equipped, remove the belly pan below the engine.
6. Remove the front fascia. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Removal** .
7. Disengage clips (2) that attach the power steering cooler line to radiator brace.
8. Remove the screw (3) that attaches the power steering cooler bracket and remove the power steering cooler line from the vehicle.

Installation

INSTALLATION

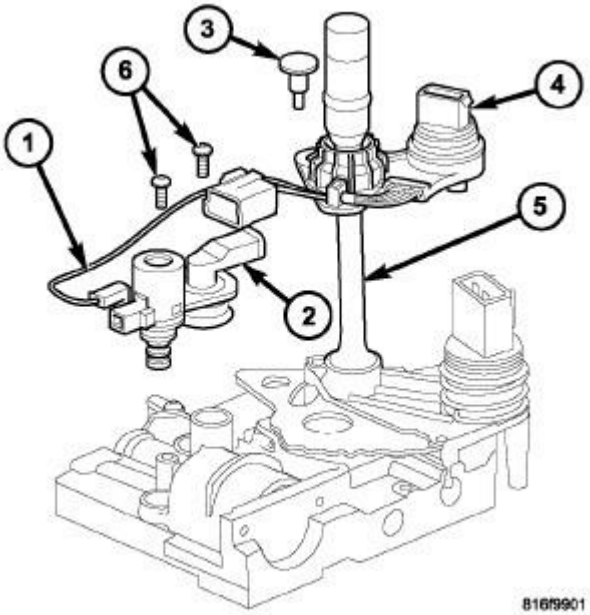

Fig. 140: Removing/Installing Power Steering Cooler Line
Courtesy of CHRYSLER LLC

1. Install the power steering cooler line (1) and snap in the clips (2) to the radiator brace.
2. Install screw (3) to attach power steering cooler line (1) to the body.

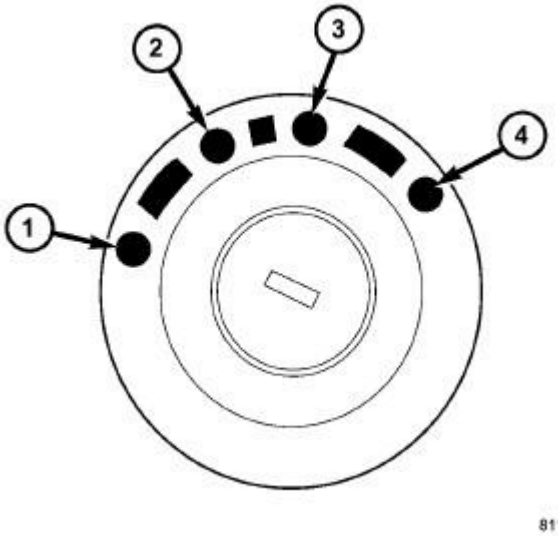

Fig. 141: Identifying Power Steering Cooler Hose & Return Hose
Courtesy of CHRYSLER LLC

3. Install the power steering cooler hose (2) and clamp to the power steering fluid reservoir fitting.

4. Install the supply hose (1) to the power steering cooler fitting. Slide hose clamp into position and attach it.
5. Install the front fascia. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Installation** .
6. If equipped, install the belly pan below the engine.
7. Fill and bleed the power steering system. See **Steering - Standard Procedure**.
8. Check for leaks.

FLUID

Standard Procedure

POWER STEERING FLUID LEVEL CHECKING

WARNING: Fluid level should be checked with the engine OFF to prevent personal injury from moving parts and to assure an accurate fluid level reading.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

NOTE: Although not required at specific intervals, the fluid level may be checked periodically. Check the fluid level anytime there is a system noise or fluid leak suspected.

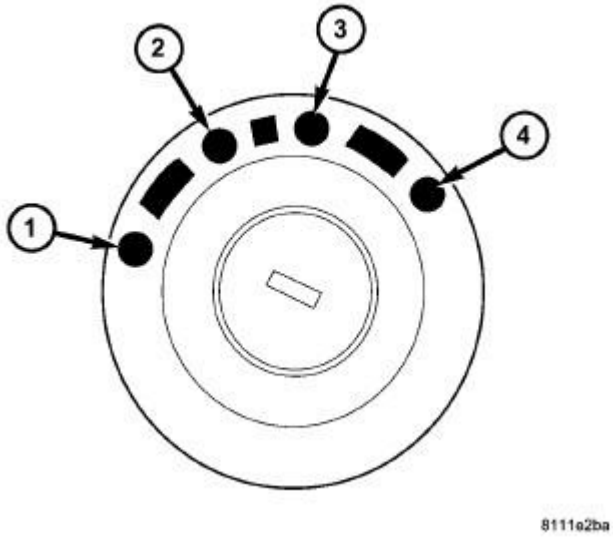

Fig. 142: Identifying Power Steering Reservoir
Courtesy of CHRYSLER LLC

The power steering fluid level can be viewed through the side of the power steering fluid reservoir. Compare the fluid level to the markings on the side of the reservoir. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the MAX. and MIN. markings. When the fluid is hot, fluid level is allowed to read up to the MAX. line.

HOSE, POWER STEERING, PRESSURE AND RETURN, 2.8L DIESEL

Removal

REMOVAL

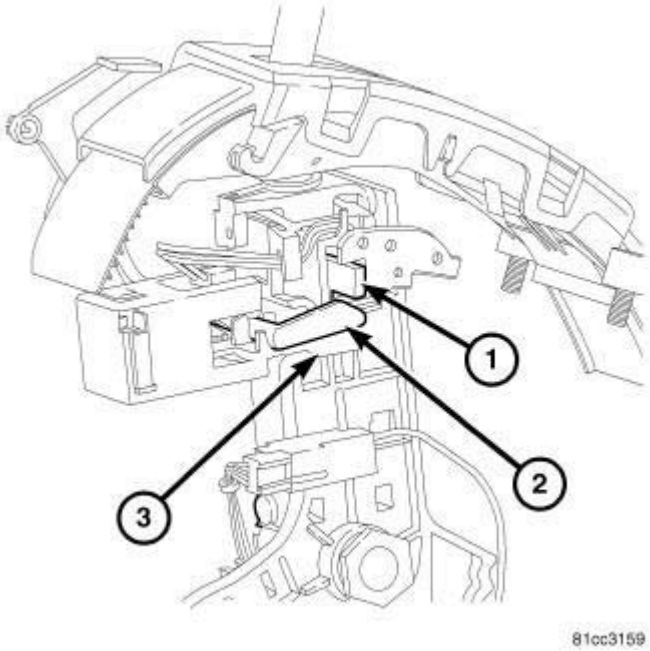

Fig. 143: Identifying Power Steering Cooler Hose & Return Hose
Courtesy of CHRYSLER LLC

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.
4. Loosen clamp attaching return hose (1) to the power steering cooler, and remove hose from the fitting.

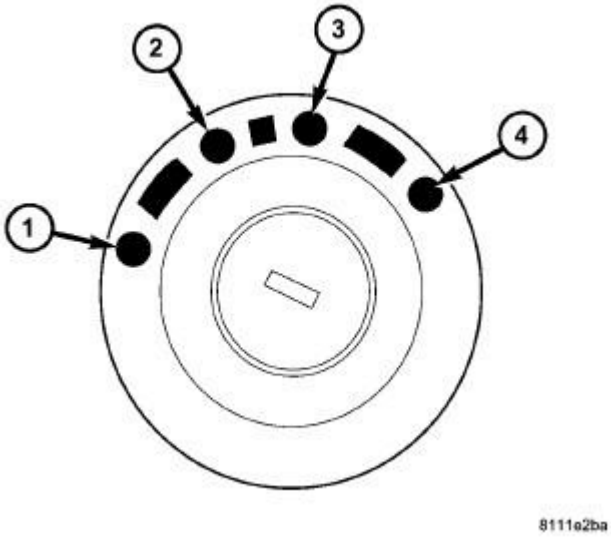

Fig. 144: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

5. Un-thread tube nut and remove pressure hose (1) from pump (2).

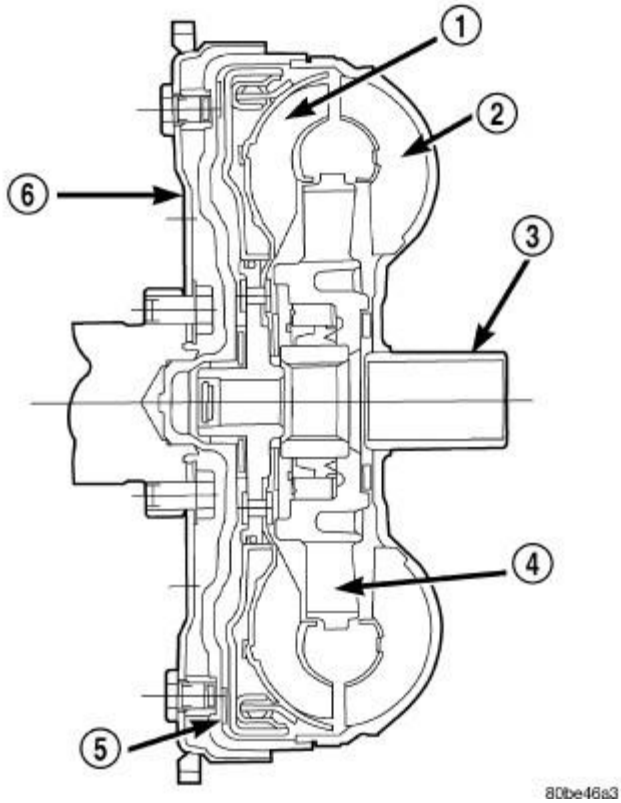

Fig. 145: Removing/Installing Screw & Nut At Hose Routing Clamp
Courtesy of CHRYSLER LLC

6. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .
7. Remove nut (4), then hose tube routing clamp (3) from bracket (7) above A/C compressor.
8. Remove screw (5), securing hose routing clamp to engine flange (6).

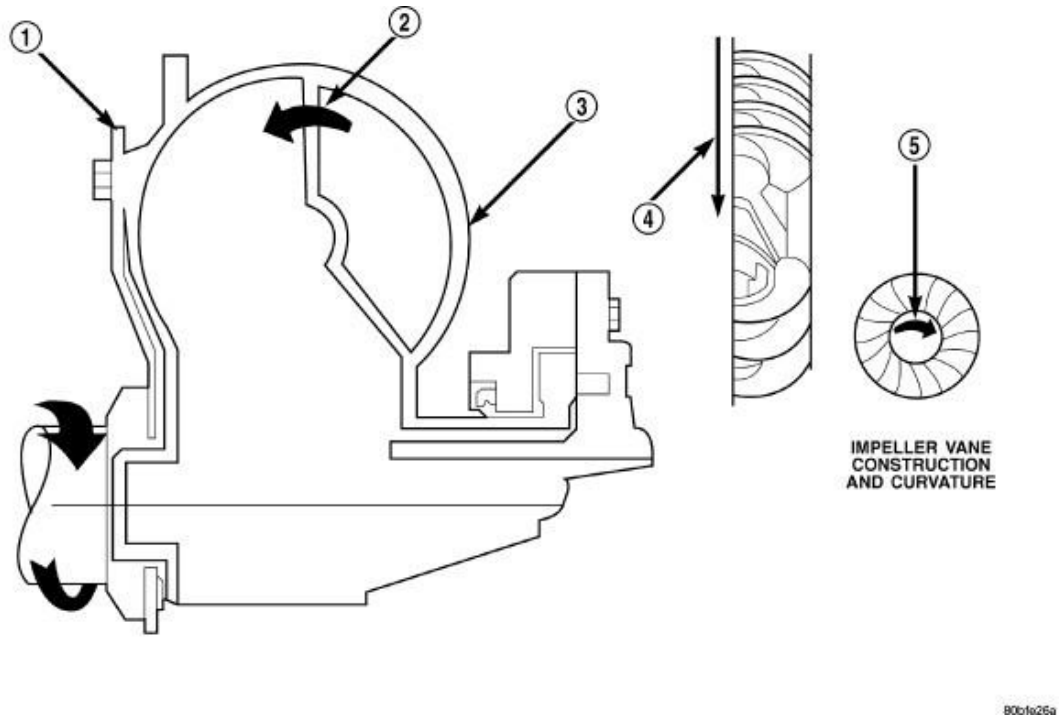

Fig. 146: Removing/Installing Pressure/Return Hose Assembly
Courtesy of CHRYSLER LLC

NOTE: Figure at right shows left-hand-drive configuration. Right-hand-drive is typical.

9. Remove the rear engine mount.
   - For 3.3L / 3.8L engine, refer to **REMOVAL** .
   - For 4.0L engine, refer to **REMOVAL** .
   - For 2.8L Diesel engine, refer to **ENGINE MOUNTING** .
10. Remove screw (4), securing hose routing clamp to front suspension crossmember (3).
11. Remove both tube nuts fastening hose assembly (2) to power steering gear (1). Remove hoses from gear ports.
12. Remove pressure/return hose assembly from vehicle.

Installation

INSTALLATION

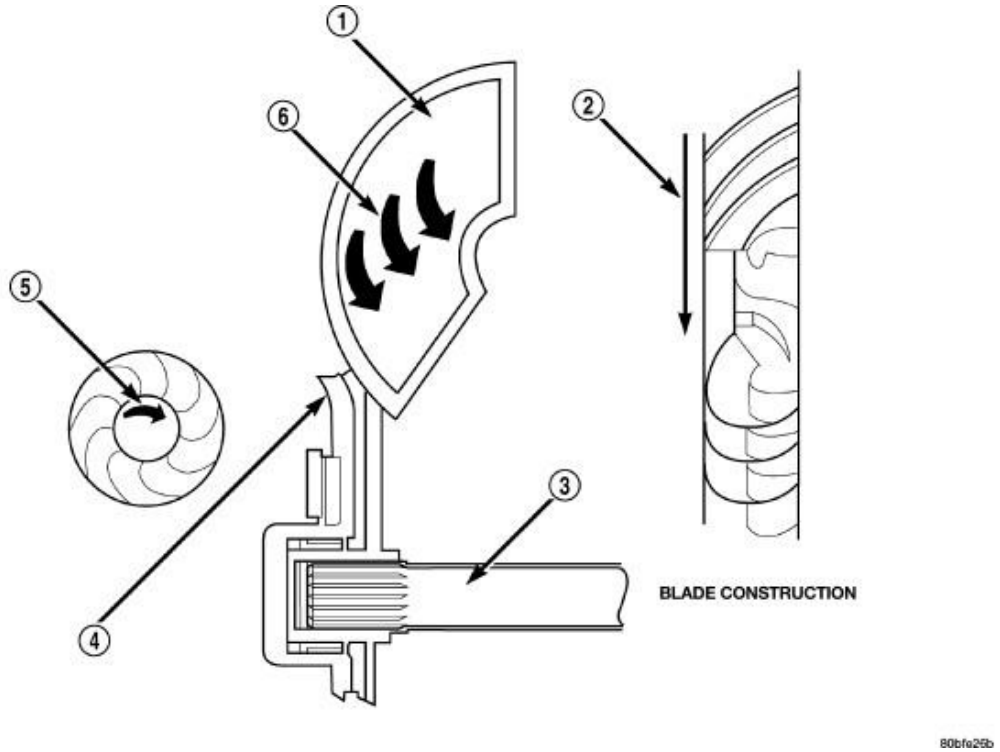

Fig. 147: Removing/Installing Pressure/Return Hose Assembly
Courtesy of CHRYSLER LLC

NOTE: Figure at right shows left-hand-drive configuration. Right-hand-drive is typical.

1. Insert the pressure/return hose assembly into the engine compartment from below.

   NOTE: Before installing power steering hoses at power steering gear, wipe clean connections with a lint-free cloth and replace O-rings. Lubricate O-rings using clean power steering fluid.

2. Install pressure/return hoses into power steering gear (1) ports (lower-pressure/upper-return). Thread tube nuts into gear, but do not tighten at this time.
3. Position hose routing clamp on front suspension crossmember (3). Install and tighten screw (4) to 8 N.m (71 in. lbs.).
4. Tighten hose tube nuts at steering gear (1) to 31 N.m (23 ft. lbs.).
5. Install the rear engine mount.
   - For 3.3L / 3.8L engine, refer to **INSTALLATION** .
   - For 4.0L engine, refer to **INSTALLATION** .
   - For 2.8L Diesel engine, refer to **ENGINE MOUNTING** .

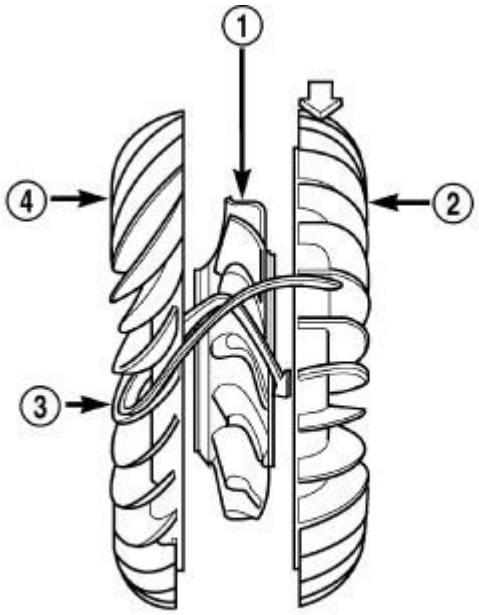

Fig. 148: Removing/Installing Screw & Nut At Hose Routing Clamp
Courtesy of CHRYSLER LLC

6. Guide hoses up the front of the engine toward the power steering pump (1).
7. Place hose routing clamp on engine flange (6). Install and tighten screw (5) to 8 N.m (71 in. lbs.).
8. Position hose tubes (2) at bracket (7) on front of engine above A/C compressor and install tube routing clamp (3) and nut (4). Tighten nut to 10 N.m (89 in. lbs.).

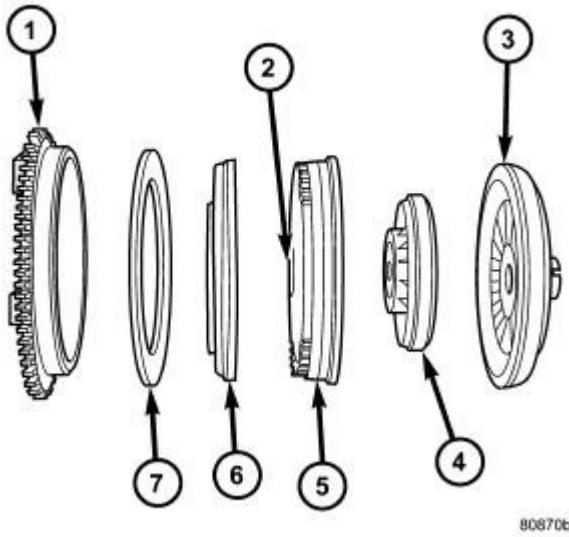

Fig. 149: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

9. Lower vehicle.

NOTE: Before installing power steering pressure hose at power steering pump, replace O-ring on end of power steering pressure hose. Lubricate O-ring using clean power steering fluid.

10. Install pressure hose (1) into pump (2) fitting. Thread pressure hose tube nut into pump and tighten to 31 N.m (23 ft. lbs.).

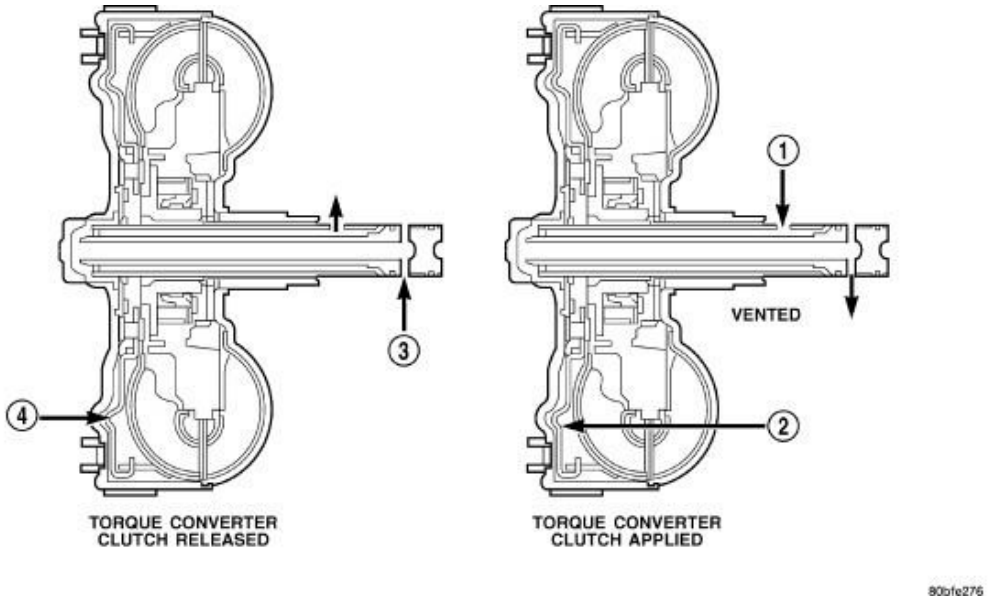

Fig. 150: Identifying Power Steering Cooler Hose & Return Hose
Courtesy of CHRYSLER LLC

11. Install return hose (1) onto power steering cooler fitting. Slide hose clamp into position on fitting and attach it.
12. Install negative (-) battery cable on negative battery post.
13. Fill and bleed power steering system. See **Steering - Standard Procedure**.
14. Inspect for leaks.

HOSE, POWER STEERING, PRESSURE, 3.3L AND 3.8L

Removal

REMOVAL

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

4. Remove air cleaner housing cover and hose to intake manifold.
   - For 3.3L / 3.8L engine, refer to **REMOVAL** .
   - For 4.0L engine, refer to **REMOVAL** .
   - For 2.8L Diesel engine, refer to **REMOVAL** .

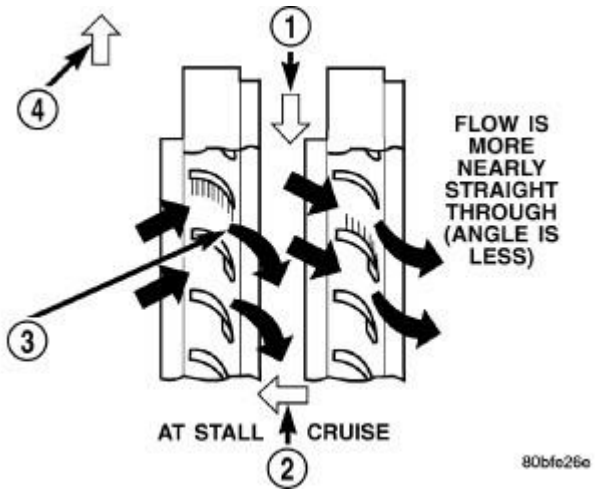

Fig. 151: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

5. Un-thread tube nut and remove pressure hose (1) from pump (2).

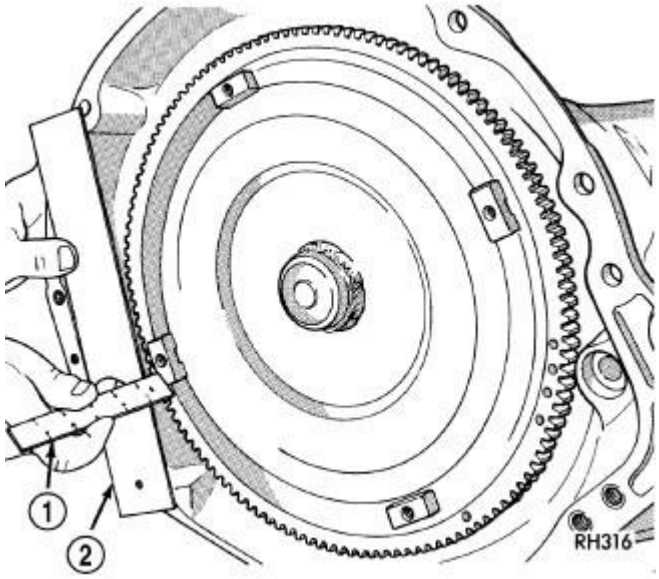

Fig. 152: Removing/Installing Alternator Bracket
Courtesy of CHRYSLER LLC

6. Remove alternator bracket bolt (1).
7. Remove alternator bracket nut (2) and bracket (3).

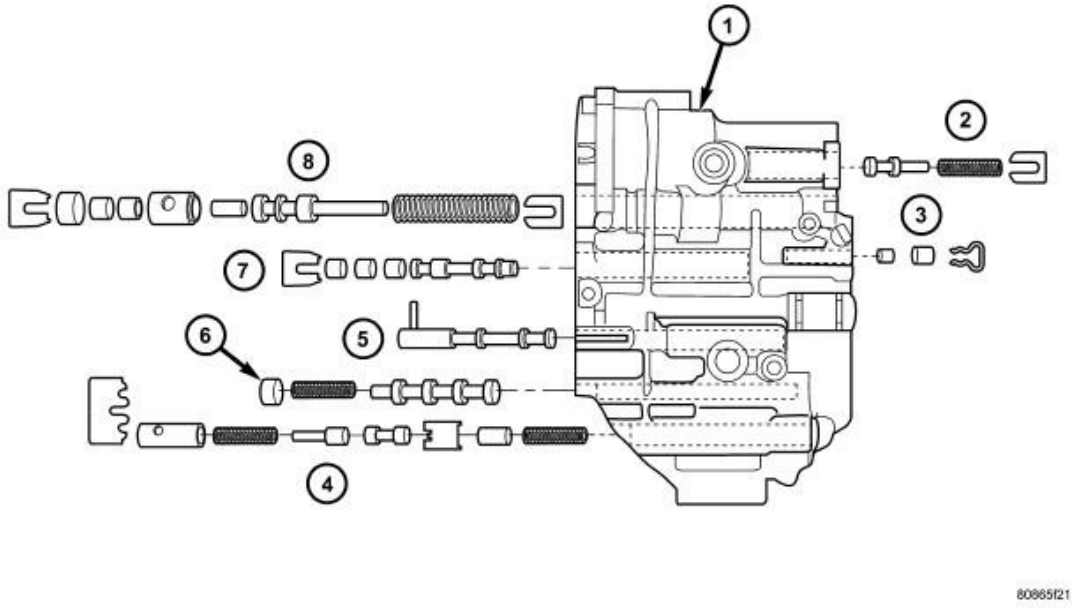

Fig. 153: Removing/Installing Pressure Hose Screws
Courtesy of CHRYSLER LLC

8. Remove stud head screw (2) securing pressure hose (3) routing clamp to intake manifold (4).
9. Remove screw (1) securing pressure hose (3) routing clamp to right side of engine (5).
10. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

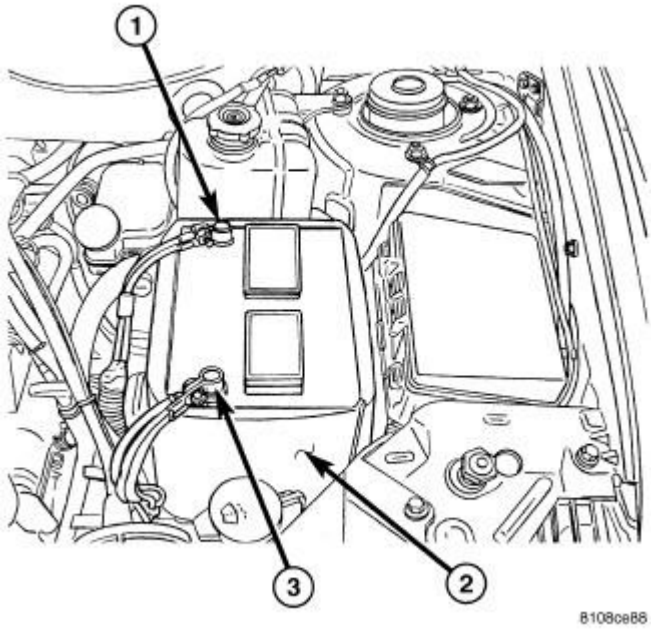

Fig. 154: Removing/Installing Screws At Power Steering Pressure Hose Routing Clamp(s) & Rear Of Crossmember

Courtesy of CHRYSLER LLC

11. Remove screw (2) securing pressure hose clamp to right side of front suspension crossmember.
12. Remove screws (3) securing pressure hose routing clamps to rear of front suspension crossmember.

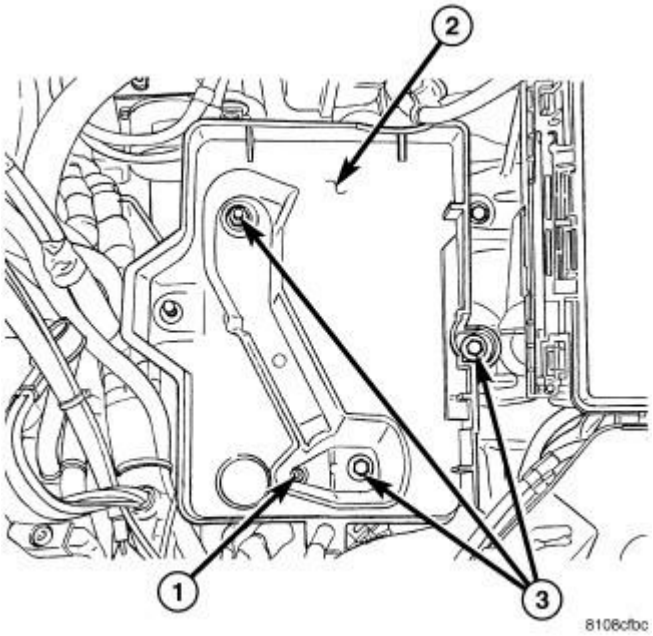

Fig. 155: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

13. Remove tube nut fastening pressure hose (4) to power steering gear (3). Remove pressure hose from gear port.
14. Lower vehicle enough to access pressure hose from engine compartment, but still clearing floor.
15. Remove pressure hose by pushing it down and out behind front suspension crossmember.

Installation

INSTALLATION

1. Place pressure hose into engine compartment using reverse order of removal. Push the pump end of hose up into engine compartment from underneath, over rear of front suspension crossmember.
2. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

NOTE: Before installing power steering pressure hose on power steering gear, wipe clean connections with a lint-free cloth and replace O-ring. Lubricate O-ring using clean power steering fluid.

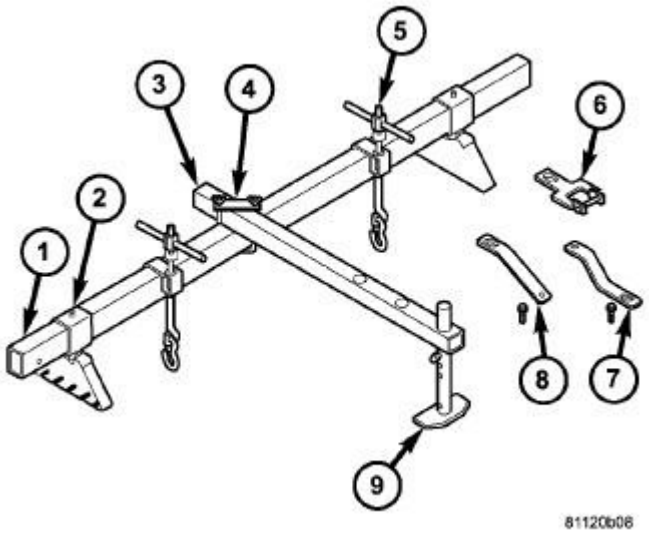

Fig. 156: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

3. Install pressure hose (4) into power steering gear (3) port. Thread pressure hose tube nut into gear, but do not tighten at this time.

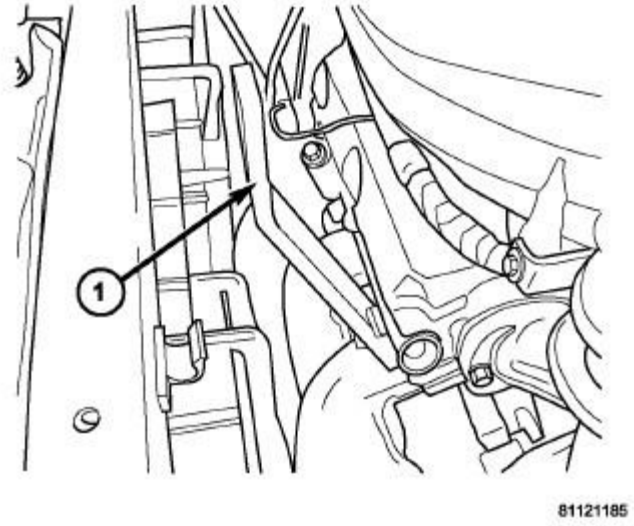

Fig. 157: Removing/Installing Screws At Power Steering Pressure Hose Routing Clamp(s) & Rear Of Crossmember
Courtesy of CHRYSLER LLC

4. Position pressure hose (1) routing clamps on rear of front suspension crossmember. Install and tighten screws (3) to 8 N.m (71 in. lbs.).

5. Position pressure hose (1) routing clamp at right side of front suspension crossmember. Install and tighten screw (2) to 8 N.m (71 in. lbs.).

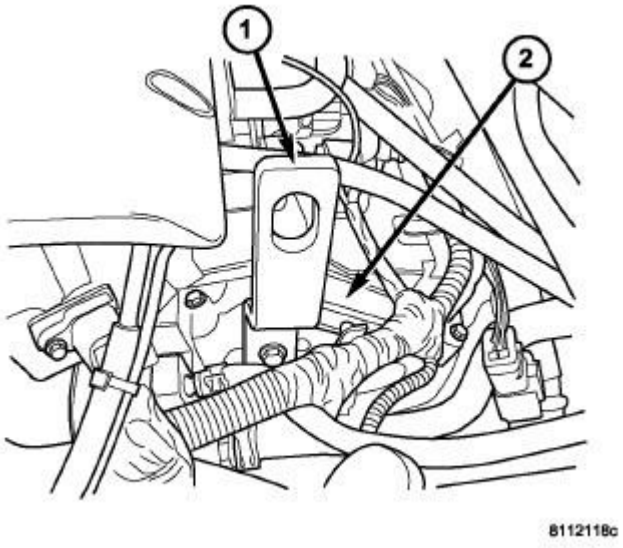

Fig. 158: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

6. Tighten pressure hose (4) tube nut at steering gear (3) to 31 N.m (23 ft. lbs.).
7. Lower vehicle.

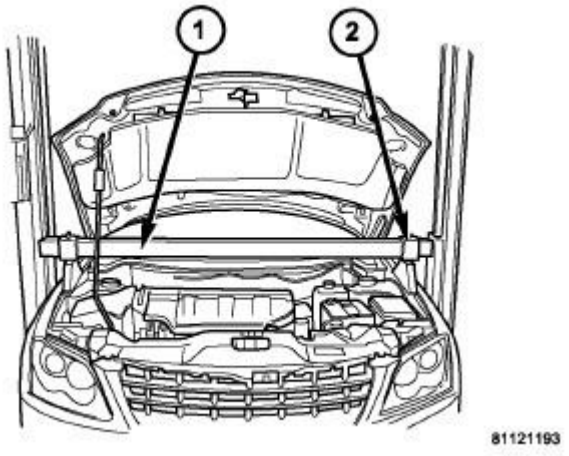

Fig. 159: Removing/Installing Pressure Hose Screws
Courtesy of CHRYSLER LLC

8. Route hose over engine and down to pump.
9. Position pressure hose (3) routing clamp at right side of engine (5) and install mounting screw. Tighten

screw to 10 N.m (89 in. lbs.).

10. Position pressure hose (3) routing clamp at intake manifold (4) and install stud head mounting screw. Tighten screw to 28 N.m (21 ft. lbs.).

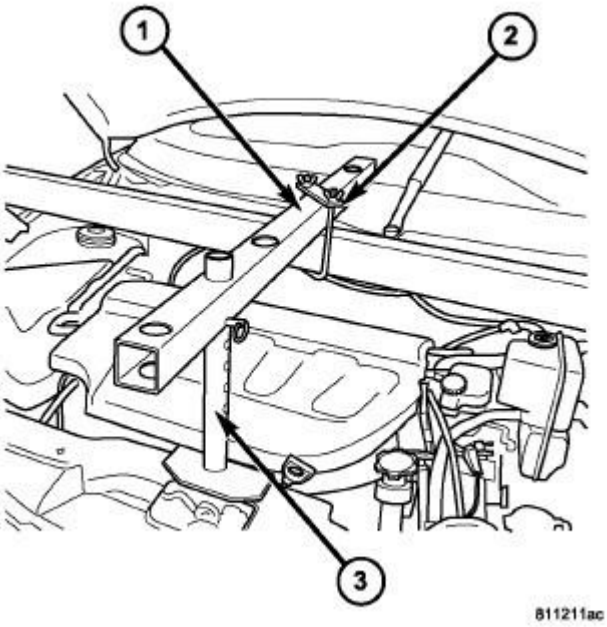

Fig. 160: Removing/Installing Alternator Bracket
Courtesy of CHRYSLER LLC

11. Install alternator bracket (3) to the alternator and stud.
12. Install alternator bracket nut (2) and tighten to 28 N.m (21 ft. lbs.).
13. Install alternator bracket bolt (1) and tighten to 28 N.m (21 ft. lbs.).

NOTE: Before installing power steering pressure hose on power steering pump, replace O-ring on end of power steering pressure hose. Lubricate O-ring using clean power steering fluid.

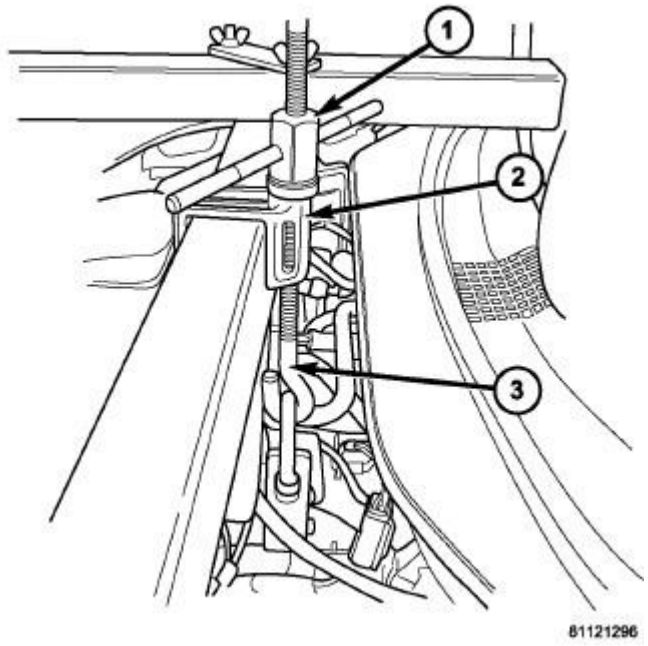

Fig. 161: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

14. Install pressure hose (1) into pump (2) fitting. Thread pressure hose tube nut into pump and tighten to 31 N.m (23 ft. lbs.).
15. Install air cleaner housing cover and hose to intake manifold.
    - For 3.3L / 3.8L engine, refer to **INSTALLATION** .
    - For 4.0L engine, refer to **INSTALLATION** .
    - For 2.8L Diesel engine, refer to **INSTALLATION** .
16. Install negative (-) battery cable on negative battery post.
17. Fill and bleed power steering system. See **Steering - Standard Procedure**.
18. Inspect for leaks.

HOSE, POWER STEERING, PRESSURE, 4.0L

Removal

REMOVAL

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

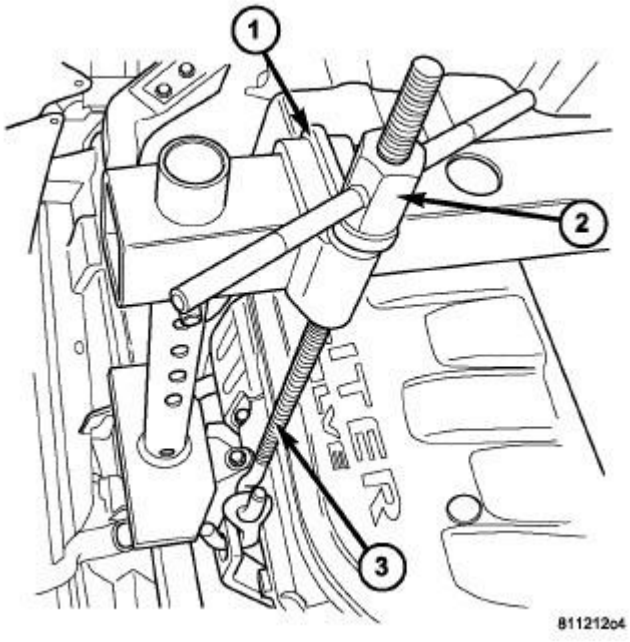

Fig. 162: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

4. Un-thread tube nut and remove pressure hose (1) from pump (2).
5. Remove nuts (5) securing pressure hose routing clamps to engine.
6. Remove pressure hose (1) routing clamps from studs (3).
7. Remove screw (4) securing pressure hose routing clamp to left side of engine.
8. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

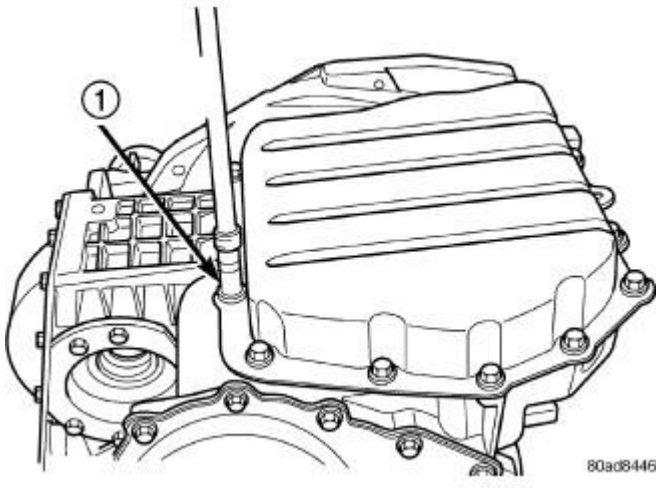

Fig. 163: Removing/Installing Power Steering Pressure Hose Screw At Routing Clamp & Rear Of Crossmember
Courtesy of CHRYSLER LLC

9. Remove screw (2) securing power steering pressure hose (1) routing clamp to rear of crossmember.

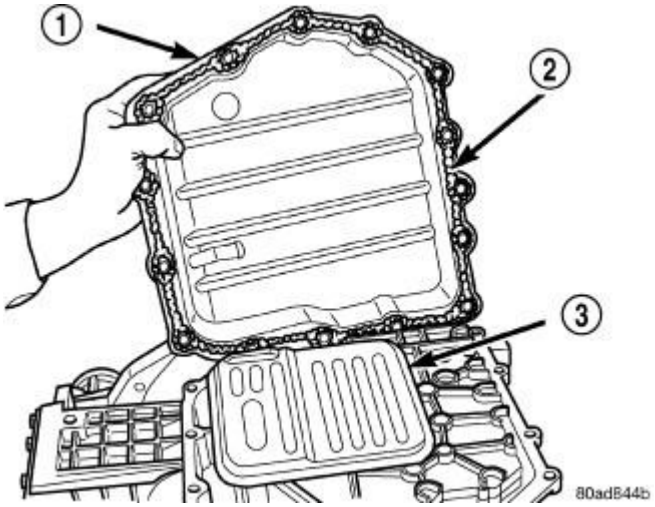

Fig. 164: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

10. Remove tube nut fastening pressure hose (4) to power steering gear (3). Remove pressure hose from gear port.
11. Lower vehicle enough to access pressure hose from engine compartment, but still clearing floor.
12. Remove pressure hose by pushing it down and out behind front suspension crossmember.

Installation

INSTALLATION

1. Place pressure hose into engine compartment using reverse order of removal. Push the pump end of hose up into engine compartment from underneath, over rear of front suspension crossmember.
2. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

NOTE: Before installing power steering pressure hose on power steering gear, wipe clean connections with a lint-free cloth and replace O-ring. Lubricate O-ring using clean power steering fluid.

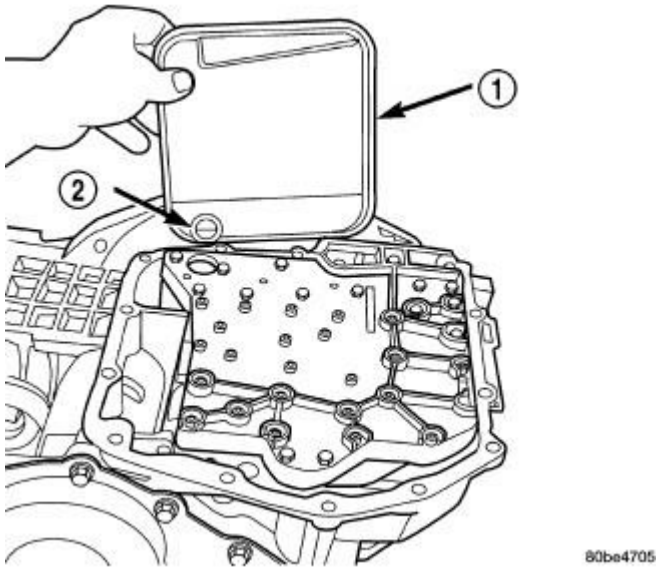

Fig. 165: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

3. Install pressure hose (4) into power steering gear (3) port. Thread pressure hose tube nut into gear, but do not tighten at this time.

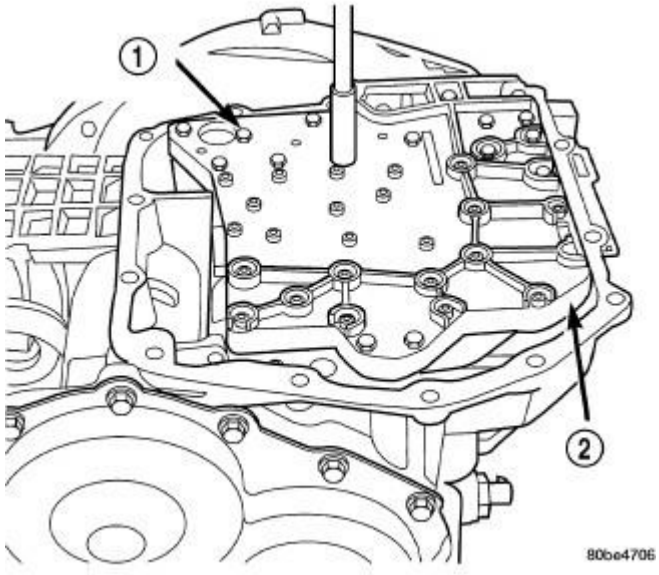

Fig. 166: Removing/Installing Power Steering Pressure Hose Screw At Routing Clamp & Rear Of Crossmember
Courtesy of CHRYSLER LLC

4. Position power steering pressure hose (1) routing clamp on rear of crossmember (3). Install and tighten screw (2) to 8 N.m (71 in. lbs.).

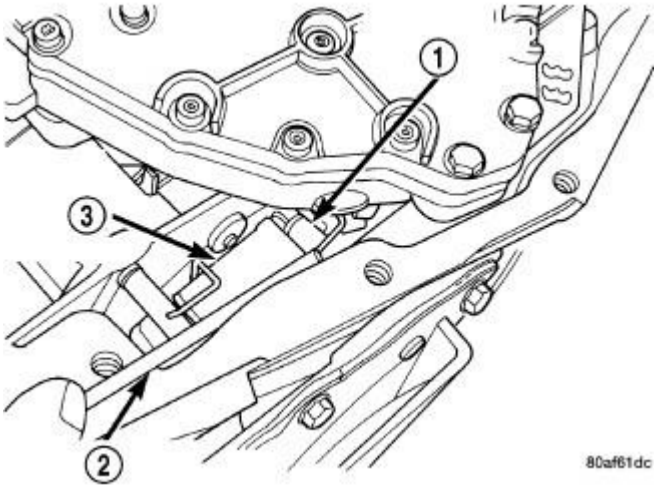

Fig. 167: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

5. Tighten pressure hose (4) tube nut at steering gear (4) to 31 N.m (23 ft. lbs.).
6. Lower vehicle.

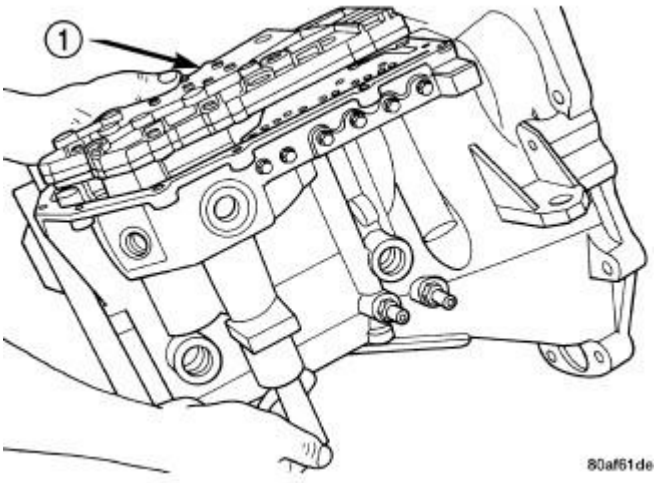

Fig. 168: Removing/Installing Pressure Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

7. Route hose around left side and front of engine.

NOTE: Before installing power steering pressure hose on power steering pump, replace O-ring on end of power steering pressure hose. Lubricate O-ring using clean power steering fluid.

8. Install pressure hose (1) into pump (2) fitting. Thread pressure hose tube nut into pump and tighten to 31 N.m (23 ft. lbs.).

9. Install pressure hose routing clamps over studs (3) on engine mounted bracket and install nuts (5). Tighten nut to 28 N.m (21 ft. lbs.).
10. Install screw (4) securing pressure hose routing clamp to left side of engine. Tighten screw to 28 N.m (21 ft. lbs.).
11. Install negative (-) battery cable on negative battery post.
12. Fill and bleed power steering system. See **Steering - Standard Procedure**.
13. Inspect for leaks.

HOSE, POWER STEERING, RETURN

Removal

GEAR TO COOLER

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.
4. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

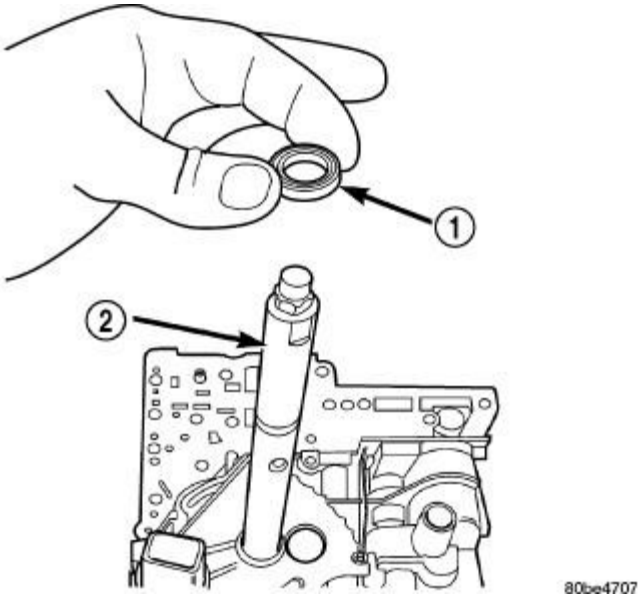

Fig. 169: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

5. Remove screw (1) securing return hose routing clamp to rear of ABS support bracket.
6. Remove tube nut fastening return hose (5) to power steering gear (3). Remove pressure hose from gear port.
7. Lower vehicle.

8. Remove battery. Refer to **Electrical/Battery System/BATTERY - Removal** .

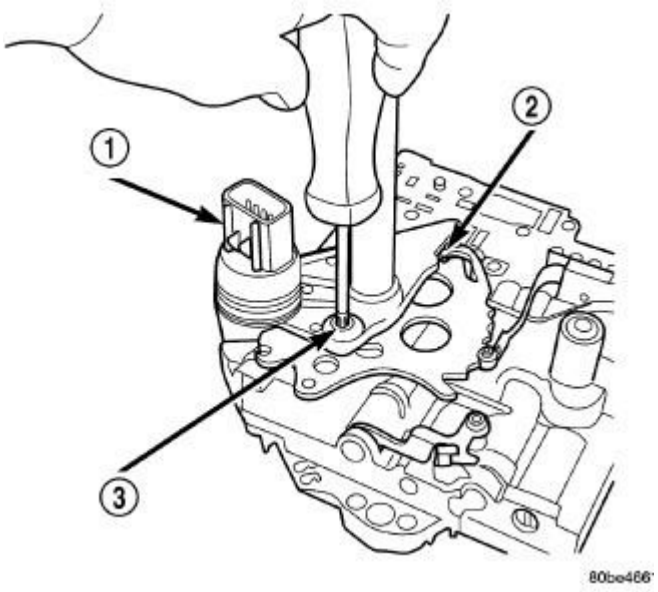

Fig. 170: Identifying Bolts, Nut, Battery Tray And Frame Rail
Courtesy of CHRYSLER LLC

9. Remove the two bolts (2) and one nut (1) securing the battery tray (3) to the left frame rail (4).

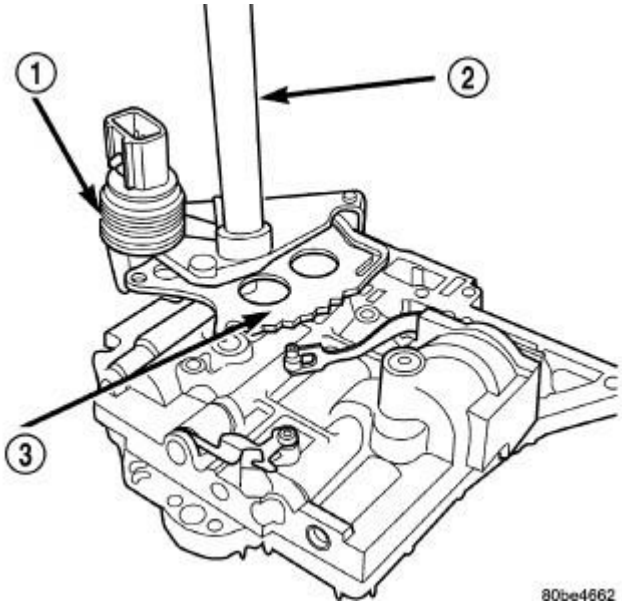

Fig. 171: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

10. Lift the battery tray off the mounting stud.
11. Remove clamp attaching return hose (5) from gear at return hose (2) to cooler. Separate hoses.

12. Remove return hose (5) from vehicle.

COOLER TO RESERVOIR

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

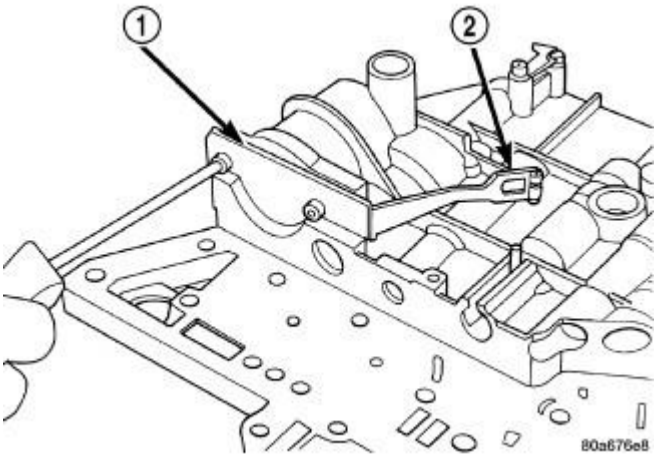

Fig. 172: Removing/Installing Front Fascia
Courtesy of CHRYSLER LLC

4. Remove the front bumper fascia (1). Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Removal** .

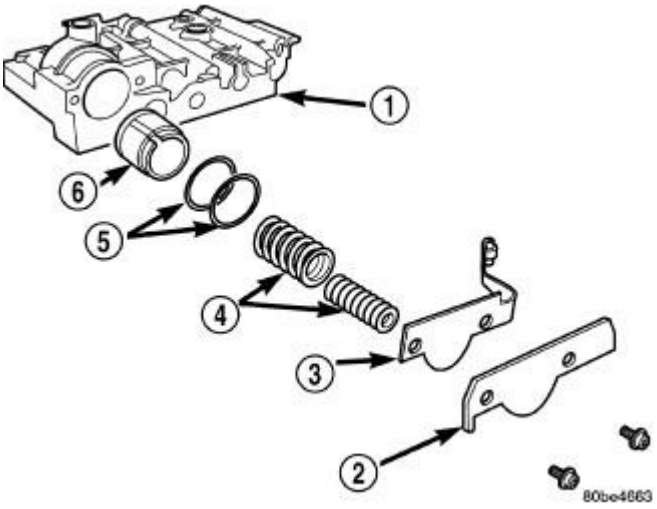

Fig. 173: Removing/Installing Lower Plastic Grille
Courtesy of CHRYSLER LLC

5. Disconnect the air temp sensor electrical connector (2).
6. Remove the air temp sensor mounting bolt (3).
7. Remove all the push pins securing the lower plastic grille (1) to the bumper and support frame.
8. Remove the lower plastic grille (1) from the bumper reinforcement.

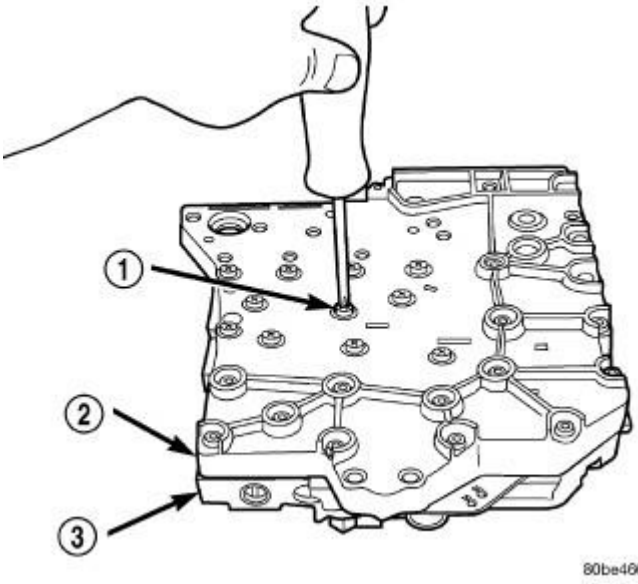

Fig. 174: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

9. Remove clamp attaching return hose (5) from gear at return hose (2) to cooler. Separate hoses.

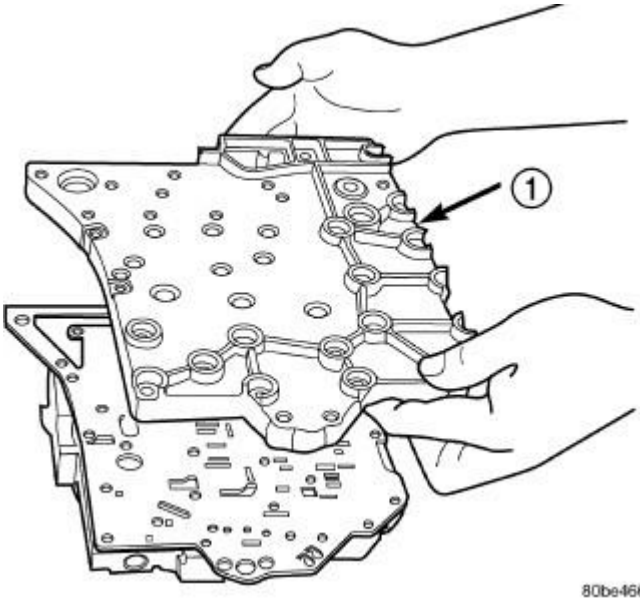

Fig. 175: Identifying Return Hose & Power Steering Fluid Reservoir

Courtesy of CHRYSLER LLC

10. Remove clamp attaching return hose (2) to power steering fluid reservoir (1). Remove hose from reservoir.

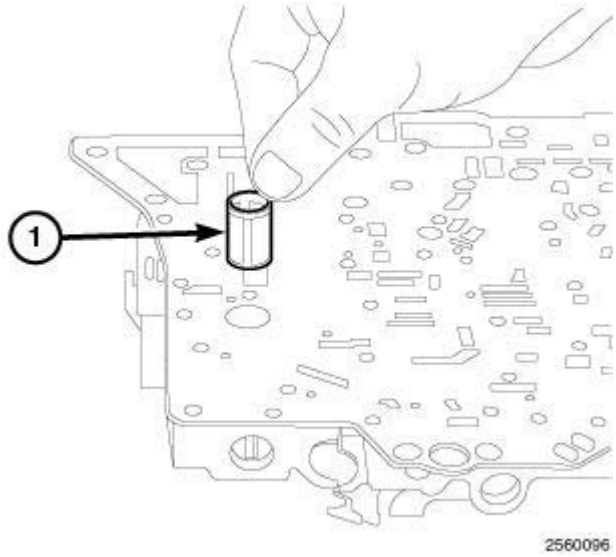

Fig. 176: Removing/Installing Tie Strap Clip At Right Side Of Cooling Module
Courtesy of CHRYSLER LLC

11. Remove tie strap clip (1 - overhead view) from right side of cooling module near reservoir end of hose.

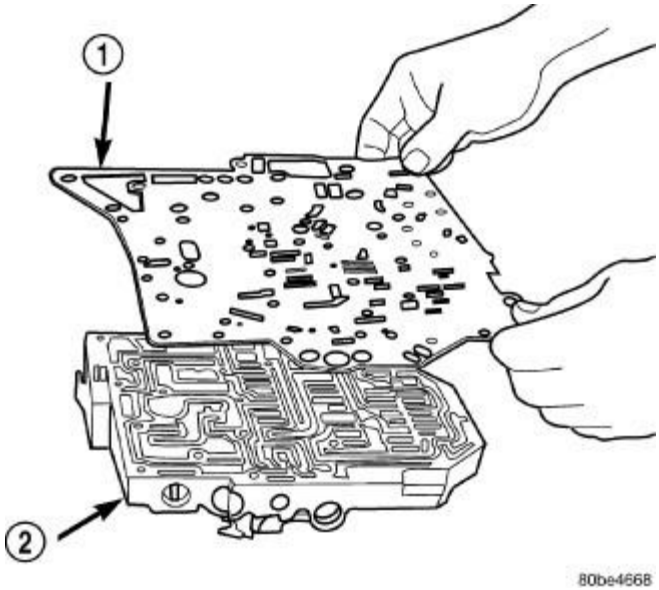

Fig. 177: Identifying Top & Bottom Clip Tabs Of Cooling Module
Courtesy of CHRYSLER LLC

NOTE: To release each return hose cooler tube mounting bracket in the following step, push inward on top and bottom clip tabs of cooling module, then pull

mounting bracket away from clip.

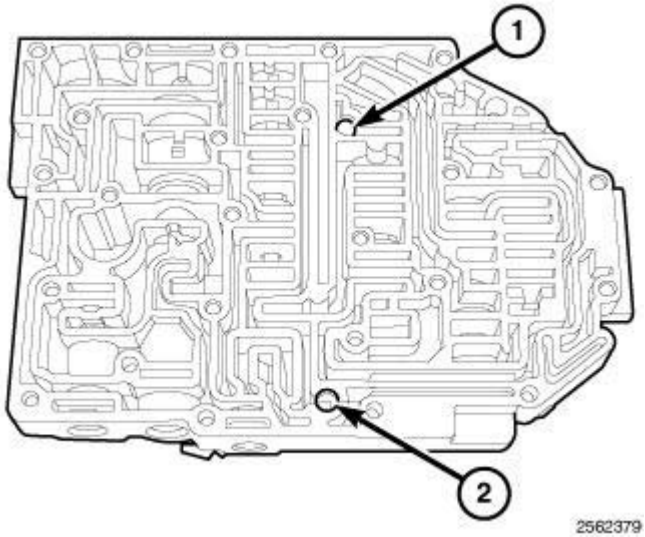

Fig. 178: Identifying Return Hose Cooler Tube & Cooler Tube Mounting Brackets
Courtesy of CHRYSLER LLC

12. Push inward on return hose cooler tube (1) mounting clip tabs and remove cooler tube mounting brackets (2) from clips on cooling module.
13. Remove return hose assembly.

Installation

GEAR TO COOLER

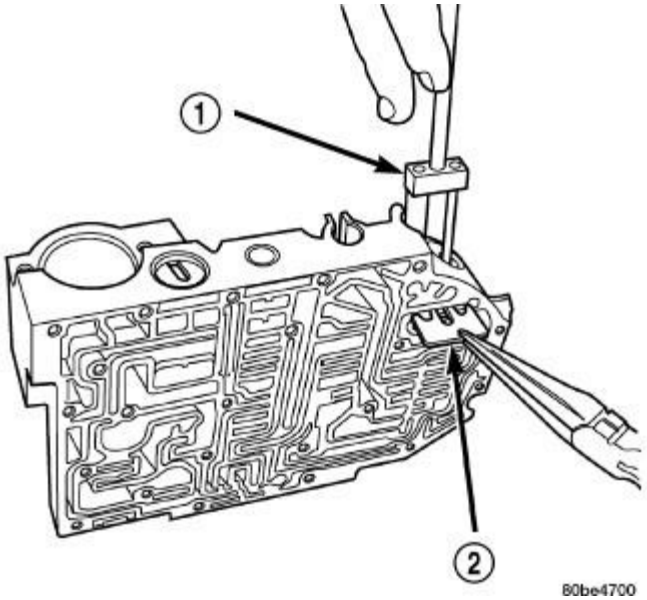

Fig. 179: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering

Gear
Courtesy of CHRYSLER LLC

1. Place return hose into engine compartment using reverse order of removal.
2. Install return hose routing clamp over battery tray mounting stud.
3. Install return hose (2) to cooler over return hose (5) from gear tube. Slide hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp is installed past bead on fluid reservoir fitting.**

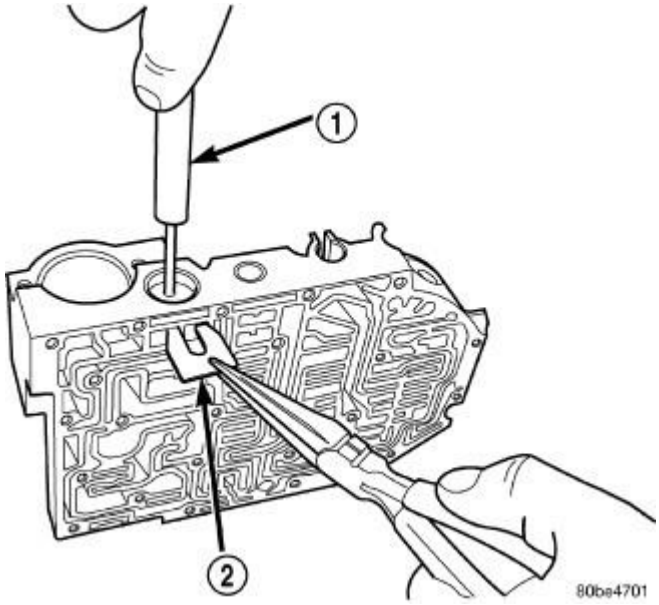

Fig. 180: Identifying Bolts, Nut, Battery Tray And Frame Rail
Courtesy of CHRYSLER LLC

4. Place the battery tray (3) into mounted position.
5. Install the one nut (1) and two bolts (2) securing the battery tray (3) to the frame rail (4).
6. Tighten the nut to 12 N.m (105 in. lbs.).
7. Tighten the bolts to 12 N.m (105 in. lbs.).
8. Install the battery. Refer to **Electrical/Battery System/BATTERY - Installation** .
9. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

NOTE: **Before installing power steering return hose on power steering gear, wipe clean connection with a lint-free cloth and replace O-ring. Lubricate O-ring using clean power steering fluid.**

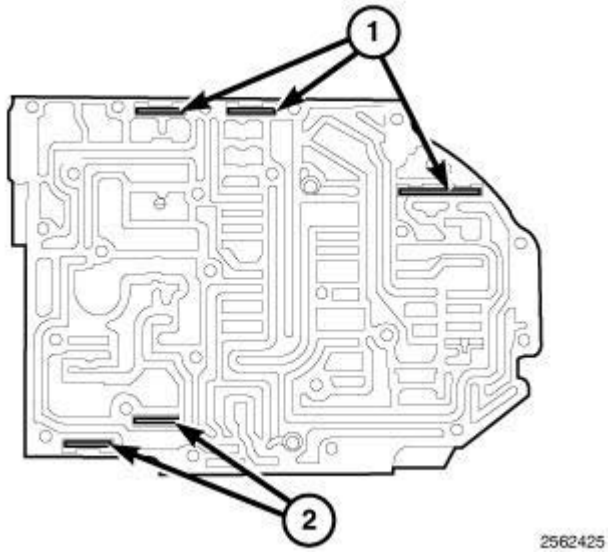

Fig. 181: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

10. Install return hose (5) into power steering gear (3) port. Thread pressure hose tube nut into gear, but do not tighten at this time.
11. Position return hose routing clamp and install screw (1) securing return hose routing clamp to rear of ABS support bracket. Tighten screw to 8 N.m (71 in. lbs.).
12. Tighten return hose (5) tube nut at steering gear (3) to 31 N.m (23 ft. lbs.).
13. Lower vehicle.
14. Install negative (-) battery cable on negative battery post.
15. Fill and bleed power steering system. See **Steering - Standard Procedure**.
16. Inspect for leaks.

COOLER TO RESERVOIR

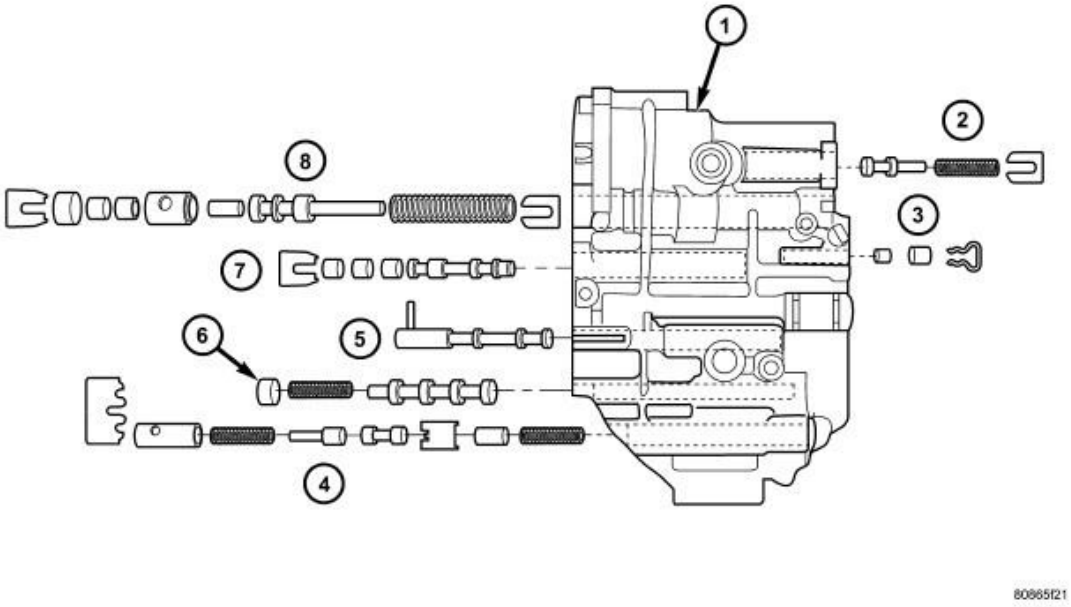

Fig. 182: Identifying Return Hose Cooler Tube & Cooler Tube Mounting Brackets
Courtesy of CHRYSLER LLC

1. Guide ends of return hose through openings around each side of cooling module.
2. Position return hose cooler tube mounting brackets (2) over clips on cooling module and press in on each until tabs on clip engage bracket, locking it in place.

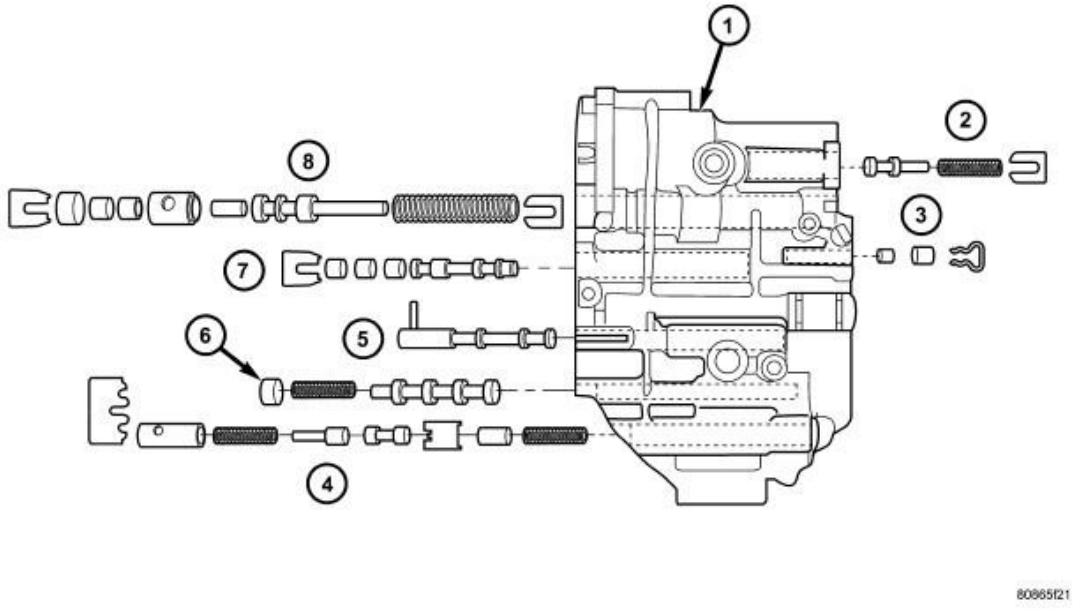

Fig. 183: Removing/Installing Tie Strap Clip At Right Side Of Cooling Module
Courtesy of CHRYSLER LLC

3. Guide reservoir end of return hose (2 - overhead view) up right side of cooling module and install tie strap clip (1 - overhead view) securing hose to cooling module.

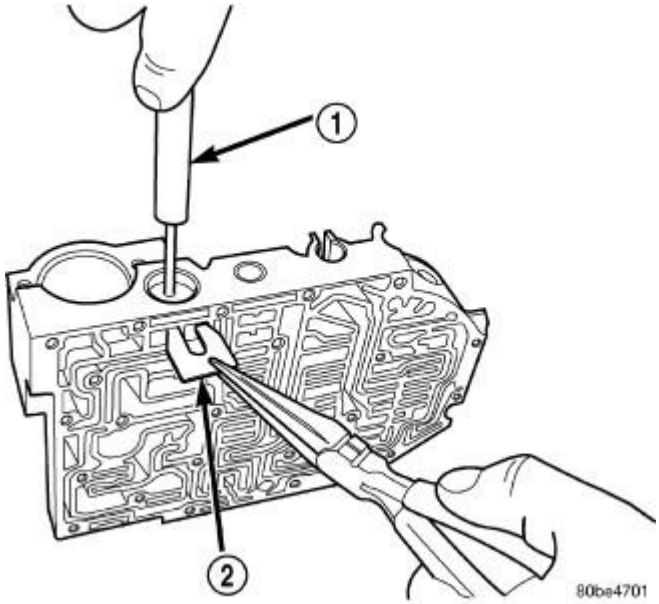

Fig. 184: Identifying Return Hose & Power Steering Fluid Reservoir
Courtesy of CHRYSLER LLC

4. Install return hose (2) onto reservoir (1). Slide hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp is installed past bead on fluid reservoir fitting.**

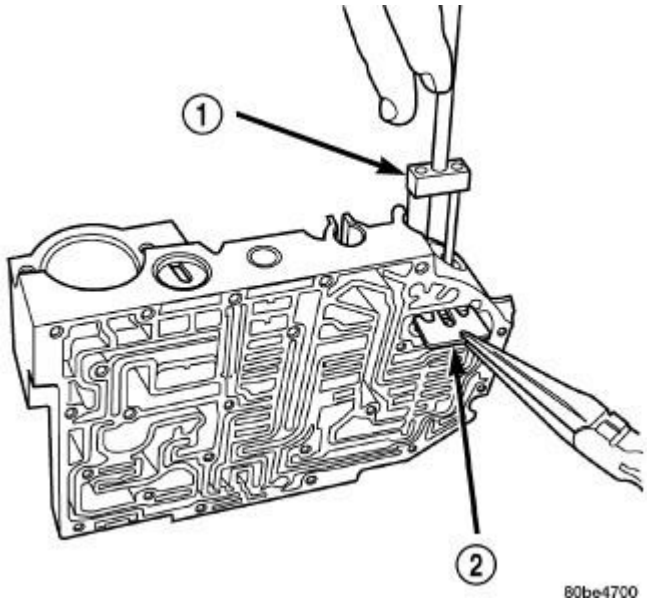

Fig. 185: Removing/Installing Tube Nuts Fastening Pressure Hose & Return Hose To Power Steering Gear
Courtesy of CHRYSLER LLC

5. Install return hose (2) to cooler over return hose (5) from gear tube. Slide hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp is installed past bead on fluid reservoir fitting.**

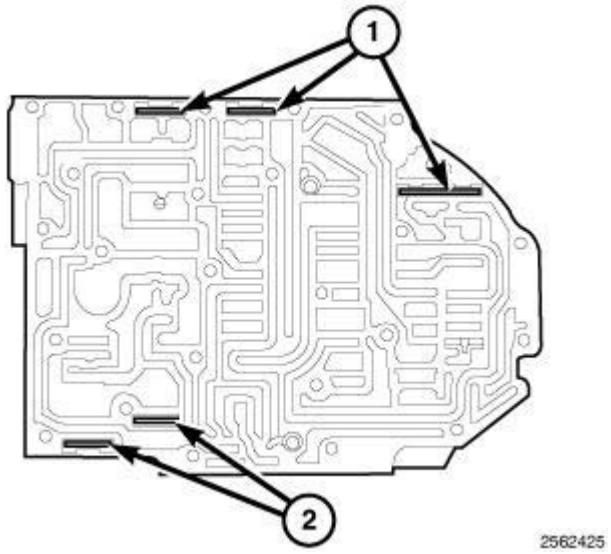

Fig. 186: Removing/Installing Lower Plastic Grille
Courtesy of CHRYSLER LLC

6. Install the lower plastic grille (1) to the vehicle.
7. Install the plastic push pins to the bumper and lower support.
8. Install the air temp sensor onto the lower support. Tighten the bolts to 5.5 N.m (49 in.lbs.).
9. Connect the electrical connector to the air temp sensor (2).

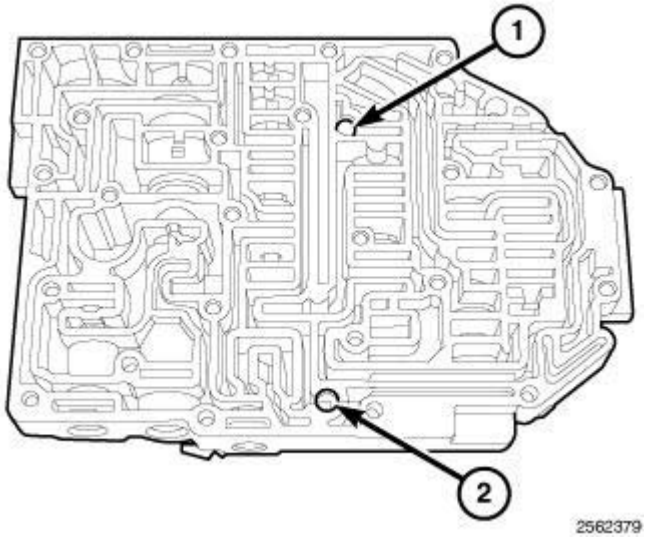

Fig. 187: Removing/Installing Front Fascia
Courtesy of CHRYSLER LLC

10. Install the front bumper fascia (1). Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Installation** .
11. Install negative (-) battery cable on negative battery post.
12. Fill and bleed power steering system. See **Steering - Standard Procedure**

13. Inspect for leaks.

HOSE, POWER STEERING, SUPPLY

Removal

REMOVAL

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.

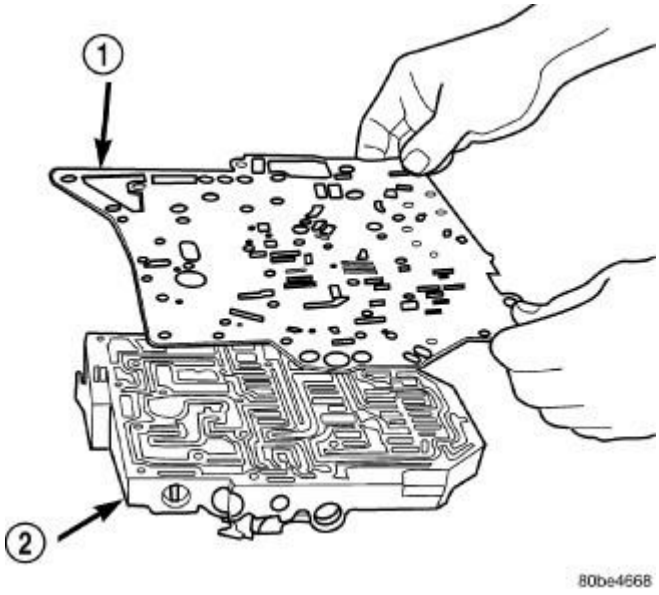

Fig. 188: Removing/Installing Supply Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

4. Remove clamp attaching supply hose (3) to power steering pump (4). Remove hose from pump.
5. Remove clamp attaching supply hose (3) to power steering fluid reservoir (2). Remove hose from reservoir.

Installation

INSTALLATION

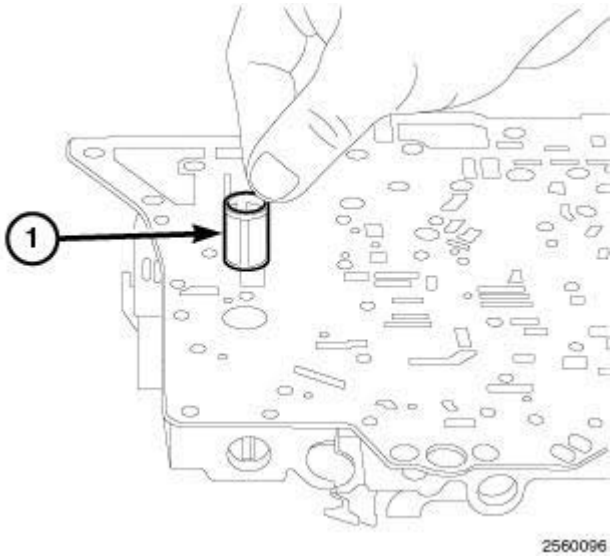

Fig. 189: Removing/Installing Supply Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

1. Slide supply hose (3) onto reservoir (2). Do not install clamp at this time.
2. Slide supply hose (3) onto power steering pump (4). Position clamp over supply hose on pump fitting and attach it. **Be sure hose clamp is installed past bead on pump fitting.**
3. Position clamp over supply hose on reservoir fitting and attach it. **Be sure hose clamp is installed past bead on fluid reservoir fitting.**
4. Install negative (-) battery cable on negative battery post.
5. Fill and bleed power steering system. See **Steering - Standard Procedure**.
6. Inspect for leaks.

PULLEY, POWER STEERING PUMP

Removal

REMOVAL

1. Remove power steering pump from engine. See **Steering/Pump - Removal**.

CAUTION: Do not hammer on power steering pump pulley or shaft to remove power steering pump pulley. Damage to pulley and power steering pump will occur.

CAUTION: It is very important to use Puller 9962, to remove pulley from power steering pump shaft. Use of other pullers can damage or break pulley and pump shaft.

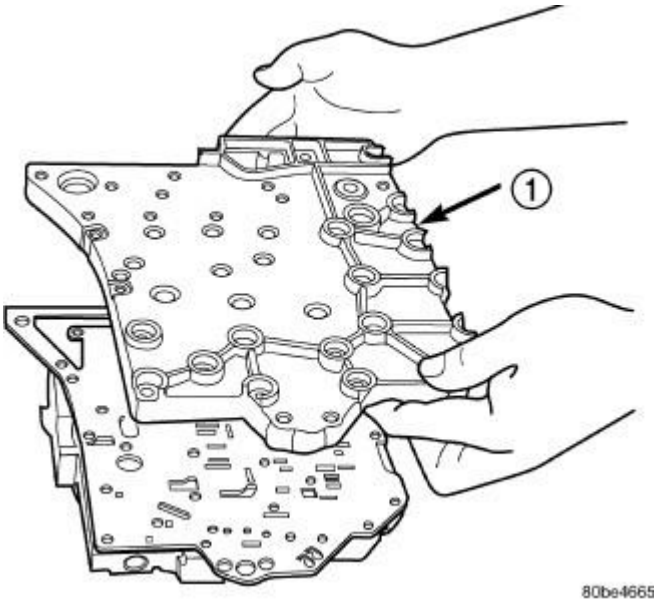

Fig. 190: Identifying Screw-Drive, Puller Body, & Buttons
Courtesy of CHRYSLER LLC

2. Coat Screw-Drive (1) with lubricant and thread into Puller Body (2).

NOTE: Two Buttons come with Puller kit (9962-3 and 9962-4). Be sure to use Button that best fits end of pump shaft to avoid damage to Button or pump shaft.

3. Insert Button 9962-4 (4), into end of Screw-Drive. Be sure not to misplace ball bearing that resides behind Button.

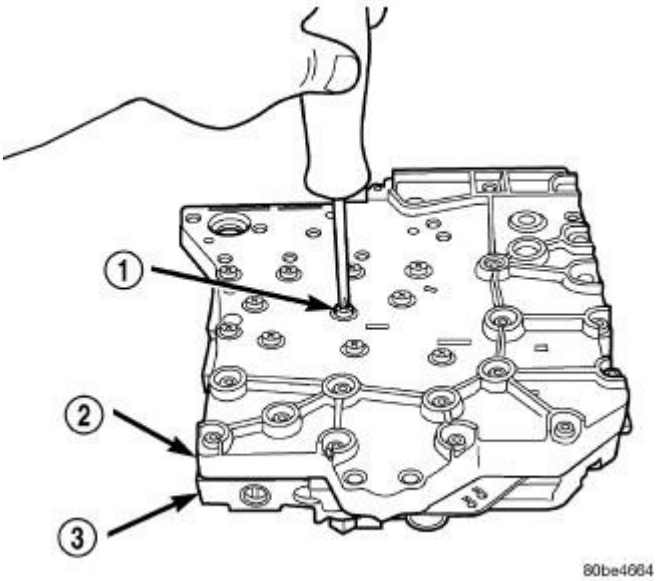

Fig. 191: Assembling Puller 9962 Over End Of Pump Shaft & Pulley Hub

Courtesy of CHRYSLER LLC

4. Assemble Puller 9962, over end of pump shaft and pulley hub.
   a. Place Button on end of Screw-Drive against pump shaft.
   b. Assemble Collets 9962-2 (3), surrounding Puller Body (1) and pulley hub flange, then slide the Collet Sleeve over the Collets.
   c. Hand tighten Screw-Drive (2) taking up any slack in Puller.
5. Hold Puller Body stationary while turning Screw-Drive until pulley is removed from power steering pump shaft.

NOTE: Inspect pulley. Replace if pulley is bent, cracked, or loose.

Installation

INSTALLATION

1. Place pulley hub over pump shaft.

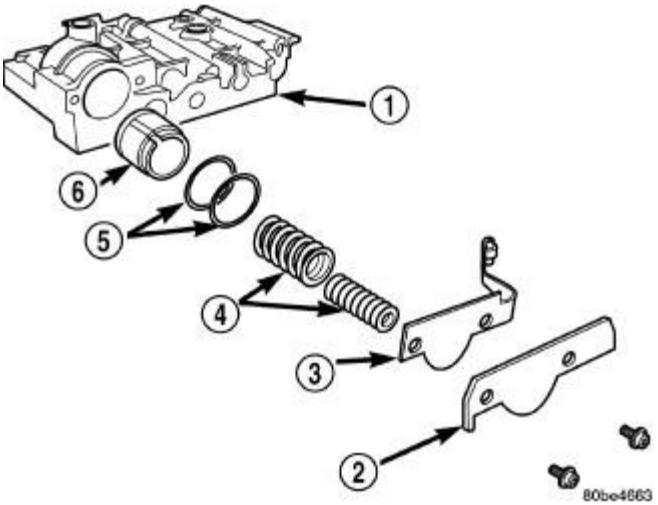

Fig. 192: Installing Pulley Using Installer C-4063C & Washers
Courtesy of CHRYSLER LLC

1 - INSTALLER C-4063C
2 - STACK OF WASHERS

2. Place a stack of washers approximately 13 mm (0.5 in.) thickness (2) over pulley hub.

NOTE: Installer, Special Tool C-4063C, is a combination of Installer, Special Tool C-4063C, and Forcing Screw, Special Tool C-4063-2. It is important to use Forcing Screw C-4063-2 when performing this procedure.

3. Thread Installer (1), Special Tool C-4063C, completely into internal threads of power steering pump shaft, then rotate Installer Nut down against washers on pump pulley.
4. Ensuring that special tool and pulley remain aligned with pump shaft, tighten Installer Nut, forcing pulley onto power steering pump shaft until washers come in contact with end of pump shaft. **When washers contact end of pump shaft, Installer Nut will no longer rotate.**
5. Remove special tool from power steering pump.
6. Install power steering pump on engine. See **Steering/Pump - Installation**.

RESERVOIR, POWER STEERING PUMP

Removal

REMOVAL

1. Remove negative (-) battery cable from battery and isolate cable.
2. Remove cap from power steering fluid reservoir.
3. Using a siphon pump, remove as much power steering fluid as possible from power steering fluid reservoir.
4. Remove engine appearance cover.

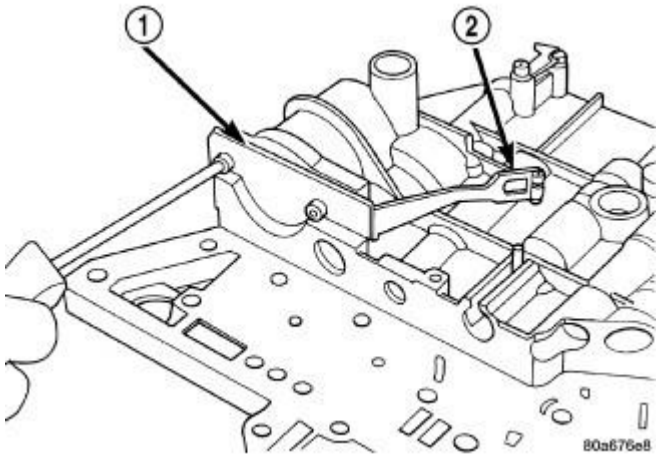

Fig. 193: Identifying Return Hose & Power Steering Fluid Reservoir
Courtesy of CHRYSLER LLC

5. Remove clamp attaching return hose (2) to power steering fluid reservoir (1). Remove hose from reservoir.

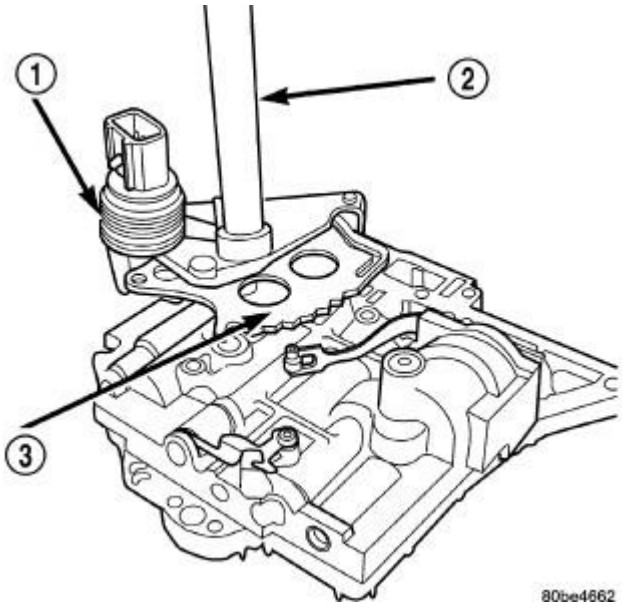

Fig. 194: Removing/Installing Supply Hose At Power Steering Pump
Courtesy of CHRYSLER LLC

6. Remove clamp attaching supply hose (3) to power steering fluid reservoir (2). Remove hose from reservoir.
7. Remove mounting nut (1) securing reservoir in place.
8. Slide reservoir upward and remove from mounting stud (5).

Installation

INSTALLATION

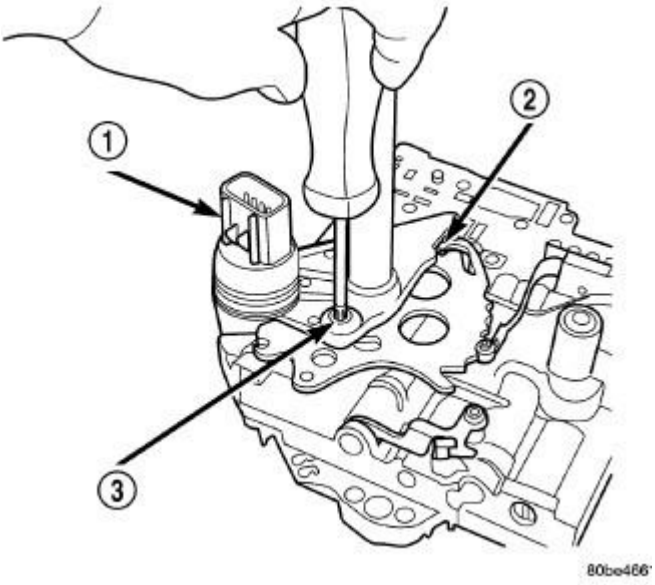

Fig. 195: Removing/Installing Supply Hose At Power Steering Pump

Courtesy of CHRYSLER LLC

1. Position reservoir (2) in place on mounting stud (5).
2. Install reservoir mounting nut (1). Tighten mounting nut to 12 N.m (9 ft. lbs.)
3. Install supply hose (3) onto reservoir (2). Slide hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp is installed past bead on fluid reservoir fitting.**

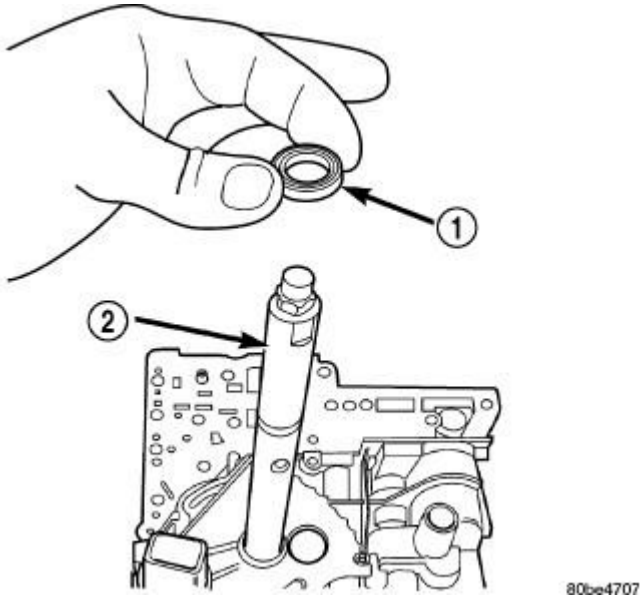

Fig. 196: Identifying Return Hose & Power Steering Fluid Reservoir
Courtesy of CHRYSLER LLC

4. Install return hose (2) onto reservoir (1). Slide hose clamp into position on fluid reservoir and attach it. **Be sure hose clamp is installed past bead on fluid reservoir fitting.**
5. Install negative (-) battery cable on negative battery post.
6. Fill and bleed power steering system. See **Steering - Standard Procedure**.
7. Inspect for leaks.

2009 ACCESSORIES AND EQUIPMENT

Power Top, Sunroof - Service Information - Journey

DESCRIPTION

DESCRIPTION

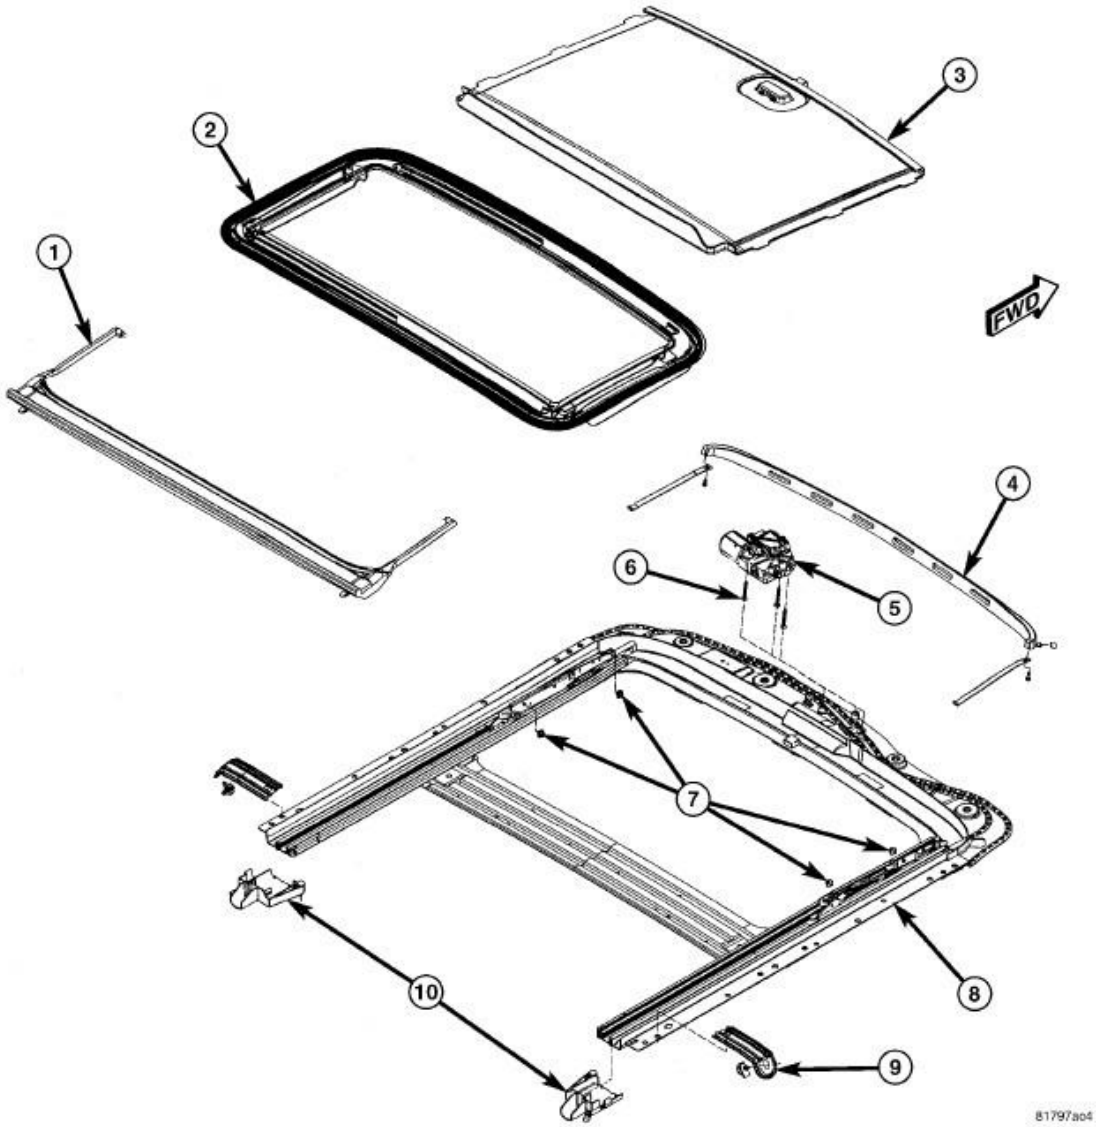

Fig. 1: Power Top/Sunroof Components
Courtesy of CHRYSLER LLC

1 - DRAIN TROUGH
2 - GLASS ASSEMBLY
3 - SUN SHADE
4 - WIND DEFLECTOR

5 - MOTOR
6 - MOTOR SCREWS (3) 3 N.m (26 in. lbs.)
7 - GLASS ASSEMBLY SCREWS (4) 3.5 N.m (31 in. lbs.)
8 - FRAME ASSEMBLY
9 - BRACKETS
10 - END CAPS

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from two switches located on the windshield header, between the map lamp. To operate the sunroof the ignition switch must be in either the Accessory or On/Run position. One switch (vent) is a push button type and opens the sunroof to the vent position only. The other switch (open/close) is a rocker type for opening and closing the sunroof. Pressing and releasing the open button once the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position. Also, by pressing the close button the sunroof will close automatically.

SUNROOF OPERATION INSTRUCTIONS

SWITCH INPUTS			
-	OPEN	CLOSE	VENT
FULL VENT	1. Push and hold switch until glass stops in flush closed position glass will then express open 2. Press switch for less than 0.65 seconds for express to full open.	1. Push and hold switch until glass stops in flush closed position. 2. Press switch for less than 0.65 seconds for express to flush closed.	No action -
VENT RANGE	1. Push and hold switch until glass passes through flush closed position. Glass will then open 2. Press switch for less than 0.65 seconds for express to full open.	1. Push and hold switch until glass stops in flush closed position. 2. Press switch for less than 0.65 seconds for express to flush closed.	1. Push and hold switch until glass stops in full vent position. 2. Press switch for less than 0.65 seconds for express to full vent.
FLUSH	1. Press switch for less than 0.65 seconds for express to full open.	No action	1. Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released or when fully vented.

	2. Press switch for more than 0.65 seconds and glass will stop when switch is released	-	2. Press switch for less than 0.65 seconds for express to full vent.
FULL OPEN	No action -	1. Press and hold switch until glass stops in flush closed position or anywhere in between. 2. Press switch for less than 0.65 seconds for express to flush closed.	1. Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released. 2. Press switch for less than 0.65 seconds for express to full vent.

OPERATION

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open/close feature. The sunroof system receives battery feed through the "sunroof" relay and a 25 amp mini fuse located in the Totally Integrated Power Module (TIPM). The sunroof system power is supplied when the ignition switch is in the RUN and ACCESSORY positions. The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The sunroof is electrically operated from two switches located in the overhead console in between the two reading lamps. The "VENT" switch is a push button type switch and opens the sunroof to the vent position only. The other switch "OPEN/CLOSED" is a rocker type switch for opening and closing the sunroof. Pressing and releasing the open button once, the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and releasing the close button once will express close the sunroof. If the close button is pressed a second time during the express close operation the sunroof will stop in that position.

DIAGNOSIS AND TESTING

DIAGNOSTIC PROCEDURES

Before beginning sunroof diagnostics, verify that all other power accessories are in proper operating condition. Refer to **SUNROOF DIAGNOSIS CHART** table for possible causes. If not, a common electrical problem may exist. Refer to appropriate wiring diagrams information for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in the Totally Integrated Power Module (TIPM)). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof drive motor. Refer to **SYSTEM WIRING DIAGRAMS** for circuit information. If battery voltage of more than 9 volts is detected at the drive motor, proceed with the following tests (the drive motor will not operate at less than 9 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If

however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof drive motor, control switch, and body harness. Faulty power circuit between sunroof drive motor, control switch, and body harness. Faulty drive motor. Faulty drive motor electrical connector.
Audible whine when switch is depressed, sunroof does not operate.	Faulty drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Binding cable. Faulty circuit. Faulty control switch. Faulty drive motor. Broken trough guide
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty drive motor.
Sunroof does not vent.	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty drive motor.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof.	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Front of glass panel to high or rear to low. Wind deflector not deploying. Glass not centered in opening. Faulty glass panel seal.
Rattles from open sunroof while driving.	Loose or broken attaching hardware. Worn or broken mechanism.
Sunroof does not stop in the fully closed position.	Drive motor has lost position of glass, teach procedure required to reprogram drive motor. Refer to **Standard**

Procedure .

MOTOR, SUNROOF

STANDARD PROCEDURE

DRIVE MOTOR TEACH PROCEDURE

REPLACEMENT DRIVE MOTOR

1. Upon first powering up the sunroof, **continuously** press the close button on the power sunroof switch. The sunroof will begin moving in the tilt up direction.
2. The glass panel will move to the hard stop (just past the full tilt position) and then reverse to the soft stop (the full tilt position).
3. Once the sunroof has reversed **immediately** (within 5 seconds of stopping travel), release the switch and **continuously** press the close button again.
4. The sunroof glass will continue to move to the fully closed position. Once fully closed the close button can be released.

ORIGINAL DRIVE MOTOR

1. Cycle the sunroof to full close position and release close button on the power sunroof switch.
2. Once the sunroof is in the fully closed position, press and **continuously** hold the close button again.
3. After a ten second delay the sunroof will begin to move past the normal vent position to the hard stop position. It will then reverse to the normal full vent position (also called the soft stop).
4. Once the sunroof has reversed to the vent soft stop, **immediately** (within 5 seconds of stopping travel) release the close button and **continuously** press it again.
5. After a three second delay the sunroof glass will continue to move to the fully closed position. Once fully closed the close button can be released.

REMOVAL

REMOVAL

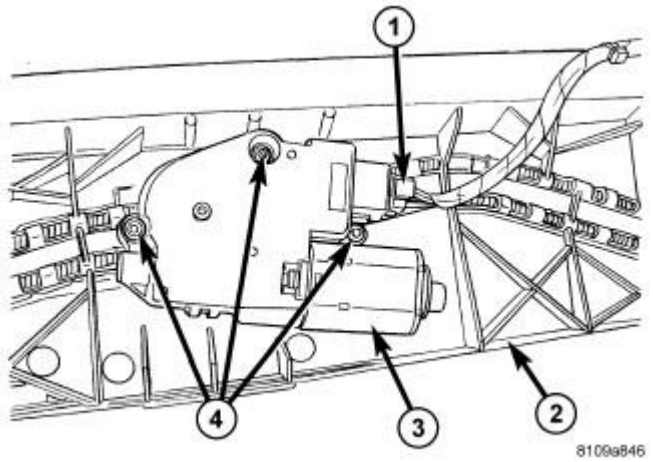

Fig. 2: Identifying Drive Motor Components
Courtesy of CHRYSLER LLC

1 - ELECTRICAL CONNECTOR
2 - MODULE ASSEMBLY
3 - DRIVE MOTOR
4 - MOUNTING SCREWS

1. Remove headliner. Refer to **Body/Interior/HEADLINER - Removal** .
2. Disconnect the electrical connector (1).
3. Remove three motor assembly attaching screws (4) from bottom side of motor assembly (3) and remove motor assembly from the motor bracket.

INSTALLATION

INSTALLATION

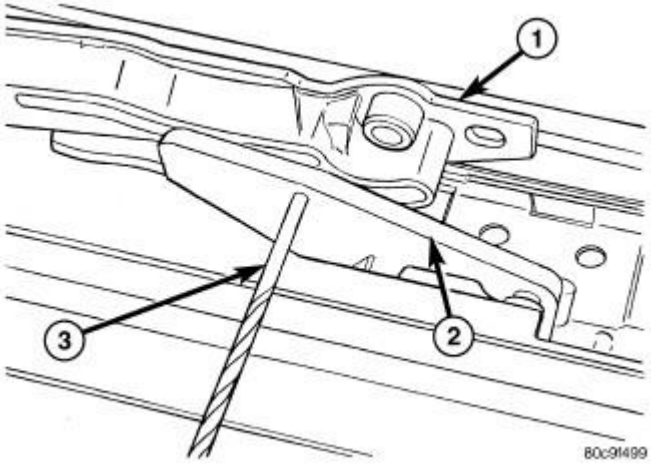

Fig. 3: Identifying Lifter Arm, Trolley, & Alignment Pin
Courtesy of CHRYSLER LLC

1 - LIFTER ARM
2 - TROLLEY
3 - ALIGNMENT PIN

1. If sunroof was open when drive motor was removed, carefully move glass panel into closed position and remove glass panel. Refer to **Body/Sunroof/GLASS, Sunroof - Removal** .
2. Set lifter arm timing by manually sliding the mechanisms (1) in the track until timing holes in the trollies are aligned with the timing holes in the lifter arm cams (2) and insert pins (3) into the mechanisms to hold mechanisms in closed position.

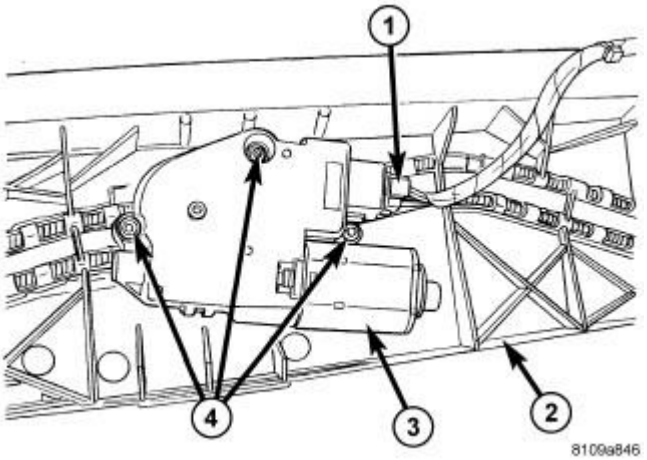

Fig. 4: Drive Motor Components
Courtesy of CHRYSLER LLC

1 - ELECTRICAL CONNECTOR
2 - MODULE ASSEMBLY
3 - DRIVE MOTOR
4 - MOUNTING SCREWS

3. Place motor (3) into position and install screws (4) attaching motor to bracket (2).
4. Tighten the screws (4) to 3 N.m (26 in. lbs.).
5. If sunroof glass panel was removed previously, remove the timing pins and install the sunroof glass panel. Refer to **Body/Sunroof/GLASS, Sunroof - Installation** .
6. Partially install the headliner and connect the sunroof wiring electrical connectors. Refer to **Body/Interior/HEADLINER - Installation** .
7. Temporarily install sunroof switch and perform the sunroof motor teach procedure. See **Standard Procedure** .
8. Test sunroof operation, adjust glass as necessary. Refer to **Body/Sunroof/GLASS, Sunroof -**

Adjustments .

9. Complete the headliner installation. Refer to **Body/Interior/HEADLINER - Installation** .

SWITCH, SUNROOF

DESCRIPTION

DESCRIPTION

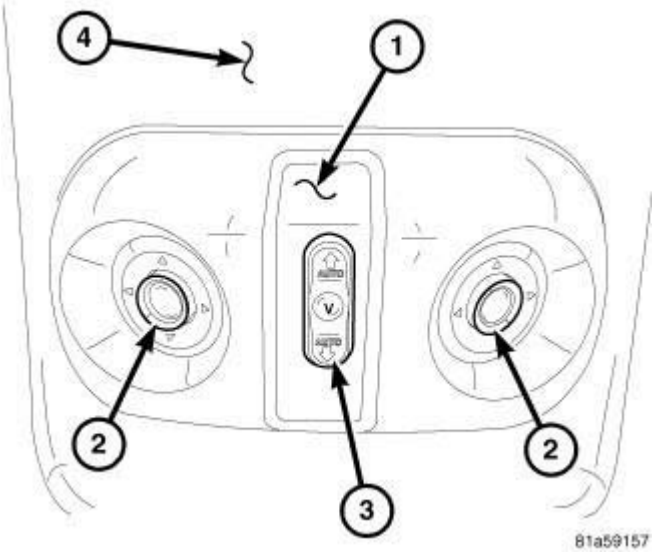

Fig. 5: Power Sunroof Switch
Courtesy of CHRYSLER LLC

The power sunroof switch (3) is a combination push-button and rocker switch module mounted in the overhead console assembly (1). The sunroof switch is a direct contact unit that is directly wired to the sunroof motor/module assembly. The sunroof switch performs the following functions:

- Power sunroof open (back of switch pushed)
- Power sunroof express open (back of switch pushed and released)
- Power sunroof closed (front of switch pushed)
- Power sunroof express closed (front of switch pushed and released)
- Power sunroof vent (switch center button pushed)

The power sunroof switch cannot be repaired. If the individual components are damaged or inoperative the switch assembly must be replaced. See **Removal** .

OPERATION

OPERATION

The sunroof is electrically operated from two switches located in the headliner on the courtesy/reading lamp

assembly. The power sunroof switch is hard wired to the sunroof motor/module assembly. The "VENT" switch is a push button type switch and opens the sunroof to the vent position only. The other switch "OPEN/CLOSED" is a rocker type switch for opening and closing the sunroof. Pressing and releasing the open button once, the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and releasing the close button once will express close the sunroof. If the close button is pressed a second time during the express close operation the sunroof will stop in that position.

The switch is grounded at one terminal and receives a 5 volt signal from the sunroof motor/module on the remaining three terminals. The switch pulls down the 5 volt reference voltage from the module signaling it to perform the desired function.

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

SUNROOF SWITCH

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Remove the overhead console. Refer to **Electrical - Message Systems/Overhead Console - Removal** .
2. Disconnect the power sunroof switch wire harness connector.
3. With the ignition key in the "RUN" position check for 5 volts on the "OPEN", "CLOSE" and "VENT" circuits of the sunroof switch harness connector. If OK, go to step 4. If not OK, inspect the wiring harness and connectors between the motor/module and switch for damage and repair as necessary.
4. With the ignition key in the "OFF" position check for continuity between the ground circuit of the sunroof switch harness connector and a known good ground. Continuity should be present. If OK, go to step 5. If not OK, inspect the wiring harness and connector and repair the ground circuit as necessary.

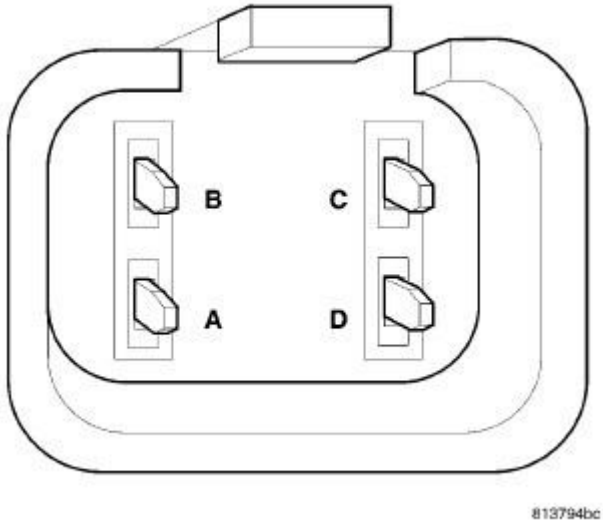

Fig. 6: Power Sunroof Switch Wire Harness Connector
Courtesy of CHRYSLER LLC

5. Using an ohmmeter, test the continuity of the power sunroof switch in each switch position. Refer to the **POWER SUNROOF SWITCH CONTINUITY TABLE**. If OK, inspect the wiring harness and connectors for damage and repair as necessary. If not OK, replace the overhead console assembly. Refer to **Electrical - Message Systems/Overhead Console - Removal** .

POWER SUNROOF SWITCH CONTINUITY TABLE

SWITCH POSITION	CONTINUITY BETWEEN PINS
OFF	NO CONTINUITY
SUNROOF OPEN	B AND D
SUNROOF CLOSED	B AND C
SUNROOF VENT	B AND A

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove overhead console. Refer to **Electrical - Message Systems/Overhead Console - Removal** .
3. Using a suitable flat bladed tool, release the mounting tabs from the sides of the sunroof control switch and pull the switch out of the overhead console assembly.

INSTALLATION

INSTALLATION

1. Insert the sunroof control switch into the overhead console assembly. Push the switch until it is securely

held in place by the mounting tabs.

2. Install the overhead console. Refer to **Electrical - Message Systems/Overhead Console - Installation** .
3. Connect the battery negative cable.

2009 ACCESSORIES AND EQUIPMENT

Power Windows - Service Information - Journey

DESCRIPTION

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows, and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed only when the ignition switch is in the RUN or ACCESSORY position. The power window system will also operate when in power accessory delay

For service of mechanical components, such as the regulator, lift plate, window tracks, or glass, refer to **BODY** article.

OPERATION

OPERATION

Front and rear door window lift motors are of the permanent magnet type. A battery positive and negative connection to either of the two motor terminals will cause the motor to rotate in one direction. Reversing current through these same two connections will cause the motor to rotate in the opposite direction.

Each individual motor is grounded through the master switch.

EXPRESS DOWN WINDOW FEATURE

This feature allows you to remotely lower both front door windows at the same time. To use this feature, press and release the UNLOCK button on the RKE transmitter and then immediately press and hold the UNLOCK button until the windows lower to the desired level or until they lower completely.

STANDARD PROCEDURE

CLEAR/RELEARN

NOTE: Make sure battery is fully charged before proceeding.

NOTE: This needs to be completed every time the window glass is adjusted/removed, motor replaced, and or regulator replaced.

CLEAR/DENORMALIZE USING A SCAN TOOL

To clear/denormalize the door module memory, using a scan tool under the Miscellaneous menu look for Denormalization Window Command/ECU reset, and follow the directions.

RELEARN/NORMALIZE USING A SCAN TOOL

To relearn/normalize the door module memory, using a scan tool under the Miscellaneous menu look for Normalization Window command, and follow the directions.

CLEAR/DENORMALIZE, RELEARN/NORMALIZE WITHOUT A SCAN TOOL

Hold up/down the window switch for at least 30 seconds until the DTC is set for stuck switch. This will clear the memory of the calibration information (CLEAR/DENORMALIZE). Proceed to relearn/normalize.

1. Put a battery charger on vehicle.
2. If equipped with express-up/express-down, reset the express-up/down module for the door window glass. The window switch on the corresponding door must be used to control the window. Do not use the master switch for the passenger window.
3. To calibrate, start by moving the window to the middle position.
4. Drive the glass to the full-up position by pulling up on the window switch to its second detent and hold the switch until the glass is fully closed. Do not release the window switch. Continue to hold the window switch up for 2 seconds after the window glass is full closed.
5. Drive the glass to the full - down position by pushing down (depress) the window switch, (second detent if equipped with express-down) until the window glass is down for 2 seconds after the window glass is fully open. Do not release the window switch. Continue to hold the window switch down for 2 seconds after the window glass is fully open.
6. Check the operation of the express-up/ express-down feature.
7. If the express up/down doesn't work, repeat step # 3, waiting for 3 seconds.
8. Check that the window glass reverses when in the express-up mode by holding a pen in the path of the glass.
9. Once the proper operation of the express-up/express-down feature has been verified, clear all Diagnostic Trouble Codes (DTC's).

MOTOR, WINDOW REGULATOR

DIAGNOSIS AND TESTING

WINDOW MOTOR

1. Remove door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Removal** .
2. Connect positive (+) lead from a test battery to either of the two motor terminals.
3. Connect negative (-) lead from test battery to remaining motor terminal.
4. The motor should now rotate in one direction to either move window up or down.
    a. If window happens to already be in full UP position and motor is connected so as to move it in UP direction no movement will be observed.

b. Likewise, motor connected to move window in DOWN direction no movement will be observed if window is already in full DOWN position.
c. Reverse battery leads in steps 1 and 2 and window should now move. If window does not move, replace motor.

5. If window moved completely up or down, the test leads should be reversed one more time to complete a full window travel inspection.
6. If window does not move, check to make sure that it is free.
7. It is necessary that the window be free to slide up and down in the glass channels. If the window is not free to move up and down, the window lift motor will not be able to move the glass.
8. To determine if the glass is free, disconnect the regulator from the glass lift plate. Remove the two attaching screws, and slide the window up and down by hand.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Removal** .
3. Disconnect the electrical connector.
4. Remove the mounting fasteners and remove the motor.

INSTALLATION

INSTALLATION

1. Install the window motor and install the mounting fasteners.
2. Connect the electrical connector.
3. Install the door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Installation** .
4. Connect the battery negative cable.

SWITCH, POWER WINDOW

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

For switch testing, remove the switch. See **Removal** . Using an ohmmeter, refer to **MASTER WINDOW SWITCH TEST** table to determine if continuity is correct. If the results are not obtained, replace the switch.

The master window switch has an Auto-Down feature. Actuation of the master switch to the second down position will move the drivers side window completely down. The electronic switch will automatically disconnect the motor approximately 1 second after the window bottoms out. Failure of the electronic switch to detect stall current, will cause the switch to disconnect after approximately 13 seconds. The auto down function can be canceled by any movement of that switch.

MASTER WINDOW SWITCH TEST

SWITCH POSITION	CONTINUITY BETWEEN
OFF	5/13 AND 2
-	5/13 AND 3
-	5/13 AND 6
-	5/13 AND 7
LEFT FRONT UP-NON EXPRESS	1 AND 10
LEFT FRONT DOWN-NON EXPRESS	1 AND 9
RIGHT FRONT UP-NON EXPRESS	1 AND 12
RIGHT FRONT DOWN-NON EXPRESS	1 AND 14
LEFT REAR UP	1 AND 2
LEFT REAR DOWN	1 AND 3
RIGHT REAR UP	1 AND 6
RIGHT REAR DOWN	1 AND 7
LOCKOUT SWITCH (SWITCH NOT DEPRESSED)	1 AND 4

PASSENGER WINDOW SWITCH TEST

SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
UP	4 AND 9	330 ohms ± 10%
DOWN	4 AND 9	3000 ohms ± 10%

REMOVAL

REMOVAL

SWITCH - FRONT DOOR	Refer to the **SWITCH - FRONT DOOR** removal procedure.
SWITCH - REAR DOOR	Refer to the **SWITCH - REAR DOOR** removal procedure.

SWITCH - FRONT DOOR

1. Disconnect and isolate the battery negative remote cable.
2. Using a trim tool, or equivalent, carefully pry up on the window switch until it disengages from the door trim panel.
3. Disconnect switch wire connector.
4. Remove switch assembly.

SWITCH - REAR DOOR

1. Disconnect and isolate the battery negative cable.
2. Using a trim tool, or equivalent, carefully pry up on the window switch until it disengages from the door

trim panel.
3. Disconnect the electrical connector.
4. Remove the switch from the handle.

INSTALLATION

INSTALLATION

SWITCH - FRONT DOOR	Refer to the **SWITCH - FRONT DOOR** installation procedure.
SWITCH - REAR DOOR	Refer to the **SWITCH - REAR DOOR** installation procedure.

SWITCH - FRONT DOOR

1. Install the switch by snapping into place.
2. Connect switch wire connector.
3. Install the switch to the door trim panel.
4. Connect the battery negative cable.

SWITCH - REAR DOOR

1. Connect the electrical connector.
2. Install the switch to the door trim panel.
3. Connect the battery negative cable.

2009 ACCESSORIES AND EQUIPMENT

Vehicle Theft Security - Service Information - Journey

DESCRIPTION

DESCRIPTION

The Vehicle Theft Security System (VTSS) is an available factory-installed option on this vehicle. The VTSS is comprised of two primary subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). The VTA is an active system that provides visual and audible responses as deterrents to and warnings of unauthorized vehicle tampering. The SKIS is a passive system that effectively immobilizes the vehicle against unauthorized operation. Following are paragraphs, which describe these subsystems of the VTSS.

Certain functions and features of the VTSS rely upon resources shared with or controlled by other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Other modules that may affect VTSS operation are:

- **Totally Integrated Power Module (TIPM)** - The TIPM is located in the engine compartment, near the battery. The TIPM provides the VTA system logic, driver and front passenger door ajar switch status, and power lock switch status. Refer to **Electrical - Wiring/Power Distribution/MODULE, Totally Integrated Power (TIPM) - Description** .
- **ElectroMechanical Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. The EMIC provides the security indicator. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) provides the SKIS engine control logic. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Powertrain Control - Description** .
- **Wireless Ignition Node** - The Wireless Ignition Node (WIN) provides ignition switch status. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Description** .

Except for the Sentry Key transponders integral to the FOB with Integrated Key (FOBIK), which rely upon Low Frequency (LF) communication, hard-wired circuitry connects the VTA and SKIS components to the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SKIS components through a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, procedures for proper wire and connector repair, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

VEHICLE THEFT ALARM

The VTA is available in two different configurations for this vehicle: One configuration is designed for vehicles

manufactured for sale in North America; while, the other configuration is designed for vehicles manufactured for sale in markets outside of North America, also referred to as export markets within the context of this service information. All vehicles equipped with VTA are also equipped with the Remote Keyless Entry (RKE) system and the Sentry Key Immobilizer System (SKIS), regardless of their market destination.

The North American and export base version of the VTA system provide perimeter vehicle protection by monitoring the vehicle doors, the ignition switch, the liftgate, and the hood for vehicles built for certain markets where it is required equipment. If unauthorized vehicle use or tampering is detected these systems respond by pulsing the vehicle horn as an audible deterrent and flashing certain exterior lamps as a visual deterrent.

The VTA includes the following major components, which are described in further detail elsewhere in this service information:

- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each front and rear door.
- **Hood Ajar Switch** - A hood ajar switch is located in a bracket on the right inner fender side shield of vehicles built for sale in certain export markets where it is required equipment.
- **Liftgate Ajar Switch** - A liftgate ajar switch is integral to the latch for the liftgate in the vehicle. Refer to **Body/Decklid/Hatch/Liftgate/Tailgate/LATCH - Removal** .
- **Security Indicator** - A security indicator is integral to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is standard on all vehicles equipped with a Wireless Ignition Node (WIN). Vehicles equipped with the Vehicle Theft Alarm (VTA) are also equipped with SKIS. The SKIS provides passive vehicle protection by preventing the engine from operating unless a valid electronically encoded key is detected in the ignition lock cylinder.

The SKIS includes the following major components, which are described in further detail elsewhere in this service information:

- **Security Indicator** - A security indicator is integral to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .
- **Sentry Key Transponder** - The Sentry Key transponder is integral to the FOB with Integrated Key (FOBIK), which also includes an integral Remote Keyless Entry (RKE) transmitter and an integral mechanical valet key. See **Description**.
- **Wireless Ignition Node** - The Wireless Ignition Node (WIN) is located behind the instrument panel, and is partially concealed by the ignition switch bezel. The remainder of the WIN including its mounting provisions and electrical connections are concealed within the instrument panel. The WIN contains the integral ignition switch and performs all of the same SKIS functions performed by a Sentry Key Immobilizer Module (SKIM) used on prior vehicles. See **Description** .

OPERATION

OPERATION

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). Following are paragraphs that briefly describe the operation of each of these two subsystems.

VEHICLE THEFT ALARM

The Totally Integrated Power Module (TIPM) is used on this vehicle to control and integrate many of the functions and features included in the Vehicle Theft Alarm (VTA). In the VTA system, the TIPM receives inputs indicating the status of the door ajar switches, the ignition switch, the liftgate ajar switch, and the power lock switches. In vehicles built for certain export markets where it is required, the hood ajar switch provides a hard-wired input to the TIPM. The TIPM processes the information from all of these inputs and sends the appropriate electronic messages over the CAN data bus. The TIPM internally controls the output to the hazard warning lamps and sends a control output to energize or de-energize the horn relay as appropriate.

The hard-wired circuits between components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information, and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls or communication between modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. See the **Vehicle Theft Security System** menu item on the scan tool. Refer to the appropriate diagnostic service information.

Following are paragraphs that briefly describe the operation of each of the VTA features. See the owner's manual in the vehicle glove box for more information on the features, use, and operation of the VTA.

ENABLING

The TIPM must have the VTA function electronically enabled in order for the VTA to perform as designed. The logic in the TIPM keeps its VTA function dormant until it is enabled using a diagnostic scan tool. The VTA function of the TIPM is enabled on vehicles equipped with the VTA option at the factory, but a service replacement TIPM must be VTA-enabled by the dealer using a diagnostic scan tool. Refer to the appropriate diagnostic service information.

ARMING

Passive arming of the VTA occurs when the vehicle is exited with the FOB with Integrated Key (FOBIK) removed from the ignition switch, the headlamps are turned OFF, and the doors are locked while they are open using the power lock switch. Active arming occurs when the LOCK button on the Remote Keyless Entry (RKE) transmitter integral to the FOBIK is depressed to lock the vehicle. For active arming to occur, the doors, and the liftgate must be closed and the ignition switch must be in the OFF position when the FOBIK RKE transmitter LOCK button is depressed. The power lock switch will not function if the FOBIK is in the ignition switch or the headlamps are turned ON with the driver side front door open.

Pre-arming of the VTA is initiated when a door or the liftgate is open when the vehicle is locked using a power door lock switch or when the RKE transmitter LOCK button is depressed. Pre-arming will not occur if the FOBIK is in the ignition switch or the headlamps are turned ON with the driver side front door open. When the VTA is pre-armed, the arming sequence is delayed until all of the doors and the liftgate have been closed. The VTA will remain in pre-armed mode for up to 16 seconds after all doors and the liftgate have been closed.

Once the VTA begins the passive or active arming sequence, the security indicator in the instrument cluster will flash rapidly for about 16 seconds. This indicates that VTA arming is in progress. If the ignition switch is turned to the ON position, if a door or the liftgate is unlocked and opened by any means, or the RKE PANIC button (if equipped) is depressed during the 16 second arming process, the security indicator will stop flashing and the arming process will abort. Once the arming sequence is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

On vehicles equipped with the hood ajar switch, the VTA arming sequence will occur regardless of whether the hood is open or closed, but the underhood area will not be protected unless the hood is closed when the VTA arming sequence begins. Also, if the status of the hood ajar switch changes from open to closed during the 16 second arming process, the security indicator will stop flashing and the VTA arming sequence will abort. Once the arming process is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

DISARMING

For vehicles built for the North American market, passive disarming of the VTA occurs by inserting a valid Sentry Key Immobilizer System (SKIS) FOBIK into the ignition switch. Active disarming of the VTA for all markets occurs when the vehicle is unlocked by depressing the UNLOCK button of the FOBIK RKE transmitter. Once the alarm has been activated, either disarming method will also deactivate the alarm. Depressing the PANIC button (if equipped) on the FOBIK RKE transmitter will **not** disarm the VTA.

POWER-UP MODE

When the armed VTA senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode, the alarm system remains armed following a battery failure or disconnect. If the VTA was armed prior to a battery disconnect or failure, the technician, or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed, and battery jump-starting is attempted. The VTA will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTA is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

ALARM

The VTA alarm output varies by the version of the VTA with which the vehicle is equipped. In all cases, the alarm provides both visual and audible outputs; however, the time intervals of these outputs vary by the requirements of the market for which the vehicle is manufactured. In all cases, the visual output will be a flashing ON and OFF of the exterior lamps. For vehicles equipped with the North American or the export base version of the VTA, the audible output will be a pulsing of the horn. See the owner's manual in the vehicle glove box for details of the alarm output requirements of the specific market for which the vehicle was manufactured. The inputs that will trigger the alarm include the door ajar switches, the liftgate ajar switch, and

in vehicles built for certain markets where required, the hood ajar switch.

TAMPER ALERT

The VTA tamper alert feature will pulse the horn three times upon VTA disarming if the alarm was triggered and has since timed out or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator that the VTA alarm was activated while the vehicle was unattended.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by disabling the engine whenever any method other than a valid Sentry Key FOB with Integrated Key (FOBIK) is used to start the vehicle. The SKIS is considered a passive protection system, because it is always active when the ignition system is energized and it does not require any customer intervention. The SKIS uses Low Frequency (LF) communication to obtain confirmation that the FOBIK in the ignition switch is valid for operating the vehicle. The microprocessor-based SKIS hardware and software also uses electronic messages to communicate with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/COMMUNICATION - Operation** .

Pre-programmed Sentry Key FOBIK transponders are provided with the vehicle from the factory. Each Wireless Ignition Node (WIN) will recognize a maximum of eight Sentry Key FOBIK transponders. If the customer would like additional FOBIKs, other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional FOBIKs must be programmed to the WIN in the vehicle in order for the system to recognize them as valid. This can be done by the dealer using a diagnostic scan tool, or if Customer Learn programming is an available SKIS feature in the market where the vehicle was purchased, the customer can program the additional FOBIKs, as long as at least two valid Sentry Key FOBIKs are already available. See **Standard Procedure** .

The WIN performs a self-test of the SKIS each time the ignition switch is turned to the ON position, and will store fault information in the form of a Diagnostic Trouble Code (DTC) if a system malfunction is detected. The WIN will also send an electronic message to the instrument cluster if a fault is detected, and the instrument cluster illuminates the security indicator.

The hard-wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls or communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient, and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information.

DIAGNOSIS AND TESTING

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). Following are the recommended procedures for diagnosis of each of these two subsystems.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

VEHICLE THEFT ALARM

The hard-wired circuits between components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls or communication between other modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. See the **Vehicle Theft Security System** menu item on the scan tool. Refer to the appropriate diagnostic service information.

SENTRY KEY IMMOBILIZER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard-wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls or communication between other modules and devices that provide some features of the

SKIS. The most reliable, efficient, and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information.

STANDARD PROCEDURE

WIN INITIALIZATION - EXPORT WITH COLUMN LOCK MODULE

CAUTION: On vehicles equipped with the optional export premium Vehicle Theft System, when either the Wireless Ignition Node (WIN) or the shaft lock module (also known as Elektrische LenksAulenverriegelung/ELV or electric steering column lock) is replaced with a new unit, the existing WIN or ELV MUST also be replaced with a new unit. In other words, any time either the WIN or the ELV is replaced with a new unit, BOTH the WIN and the ELV MUST be replaced with new units, WITHOUT EXCEPTION. Following replacement of BOTH the WIN and the column lock module/ELV, the two modules MUST be initialized using diagnostic scan tool routines in the EXACT SEQUENCE that follows. Failure to follow this sequence may result in BOTH the new WIN and the new ELV being rendered unusable, requiring BOTH units to be replaced a second time.

1. After both the WIN and the ELV have been replaced with new units, connect the diagnostic scan tool to the Data Link Connector (DLC) and turn the ignition key to the ON/RUN position.
2. Navigate to the WIN in the ECU View of the diagnostic scan tool.
3. Run the WIN Replaced routine found under the Miscellaneous Functions menu item of the scan tool.
4. Turn the ignition key to the OFF position, wait 30 seconds, then cycle the key back to the ON/RUN position.
5. Scan tool to program the ignition key(s) to the WIN. See **Standard Procedure** .
6. Run the ELV Replaced routine, also found under the Miscellaneous Functions menu item of the r WIN in the ECU View of the diagnostic scan tool.
7. Turn the ignition key to the OFF position, wait 30 seconds, then cycle the key back to the ON/RUN position.
8. Verify that the ELV Locks the steering column when the key is removed from the ignition lock cylinder, and Unlocks the steering column when the key is inserted into the ignition lock cylinder.

SPECIAL TOOLS

VEHICLE THEFT SECURITY SYSTEMS

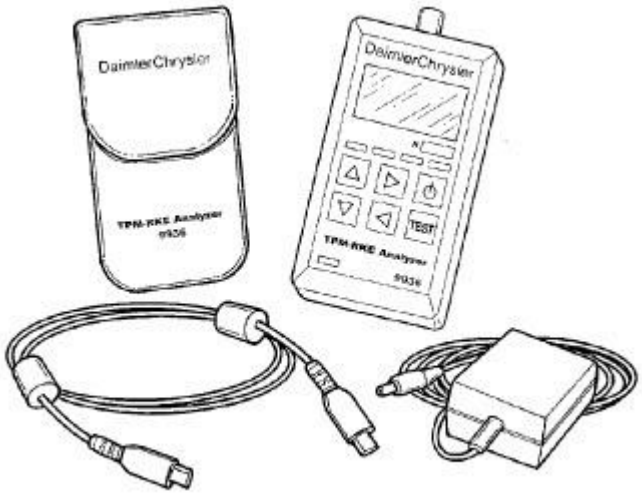

Fig. 1: TPM - RKE Analyzer No. 9936
Courtesy of CHRYSLER LLC

KEY, TRANSPONDER

DESCRIPTION

DESCRIPTION

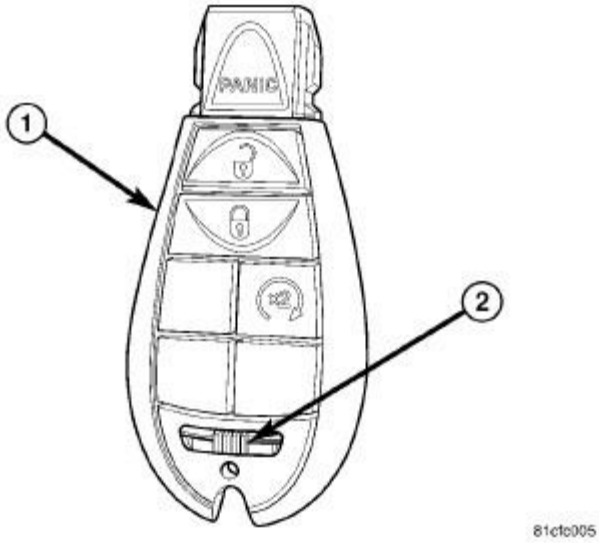

Fig. 2: Transponder Key
Courtesy of CHRYSLER LLC

The Sentry Key Immobilizer System (SKIS) has a transponder chip included on the circuit board beneath the

cover of each FOB with Integrated Key (FOBIK) (1) included with the vehicle. The FOBIK includes an integral mechanical valet key which is stored within the bottom of the FOBIK housing until it is released using the latch button (2). The valet key is cut to match the mechanical coding of the door and glove box lock cylinders. Each new replacement FOBIK must be programmed for operation of the Remote Keyless Entry (RKE) system and has a unique transponder identification code that is permanently programmed into it by the manufacturer. This identification code must be programmed into the Wireless Ignition Node (WIN) to be recognized by the SKIS as a valid key.

The FOBIK transponder cannot be adjusted or repaired. If ineffective or damaged, the entire FOBIK and RKE transmitter unit must be replaced.

OPERATION

OPERATION

When the ignition switch is turned to the ON position, the Wireless Ignition Node (WIN) communicates through its antenna with the Sentry Key transponder within the FOB with Integrated Key (FOBIK) using a Low Frequency (LF) signal. The Sentry Key transponder chip is within the range of the WIN transceiver antenna ring when it is inserted into the ignition switch.

The WIN determines whether a valid FOBIK is present in the ignition switch based upon the signal from the transponder. If a valid FOBIK is detected, that fact is communicated by the WIN to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus, and the PCM allows the engine to start. If the PCM receives an **invalid key** message, or receives no message from the WIN over the CAN data bus, the engine will be disabled. The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) will also respond to the **invalid key** message on the CAN data bus by flashing the security indicator ON and OFF.

Each Sentry Key FOBIK has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the WIN has a unique Secret Key code programmed into it by the manufacturer. When a Sentry Key FOBIK is programmed into the memory of the WIN, the WIN stores the transponder identification code from the Sentry Key FOBIK and the Sentry Key FOBIK learns the Secret Key code from the WIN. Once the Sentry Key FOBIK learns the Secret Key code of the WIN, it is permanently stored in the memory of the transponder. Therefore, once a FOBIK has been programmed to a particular vehicle, it cannot be used on any other vehicle. Refer to **RECEIVER, WIRELESS IGNITION NODE** .

The Sentry Key Immobilizer System (SKIS) performs a self-test each time the ignition switch is turned to the ON position, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in WIN memory if a Sentry Key FOBIK transponder problem is detected. The Sentry Key FOBIK transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic service information.

MODULE, SHAFT LOCK

DESCRIPTION

DESCRIPTION

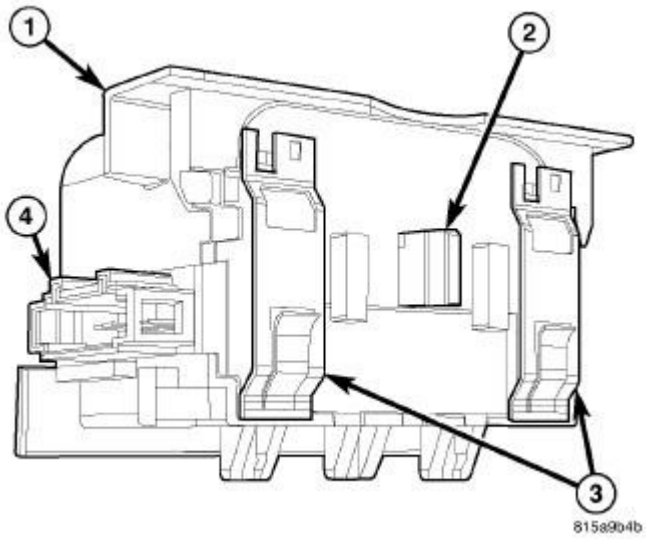

Fig. 3: Shaft Lock Module
Courtesy of CHRYSLER LLC

A shaft lock module (1) is part of the premium version of the Sentry Key Immobilizer System (SKIS) in the Vehicle Theft Security System (VTSS). The premium version of the SKIS is only available in vehicles built for certain markets, where the additional features offered by this system are required. The shaft lock module is located in a bracket integral to the lower end of the steering column housing casting below the instrument panel in the passenger compartment. This unit is designed to work in conjunction with the Wireless Ignition Node (WIN), sometimes reffered to as the Sentry Key REmote Entry Module (SKREEM) to control a locking bolt (2) that engages a machined slot in the steering shaft to prevent shaft rotation whenever there is not a valid key present in the ignition lock cylinder on the instrument panel.

Concealed within the module is the electronic circuitry of the module, and a bi-directional electric motor that actuates the locking bolt. The module is connected to the vehicle electrical system through the instrument panel wire harness.

The mounting provisions for the shaft lock module are designed to resist unauthorized tampering. The module cannot be removed from the steering column while the locking bolt is in the locked position, or while the steering column is installed in the vehicle. The shaft lock module unit cannot be adjusted or repaired and, if ineffective or damaged, the entire steering column must be replaced.

OPERATION

OPERATION

The electronic circuitry within the shaft lock module contains all of the logic circuits and components to monitor and control the operation of the shaft locking bolt. The module uses a serial data bus for bi-directional communication with the Wireless Ignition Node (WIN) , sometimes referred to as the Sentry Key REmote Entry Module (SKREEM). If the module detects a problem with the positioning or operation of the locking bolt, it sends an error message to the WIN. The WINthen stores a Diagnostic Trouble Code (DTC) and sends an

electronic error message to the Instrument Cluster, sometimes referred to as the Cab Compartment Node (CCN), over the Controller Area Network (CAN) data bus.

The shaft lock module continuously monitors inputs from the WIN and energizes the electric motor to move the locking bolt to the locked or unlocked position based upon that input. If the WIN indicates that the key present in the ignition lock cylinder is invalid, the locking bolt remains in the locked position. When the WIN indicates that a valid key is present in the ignition lock cylinder, the shaft lock module operates a motor to move the locking bolt to the unlocked position. However, to prevent inadvertent column locking due to a failure while the vehicle is being operated, the module cannot move the locking bolt from the unlocked position to the locked position as long as a key remains in the ignition lock cylinder.

The shaft lock module receives ground at all times through a hard wired remote ground point. The module receives battery voltage to operate and to move the locking bolt in the unlocked direction on a B(+) circuit, and receives battery voltage to operate the locking bolt in the locked direction only when the key is removed from the ignition switch. These connections allow the module to remain operational, regardless of the ignition switch position.

For added system security, the shaft lock module learns a unique Secret Key code from the WIN over the serial data bus upon initialization. This code is stored in the memory of the module and cannot be changed. Therefore, if the WIN requires service replacement, a new shaft lock module will also be required. Another security code, called a PIN, is used to gain access to the WIN Secured Access Mode. The Secured Access Mode is required during service to initialize a new shaft lock module. The shaft lock module is not available for separate service replacement. It is integral to the steering column so a complete column must be installed if the module is damaged or inoperative. Refer to **Steering/Column - Removal** .

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: The shaft lock module cannot be removed from the steering column while the locking bolt is in the locked position without irreversibly damaging the column. Before attempting service, insert a valid FOB with Integrated Key (FOBIK) into the ignition switch, then rotate the steering wheel from side to side. If the steering wheel can be rotated, the locking bolt is in the unlocked position. Leave the FOBIK in the ignition switch until service has been completed. If the steering wheel cannot be rotated, test and repair the wiring circuits between the module and the ignition switch as required. If no problem is found in these circuits, the module has failed with the locking bolt in the locked position and

both the module and the steering column must be replaced with new units.

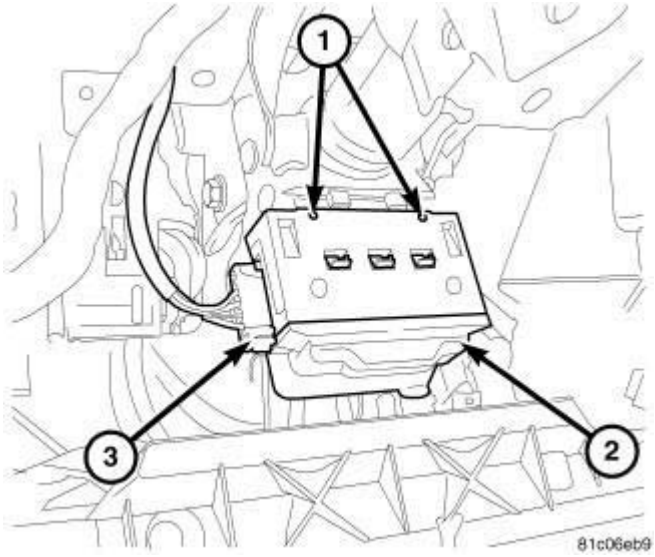

Fig. 4: Identifying Shaft Lock Module
Courtesy of CHRYSLER LLC

1. Insert a FOB with Integrated Key (FOBIK) into the ignition switch to move the shaft lock module locking bolt to the unlocked position. Leave the FOBIK in the ignition switch while the shaft lock module service is being completed.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the instrument panel wire harness connector (3) from the shaft lock module (2) connector receptacle.
4. Remove the steering column from the vehicle. Refer to **Steering/Column - Removal** .
5. Depress the two spring clips that secure the shaft lock module to the mounting bracket on the steering column by inserting a suitable drift or punch into the release holes (1) on the upper surface of the bracket opposite the module.
6. While holding both of the spring clips depressed, slide the module toward the base of the column far enough to disengage the engagement tabs and slide tabs on the module from the slots and channels in the bracket.
7. Remove the module from the steering column bracket.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system

capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

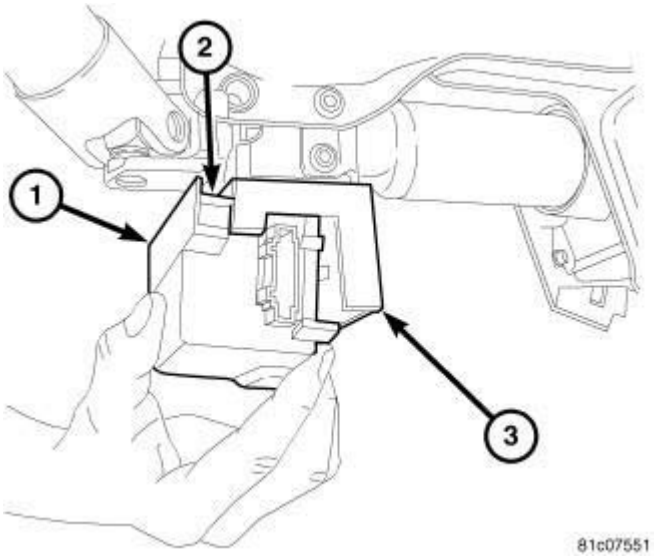

Fig. 5: Shaft Lock Module Components
Courtesy of CHRYSLER LLC

1. Be certain that a valid FOB with Integrated Key (FOBIK) is still present in the ignition switch. Leave the FOBIK in the ignition switch while the shaft lock module service is being completed.
2. Align the engagement and slide tabs integral to the housing of the shaft lock module (1) with the slots and channels in the mounting bracket (3) on the steering column.
3. Slide the module toward the top of the column far enough for the spring clips (2) on the module to engage the bracket.
4. Reinstall the steering column into the vehicle. Refer to **Steering/Column - Installation** .
5. Reconnect the instrument panel wire harness connector to the shaft lock module connector receptacle.
6. Reconnect the battery negative cable.

NOTE: If the shaft lock module has been replaced with a new unit, the Wireless Ignition Node (WIN) MUST also be replaced. Refer to Electrical - Electronic Control Modules/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Removal . Also, a diagnostic scan tool MUST be used to initialize the new module before the vehicle can be operated. See Standard Procedure .

SWITCH, HOOD AJAR

DESCRIPTION

DESCRIPTION

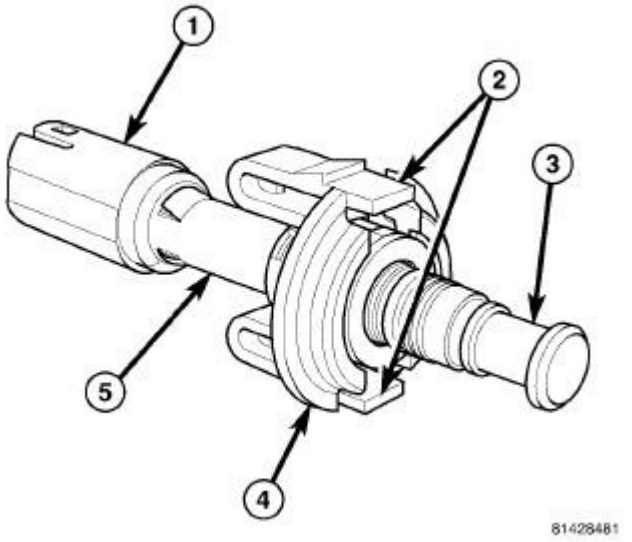

Fig. 6: Hood Ajar Switch
Courtesy of CHRYSLER LLC

The hood ajar switch is a normally closed, single pole, spring-loaded plunger actuated switch. This switch has two unique versions that are used in two different applications. One switch is used only on vehicles equipped with the Vehicle Theft Security System (VTSS) for sale in certain export markets where protection of the underhood area is required equipment. The second switch is used only on domestic vehicles equipped with an optional remote starter system.

The molded plastic switch body (5) has an integral molded connector receptacle (1) on the lower end containing two terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the headlamp and dash wire harness. Two integral latches (2) lock the switch into a keyed mounting hole in the stamped steel switch mounting bracket. The mounting bracket is secured with screws to the right inner fender shield near the fender ledge in the engine compartment. The underside of the hood panel inner reinforcement actuates the switch plunger as the hood panel is closed.

The switch plunger (3) extends through a mounting collar (4) and a sleeve-like retainer ring on the upper end of the switch body. The retainer ring has a one time, self-adjustment feature that is activated after the switch is installed by closing the hood. The retainer ring is also color-coded to aid in identifying the switch application. A dark brown retainer ring identifies the underhood security switch application, while a white retainer ring identifies the remote starter system application.

An installed hood ajar switch cannot be readjusted or repaired. If the switch is damaged, ineffective, or requires readjustment, it must be replaced with a new unit.

OPERATION

OPERATION

The hood ajar switches are interchangeable physically, but not functionally. In each case, the hood ajar switch is

a normally closed switch that is held open as the spring-loaded switch plunger is depressed by the inner hood panel reinforcement when the hood panel is closed and latched. When the hood is opened, the spring-loaded switch plunger extends from the switch body and the switch contacts are closed.

In the underhood security application (export vehicles only - dark brown retainer ring), the switch is connected in series between ground and the hood ajar switch sense input of the Totally Integrated Power Module (TIPM). The TIPM uses an internal resistor pull up to monitor the state of the hood ajar switch contacts.

In the remote starter system application (domestic vehicles only - white retainer ring) the switch has a 1 kilohm diagnostic resistor connected in parallel to the switch contacts between the two switch terminals. The switch is connected in series between an output of the TIPM and the hood ajar switch sense input of the TIPM. The TIPM continually monitors this circuit and it will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The components of the switch self-adjustment feature include an integral stop on the shaft of the plunger and a ribbed, ratcheting sleeve-like retainer ring at the top of the switch body from which the plunger extends. With the switch mounting collar secured in its mounting bracket, the plunger is depressed by the hood inner reinforcement as the hood is closed. As the plunger is depressed, the plunger stop contacts the top of the retainer ring and it is driven downward, ratcheting through the switch mounting collar until the hood is fully closed and latched. The ribs on the retainer ring are engaged within the mounting collar to maintain this adjusted position.

The hood ajar switch as well as the hard-wired circuits between the switch and the TIPM may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices related to hood ajar switch operation that provide some features of the export vehicle theft or domestic remote starter systems. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to hood ajar switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information.

REMOVAL

SWITCH

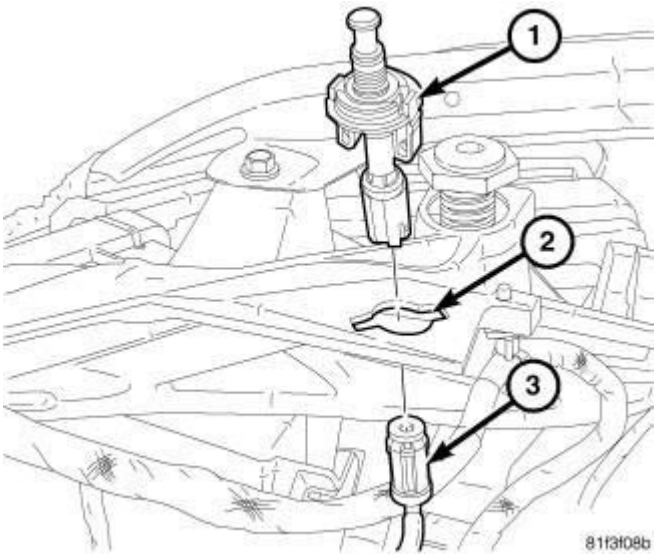

Fig. 7: Switch Connector Receptacle
Courtesy of CHRYSLER LLC

1. Unlatch and open the hood.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the wire harness connector (3) from the switch connector receptacle.
4. From the top of the hood ajar switch mounting bracket (2), squeeze the two switch latch tabs together and pull the switch (1) upward through the hole in the mounting bracket.
5. Remove the hood ajar switch from the mounting bracket and discard.

INSTALLATION

SWITCH

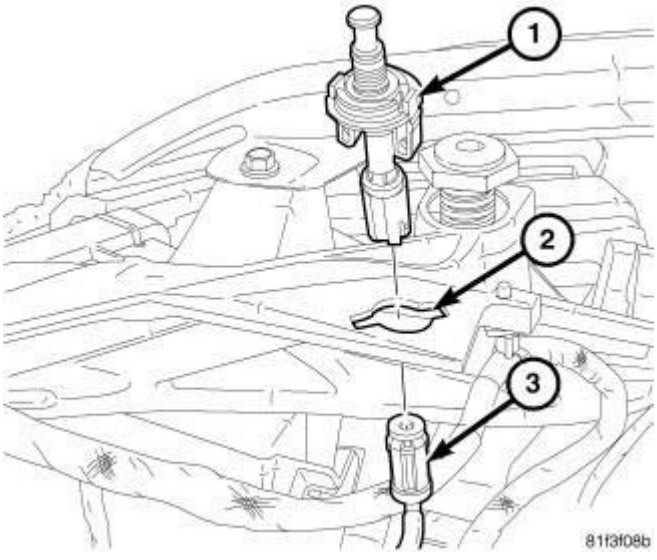

Fig. 8: Switch Connector Receptacle

Courtesy of CHRYSLER LLC

NOTE: Self-adjustment of the hood ajar switch is a one-time feature. If the switch is damaged, ineffective, removed or requires readjustment, it must be replaced with a new unit.

1. Position the hood ajar switch (1) above the hole in the mounting bracket (2).
2. Press the switch into the mounting hole until the integral switch latch tabs lock it into place.
3. Connect the harness connector (3) to the switch connector receptacle.
4. Reconnect the battery negative cable.
5. Close and latch the hood.

2009 ACCESSORIES AND EQUIPMENT

Wipers/Washers - Service Information - Journey

DESCRIPTION

FRONT

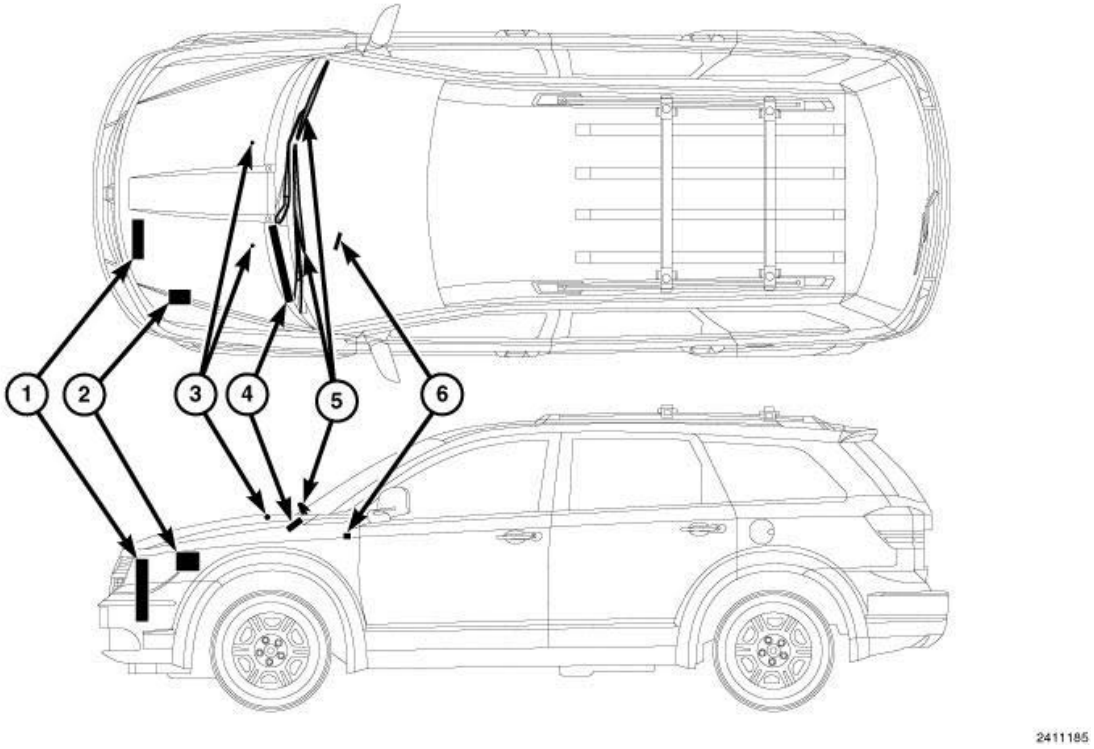

Fig. 1: Intermittent Front Wiper & Washer System
Courtesy of CHRYSLER LLC

An electrically operated intermittent front wiper and washer system is standard factory-installed safety equipment on this vehicle. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **ElectroMechanical Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is located on the instrument panel directly in front of the driver. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .
- **Front Washer Nozzle (3)** - Two fluidic front washer nozzles with integral check valves are secured by latch features to dedicated openings in the hood panel near the base of the windshield.
- **Front Washer Plumbing** - The plumbing for the washer system consists of rubber hoses, plastic tubes and molded rubber or plastic fittings. The plumbing is routed through the engine compartment from the washer reservoir. The front washer hose is routed along the left fender ledge to the hood hinge, then across the underside of the inner hood panel reinforcement to the washer nozzles.

- **Front Wiper Arms And Blades (5)** - The two front wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl plenum cover/grille panel located near the base of the windshield. The two front wiper blades are each secured to their wiper arm with an integral latch, and are parked on the glass near the bottom of the windshield when the front wiper system is not in operation. The left and right wiper arms and wiper blades are unique and are not interchangeable.
- **Front Wiper Module (4)** - The wiper pivot shafts are the only visible components of the front wiper module. The remainder of the module is concealed within the cowl plenum beneath the cowl plenum cover/grille panel. The wiper module includes the wiper module bracket, three rubber-isolated wiper module mounts, the wiper motor, the wiper motor crank arm, the two wiper drive links and the two wiper pivots.
- **Right Multi-Function Switch (6)** - The right (wiper) multi-function switch and the left (lighting) multi-function switch are secured to brackets integral to the clockspring housing on the top of the steering column just below the steering wheel. The right multi-function switch is connected by a short jumper harness to the Steering Control Module (SCM), which is internal to the left multi-function switch housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multi-function switch is dedicated to providing all of the driver controls for both the front and rear wiper and washer systems.
- **Steering Control Module** - The Steering Control Module (SCM) is internal to the left multi-function switch housing, which is secured to a bracket integral to the left side of the clockspring housing on the top of the steering column just below the steering wheel. Only the left switch control stalk extending from the left side of the steering column is visible, while the remainder of the switch housing containing the SCM is concealed beneath the steering column shrouds. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Steering Column - Description** .
- **Totally Integrated Power Module (2)** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **Electrical - Wiring/Power Distribution/MODULE, Totally Integrated Power (TIPM) - Description** .
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, rearward facing surface of the washer reservoir, on the back of the cooling module just to the left of center. This single reversible washer pump/motor provides washer fluid to either the front or rear washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir (1)** - The washer reservoir is located in the engine compartment on the back of the cooling module just to the left of center. The cap is accessed from the front of the engine compartment.

Hard wired circuitry connects the front wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the front wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

HEADLAMP

An electrically operated headlamp washer system is optional factory-installed equipment on this vehicle when it

is manufactured for certain export markets. The headlamp washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **ElectroMechanical Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is located on the instrument panel directly in front of the driver. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .
- **Headlamp Washer Nozzle** - A headlamp washer nozzle is secured to the front fascia beneath each front lamp unit.
- **Headlamp Washer Pump/Motor** - The electric headlamp washer pump/motor unit is located in a dedicated hole on the rearward facing side of the washer reservoir, on the left side of the cooling module in the engine compartment. This high pressure pump is located above and to the left of the reversible front and rear washer pump/motor unit on the reservoir.
- **Headlamp Washer Plumbing** - The plumbing for the headlamp washer system consists of large diameter rubber hoses and molded plastic fittings. The plumbing is routed to the washer nozzles on the front fascia from the washer reservoir. The connections at the headlamp washer pump and the two headlamp washer nozzles feature unique quick-connect fittings.
- **Headlamp Washer Relay** - The headlamp washer relay is an International Standards Organization (ISO) relay that is located near the Totally Integrated Power Module (TIPM) in the engine compartment near the battery.
- **Right Multi-Function Switch** - The right (wiper) multi-function switch and the left (lighting) multi-function switch are secured to brackets integral to the clockspring housing on the top of the steering column just below the steering wheel. The right multi-function switch is connected by a short jumper harness to the Steering Control Module (SCM), which is internal to the left multi-function switch housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multi-function switch is dedicated to providing all of the driver controls for both the front and rear wiper and washer systems.
- **Steering Control Module** - The Steering Control Module (SCM) is internal to the left multi-function switch housing, which is secured to a bracket integral to the left side of the clockspring housing on the top of the steering column just below the steering wheel. Only the left switch control stalk extending from the left side of the steering column is visible, while the remainder of the switch housing containing the SCM is concealed beneath the steering column shrouds. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Steering Column - Description** .
- **Totally Integrated Power Module** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **Electrical - Wiring/Power Distribution/MODULE, Totally Integrated Power (TIPM) - Description** .
- **Washer Reservoir** - A unique washer reservoir is used on vehicles with the optional headlamp washer system, which has dedicated provisions for the headlamp washer pump and plumbing. This reservoir is mounted in the same location and using the same mounting hardware as is used for vehicles without the headlamp washers. The reservoir is located on the left side of the cooling module in the engine compartment.

Hard wired circuitry connects the headlamp washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical

system and to the headlamp washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

REAR

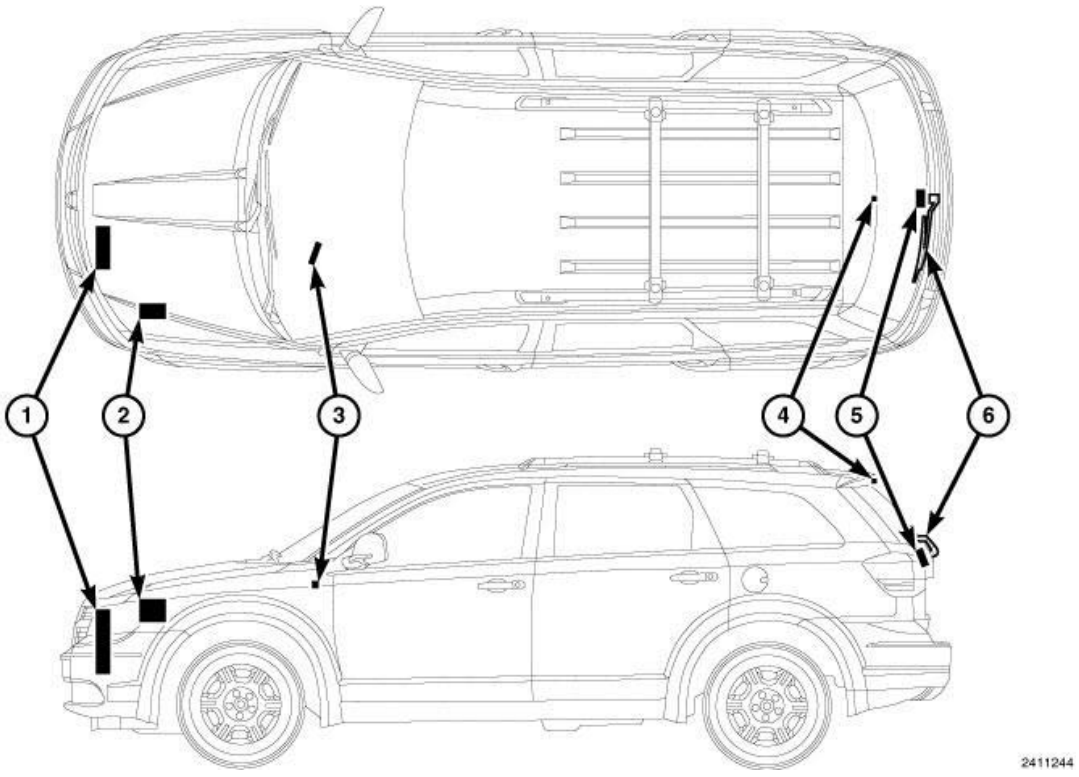

Fig. 2: Intermittent Rear Wiper & Washer System
Courtesy of CHRYSLER LLC

An electrically operated fixed interval intermittent rear wiper and washer system is standard factory-installed equipment on this vehicle. The rear wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **ElectroMechanical Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is located on the instrument panel directly in front of the driver. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .
- **Rear Washer Nozzle (4)** - The fluidic rear washer nozzle with an integral check valve is secured by integral latch features to a mounting hole on the lower surface of the rear spoiler formation on the liftgate outer panel above the liftgate glass.
- **Rear Washer Plumbing** - The plumbing for the rear washer system consists of rubber hoses and molded plastic fittings. The plumbing is routed along the left side of the engine compartment from the washer reservoir on the cooling module through the dash into the passenger compartment. It is then routed within the body wiring harness along the left side of the floor to the left rear inner wheel housing, then up the

wheel housing to the D-pillar. It exits the wire harness near the top of the D-pillar and connects to the liftgate washer hose, which is routed along the liftgate opening upper reinforcement to the center of the vehicle then through the upper liftgate opening to the rear washer nozzle on the upper liftgate.

- **Rear Wiper Arm And Blade (6)** - The single rear wiper arm is secured by a nut directly to the rear wiper motor output shaft, which extends through a rubber grommet inserted into a hole in the liftgate outer panel at the base of the liftgate glass. The rear wiper blade is secured to the rear wiper arm with an integral latch feature, and is parked near the base of the glass when the rear wiper system is not in operation.
- **Rear Wiper Motor (5)** - The rear wiper motor includes the motor bracket and three rubber-isolated wiper motor mounts. The wiper motor output shaft is the only visible component of the rear wiper motor. The remainder of the motor is concealed by the inner liftgate trim on the inside of the liftgate beneath the liftgate glass opening.
- **Right Multi-Function Switch (3)** - The right (wiper) multi-function switch and the left (lighting) multi-function switch are secured to brackets integral to the clockspring housing, on the top of the steering column just below the steering wheel. The right multi-function switch is connected to the Steering Control Module (SCM) by a short jumper harness. The SCM is internal to the left multi-function switch housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multi-function switch is dedicated to providing all of the driver controls for both the front and rear wiper and washer systems.
- **Steering Control Module** - The Steering Control Module (SCM) is internal to the left multi-function switch housing, which is secured to a bracket integral to the left side of the clockspring housing on the top of the steering column just below the steering wheel. Only the left switch control stalk extending from the left side of the steering column is visible, while the remainder of the switch housing containing the SCM is concealed beneath the steering column shrouds. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Steering Column - Description** .
- **Totally Integrated Power Module (2)** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **Electrical - Wiring/Power Distribution/MODULE, Totally Integrated Power (TIPM) - Description** .
- **Washer Reservoir (1)** - The rear washer system shares a single reservoir and reversible pump with the front washer system, but has its own dedicated plumbing. The washer reservoir is located in the engine compartment attached to the FEM (Front End Module). The filler neck and cap are accessed from the right front corner of the engine compartment.

Hard wired circuitry connects the rear wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the rear wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

FRONT

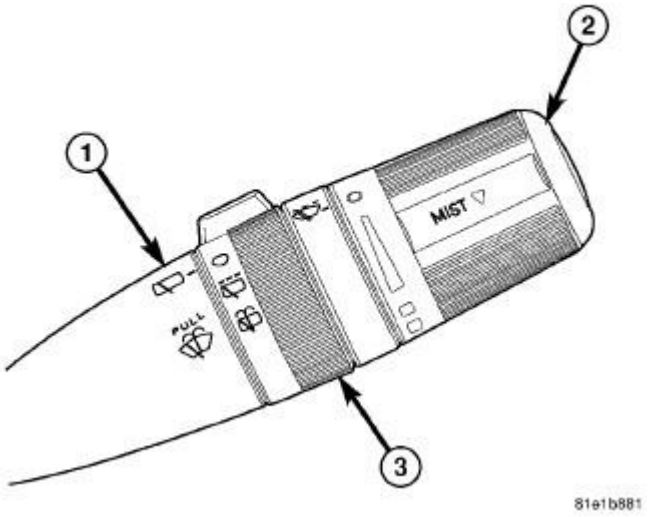

Fig. 3: Right (Wiper) Multi-Function Switch
Courtesy of CHRYSLER LLC

The front wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outer surface of the windshield glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all front and rear wiper and washer system functions with the control stalk of the right (wiper) multi-function switch (1) that extends from the right side of the steering column, just below the steering wheel. Rotating the control knob (2) on the end of the control stalk, selects the OFF, DELAY, LOW, or HIGH front wiper system operating modes. In the DELAY mode, the control knob also allows the vehicle operator to select from one of five intermittent wipe delay intervals.

Pulling the control stalk rearward actuates the momentary front washer system switch, which selects the WASH and WIPE-AFTER-WASH modes, depending upon when and how long the switch is held closed. Pushing the control stalk downward actuates a momentary switch and selects the MIST mode, which cycles the wiper blades for as long as the switch is held closed then completes the current cycle and parks the blades at the base of the windshield after the switch is released.

The right multi-function switch provides hard wired analog and resistor multiplexed inputs to the Steering Control Module (SCM) internal to the left (lighting) multi-function switch housing for all of the wiper and washer system functions. The SCM then sends electronic **wiper** and **washer switch** status messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), over a Local Interface Network (LIN) data bus. The EMIC responds to the SCM inputs by sending electronic **wiper** and

washer system request messages to the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Front wiper and washer system operation is completely controlled by the SCM, EMIC and TIPM logic circuits, and that logic will only allow these systems to operate when the ignition switch is in the ACCESSORY or ON positions. The TIPM uses intelligent, high current, self-protected high side switches to control wiper system operation by energizing or de-energizing the wiper motor low and high speed brushes. The TIPM uses an H-bridge circuit to control the operation of the reversible washer pump/motor unit. The right multi-function switch circuitry receives battery current and a clean ground output from the SCM, then provides analog and multiplexed inputs to the SCM to indicate the selected front wiper and front washer system mode.

The hard wired circuits and components of the front wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient, and accurate means to diagnose the front wiper and washer system or the electronic controls and communication related to front wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the front wiper and washer system operating modes.

CONTINUOUS WIPE MODE

When the LOW position of the control knob on the control stalk of the right (wiper) multi-function switch is selected, the SCM sends an electronic **wiper switch low** status message to the EMIC over the LIN data bus. The EMIC then relays an electronic **wiper switch low** request message to the TIPM over the CAN data bus. The TIPM then directs battery current to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

When the HIGH position of the control knob is selected, the SCM sends an electronic **wiper switch high** status message to the EMIC. The EMIC then relays an electronic **wiper switch high** request message to the TIPM. The TIPM then directs battery current to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

When the OFF position of the multi-function switch control knob is selected, the SCM sends an electronic **wiper switch off** status message to the EMIC, the EMIC relays an electronic **wiper switch off** request message to the TIPM, then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob OFF position is selected.

If the wiper blades are in the down position on the windshield when the OFF position is selected, the park switch that is integral to the wiper motor is closed to ground, which provides a hard wired park switch sense input to the TIPM. The TIPM then de-energizes the wiper motor and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the OFF position is selected, the park switch is an open circuit and the TIPM continues running the wiper motor at low speed until the wiper blades are in the down position on the windshield and the park switch input to the TIPM is again closed to

ground.

INTERMITTENT WIPE MODE

When the control knob on the control stalk of the right (wiper) multi-function switch is moved to one of the five DELAY interval positions, the SCM sends an electronic **wiper switch delay interval** status message to the EMIC. The EMIC then relays an electronic **wiper switch delay interval** request message to the TIPM. The TIPM's electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input.

The TIPM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the TIPM to determine the proper intervals at which to energize and de-energize the wiper motor intermittently for one low speed cycle at a time.

The TIPM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature, the TIPM monitors electronic **vehicle speed** messages from the Controller Antilock Brake (CAB) and doubles the selected delay interval whenever the vehicle speed is about 16 kilometers-per-hour (10 miles-per-hour) or less.

MIST WIPE MODE

When the control stalk of the right (wiper) multi-function switch is moved downward to the momentary MIST position, the SCM sends an electronic **wiper mist mode** status message to the EMIC, the EMIC relays an electronic **wiper mist mode** request message to the TIPM, then the TIPM energizes the low speed brush of the wiper motor for as long as the switch is held closed, then de-energizes the motor when the state of the switch changes to open, parking the wiper blades near the base of the windshield. The TIPM can operate the front wiper motor in this mode for only one low speed cycle at a time, or for an indefinite number of sequential low speed cycles, depending upon how long the switch is held closed.

WASH MODE

When the control stalk of the right (wiper) multi-function switch is pulled rearward to the front momentary WASH position for more than about one-half second with the wiper system operating, the SCM sends an electronic **washer switch** status message to the EMIC, the EMIC relays an electronic **washer switch** request message to the TIPM, then the TIPM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized in the front wash direction for as long as the switch is held closed (up to approximately 10 seconds) and to be de-energized when the control stalk is released.

When the control stalk is pulled rearward to the front momentary WASH position while the front wiper system is operating in one of the DELAY interval positions, the washer pump/motor operation is the same. However, the TIPM also overrides the selected delay interval and operates the front wiper motor in a continuous low speed mode for as long as the control stalk is held in the front momentary WASH position, then reverts to the selected delay interval several wipe cycles after the control stalk is released. If the WASH switch is held closed for more than approximately 10 seconds, the TIPM will suspend washer pump/motor operation until the control stalk is released for about 2 seconds and then cycled back to the WASH position.

WIPE-AFTER-WASH MODE

When the control stalk of the right (wiper) multi-function switch is pulled rearward to the front momentary WASH position for more than about one-half second while the wiper system is not operating, the SCM sends an electronic **washer switch** status message to the EMIC, the EMIC relays an electronic **washer switch** request message to the TIPM, and the TIPM directs battery current and ground to the washer pump/motor and energizes the wiper motor in a continuous low speed mode for as long as the switch is held closed (up to approximately 10 seconds). When the control stalk is released, the TIPM de-energizes the washer pump/motor immediately, but allows the wiper motor to operate for two or three additional wipe cycles before it de-energizes the wiper motor and parks the wiper blades near the base of the windshield.

If the control stalk is held rearward for more than about 10 seconds, the TIPM will suspend washer pump/motor operation until the stalk is released for about 2 seconds and then cycled back to the WASH position; however, the wipers will continue to operate for as long as the switch is held closed. The TIPM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the TIPM to count the number of wipe cycles that occur after the control stalk is released, and to determine the proper interval at which to de-energize the wiper motor to complete the WIPE-AFTER-WASH mode cycle.

HEADLAMP

The headlamp washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining headlamp lighting performance. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the lenses of the two front lamp units, removing excess accumulations of snow, ice, bugs, mud, or other minor debris from the front lamps that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates the headlamp washer system function using the control knob on the end of the right multi-function switch control stalk that extends from the right side of the steering column, just below the steering wheel. While the headlamps are turned ON and the engine is running, pushing the knob on the end of the control stalk towards the steering column beyond the actuation point for more than about 100 milliseconds (0.10 second) activates the headlamp washer pump/motor in combination with the front washer pump/motor. When the headlamp washer pump/motor unit is energized, hydraulic pressure builds within the headlamp washer system plumbing against the pressure of the control valve in each headlamp washer nozzle. Sufficient pressure causes the headlamp washer nozzles to dispense high pressure washer fluid onto the lenses of both front lamp units for about 1600 milliseconds (1.6 seconds).

Headlamp washer system operation is completely controlled by the Totally Integrated Power Module (TIPM) logic circuits based upon electronic **wash command** message inputs received from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Controller Area Network (CAN) data bus. The EMIC monitors electronic **wash switch status** and **lighting switch status** message inputs received over the Local Interface Network (LIN) data bus from the Steering Control Module (SCM) (also known as the steering column module) based upon the right and left multi-function switch positions. The TIPM will only allow this system to operate when the engine is running and the headlamp low beams are turned ON. The TIPM uses a low side driver to energize or de-energize the headlamp washer system relay which, in turn, controls the operation of the headlamp washer pump/motor unit.

The hard wired circuits and components of the headlamp washer system may be diagnosed using conventional

diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient, and accurate means to diagnose the headlamp washer system or the electronic controls and communication related to headlamp washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REAR

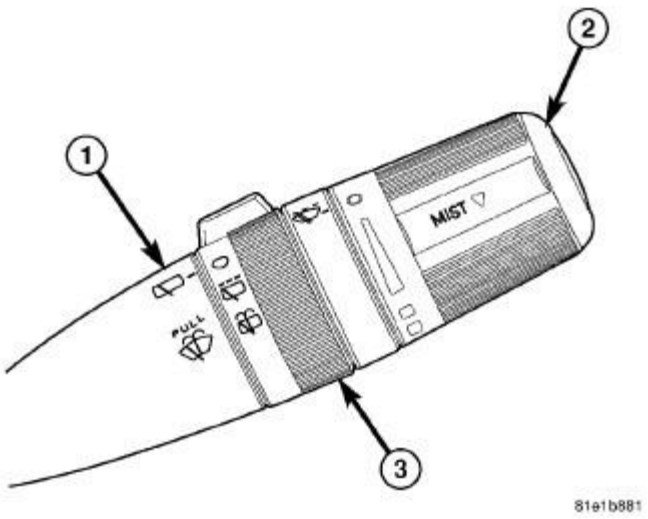

Fig. 4: Right (Wiper) Multi-Function Switch
Courtesy of CHRYSLER LLC

The rear wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the liftgate glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blade to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outer surface of the liftgate glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all front and rear wiper and washer system functions with the control stalk (1) of the right (wiper) multi-function switch that extends from the right side of the steering column, just below the steering wheel. Rotating the control sleeve (3) on the control stalk to the OFF or INTERMITTENT detent positions or the momentary WASH position selects the rear wiper and washer system operating modes.

The right multi-function switch provides hard wired analog and resistor multiplexed inputs to the Steering Control Module (SCM) integral to the left (lighting) multi-function switch for all of the wiper and washer system functions. The SCM then sends electronic **rear wiper/washer switch** status messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over a Local

Interface Network (LIN) data bus. The EMIC then sends electronic **rear wiper/washer switch** request messages to the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus requesting the appropriate rear wiper and washer system operating modes.

Rear wiper and washer system operation is completely controlled by the SCM, EMIC and TIPM logic circuits, and that logic will only allow these systems to operate when the ignition switch is in the ACCESSORY or ON positions. The TIPM uses intelligent, high current, self-protected high side switches to control wiper system operation by energizing or de-energizing the rear wiper motor. The TIPM uses an H-bridge circuit to control the operation of the reversible washer pump/motor unit. The right multi-function switch circuitry receives a clean ground output from the SCM on a multi-function switch return circuit, then provides analog and resistor multiplexed inputs to the SCM to indicate the selected rear wiper and rear washer system mode.

The hard wired circuits and components of the rear wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient, and accurate means to diagnose the rear wiper and washer system or the electronic controls and communication related to rear wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the rear wiper and washer system operating modes.

INTERMITTENT WIPE MODE

When the INTERMITTENT WIPE position of the control sleeve on the control stalk of the right multi-function switch is selected, the SCM sends an electronic **rear wiper switch** status message to the EMIC over the LIN data bus, then the EMIC relays an electronic **rear wiper switch** request message to the TIPM over the CAN data bus, and the TIPM directs battery current to the rear wiper motor at fixed delay intervals to enable the rear wiper motor intermittent wipe mode.

WASH MODE

When the control sleeve of the right multi-function switch is rotated counterclockwise past the INTERMITTENT detent position to the momentary rear WASH position, the SCM sends an electronic **rear washer switch** status message to the EMIC over the LIN data bus, then the EMIC relays an electronic **rear washer switch** request message to the TIPM over the CAN data bus, and the TIPM directs battery current to the rear wiper motor and directs battery current and ground to the washer pump/motor unit. These outputs will cause the washer pump motor and the rear wiper motor to operate continuously for as long as the switch is held closed up to approximately 10 seconds. The washer pump is de-energized as soon as the control sleeve is released, but the rear wiper motor continues to operate for two to three continuous cycles before reverting to the fixed delay interval operation. The TIPM uses a hard wired output from a park switch internal to the rear wiper motor as an additional logic input to monitor the position of the rear wiper blade on the glass and to control the number of continuous wiper sweeps following washer operation.

DIAGNOSIS AND TESTING

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If the front wiper motor operates, but the wipers do not move on the windshield, replace the ineffective front wiper module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the front wiper and washer system components as required. See **Electrical - Wipers/Washers/Wipers/Washers - Cleaning** and. See **Electrical - Wipers/Washers/Wipers/Washers - Inspection**.

The hard wired front wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient, and accurate means to diagnose the front wiper and washer system or the electronic controls and communication related to front wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: The front wiper and washer switches are integral to the right multi-function switch. The right multi-function switch is hard wired to the left multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the right and left multi-function switch/SCM are operational. If only the right multi-function switch functions are inoperative, test and repair the right multi-function switch or the jumper harness between the right and left multi-function switches before attempting to repair the Front Wiper and Washer System. If both the right and left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Front Wiper and Washer System.

CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH	1. Ineffective motor ground circuit.	1. Test and repair open wiper motor ground circuit if required.

POSITION	2. Ineffective motor feed circuits.	2. Test and repair low speed and high speed feed circuits between TIPM and front wiper motor if required.
	3. Ineffective right multi-function switch.	3. Test and replace ineffective right multi-function switch if required.
	4. Ineffective SCM inputs or outputs.	4. Use a diagnostic scan tool to test the SCM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective EMIC (CCN) inputs or outputs.	5. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	7. Ineffective wiper motor.	7. Test and replace open or shorted wiper motor as required.
WIPERS DO NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit.	1. Test and repair wiper park switch input circuit between TIPM and front wiper motor if required.
	2. Ineffective TIPM inputs or outputs.	2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective wiper motor park switch.	3. Test and replace ineffective wiper motor if required.
WIPER MOTOR OPERATES SLOWLY IN ALL SWITCH POSITIONS	1. Ineffective wiper motor.	1. Check amperage draw with linkage disconnected from wiper motor crank arm. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows:
	2. Amperage draw too low.	2. Test and repair shorted low and high speed feed circuits if required.
	3. Amperage draw too high.	3. With linkage disconnected from wiper motor crank arm check linkage and pivots for binding. If binding is detected, repair or replace front wiper module if required. If no linkage binding detected, replace the front wiper motor if required.
WIPERS RUN AT HIGH SPEED WITH SWITCH LOW SPEED SELECTED OR AT LOW SPEED WITH SWITCH HIGH SPEED SELECTED	1. Ineffective motor feed circuit wiring.	1. Test and repair low speed and high speed feed circuits between TIPM and front wiper motor if required.
	1. Ineffective washer pump ground circuit.	1. Test and repair open washer pump ground circuit if required.
	2. Ineffective washer pump	2. Test and repair washer pump feed circuits between TIPM and washer pump

	feed circuits.	if required.
	3. Ineffective right multi-function switch.	3. Test and replace ineffective right multi-function switch if required.
	4. Ineffective SCM inputs or outputs.	4. Use a diagnostic scan tool to test the SCM inputs and outputs. Refer to the appropriate diagnostic information.
WASHER PUMP DOES NOT OPERATE	5. Ineffective EMIC (CCN) inputs or outputs.	5. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	7. Ineffective washer pump.	7. Test and replace open or shorted washer pump if required.

HEADLAMP

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Before attempting to diagnose the headlamp washer system, confirm whether the front washer system operates satisfactorily. If the front washer system is ineffective or operates improperly, diagnose and repair that problem before attempting to repair the headlamp washer system. If the front washer system operates satisfactorily and the headlamp washer pump/motor unit operates, but no washer fluid is dispensed on the front lamp unit lenses, inspect the headlamp washer plumbing for pinched or leaking hoses and fittings. If the headlamp washer pump/motor unit does not operate, check the headlamp washer system fuse.

The hard wired headlamp washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient, and accurate means to diagnose the headlamp washer system or the electronic controls and communication related to headlamp washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REAR

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment, possible personal injury, or death.

If the rear wiper motor operates, but the wiper motor output shaft does not move, replace the ineffective rear wiper motor. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wiper operates, but chatters, lifts, or does not clear the glass, clean and inspect the rear wiper and washer system components as required. See **Electrical - Wipers/Washers/Wipers/Washers - Cleaning** and. See **Electrical - Wipers/Washers/Wipers/Washers - Inspection**.

The hard wired rear wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient, and accurate means to diagnose the rear wiper and washer system or the electronic controls and communication related to rear wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: The rear wiper and washer switches are integral to the right multi-function switch. The right multi-function switch is hard wired to the left multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the right and left multi-function switch/SCM are operational. If only the right multi-function switch functions are inoperative, test and repair the right multi-function switch or the jumper harness between the right and left multi-function switches before attempting to repair the Rear Wiper and Washer System. If both the right and left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Rear Wiper and Washer System.

CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit. 2. Ineffective motor feed circuits.	1. Test and repair open wiper motor ground circuit if required. 2. Test and repair motor feed circuit between TIPM and rear wiper motor if required.

	3. Ineffective right multi-function switch.	3. Test and replace ineffective right multi-function switch if required.
	4. Ineffective SCM inputs or outputs.	4. Use a diagnostic scan tool to test the SCM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective EMIC (CCN) inputs or outputs.	5. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	7. Ineffective wiper motor.	7. Test and replace open or shorted wiper motor if required.
WIPER DOES NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit.	1. Test and repair wiper park switch input circuit between TIPM and front wiper motor if required.
	2. Ineffective TIPM inputs or outputs.	2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
	3. Ineffective wiper motor park switch.	3. Test and replace ineffective wiper motor if required.
WIPER MOTOR OPERATES SLOWLY	1. Ineffective wiper motor.	1. Check amperage draw with wiper arm disconnected from rear wiper motor output shaft. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows:
	2. Amperage draw too low.	2. Test and repair shorted rear wiper motor signal and fused ignition switch output (run - accessory) circuits if required.
	3. Amperage draw too high.	3. With wiper arm disconnected from wiper motor output shaft check for binding between output shaft and rubber grommet in liftgate. If binding is detected, lubricate or replace grommet if required. If no binding is detected, replace the wiper motor if required.
	1. Ineffective washer pump ground circuit.	1. Test and repair open washer pump ground circuit if required.
	2. Ineffective washer pump feed circuits.	2. Test and repair washer pump feed circuits between TIPM and washer pump if required.
	3. Ineffective right multi-function switch.	3. Test and replace ineffective right multi-function switch if required.

Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. 7. Test and replace open or shorted washer pump if required.

CLEANING

FRONT

WIPER SYSTEM

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms, and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor unit from the reservoir. Clean foreign material from the inside of the washer pump inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hose from the washer nozzle, then running the washer pump/motor to run clean washer fluid or water through the system. A plugged

or restricted washer nozzle should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

REAR

WIPER SYSTEM

CAUTION: Protect the rubber squeegee of the wiper blade from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegee.

The squeegee of a wiper blade exposed to the elements for a long time tends to lose its wiping effectiveness. Periodic cleaning of the squeegee is suggested to remove any deposits of salt or road film. The wiper blade, arm, and liftgate glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blade continues to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegee of the wiper blade.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor from the reservoir. Clean foreign material from the inside of the washer pump/motor inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hose from the rear washer nozzle, then running the washer pump/motor to run clean washer fluid or water through the system. A plugged or restricted rear washer nozzle should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the rear washer nozzle.

INSPECTION

FRONT

WIPER SYSTEM

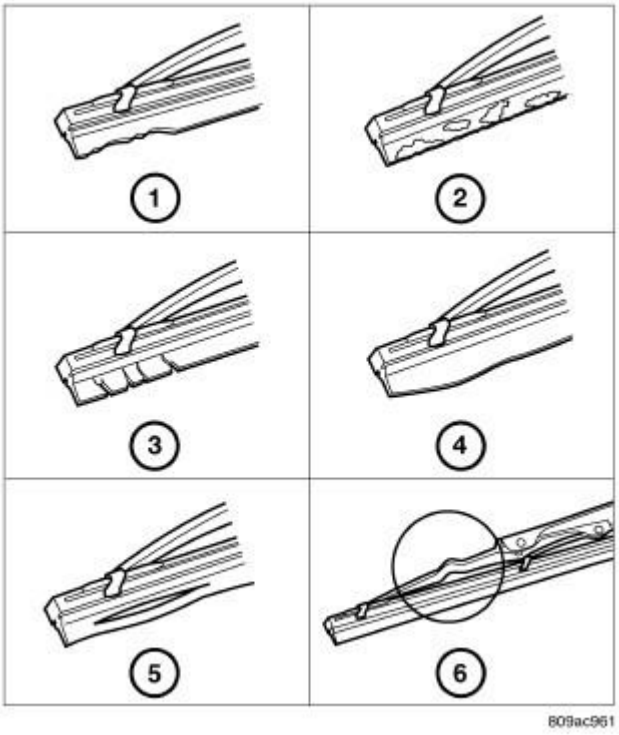

Fig. 5: Inspecting Wiper Blades
Courtesy of CHRYSLER LLC

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blades for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arms for damage (6) or corrosion. If the wiper arms and blades are contaminated with any foreign material, clean them and the glass as required. See **Electrical - Wipers/Washers/Wipers/Washers - Cleaning**. If a wiper blade or arm is damaged, or if corrosion is evident, replace the affected wiper arm or blade with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or if there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. On vehicles with unequal wiper arm lengths, be certain that measurements on both arms are

taken at a point an equal distance from their wiper arm hinge pins. Compare the scale readings between the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.

4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. See **Electrical - Wipers/Washers/Wipers/Washers - Cleaning**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an inline connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using inline connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

REAR

WIPER SYSTEM

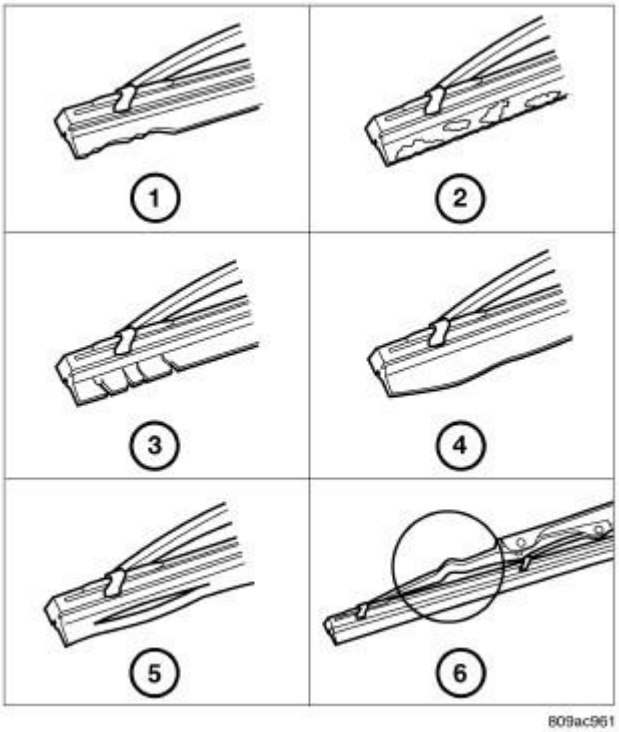

Fig. 6: Inspecting Wiper Blades
Courtesy of CHRYSLER LLC

The rear wiper blade and wiper arm should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blade for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arm for damage (6). If the wiper arm and blade are contaminated with any foreign material, clean them and the glass as required. See **Electrical - Wipers/Washers/Wipers/Washers - Cleaning**. If the wiper blade or arm is damaged, replace it with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. The spring tension of the wiper arm should be sufficient to cause the rubber squeegee to conform to the curvature of the glass. Replace a wiper arm if it has insufficient spring tension to maintain contact between the squeegee and the glass.
4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. See **Electrical - Wipers/Washers/Wipers/Washers - Cleaning**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an inline connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using inline connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

ARM, WIPER

DESCRIPTION

FRONT

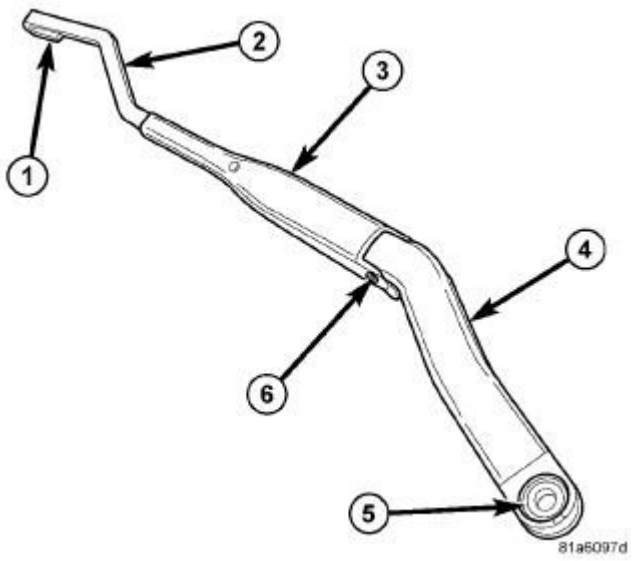

Fig. 7: Front Wiper Arm
Courtesy of CHRYSLER LLC

The front wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. These wiper arms feature an over-center hinge that allows easy access to the windshield glass for cleaning.

The wiper arm has a die cast metal pivot end (4) with a large tapered mounting hole (5) at one end. A molded

black plastic cap fits over the wiper arm retaining nut to conceal the nut and this mounting hole following wiper arm installation.

The wide end of a tapered, stamped steel channel (3) hinges on and is secured with a hinge pin (6) to the blade end of the wiper arm pivot end. One end of a long, rigid, stamped steel strap (2) with a small hole near its pivot end is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook (1). Concealed within the stamped steel channel, one end of a long tension spring is engaged with a wire hook on the underside of the die cast pivot end, while the other end of the spring is hooked through the small hole in the steel strap. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

The right and left wiper arms are unique and are not interchangeable. A wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

REAR

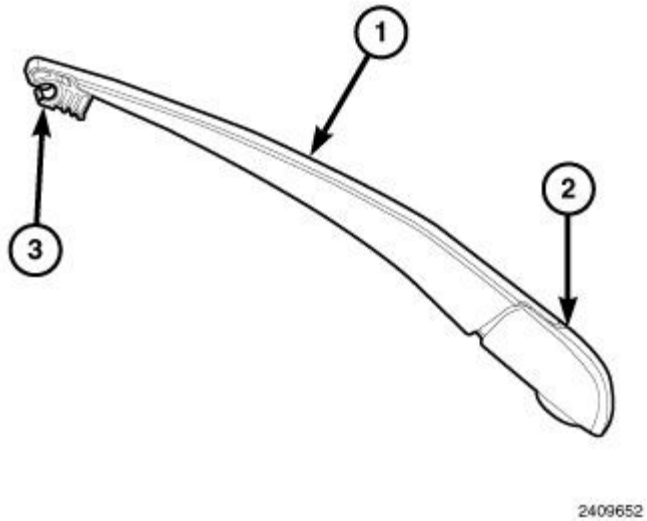

Fig. 8: Rear Wiper Arm
Courtesy of CHRYSLER LLC

The rear wiper arm is the rigid member located between the rear wiper motor output shaft that protrudes through the liftgate outer panel below the center of the liftgate glass opening and the wiper blade on the outside of the glass. The wiper arm is constructed of molded black plastic. A hinged pivot end is also molded plastic.

A molded black plastic nut cover (2) with two pivot pins on one end and a snap feature on the other fits over the wiper arm retaining nut to conceal the nut and mounting hole following wiper arm installation. The wiper arm hinge and tension spring are concealed on the underside of the wide end of the arm (1), while an integral latch feature (3) concealed on the underside of the narrow end of the wiper arm accepts the pivot pin of the matching molded plastic wiper blade unit.

The rear wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

OPERATION

FRONT

The front wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The tapered mounting hole in the wiper arm pivot end interlocks with the serrations on the tapered outer circumference of the wiper pivot shaft, allowing positive engagement and finite adjustment of this connection.

The mounting nuts lock the wiper arms to the threaded studs of the wiper pivot shafts. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REAR

The rear wiper arm is designed to mechanically transmit the motion from the rear wiper motor output shaft to the rear wiper blade. The wiper arm must be properly indexed to the motor output shaft in order to maintain the proper wiper blade travel on the glass. The tapered hole in the wiper arm pivot end interlocks with the serrations on the outer circumference of the tapered motor output shaft, allowing positive engagement and finite adjustment of this connection.

A hex nut secures the wiper arm pivot end to the threads on the rear wiper motor output shaft and the plastic cover snaps over this connection for a neat appearance. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The latch formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot pin to the wiper arm.

REMOVAL

FRONT

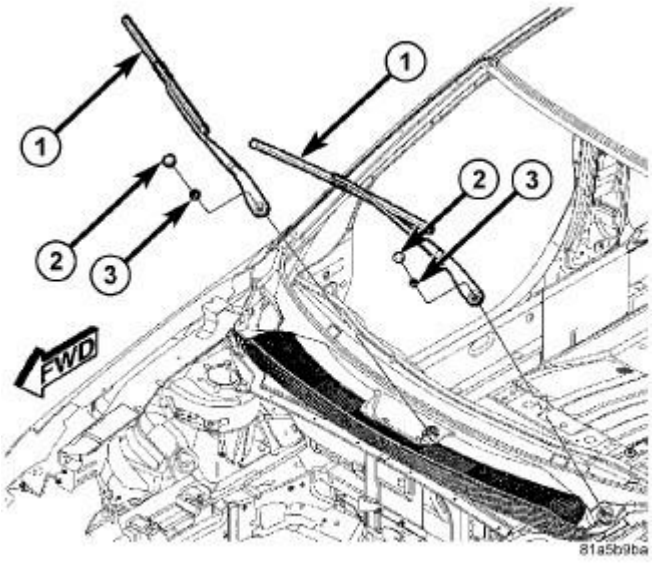

Fig. 9: Removing/Installing Wiper Arm
Courtesy of CHRYSLER LLC

1. Lift the front wiper arm (1) to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to pivot shaft connection.
2. Carefully pry the plastic nut cap (2) off of the pivot end of the wiper arm.
3. Remove the nut (3) that secures the wiper arm to the wiper pivot shaft.

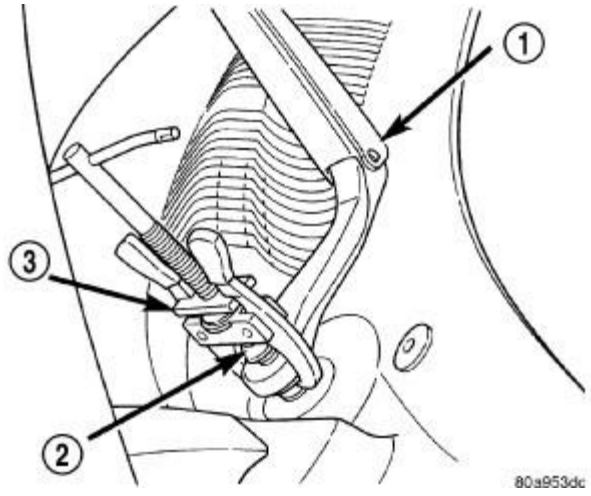

Fig. 10: Disengaging Wiper Arm From Pivot Shaft
Courtesy of CHRYSLER LLC

4. If necessary, use a suitable battery terminal puller (3) to disengage the wiper arm (1) from the pivot shaft (2).
5. Remove the front wiper arm pivot end from the pivot shaft.

REAR

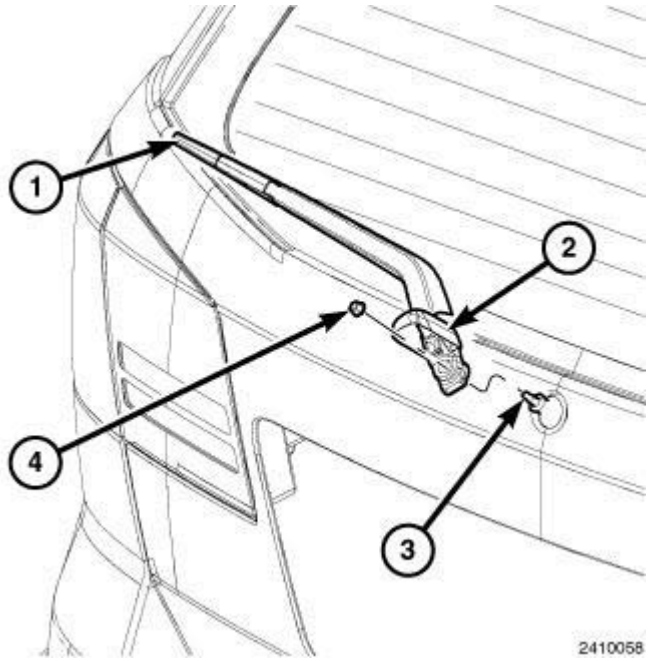

Fig. 11: Rear Wiper Motor Output Shaft
Courtesy of CHRYSLER LLC

1. Unsnap and swing the molded plastic nut cover (2) off of the pivot end of the wiper arm (1).
2. Remove the nut (4) that secures the wiper arm to the rear wiper motor output shaft (3).

CAUTION: The use of a battery terminal puller when removing the rear wiper arm is NOT recommended as this may damage the rear wiper arm.

3. Use a slight rocking action to disengage the rear wiper arm pivot end from the output shaft and remove the wiper arm.

INSTALLATION

FRONT

NOTE: Be certain that the wiper motor is in the park position before attempting to install the front wiper arms. Turn the ignition switch to the ON position and move the right (wiper) multi-function switch control knob to its OFF position. If the wiper pivots move, wait until they stop moving, then turn the ignition switch back to the OFF position. The front wiper motor is now in its park position.

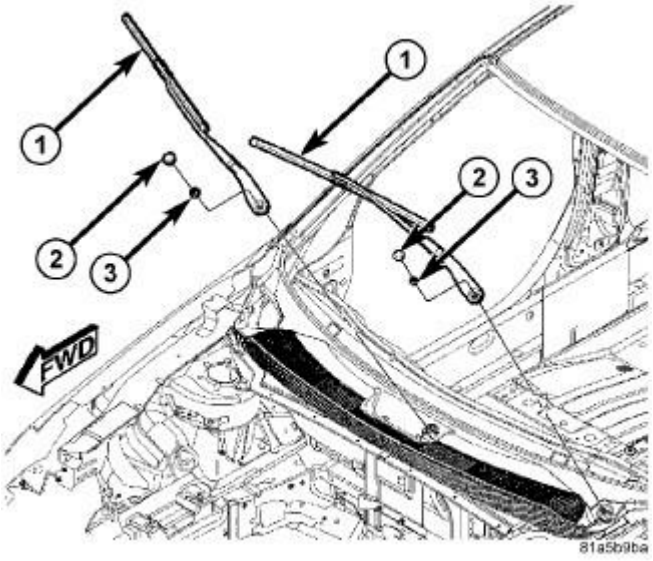

Fig. 12: Removing/Installing Wiper Arm
Courtesy of CHRYSLER LLC

1. The front wiper arms (1) must be indexed to the pivot shafts with the front wiper motor in the park position to be properly installed. Position the wiper arm pivot ends onto the wiper pivot shafts so that the tip of the wiper blade is aligned with the wiper alignment lines located within the lower margin (blackout area) of the windshield glass.
2. Once the wiper blade is aligned, lift the wiper arm away from the windshield slightly to relieve the spring tension on the pivot end and push the pivot end of the wiper arm down firmly and evenly over the pivot shaft.
3. Install and tighten the nut (3) that secures the wiper arm to the pivot shaft. Tighten the nut to 24 N.m (18 ft. lbs.).
4. Wet the windshield glass, then operate the front wipers. Turn the front wipers OFF, then check for the correct wiper arm position and readjust as required.
5. Reinstall the plastic nut cap (2) onto the wiper arm pivot nut.

INSTALLATION

NOTE: Be certain that the rear wiper motor is in the park position before attempting to install the rear wiper arm. Turn the ignition switch to the ON position and move the rear wiper switch to its OFF position. If the wiper motor output shaft moves, wait until it stops moving, then turn the ignition switch back to the OFF position. The wiper motor is now in its park position.

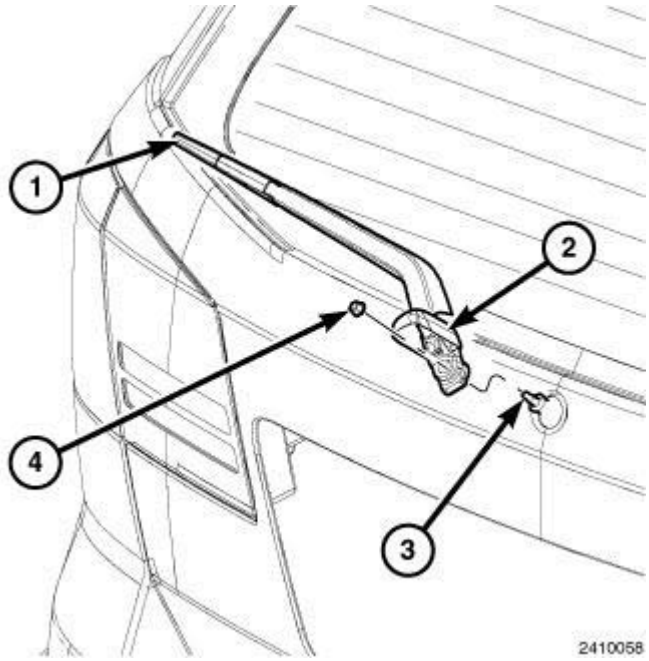

Fig. 13: Rear Wiper Motor Output Shaft
Courtesy of CHRYSLER LLC

1. The rear wiper arm (1) must be indexed to the rear wiper motor output shaft with the motor in the park position to be properly installed. Position the wiper arm pivot end onto the output shaft (3) so that the tip of the wiper blade is aligned with the second rear window defogger grid line from the bottom of the liftgate glass.
2. With the rear wiper arm properly indexed, push the tapered mounting hole on the pivot end of the wiper arm down over the output shaft.
3. Install and tighten the nut (4) that secures the rear wiper arm to the output shaft. Tighten the nut to 9 N.m (80 in. lbs.).
4. Fold and snap the molded plastic nut cover (2) over the nut on the pivot end of the rear wiper arm.
5. Wet the lift glass and operate the rear wiper. Turn the rear wiper switch to the OFF position, then check for correct wiper arm position and readjust as required.

BLADE, WIPER

DESCRIPTION

FRONT

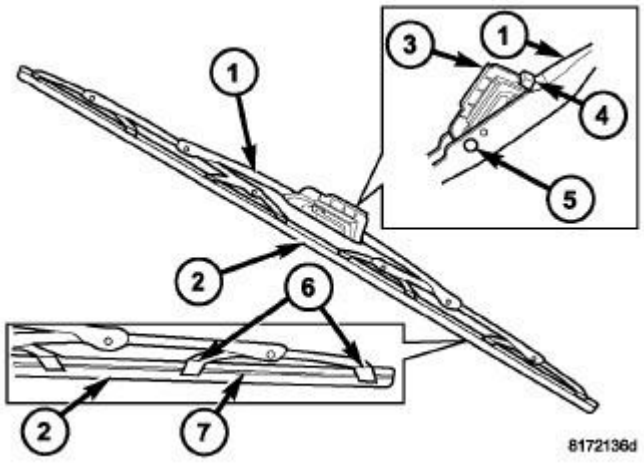

Fig. 14: Identifying Wiper Blade Components
Courtesy of CHRYSLER LLC

Each wiper blade is secured by an integral latching pivot block (3) to the hook formation on the tip of each wiper arm, and rests on the glass near the base of the windshield when the wipers are not in operation. The wiper blade consists of the following components:

- **Superstructure (1)** - The superstructure includes several stamped steel bridges and links with claw formations (6) that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.
- **Element (2)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor (7)** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

The passenger side wiper blades are 47.50 centimeters (18.70 inches) long. The driver side wiper blades are 60 centimeters (23.62 inches) long. They have non-replaceable rubber elements (squeegees). The wiper blades cannot be adjusted or repaired. If ineffective, worn, or damaged the entire wiper blade unit must be replaced.

REAR

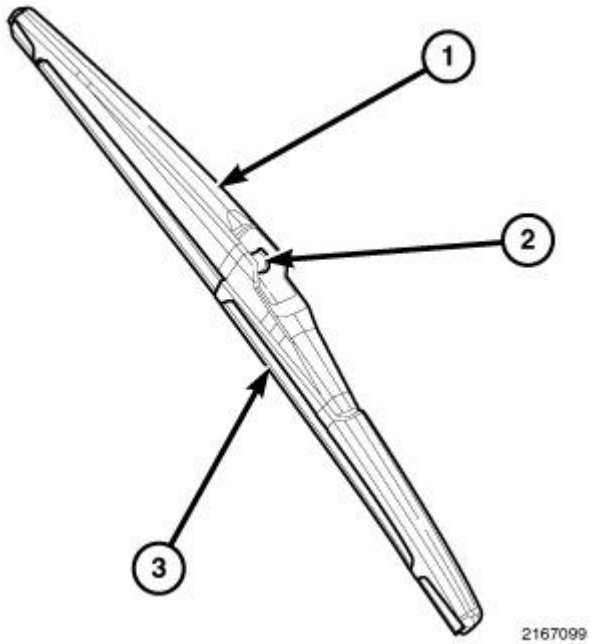

Fig. 15: Rear Wiper Blade Is Secured By An Integral Pivot Pin
Courtesy of CHRYSLER LLC

The rear wiper blade is secured by an integral pivot pin (2) to a receptacle at the tip of the rear wiper arm, and rests near the base of the liftgate glass when the wiper is not in operation. The rear wiper blade consists of the following components:

- **Superstructure (1)** - The superstructure includes a molded black plastic bridge and plastic links with claw formations that grip the wiper blade element. Also included in this unit is the pivot pin that secures the superstructure to the wiper arm.
- **Element (3)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

The rear wiper blade is 30.50 centimeters (12.00 inches) long with a non-replaceable element (squeegee). The wiper blade superstructure cannot be adjusted or repaired. If ineffective, worn, or damaged the entire wiper blade unit must be replaced.

OPERATION

FRONT

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the

glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, yet resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REAR

The rear wiper blade is moved back and forth across the liftgate glass by the wiper arm when the rear wiper system is in operation. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature found across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, but resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

FRONT

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

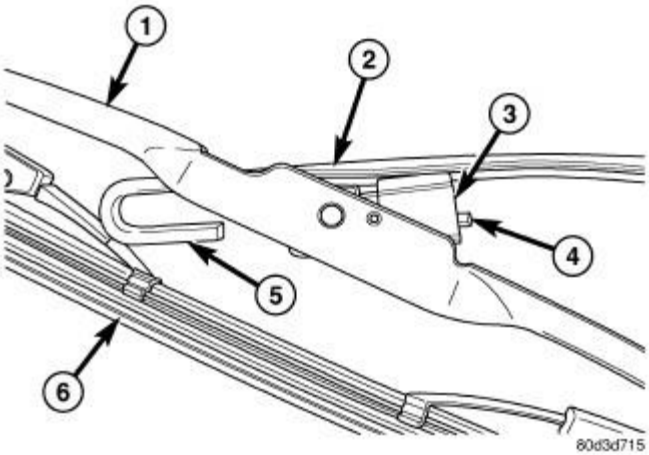

Fig. 16: Removing/Installing Wiper Blade
Courtesy of CHRYSLER LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards

the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) to raise the wiper blade and element (6) off of the glass, until the wiper arm hinge is in its over-center position.
2. To remove the blade from the arm, depress the latch release tab (4) on the pivot block (3) under the tip of the arm and slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook formation (5) on the end of the arm.
3. Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure (1) just ahead of the pivot block.
4. Gently lower the tip of the wiper arm onto the glass.

REAR

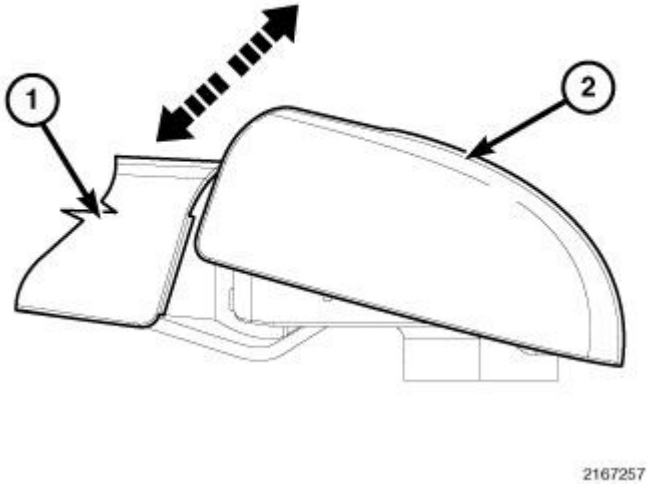

Fig. 17: Rear Wiper Arm Pivot Cap
Courtesy of CHRYSLER LLC

1. Lift the rear wiper arm pivot cap (2) upward to allow the rear wiper blade to be raised off of the glass.

NOTE: The rear wiper arm cannot be raised to its over-center hinge position unless the pivot cover is raised first.

2. Lift the rear wiper arm to its over-center hinge position to raise the wiper blade and element off of the liftgate glass.

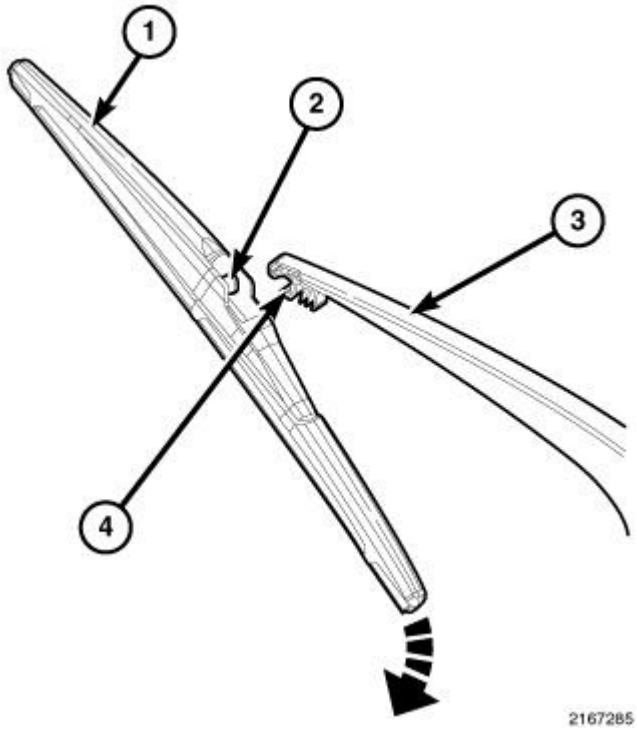

Fig. 18: Removing/Installing Wiper Blade From Wiper Arm
Courtesy of CHRYSLER LLC

3. To remove the wiper blade (1) from the wiper arm (3), grasp the end of the blade nearest to the motor output shaft, then over-rotate it out from under the arm and past its stop far enough to unsnap the blade pivot pin (2) from the receptacle (4) on the end of the arm.
4. Gently lower the tip of the wiper arm onto the glass.

INSTALLATION

FRONT

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

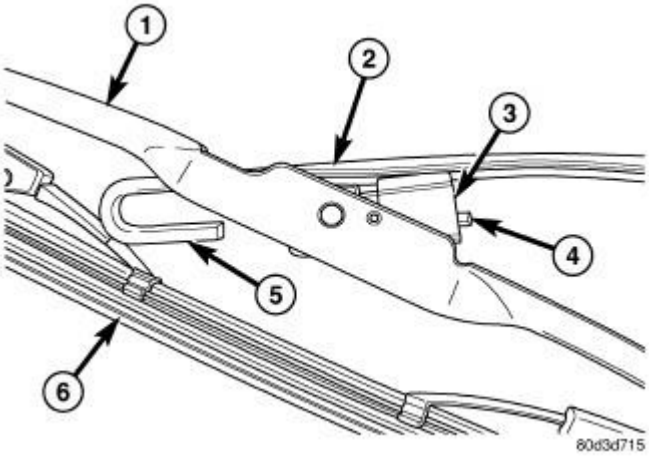

Fig. 19: Removing/Installing Wiper Blade
Courtesy of CHRYSLER LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) off of the windshield glass, until the wiper arm hinge is in its over-center position.
2. Position the wiper blade near the hook formation (5) on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.
3. Insert the hook formation on the tip of the arm through the opening in the blade superstructure (1) ahead of the pivot block (3) far enough to engage the pivot block into the hook.
4. Slide the pivot block up into the hook formation on the tip of the wiper arm until the latch release tab (4) snaps into its locked position. Latch engagement will be accompanied by an audible click.
5. Gently lower the wiper blade and element (6) onto the glass.

REAR

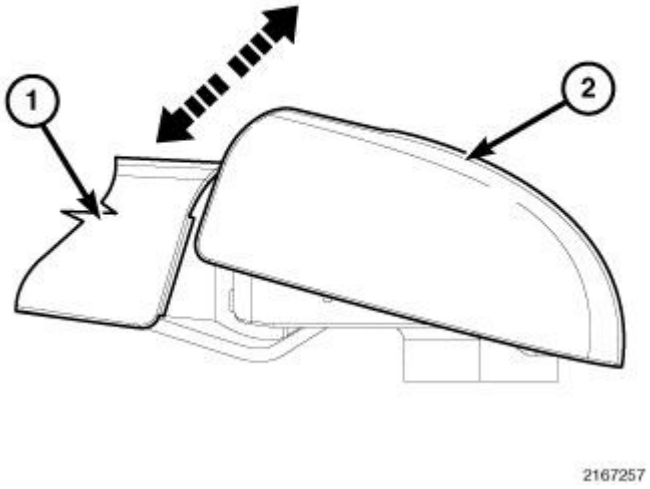

Fig. 20: Rear Wiper Arm Pivot Cap
Courtesy of CHRYSLER LLC

1. Lift the rear wiper arm pivot cap (2) upward to allow the rear wiper arm to be raised off of the glass.

NOTE: The rear wiper arm cannot be raised to its over-center hinge position unless the pivot cover is raised first.

2. Lift the rear wiper arm to its over-center hinge position and off of the liftgate glass.

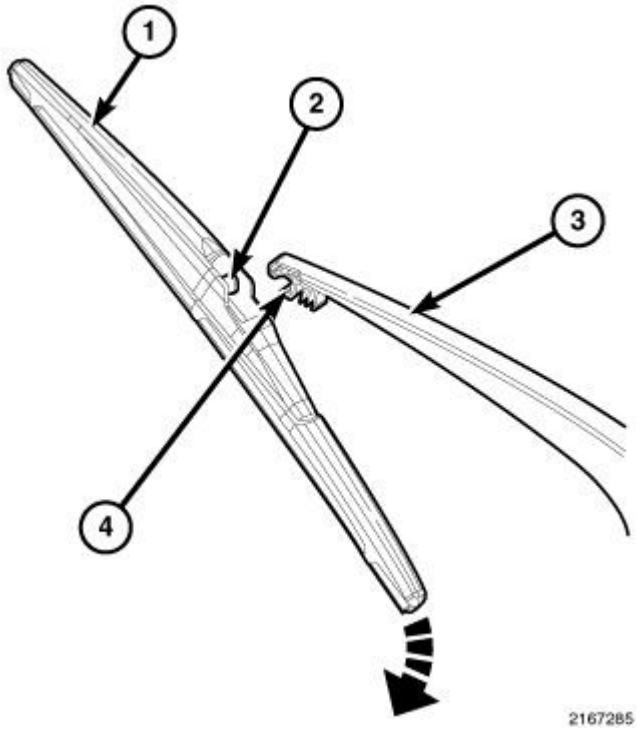

Fig. 21: Removing/Installing Wiper Blade From Wiper Arm
Courtesy of CHRYSLER LLC

3. Position the rear wiper blade (1) with the pivot pin (2) aligned with the opening of the receptacle (4) on the tip of the wiper arm (3).
4. Using hand pressure, press the wiper blade pivot pin firmly and evenly into the wiper arm receptacle until it snaps into place.
5. Lower the wiper blade onto the glass and snap the pivot cover back into place.

CHECK VALVE, WASHER

DESCRIPTION

DESCRIPTION

Diaphragm-type washer system check valves are standard equipment in this vehicle. The check valves for both the front and rear washer systems are integral to their respective washer nozzles. The check valve for the headlamp washer system, which is optional equipment only on vehicles manufactured for certain export markets, is integral to the headlamp washer hose tee fitting. The headlamp washer tee fitting is located behind the front fascia near the left headlamp washer nozzle.

Each diaphragm-type check valve consists of a molded plastic valve body where a small diaphragm is held against the lip of an integral sump well by a small plastic piston and a coiled spring.

The front and rear check valves cannot be adjusted or repaired and, if ineffective or damaged, the washer nozzle unit must replaced. The headlamp washer system tee fitting with the integral check valve also cannot be adjusted or repaired, and is serviced only as a unit with the headlamp washer hose assembly.

OPERATION

OPERATION

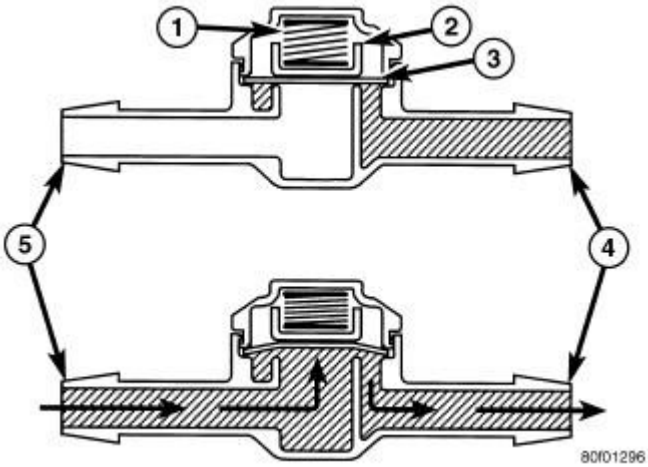

Fig. 22: Cutaway View Of Washer System Check Valve
Courtesy of CHRYSLER LLC

Diaphragm-type washer system check valves provide more than one function. First, they prevent washer fluid from draining out of the washer supply hoses back to the washer reservoir. This drain-back would result in a lengthy delay from when the washer system is activated until washer fluid was dispensed through the washer nozzles because the washer pump would have to refill the washer plumbing from the reservoir to the nozzle. Such a drain-back condition could also result in water, dirt, or other outside contaminants being drawn into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning out through the washer nozzle after the washer system is turned OFF.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing (5), the fluid pressure unseats a diaphragm (3) from over a sump well within the valve by overriding the pressure applied to it by a piston (2) and coiled spring (1). With the diaphragm unseated, washer fluid is allowed to flow toward the washer nozzle (4). When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the valve and fluid flow in either direction within the washer plumbing is prevented.

HOSES AND TUBES, WASHER

DESCRIPTION

FRONT

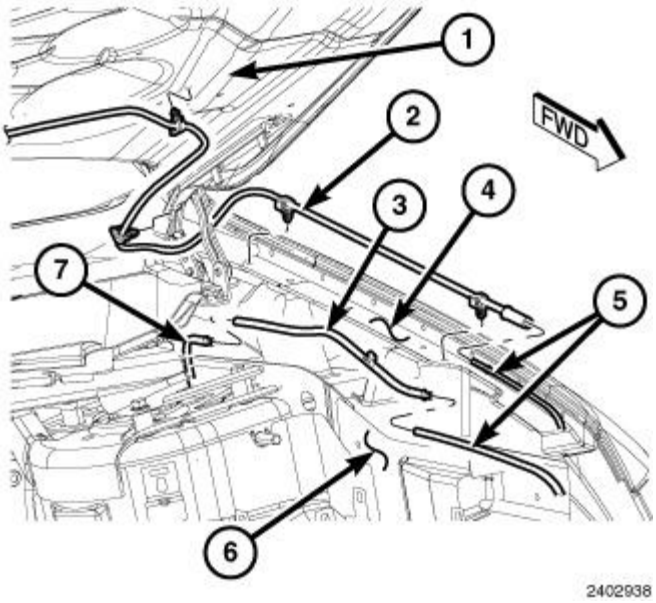

Fig. 23: Front Washer Plumbing Components
Courtesy of CHRYSLER LLC

The front washer plumbing consists of a small diameter rubber hose (2) that is routed along the left front fender ledge (4) from the washer reservoir hose (5) located at the left front corner of the engine compartment. The reservoir hose is attached to the front outlet nipple of the washer pump/motor unit near the bottom of the reservoir. The hose is then secured by plastic push-in type retainers to the left fender ledge within the engine compartment to the left side of the cowl plenum.

From the cowl plenum, the front hose is routed up toward the inner hood panel reinforcement (1). The hose is secured to the left hood hinge and the left side of the inner hood panel reinforcement by plastic push-in type retainers, then is routed through the rear hood silencer brackets across the underside of the inner hood panel. Plastic inline fittings, a molded rubber tee and a molded rubber elbow provide the take outs for the two front washer nozzles.

Washer hose is available for service as roll stock, which may be cut to length. The molded plastic or rubber washer hose fittings cannot be repaired. If these fittings are ineffective or damaged, they must be replaced.

HEADLAMP

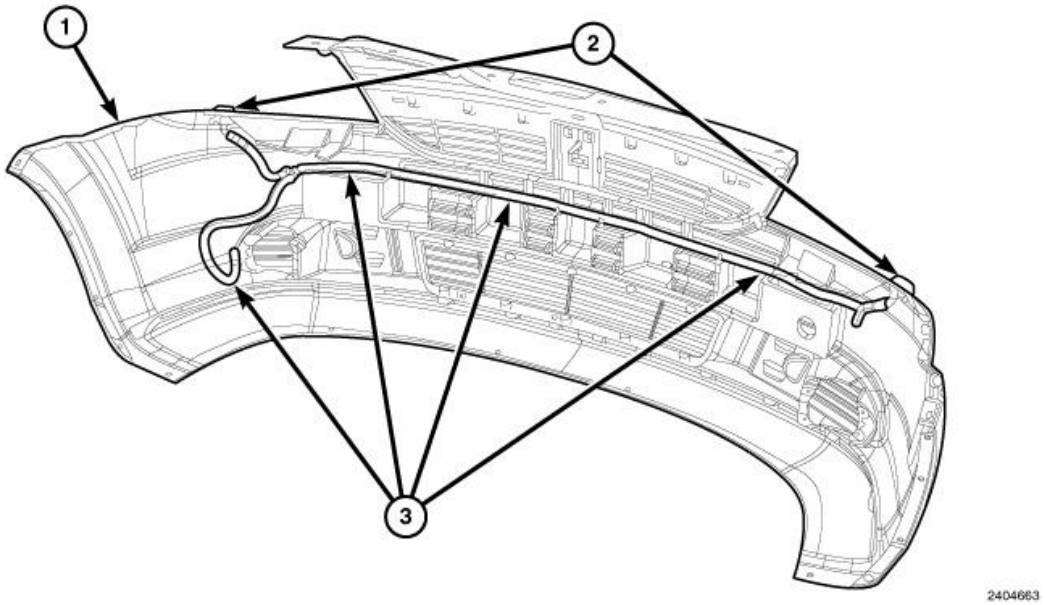

Fig. 24: Headlamp Washer System Plumbing Components
Courtesy of CHRYSLER LLC

The headlamp washer system plumbing consists of a large diameter high pressure rubber hose (3) that is routed from the outlet nipple of the headlamp washer pump/motor unit on the washer reservoir to the barbed nipple of a tee fitting with an integral check valve located near the left headlamp washer nozzle on the back side of the front fascia (1). The other two barbed nipples of the tee fitting are connected to one short and one long length of hose that each terminate at a headlamp washer nozzle (2) behind the fascia and below the two front lamp units. The hose is secured and routed from left to right behind the fascia and above the fascia reinforcement by several routing clips. The hose connections at the nozzles and the washer pump are secured using molded plastic quick-connect fittings.

The headlamp washer hose is serviced only as a complete unit. The molded plastic washer hose fittings and

check valve cannot be repaired. If these fittings or the check valve are ineffective or damaged, the entire headlamp washer hose unit must be replaced.

REAR

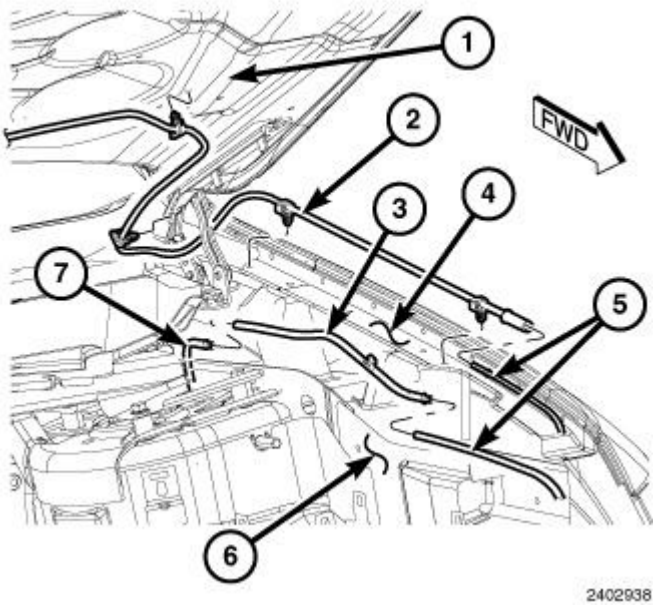

Fig. 25: Front Washer Plumbing Components
Courtesy of CHRYSLER LLC

The rear washer plumbing consists of a small diameter rubber hose (3) that is routed along the left front fender shield (6) from the washer reservoir hose (5) located at the left front corner of the engine compartment. The reservoir hose is attached to the rear outlet nipple of the washer pump/motor unit near the bottom of the reservoir. The hose is then secured by a plastic clip retainer to the front end sheet metal within the engine compartment and routed to just behind the left strut tower, where it connects to the unibody hose (7).

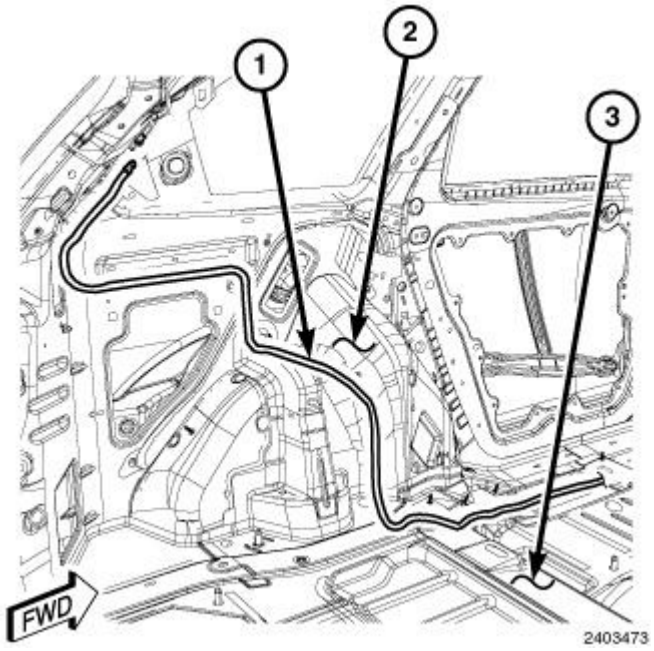

Fig. 26: Unibody Hose
Courtesy of CHRYSLER LLC

The unibody hose (1) passes from the engine compartment through a hole with a rubber grommet in the dash panel into the passenger compartment where it enters the body wire harness. The hose and wire harness bundle is routed along the floor panel (3) near the left sill back to the base of the left rear inner wheel house (2). The hose and wiring bundle is then routed over the wheel house and along the quarter inner panel near the belt line, then up the D-pillar.

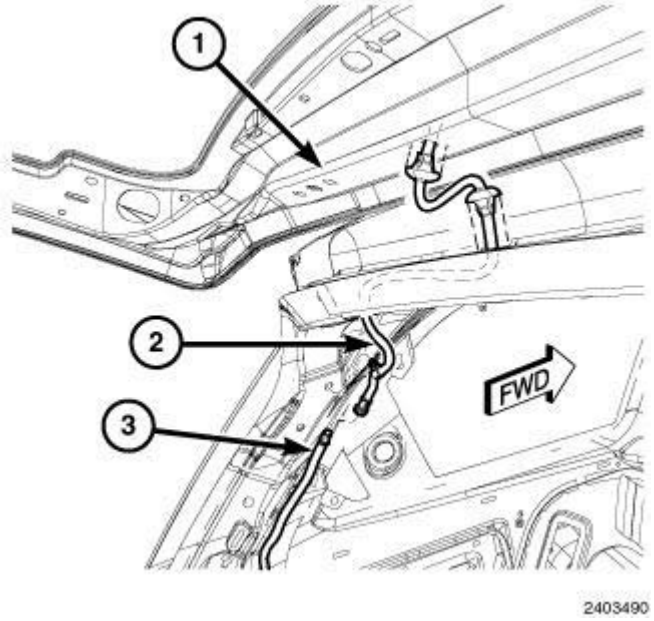

Fig. 27: Liftgate Washer Hose

Courtesy of CHRYSLER LLC

The unibody hose (3) exits the body wire harness near the top of the D-pillar, where it is connected to the liftgate washer hose (2) by a quick connect fitting. The liftgate washer hose is routed up the D-pillar to the upper liftgate opening header panel, then to the center of the upper liftgate opening. The liftgate hose is routed through a hole with a rubber grommet in the upper liftgate opening header panel and passes through another hole with a rubber grommet in the upper liftgate panel (1) to the rear washer nozzle on the upper liftgate.

Washer hose is available for service as roll stock, which may be cut to length. The unibody washer hose is integral to the body wire harness. The molded plastic washer hose fittings and routing clips cannot be repaired. If these fittings or clips are ineffective or damaged, they must be replaced.

OPERATION

FRONT

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the front washer system plumbing and fittings to the two front washer nozzles. Whenever routing the washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

HEADLAMP

Washer fluid in the washer reservoir is pressurized and fed by the headlamp washer pump/motor unit through the headlamp washer system plumbing and fittings to the two headlamp washer nozzles. Whenever routing the washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

REAR

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the rear washer system plumbing and fittings to the rear washer nozzle. Whenever routing the washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

LINKAGE, WIPER ARM

DESCRIPTION

DESCRIPTION

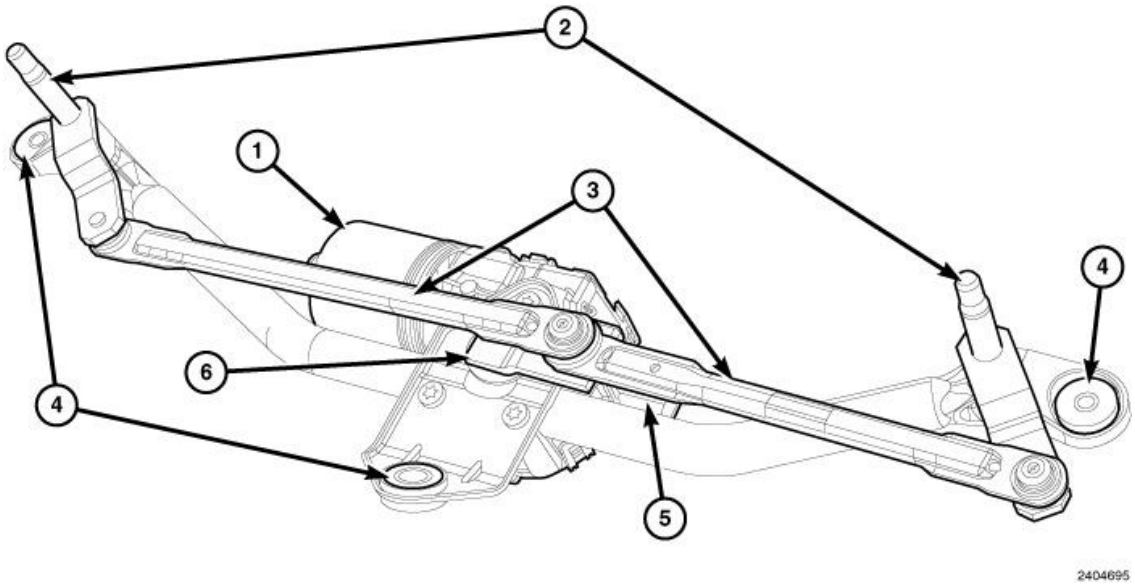

Fig. 28: Front Wiper Linkage Module
Courtesy of CHRYSLER LLC

The front wiper linkage module is secured by three screws through three rubber grommet-type insulators to two brackets and weld nuts on the cowl plenum panel and one bracket and weld nut on the driver side strut tower. The module is concealed beneath the molded plastic cowl plenum cover/grille panel between the base of the windshield and the rear edge of the hood panel. The ends of the pivot shafts that protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades and are the only visible components of the front wiper linkage module. The front wiper linkage module consists of the following major components:

- **Bracket** - The front wiper module bracket consists of a long tubular steel main member that has a die cast pivot bracket formation near each end where the two wiper pivots are secured. A stamped steel mounting bracket for the wiper motor is secured near the center of the main member. Each of the two wiper pivot brackets secures the module to the cowl plenum with a screw through a rubber insulator (4), and a third rubber insulator on the motor bracket secures the module with a screw in the bracket on the driver side strut tower.
- **Crank Arm** - The front wiper motor crank arm (6) is a stamped steel unit with a hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a long ball stud secured to the drive end to accept the wiper linkage.
- **Linkage** - Two stamped steel drive links (3) connect the wiper motor crank arm to the wiper pivot lever arms. The right side drive link has a plastic socket-type bushing on each end. The left side drive link has a plastic socket-type bushing on one end, and a plastic sleeve-type bushing on the other end. The socket-type bushing on one end of each drive link is snap-fit over the ball stud on the lever arm of its respective pivot. The left side drive link sleeve-type bushing end is then fit over the motor crank arm ball stud, and the other socket-type bushing of the right side drive link is snap-fit over the exposed end of the wiper motor crank arm ball stud.
- **Motor** - The front wiper motor (1) features a transmission housing from which the wiper motor output shaft exits, and has three mounting bosses with internal threads to which the motor is mounted to the

center wiper linkage module bracket with screws. is secured with three screws near the center of the main tubular member of the wiper module bracket. A nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal automatic resetting circuit breaker. A short pigtail wire and connector (5) connect the wiper motor to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

- **Pivots -** The two front wiper pivots (2) are secured within the die cast pivot brackets on the outboard ends of the wiper linkage module main member. The lever arms that extend from the center of the pivot shafts each have a ball stud on their end. The upper end of each pivot shaft where the wiper arms will be fastened each has a finely splined and tapered driver with a threaded stud extending from the top. The lower ends of the pivot shafts are installed through permanently lubricated bushings in the pivot brackets.

The front wiper linkage module cannot be adjusted or repaired. The wiper motor is available for separate service replacement. If any other component of the linkage module is ineffective or damaged, the entire wiper linkage module unit must be replaced.

OPERATION

OPERATION

The front wiper linkage module operation is controlled by the battery current inputs received by the wiper motor from the Totally Integrated Power Module (TIPM). The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes.

The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately opens and closes the wiper park switch sense circuit to ground, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned OFF, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads.

The wiper motor crank arm, the two wiper linkage members, and the two driven wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

The hard wired inputs and outputs of the wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the wiper system. The most reliable, efficient, and accurate means to diagnose the wiper system or the electronic controls and communication related to wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

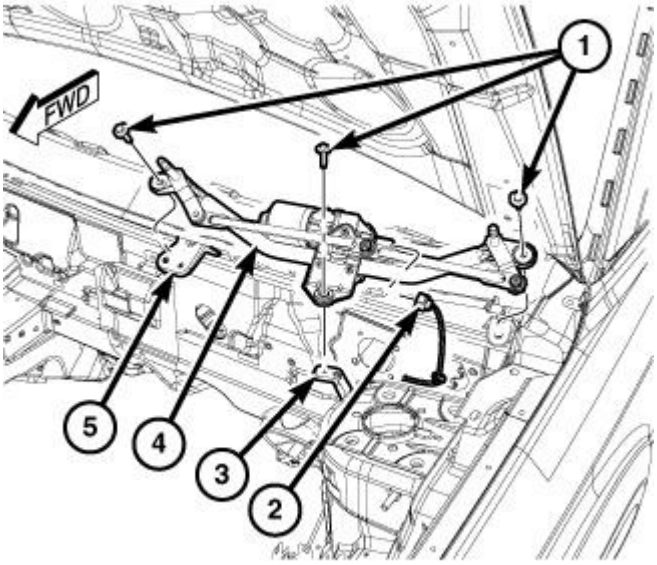

Fig. 29: Front Wiper Linkage Module Wiper Motor
Courtesy of CHRYSLER LLC

NOTE: **The front wiper linkage module includes the wiper motor. The wiper motor is also available for separate service replacement and can be removed from the wiper linkage module without removing the module from the vehicle. See Electrical - Wipers/Washers/Wipers/Washers/MOTOR, Wiper - Removal.**

1. Remove both front wiper arms from the wiper pivots. See **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Removal**.
2. Disconnect and isolate the battery negative cable.
3. Remove the outer and inner cowl plenum cover/grille panels from the vehicle. Refer to **Body/Exterior/COVER, Cowl Panel - Removal** .
4. Disconnect the headlamp and dash wire harness connector (2) from the wiper motor pigtail wire connector.
5. Remove the three screws (1) that secure the front wiper linkage module (4) to the driver side strut tower bracket (3) and the two cowl brackets (5).
6. Remove the front wiper linkage module from the vehicle as a unit.

INSTALLATION

INSTALLATION

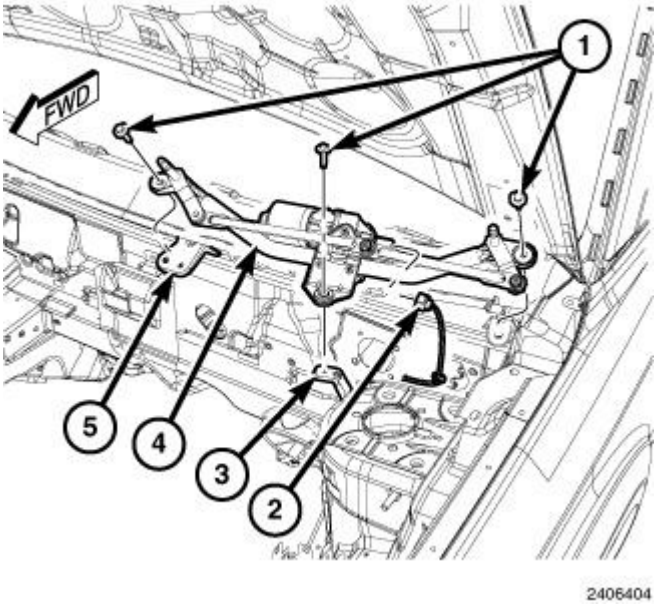

Fig. 30: Front Wiper Linkage Module Wiper Motor
Courtesy of CHRYSLER LLC

NOTE: The front wiper linkage module includes the wiper motor. The wiper motor is also available for separate service replacement and can be removed from the wiper linkage module without removing the module from the vehicle. See Electrical - Wipers/Washers/Wipers/Washers/MOTOR, Wiper - Removal.

1. Position the front wiper linkage module (4) into the vehicle as a unit.
2. Reconnect the headlamp and dash wire harness connector (2) to the wiper motor pigtail wire connector. Be certain to route the wire harness take out under the wiper linkage module.
3. Install but do not tighten the three screws (1) that secure the front wiper linkage module to the driver side strut tower bracket (3) and the two cowl brackets (5).
4. Starting on the driver side and working toward the passenger side, tighten each of the three screws. Tighten the screws to 10 N.m (90 in. lbs.).
5. Reinstall the inner and outer cowl plenum cover/grille panels. Refer to **Body/Exterior/COVER, Cowl Panel - Installation** .
6. Reconnect the battery negative cable.
7. Reinstall both front wiper arms onto the wiper pivots. See **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Installation**.

MOTOR, WIPER

DESCRIPTION

REAR

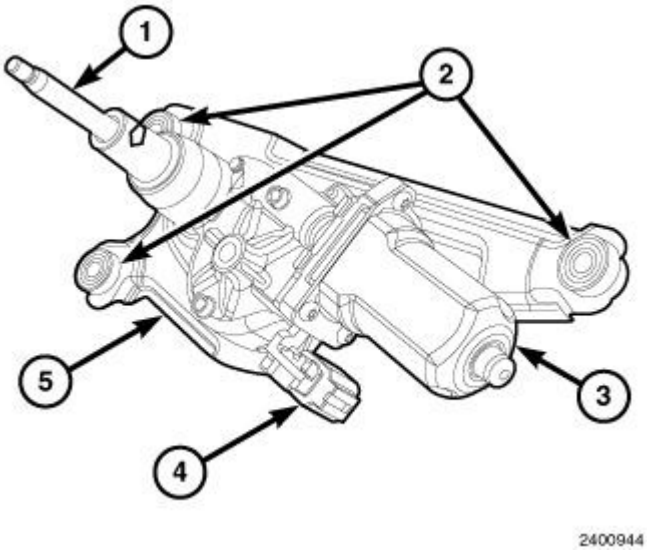

Fig. 31: Rear Wiper Motor
Courtesy of CHRYSLER LLC

The rear wiper motor is concealed within the liftgate, below the liftgate glass and behind the liftgate inner trim panel. The end of the motor output shaft (1) that extends through the liftgate outer panel to drive the rear wiper arm and blade is the only visible component of the rear wiper motor. A rubber bezel and grommet is engaged within the output shaft hole of the liftgate outer panel and seals the output shaft where it passes through the panel. An integral connector receptacle (4) connects the rear wiper motor to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness. The rear wiper motor consists of the following major components:

- **Bracket (5)** - The rear wiper motor bracket consists of a stamped metal mounting plate for the wiper motor that is secured with screws to the wiper motor transmission housing, and through three rubber isolators (2) to the liftgate inner panel.
- **Motor (3)** - The single-speed permanent magnet rear wiper motor is secured with screws to the rear wiper motor transmission, which is secured to the motor bracket with screws. The wiper motor includes the integral transmission, the motor output shaft, an automatic resetting circuit breaker, and the rear wiper motor park switch that parks the rear wiper blade near the base of the liftgate glass.

The rear wiper motor cannot be adjusted or repaired. If any component of the motor is ineffective or damaged, the entire rear wiper motor unit must be replaced. The output shaft bezel and grommet unit is available for individual service replacement.

OPERATION

REAR

The rear wiper motor operation is controlled by the Totally Integrated Power Module (TIPM), which uses intelligent, high current, self-protected high side switches to control rear wiper system operation for energizing or de-energizing the rear wiper motor. The TIPM uses internal programming and electronic messages received over the Controller Area Network (CAN) data bus from the ElectroMechanical Instrument Cluster (EMIC) (also

known as the Cab Compartment Node/CCN) to provide the appropriate rear wiper and washer system operating modes. The EMIC uses electronic messages received from the Steering Control Module (SCM) over a Local Interconnect Network (LIN) data bus to determine when to send electronic rear wiper system requests to the TIPM.

The rear wiper motor park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes and opens a path to ground for the rear wiper motor electronic control logic circuitry of the TIPM, depending upon the position of the rear wiper blade on the liftgate glass. This input allows the electronic logic circuits of the TIPM to control all of the electronic features of rear wiper motor operation and to keep the motor energized long enough to complete its current wipe cycle and park the wiper blade after the wiper system or the ignition switch has been turned OFF.

The rear wiper motor is grounded at all times through a take out in the body wire harness that is secured to a remote ground location. The automatic resetting circuit breaker protects the motor from overloads. The rear wiper motor transmission converts the rotary output of the wiper motor to the back and forth wiping motion of the rear wiper arm and blade on the liftgate glass.

The hard wired inputs and outputs of the rear wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient, and accurate means to diagnose the rear wiper system or the electronic controls and communication related to rear wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT

CAUTION: Do not apply pressure to, or pry on, the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm, apply pressure to, or pry on, only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire front wiper linkage module MUST be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire front wiper motor and crank arm unit MUST be replaced.

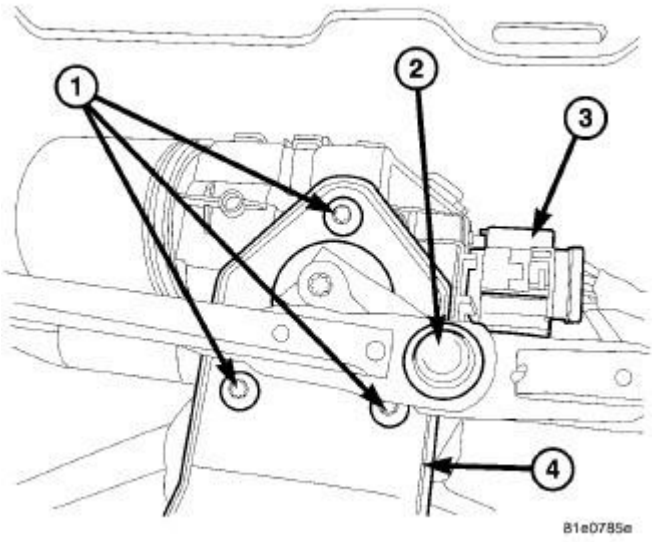

Fig. 32: Wiper Pivots
Courtesy of CHRYSLER LLC

1. Unlatch and open the hood.
2. Remove both front wiper arms from the wiper pivots. See **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Removal**.
3. Disconnect and isolate the battery negative cable.
4. Remove the outer and inner cowl plenum cover/grille panels from the vehicle. Refer to **Body/Exterior/COVER, Cowl Panel - Removal** .
5. Disconnect the headlamp and dash wire harness connector from the wiper motor pigtail wire connector (3).
6. Disengage the socket bushing (2) of the right wiper drive link from the ball stud on the wiper motor crank arm using two large screwdrivers, one on each side of the ball stud. Pry between the crank arm and the metal portion of the drive link until the socket unsnaps from the ball.
7. Disengage the sleeve bushing of the left wiper drive link from the ball stud on the wiper motor crank arm using two large screwdrivers, one on each side of the ball stud. Pry between the crank arm and the metal portion of the drive link until the sleeve unsnaps from the ball.
8. Remove the three screws (1) that secure the wiper motor to the center bracket (4) of the wiper linkage module.
9. Remove the wiper motor from under the wiper linkage module bracket and out of the cowl plenum.

REAR

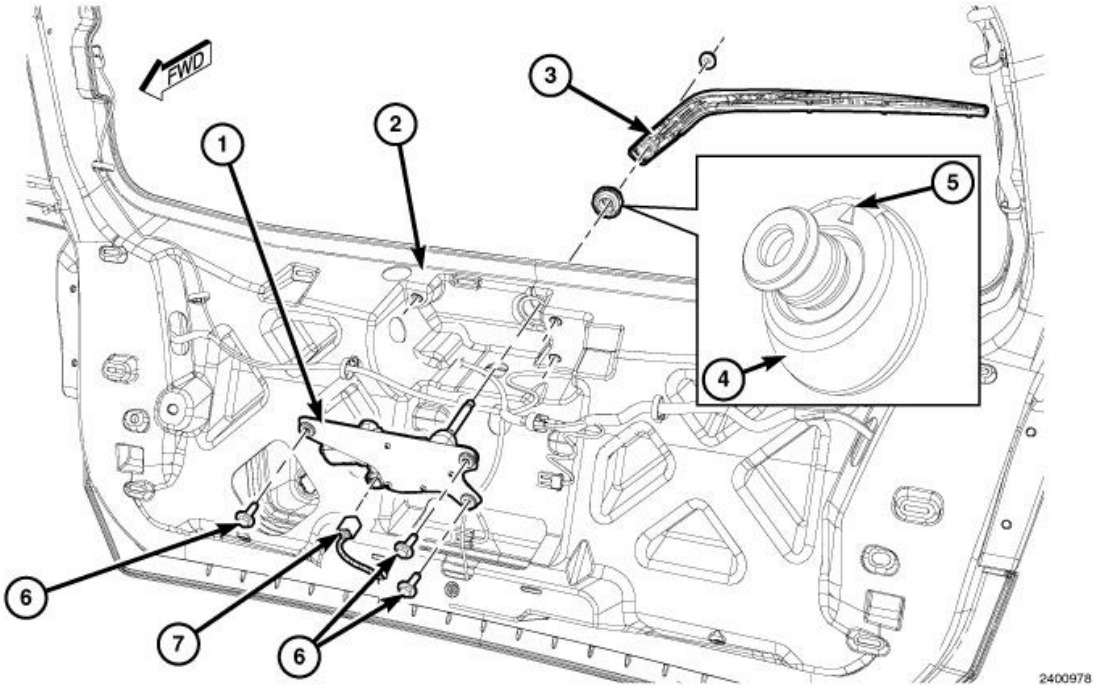

Fig. 33: Rear Wiper Motor Output Shaft
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear wiper arm (3) from the rear wiper motor output shaft. See **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Removal**.

NOTE: The output shaft bezel and grommet (4) does not have to be removed to remove the rear wiper motor from the liftgate.

3. Remove the trim panel from the liftgate inner panel (2). Refer to **Body/Decklid/Hatch/Liftgate/Tailgate/PANEL, Trim - Removal** .
4. Disconnect the wire harness connector (7) from the rear wiper motor (1).
5. Remove the three screws (6) that secure the motor mounting bracket to the liftgate inner panel.
6. Remove the motor from the liftgate.
7. Remove the bezel and rubber grommet on the outer liftgate panel from the output shaft clearance hole. **Be certain to take proper precautions to protect the outer liftgate panel and its paint finish from damage during this procedure.**

INSTALLATION

FRONT

CAUTION: Do not apply pressure to, or pry on, the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm, apply pressure to, or pry on, only the metal

portions of the drive link around the bushing. If the bushing is damaged, the entire front wiper linkage module MUST be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire front wiper motor and crank arm unit MUST be replaced.

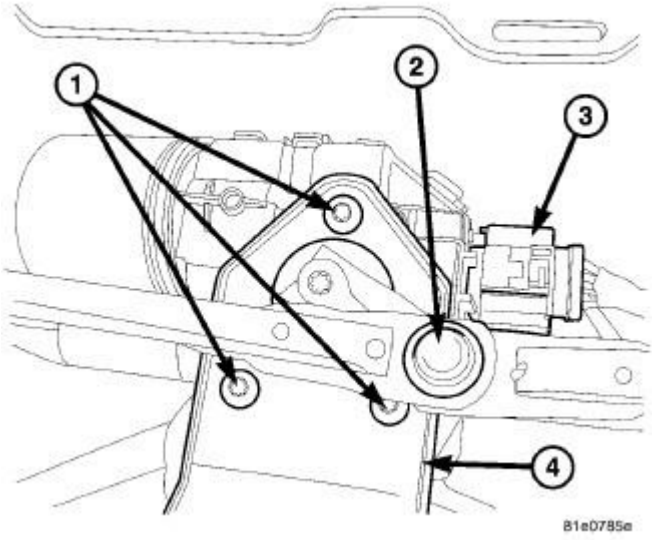

Fig. 34: Wiper Pivots
Courtesy of CHRYSLER LLC

1. Position the front wiper motor to the center bracket (4) of the wiper linkage module from the underside of the bracket.
2. Install and tighten the three screws (1) that secure the motor to the bracket. Tighten the screws to 9 N.m (80 in. lbs.).
3. Reconnect the headlamp and dash wire harness connector to the wiper motor pigtail wire connector (3). Be certain to route the wire harness take out under the wiper linkage module.
4. Reconnect the battery negative cable.
5. Turn the ignition switch (also known as the Wireless Ignition Node/WIN) to the ON position.

WARNING: To avoid serious or fatal injury and vehicle damage, be certain there are no objects including hands or fingers in the rotational path of the wiper motor crank arm. The following step will activate the front wiper motor to ensure it is in the Park position, and may cause the motor crank arm to complete up to one complete revolution.

6. Turn the front wiper system ON, then back to OFF using the right (wiper) multi-function switch control knob.
7. Wait until the wiper motor stops moving, then turn the ignition switch back to the OFF position.
8. Position the sleeve bushing of the left wiper drive link onto the ball stud on the end of the motor crank arm. Place a short 19 millimeter or 3/4 inch socket over the bushing as an installation tool. Then use large channel-lock pliers to apply enough pressure to the underside of the crank arm and the top of the socket to snap the bushing onto the ball stud. **Do not apply pressure directly to the plastic bushing.**

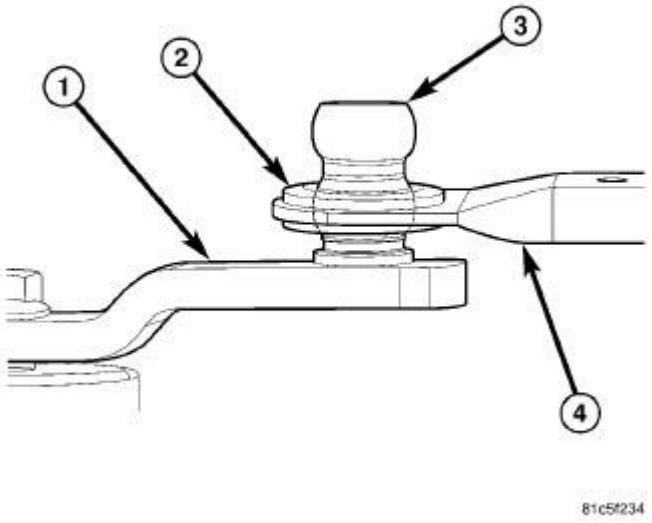

Fig. 35: Motor Crank Arm Ball Stud
Courtesy of CHRYSLER LLC

CAUTION: Carefully inspect the installed sleeve bushing (2) to be certain it is centered over the lower ball of the ball stud (3), and not trapped between the lower ball and the crank arm (1). There should be a visible clearance between the lower surface of the sleeve bushing and the crank arm. Refer to the accompanying illustration. The sleeve bushing must be able to swivel freely on the lower ball during wiper operation. If the bushing is trapped between the lower ball and the crank arm, the bushing and the drive link (4) may be damaged.

9. Position the socket bushing of the right wiper drive link over the ball stud on the crank arm. Place a short 19 millimeter or 3/4 inch socket over the bushing as an installation tool. Then use large channel-lock pliers to apply enough pressure to the underside of the crank arm and the top of the socket to snap the bushing onto the ball stud. **Do not apply pressure directly to the plastic bushing.**
10. Reinstall the inner and outer cowl plenum cover/grille panels. Refer to **Body/Exterior/COVER, Cowl Panel - Installation** .
11. Reinstall both front wiper arms onto the wiper pivots. See **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Installation**.

REAR

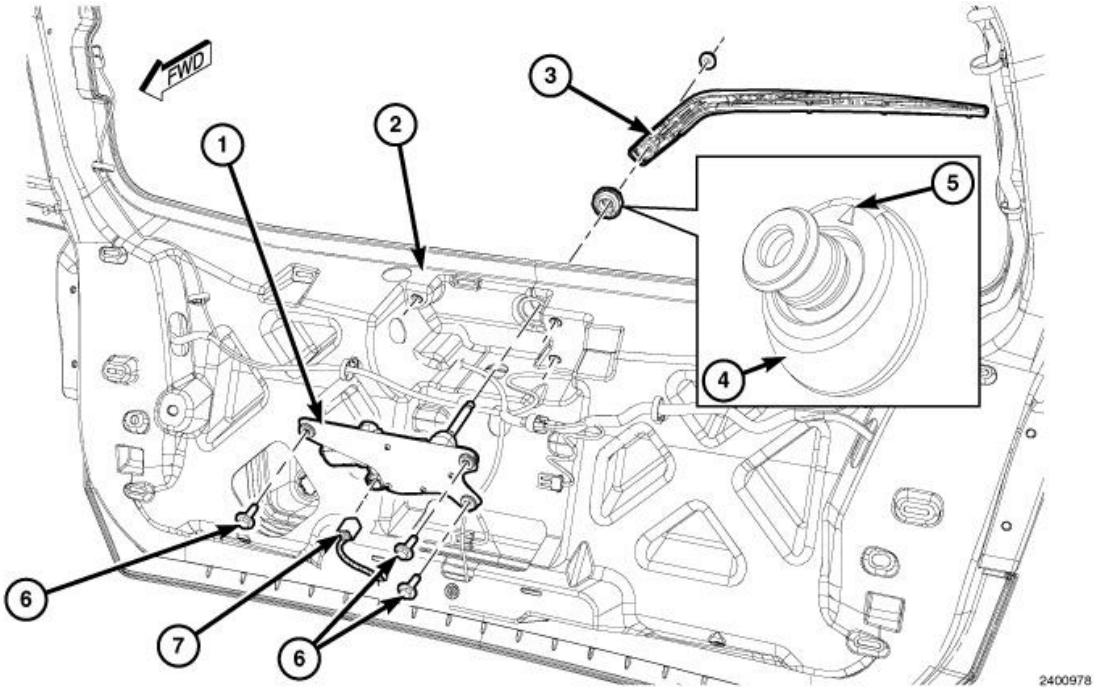

Fig. 36: Rear Wiper Motor Output Shaft
Courtesy of CHRYSLER LLC

1. If the output shaft bezel and grommet (4) were removed from the outside of the liftgate, install the rubber bezel and grommet into the clearance hole of the liftgate outer panel. Be certain the arrow (5) molded onto the grommet is oriented upward.
2. Position the rear wiper motor and bracket unit (1) onto the liftgate inner panel (2) as a unit.
3. Install and tighten the three screws (6) that secure the mounting bracket to the liftgate. Tighten the screws to 5 N.m (44 in. lbs.).
4. Reconnect the wire harness connector (7) to the motor connector receptacle.
5. Reinstall the trim panel onto the liftgate inner panel. Refer to **Body/Decklid/Hatch/Liftgate/Tailgate/PANEL, Trim - Installation** .
6. Reinstall the rear wiper arm (3) onto the output shaft. See **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Installation**.
7. Reconnect the battery negative cable.

NOZZLE, WASHER

DESCRIPTION

FRONT

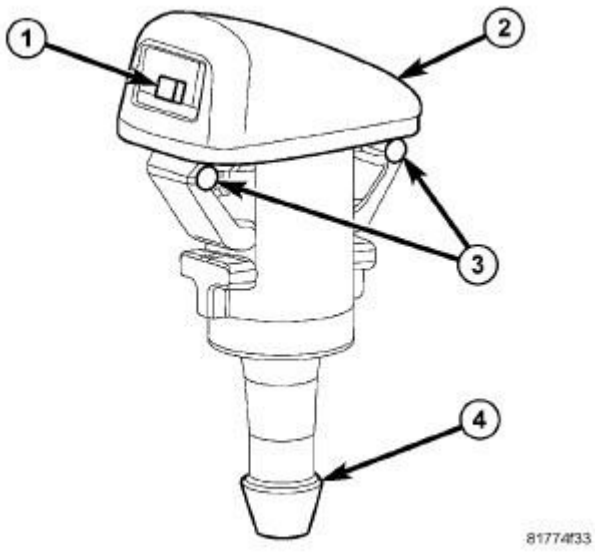

Fig. 37: Front Washer Nozzle
Courtesy of CHRYSLER LLC

The fluidic front washer nozzles (2) are constructed of molded plastic and include an integral check valve. Each nozzle has two integral latches (3) that secure them in dedicated holes in the hood panel near the base of the windshield. The domed upper surface of the washer nozzle is visible on the outside of the hood panel, and the two nozzle orifices (1) are oriented towards the windshield glass.

An integral diaphragm type check valve is contained within the body of each nozzle. The washer plumbing fittings (4) for the washer nozzles extend below the hood panel and are accessible from the engine compartment.

The front washer nozzles cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced.

HEADLAMP

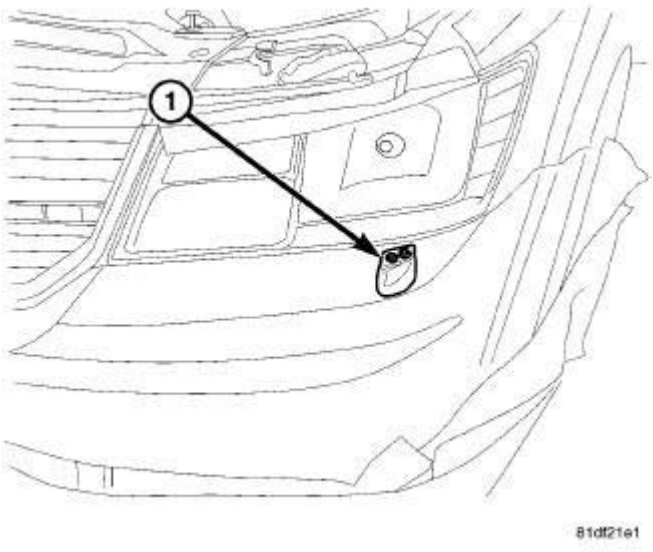

Fig. 38: Headlamp Washer Nozzles
Courtesy of CHRYSLER LLC

Vehicles equipped with the optional headlamp washer system have two fixed headlamp washer nozzles (1), one secured to the front fascia beneath each front lamp unit.

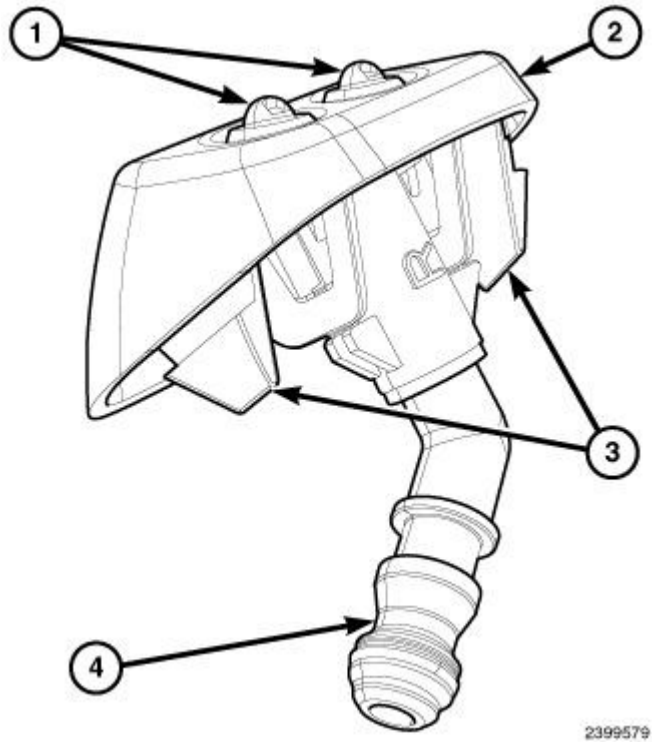

Fig. 39: Integral Mounting Bezel Is Secured By Two Integral Latch
Courtesy of CHRYSLER LLC

Each nozzle includes two orifices (1) to ensure complete headlamp lens coverage by the fluid streams emitted from the nozzle. The fixed body of the molded plastic nozzle is located below the front fascia. An integral mounting bezel (2) is secured by two integral latch features (3) within the mounting hole in the front fascia. A large diameter high pressure washer fluid supply hose from the dedicated headlamp washer pump/motor unit is routed to the nozzle, where it is secured by a quick connect fitting to the nipple fitting (4) at the base of the nozzle.

The headlamp washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, the entire nozzle and mounting bezel must be replaced with a new unit.

REAR

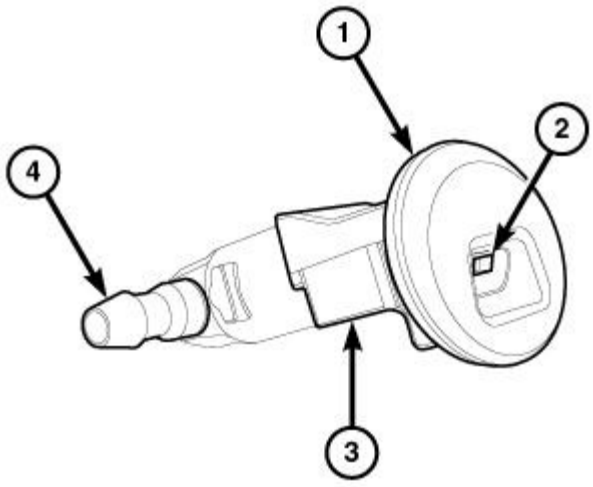

Fig. 40: Center High-Mounted Stop Lamp
Courtesy of CHRYSLER LLC

The fluidic rear washer nozzle is constructed of molded plastic and includes an integral check valve. The rear washer nozzle is secured by two integral latch features (3) within a mounting hole to the left of the Center High-Mounted Stop Lamp (CHMSL) in the lower surface of the brow above the liftgate glass opening in the outer liftgate panel.

The outer surface of the washer nozzle is visible on the lower exterior surface of the liftgate, and a rubber gasket (1) seals the nozzle to the spoiler mounting hole. The nozzle orifice (2) is oriented downward towards the liftgate glass. The washer plumbing fitting (4) is concealed between the liftgate inner and outer panels.

The rear washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

FRONT

The two front washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer

pump/motor unit through a single hose, which is attached to a barbed nipple on each washer nozzle below the inner hood panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in each nozzle prevents washer fluid from draining out of the washer supply hoses back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until washer fluid was dispensed through the nozzles, because the washer pump would have to refill the washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzles after the washer system is turned OFF.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the nozzle and fluid flow in either direction within the washer plumbing is prevented.

HEADLAMP

When the headlamp washer pump/motor unit is activated, pressure builds within the high pressure hoses to each headlamp washer nozzle. Driven by this pressure, a control valve integral to each nozzle allows a precisely metered quantity of washer fluid to be sprayed in several high pressure streams against the lenses of both front lamp units. When the pressure drops, the control valve closes and the nozzle spray ceases.

The headlamp washer system only operates when the engine is running and the headlamps are turned ON. When those conditions have been met, the headlamp washer system operates whenever the front (windshield) washer system is activated.

REAR

The rear washer nozzle is designed to dispense washer fluid into the wiper pattern area on the outside of the liftgate glass. Pressurized washer fluid is fed to the nozzle from the washer reservoir by the washer pump/motor through a single hose, which is attached to a barbed nipple on the back of the nozzle. A fluidic matrix within the nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in the nozzle prevents washer fluid from draining out of the washer supply hose back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until washer fluid was dispensed through the nozzle because the washer pump would have to refill the washer plumbing from the reservoir to the nozzle. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzle after the washer system is turned OFF.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing

the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the nozzle and fluid flow in either direction within the washer plumbing is prevented.

REMOVAL

FRONT

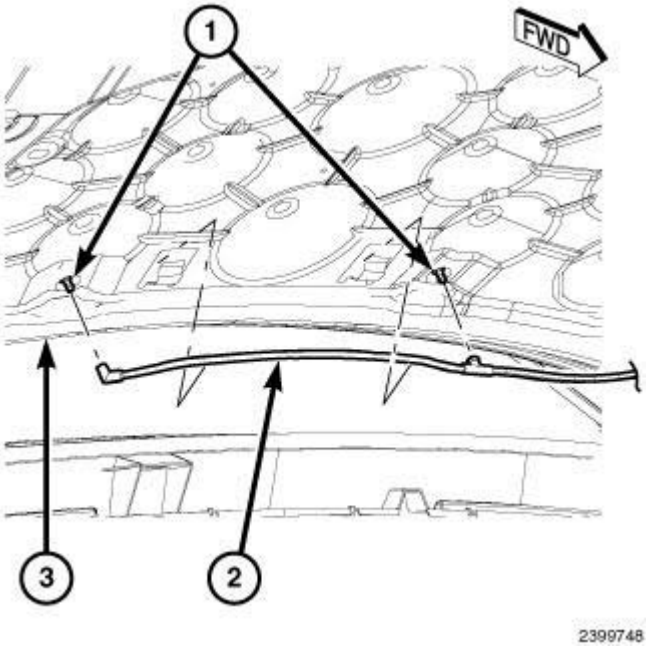

Fig. 41: Washer Nozzle Hose
Courtesy of CHRYSLER LLC

1. From the underside of the hood (3), remove the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement as necessary to access the washer nozzle hose (2) connections.
2. From the underside of the hood, disconnect the washer nozzle hose from the barbed nipple (1) of the washer nozzle.

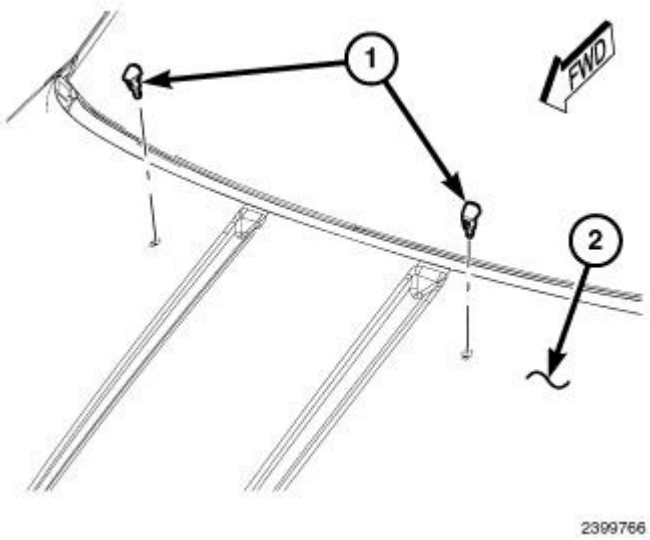

Fig. 42: Washer Nozzle
Courtesy of CHRYSLER LLC

3. From the underside of the hood, release the integral latch features of the washer nozzle (1) and push the nozzle out through the mounting hole toward the top side of the hood.
4. Remove the washer nozzle from the top of the hood panel.

HEADLAMP

CAUTION: Take proper precautions to ensure there is no cosmetic damage done to the paint finish of the headlamp washer nozzle bezel or the front fascia during the following procedure.

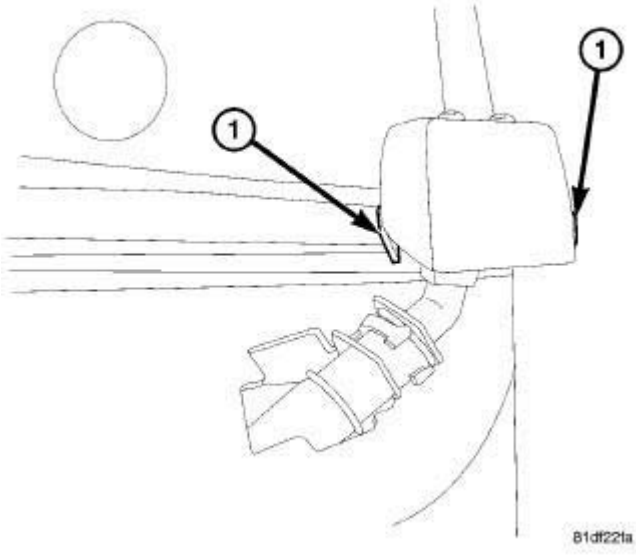

Fig. 43: Integral Latches Of Washer Nozzle Bezel

Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the push pin retainers that secure the lower front edge of the front wheel house splash shield. Refer to **Body/Exterior/SHIELD, Splash - Removal** .
3. Reach up behind the front fascia to access and securely clamp the headlamp washer supply hose to prevent the contents of the washer reservoir from draining during the following procedure.
4. From behind the front fascia, depress the two integral latches (1) of the washer nozzle bezel and push the nozzle out through the face of the fascia.

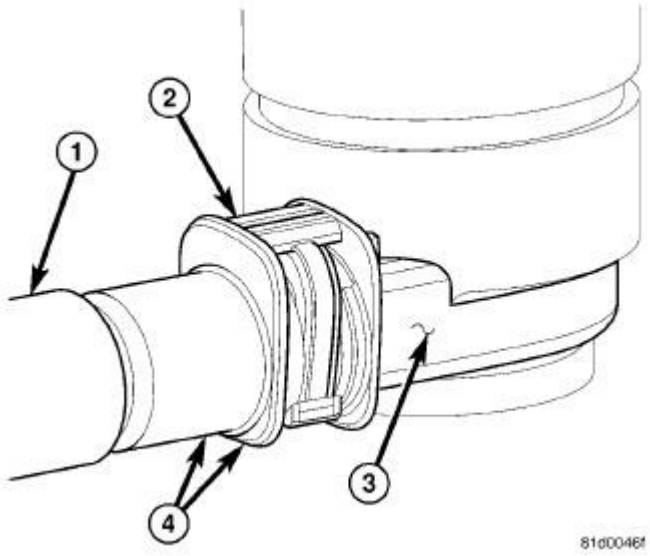

Fig. 44: Removing/Installing Hose At Headlamp Washer Nozzle Nipple
Courtesy of CHRYSLER LLC

5. From the face of the front fascia, pull the nozzle out from the mounting hole far enough to access the headlamp washer nozzle supply hose (1) quick connect fitting (4).
6. Pull the molded plastic lock (2) away from the quick connect fitting far enough to disengage the hose from the washer nozzle nipple (3).
7. Remove the nozzle from the front fascia.

REAR

NOTE: The rear washer nozzle latch feature is a one time component, and will be damaged if the nozzle is removed from its mounting hole for service. If removed from its mounting hole for any reason, the rear washer nozzle must be replaced with a new unit.

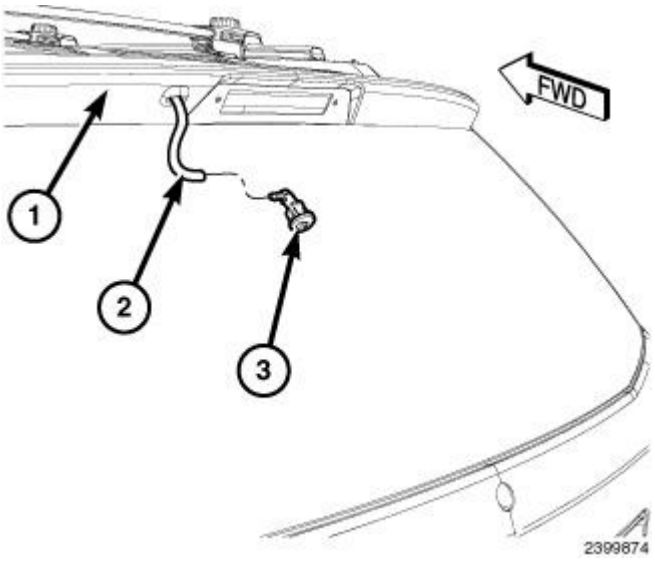

Fig. 45: Rear Washer Nozzle
Courtesy of CHRYSLER LLC

1. Using a trim stick or another suitable wide flat-bladed tool, gently pry the rear washer nozzle (3) to release the latch features that secure it in the mounting hole of the liftgate outer panel (1).
2. Pull the rear washer nozzle out from the liftgate outer panel far enough to access the washer supply hose (2).
3. Disconnect the hose from the barbed nipple on the back of the nozzle.
4. Cut 4 to 6 millimeters (0.15 to 0.23 inch) from the end of the hose to ensure a good fit to the barbed nipple of the replacement rear washer nozzle.
5. Discard the removed nozzle.

INSTALLATION

FRONT

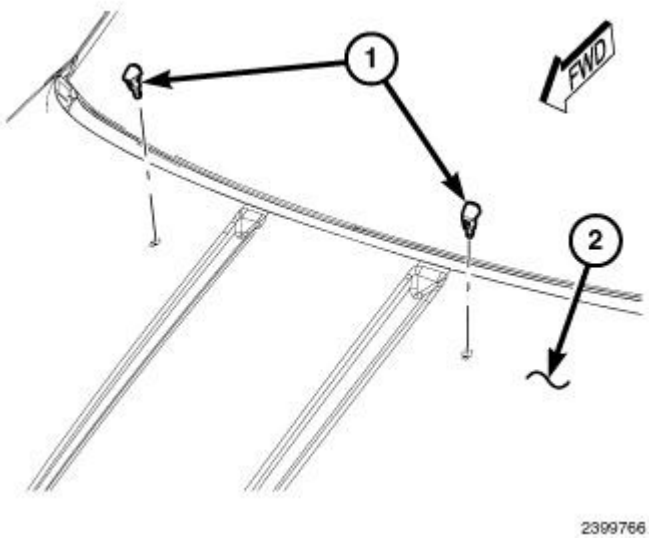

Fig. 46: Washer Nozzle
Courtesy of CHRYSLER LLC

1. From the top of the hood, position the washer nozzle (1) to the mounting hole on the outside of the hood panel (2).
2. Align the anti-rotation tabs of the nozzle with the anti-rotation notches in the mounting hole.
3. Using hand pressure, push firmly and evenly on the top of the washer nozzle until the integral latch features lock into place on the underside of the hood.

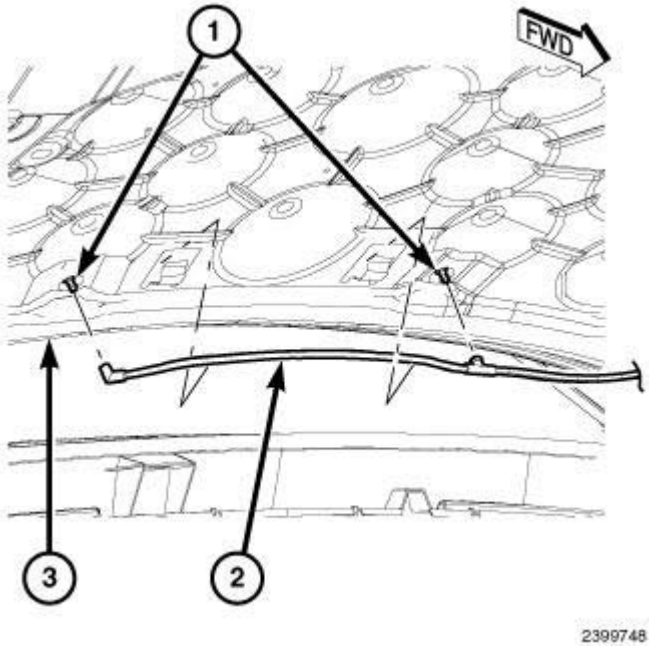

Fig. 47: Washer Nozzle Hose
Courtesy of CHRYSLER LLC

4. From the underside of the hood (3), reconnect the washer hose (2) fitting to the barbed nipple (1) of the

washer nozzle.

5. Reinstall the washer nozzle hose into its routing clips as necessary on the underside of the hood.
6. Reinstall the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement.

HEADLAMP

CAUTION: Take proper precautions to ensure there is no cosmetic damage done to the paint finish of the headlamp washer nozzle bezel or the front fascia during the following procedure.

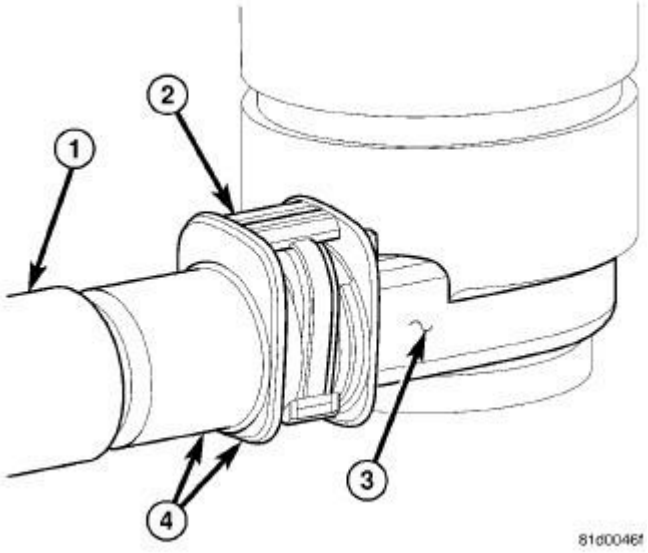

Fig. 48: Removing/Installing Hose At Headlamp Washer Nozzle Nipple
Courtesy of CHRYSLER LLC

1. Pull the washer nozzle supply hose (1) quick connect fitting (4) out through the mounting hole of the front fascia far enough to seat the molded plastic lock (2) onto the fitting.
2. Push the quick connect fitting onto the headlamp washer nozzle nipple (3) until it snaps into place with an audible click.

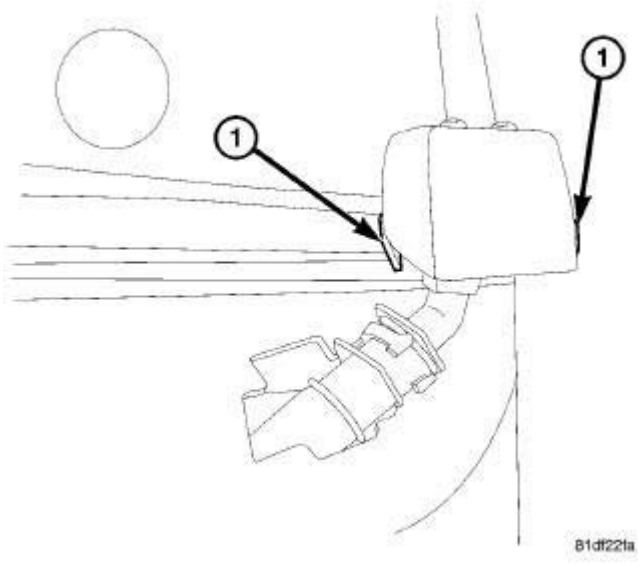

Fig. 49: Integral Latches Of Washer Nozzle Bezel
Courtesy of CHRYSLER LLC

3. Position the headlamp washer nozzle into the mounting hole in the front fascia.
4. Align the washer nozzle bezel with the mounting hole in the front fascia.
5. Using hand pressure, push the bezel down into the fascia mounting hole until both bezel latch features are fully engaged on the back side of the fascia.
6. Reach up behind the front fascia to access and remove the clamp from the washer supply hose.
7. Reinstall the push pin retainers that secure the lower front edge of the front wheel house splash shield. Refer to **Body/Exterior/SHIELD, Splash - Installation** .

REAR

NOTE: The rear washer nozzle latch feature is a one time component, and will be damaged if the nozzle is removed from its mounting hole for service. If removed from its mounting hole for any reason, the rear washer nozzle must be replaced with a new unit.

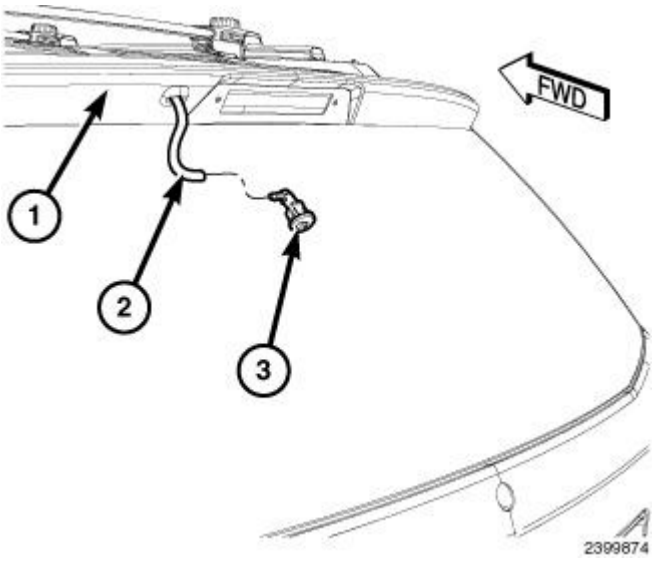

Fig. 50: Rear Washer Nozzle
Courtesy of CHRYSLER LLC

1. Position the new rear washer nozzle (3) to the mounting hole in the liftgate outer panel (1). Be certain that the rubber gasket is in position on the back of the nozzle.
2. Reconnect the washer supply hose (2) to the barbed nipple on the back of the nozzle.
3. Push the hose and nozzle nipple into the mounting hole in the liftgate outer panel and align the anti-rotation tab to the mounting hole.
4. Using hand pressure, push firmly and evenly on the nozzle until both integral latch features are fully engaged on the back side of the outer panel.

PUMP, WINDSHIELD WASHER

DESCRIPTION

FRONT AND REAR

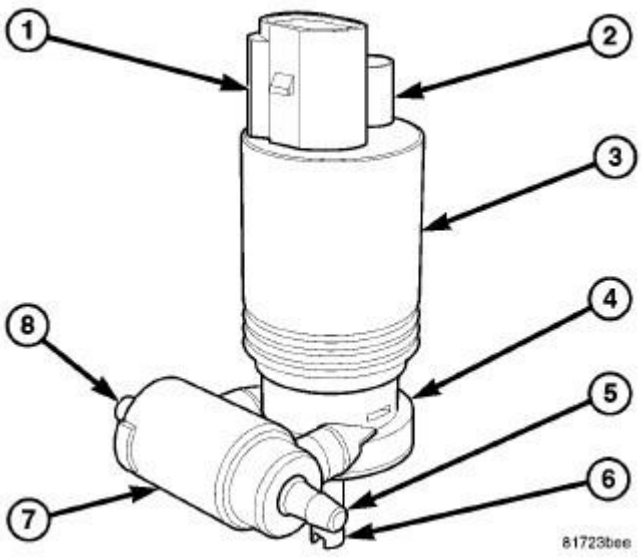

Fig. 51: Washer Pump/Motor
Courtesy of CHRYSLER LLC

The washer pump/motor unit is located on the top of a sump area on the rearward facing side of the washer reservoir, which is located on the upper left corner of the cooling module in the engine compartment. A small permanently lubricated and sealed reversible electric motor (3) is coupled to the rotor-type washer pump (4). The use of an integral valve body (7) allows the washer pump/motor unit to provide washer fluid to either the front or the rear washer systems, depending upon the direction of the motor/pump impeller rotation.

An inlet nipple (6) on the pump housing passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole of the washer reservoir sump. The filter screen prevents most debris from entering the pump housing. When the pump is installed in the reservoir the front barbed outlet nipple (5) on the pump valve body housing connects the unit to the front washer hose, and the rear barbed outlet nipple (8) connects the unit to the rear washer hose. The letters **F** and **R** molded into the valve body housing adjacent to each nipple provide further clarification of the nipple assignments.

The washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by the use of a snap fit between the motor housing and a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle (1) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

Service replacement washer pumps may also include a snap post (2) at the top of the pump motor housing, but this feature is not used in this application. The washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire washer pump/motor unit must be replaced.

HEADLAMP

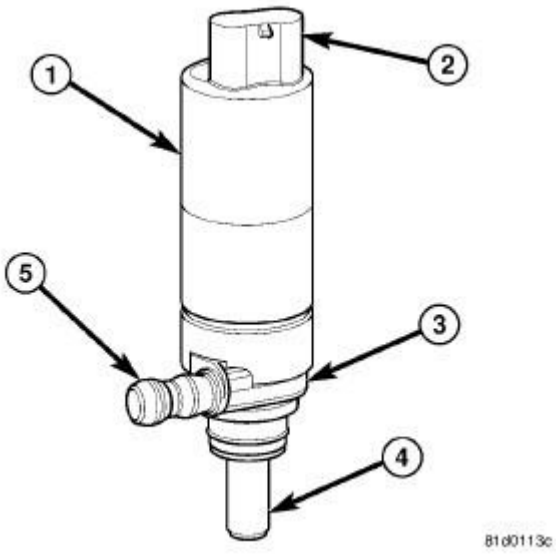

Fig. 52: Headlamp Washer Pump/Motor Unit
Courtesy of CHRYSLER LLC

The headlamp washer pump/motor unit (1) of vehicles so equipped is located on the top of a sump area just above and outboard of the reversible front and rear washer pump on the rearward facing side of the washer reservoir, on the upper left corner of the cooling module in the engine compartment. A small permanently lubricated and sealed electric motor is coupled to the rotor-type washer pump.

An inlet nipple (4) on the bottom of the pump housing (3) passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole of the washer reservoir. When the pump is installed in the reservoir the quick connect outlet nipple (5) on the pump housing points toward the left side of the vehicle and connects the unit to the headlamp washer hose.

The headlamp washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by a light snap fit into a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle (2) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The headlamp washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire headlamp washer pump/motor unit must be replaced.

OPERATION

FRONT AND REAR

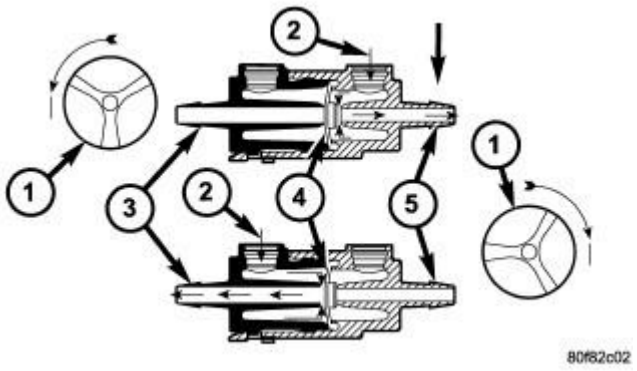

Fig. 53: Washer Pump/Motor Operation
Courtesy of CHRYSLER LLC

The washer pump/motor unit features a reversible electric motor. The direction of the motor is controlled by hard wired outputs from the Totally Integrated Power Module (TIPM). When battery current and ground are applied to the two pump motor terminals, the motor rotates in one direction. When the polarity of these connections is reversed, the motor rotates in the opposite direction. When the pump motor is energized, the rotor-type pump pressurizes the washer fluid and forces it through one of the two pump outlet nipples, and into the front or rear washer plumbing.

The TIPM controls the hard wired outputs to the pump motor based upon electronic **washer request** messages received over the Controller Area Network (CAN) data bus from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). The EMIC receives electronic **washer switch** status messages over a Local Interface Network (LIN) bus connection from the Steering Control Module (SCM) within the left (lighting) multi-function switch housing. The SCM monitors hard wired analog and multiplex inputs from the washer switch circuitry contained within the right (wiper) multi-function switch to determine the proper electronic messages to send.

Washer fluid is drawn through the pump inlet nipple from the washer reservoir to the inlet port of the washer pump housing. An integral valve body is located in a housing on the outlet port side (2) of the pump housing. A diaphragm (4) in this valve body controls which washer system plumbing receives the washer fluid being pressurized by the pump.

When the pump impeller (1) rotates in the counterclockwise direction (viewed from the bottom), the biased diaphragm is sealing off the rear washer system outlet and nipple so the pressurized washer fluid is pushed out through the pump front outlet port and the front washer outlet nipple (5). When the pump impeller rotates in the clockwise direction (viewed from the bottom), pressurized washer fluid is pushed out through the pump rear outlet port and moves the diaphragm to open the rear washer outlet nipple and seal off the front washer outlet nipple, then the pressurized washer fluid is pushed out through the rear washer outlet nipple (3).

The washer pump/motor unit and the hard wired motor control circuits from the TIPM may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer pump/motor unit or the electronic controls or communication between other modules and devices that provide some features of the front and rear wiper and washer system. The most reliable, efficient, and accurate means to diagnose the washer pump/motor unit or the electronic controls and communication related to washer pump/motor unit operation

requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

HEADLAMP

Headlamp washer pump/motor unit operation is completely controlled by the Totally Integrated Power Module (TIPM) logic circuits based upon electronic **wash request** and **lighting request** message inputs received from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Controller Area Network (CAN) data bus. The EMIC monitors electronic **washer switch** and **lighting switch** status messages received over the Local Interface Network (LIN) data bus from the Steering Control Module (SCM). The SCM monitors analog and resistor multiplexed inputs from the front washer switch circuitry contained within the right (wiper) multi-function switch and the exterior lighting switch circuitry of the left (lighting) multi-function switch to determine the proper washer switch and lighting switch status messages to send.

The headlamp washer relay control coil operates on battery voltage received from the run relay, so it is only functional while the engine is running. In addition, the TIPM will only allow the headlamp washers to operate when the headlamps are turned ON. The TIPM uses a low side driver to energize or de-energize the headlamp washer relay which, in turn, controls the operation of the headlamp washer pump/motor unit.

The hard wired circuits and components of the headlamp washer pump/motor unit may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp washer pump/motor or the electronic controls or communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient, and accurate means to diagnose the headlamp washer pump/motor unit or the electronic controls and communication related to headlamp washer pump/motor unit operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT AND REAR

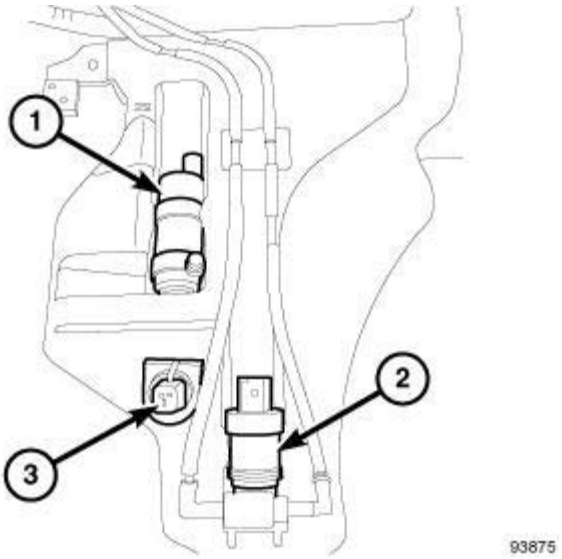

Fig. 54: Washer Pump/Motor Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir into a clean container for reuse.
3. Remove the washer reservoir from the cooling module. See **Electrical - Wipers/Washers/Wipers/Washers/RESERVOIR, Windshield Washer - Removal**.
4. Pull lightly outward on the top of the washer pump/motor housing (2), away from the washer reservoir to disengage the top of the motor from the receptacle in the reservoir.
5. Using hand pressure, firmly grasp and pull the washer pump upward far enough to disengage the pump inlet nipple from the rubber grommet seal/filter screen in the reservoir. Care must be taken not to damage the reservoir.
6. Remove the washer pump/motor unit from the washer reservoir.
7. Remove the rubber grommet seal/filter screen from the washer pump mounting hole in the reservoir and discard.

HEADLAMP

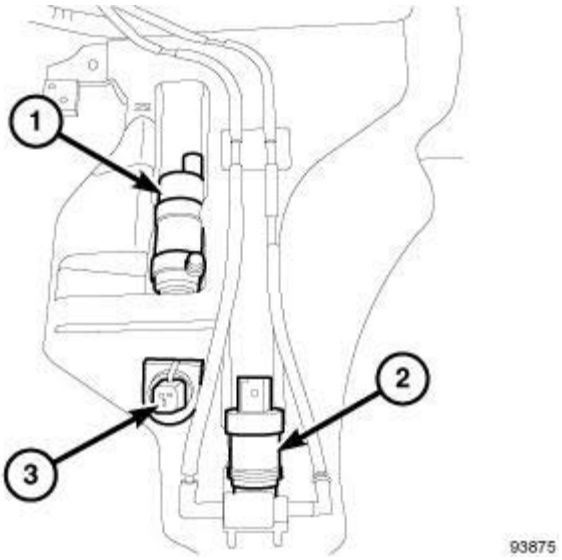

Fig. 55: Washer Pump/Motor Housing

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir into a clean container for reuse.
3. Remove the washer reservoir from the cooling module. See **Electrical - Wipers/Washers/Wipers/Washers/RESERVOIR, Windshield Washer - Removal**.
4. Pull lightly outward on the top of the washer pump/motor housing (1), away from the washer reservoir to disengage the top of the motor from the receptacle in the reservoir.
5. Using hand pressure, firmly grasp and pull the washer pump upward far enough to disengage the pump inlet nipple from the rubber grommet seal/filter screen in the reservoir. Care must be taken not to damage

the reservoir.

6. Remove the rubber grommet seal/filter screen from the pump mounting hole in the washer reservoir and discard.

INSTALLATION

FRONT AND REAR

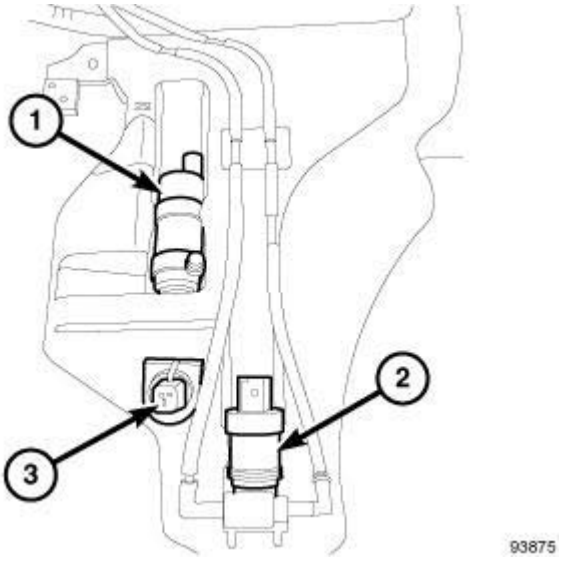

Fig. 56: Washer Pump/Motor Housing
Courtesy of CHRYSLER LLC

1. Install a new rubber grommet seal/filter screen into the washer pump mounting hole in the washer reservoir. Always use a new rubber grommet seal/filter screen on the reservoir.
2. Position the inlet nipple on the base of the pump housing of the washer pump/motor unit (2) to the rubber grommet seal/filter screen in the reservoir.
3. Using hand pressure, press firmly and evenly downward on the top of washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the reservoir.
4. Align the top of the washer pump/motor unit housing with the receptacle in the washer reservoir.
5. Using hand pressure, press firmly and evenly on the top of washer pump/motor unit until the motor housing snaps into the receptacle.
6. Reinstall the washer reservoir onto the cooling module. See **Electrical - Wipers/Washers/Wipers/Washers/RESERVOIR, Windshield Washer - Installation**.
7. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.
8. Reconnect the battery negative cable.

HEADLAMP

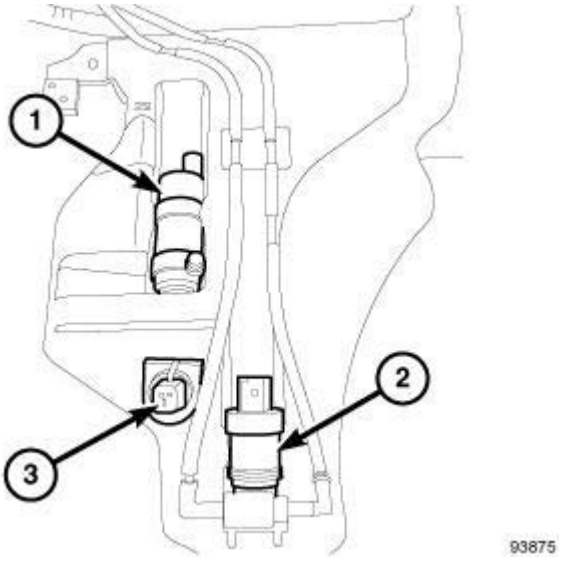

Fig. 57: Washer Pump/Motor Housing
Courtesy of CHRYSLER LLC

1. Install a new rubber grommet seal/filter screen into the headlamp washer pump/motor unit mounting hole in the washer reservoir. Always use a new rubber grommet seal on the reservoir.
2. Position the inlet nipple of the headlamp washer pump/motor unit (1) to the rubber grommet seal/filter screen in the reservoir.
3. Using hand pressure, press firmly and evenly downward on the washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the reservoir.
4. Align the top of the washer pump/motor unit housing with the receptacle in the washer reservoir.
5. Using hand pressure, press firmly and evenly on the top of washer pump/motor unit until the motor housing snaps into the receptacle.
6. Reinstall the washer reservoir onto the cooling module. See **Electrical - Wipers/Washers/Wipers/Washers/RESERVOIR, Windshield Washer - Installation**.
7. Refill the washer reservoir with the washer fluid drained during removal.
8. Reconnect the battery negative cable.

RELAY, HEADLAMP WASHER

DESCRIPTION

DESCRIPTION

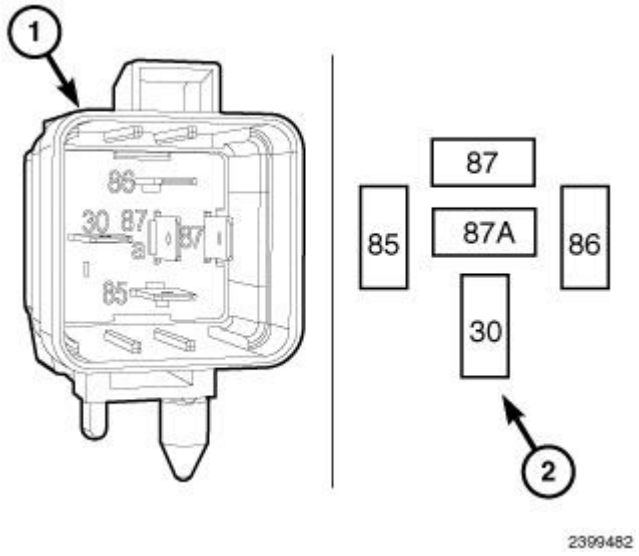

Fig. 58: Headlamp Washer Relay
Courtesy of CHRYSLER LLC

The headlamp washer relay (1) is a conventional International Standards Organization (ISO) skirted relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns (2), and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male spade-type terminals that extend from the relay base plate.

The headlamp washer relay is located in a dedicated connector on a take out of the Front End Module (FEM) wire harness, and is secured to the radiator closure panel to the left of the washer reservoir in front of the Totally Integrated Power Module (TIPM) in the engine compartment, near the battery. The headlamp washer relay cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

OPERATION

OPERATION

The headlamp washer relay is an electromechanical switch that uses a low current input from the Totally Integrated Power Module (TIPM) to control a high current output to the headlamp washer pump/motor unit. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The headlamp washer relay terminals are connected to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness. The inputs and outputs of the headlamp washer relay include:

- **Common Feed Terminal** - The common feed terminal (30) is connected to battery current on a fused B (+) circuit from a fuse in the Totally Integrated Power Module (TIPM) at all times.
- **Coil Ground Terminal** - The coil ground terminal (85) is connected to battery current on a fused run relay output circuit from a fuse in the TIPM at all times. This circuit is energized by the run relay only while the engine is running.
- **Coil Battery Terminal** - The coil battery terminal (86) is connected to a low side driver output from the TIPM on a headlamp washer relay control circuit. The TIPM controls headlamp washer system operation through this relay connection.
- **Normally Open Terminal** - The normally open terminal (87) is connected through a headlamp washer relay output circuit to the headlamp washer pump/motor unit at all times. When the relay is energized, the normally open terminal of the relay is connected to battery current from the fuse in the TIPM.
- **Normally Closed Terminal** - The normally closed terminal (87A) is not connected to any circuit in this application, but will have battery current present whenever the headlamp washer relay coil is not energized.

The headlamp washer relay as well as the hard wired inputs and outputs of the relay may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or the communication between modules and other devices that provide some features of the headlamp washer system. The most reliable, efficient, and accurate means to diagnose the headlamp washer relay or the electronic controls and communication related to headlamp washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

RESERVOIR, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

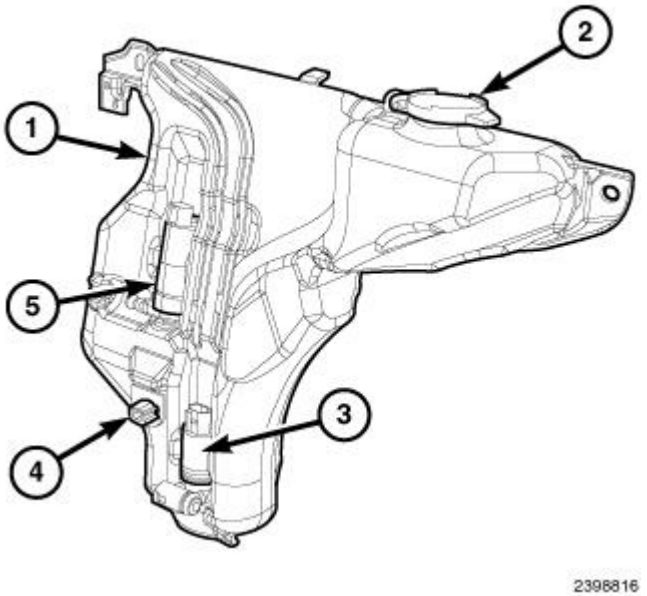

Fig. 59: Molded Plastic Washer Fluid Reservoir
Courtesy of CHRYSLER LLC

The molded plastic washer fluid reservoir (1) is mounted on the upper left corner of the cooling module on the back of the Front End Module (FEM) carrier (also known as the radiator closure). The filler neck for the reservoir extends upward just past the upper radiator closure member and through the upper radiator seal. This reservoir is constructed of opaque black plastic, which does not allow the fluid level to be inspected without removing the reservoir filler cap (2).

The bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for **Windshield Washer** molded into it snaps over the open end of the washer reservoir filler neck. The cap hinges on and is secured to an integral molded hook formation on the top of the reservoir just to the left of the filler neck when it is removed for inspecting or adjusting the fluid level in the reservoir.

The washer reservoir is secured to the cooling module through integral mounting brackets at the top on the inboard and outboard sides by two screws. In addition, integral mounting tab provisions on the bottom of the washer reservoir engage through slots or slotted loops integral to the cooling module to secure the lower end of the reservoir.

There is a dedicated mounting hole in the top of the sump area on the rearward facing side of the reservoir with a receptacle provided for the mounting of the reversible washer/pump motor unit (3) without the use of fasteners. A separate dedicated mounting hole is provided in the rearward facing side of the reservoir for the washer fluid level switch (4). An integral molded routing trough for the washer hose and washer pump/motor unit wiring routes the hose and wiring bundle from the washer pump to the outboard side of the reservoir.

A unique reservoir is used for vehicles manufactured for export markets with the optional headlamp washer system. This reservoir has a dedicated sump area and mounting receptacle for the high pressure headlamp washer pump (5) near the outboard side of the reservoir, directly above the washer fluid level switch location. The location and mounting provisions for this reservoir are the same as for those vehicles without the headlamp

washer system.

A washer reservoir cannot be repaired and, if ineffective or damaged, the unit must be replaced. The reversible washer pump/motor unit, the washer fluid level switch, the headlamp washer pump/motor unit, their rubber grommet seals, as well as the reservoir filler cap are each available for individual service replacement.

OPERATION

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the front, rear and, if equipped, headlamp washer systems. The washer reservoir filler cap provides a clearly marked and readily accessible point at which to add washer fluid to the reservoir.

The washer/pump motor unit is located in a sump area near the bottom of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer fluid level switch is mounted far enough above the washer pump inlet nipple in the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, well before the washer system will no longer operate.

REMOVAL

REMOVAL

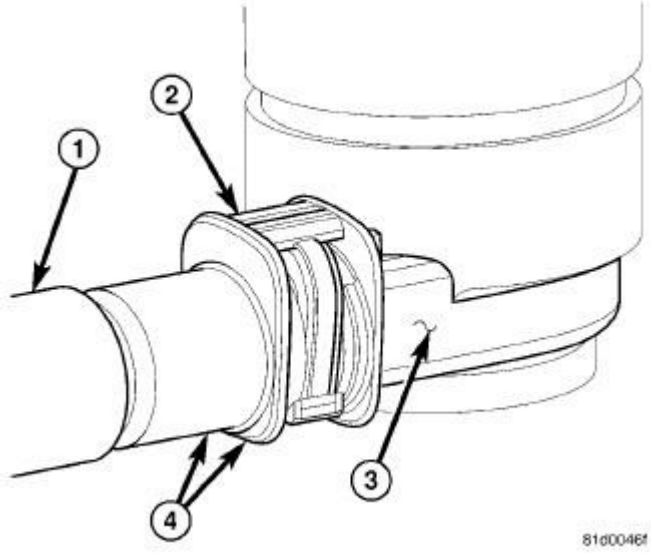

Fig. 60: Removing/Installing Hose At Headlamp Washer Nozzle Nipple
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir into a clean container for reuse.
3. If equipped with certain optional engines, it may be necessary to remove the air filter housing for access

to the washer reservoir mounting provisions and connections. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal** .

4. If the vehicle is so equipped, disconnect the Front End Module (FEM) wire harness connector (2) and headlamp washer supply hose (1) from the headlamp washer pump/motor unit (3). To disconnect the quick connect fitting (4), pull the molded plastic lock (2) away from the headlamp washer supply hose quick connect fitting far enough to disengage the hose from the washer pump nipple.

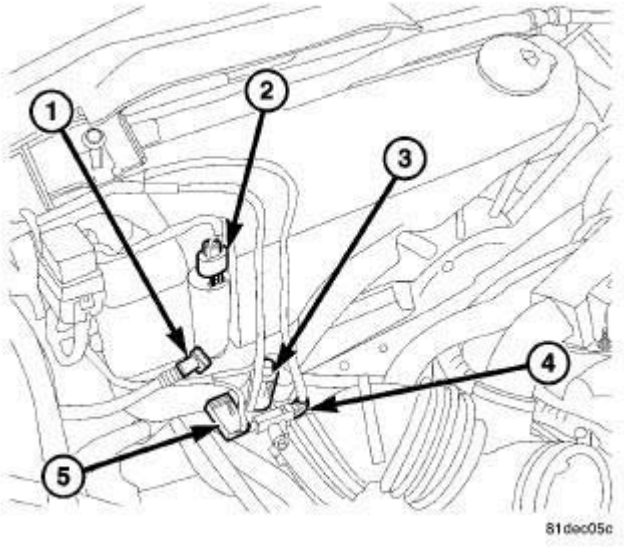

Fig. 61: Front End Module Wire Harness Connector
Courtesy of CHRYSLER LLC

5. Disconnect the FEM wire harness connector (5) from the washer fluid level switch connector receptacle on the back of the reservoir.
6. Disconnect the FEM wire harness connector (3) and the front and rear washer supply hoses (4) from the reversible washer pump/motor unit.
7. Disengage each of the FEM wire harness takeouts and washer supply hoses from the integral routing provisions of the washer reservoir.

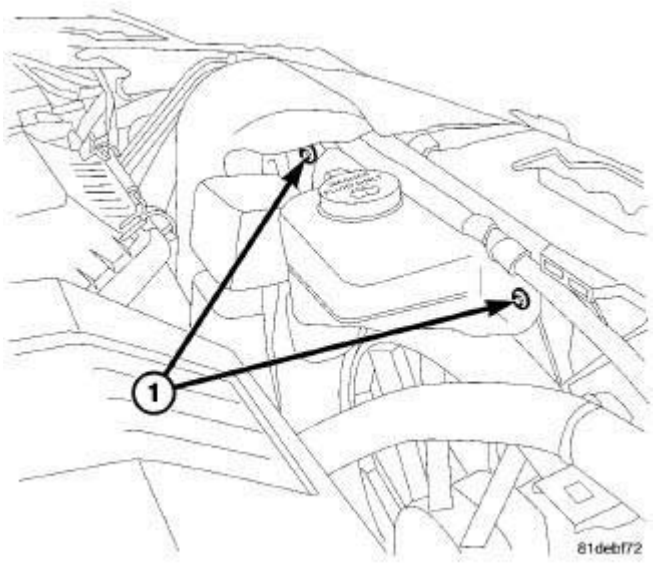

Fig. 62: Washer Reservoir Screws
Courtesy of CHRYSLER LLC

8. Remove the two screws (1) that secure the washer reservoir inboard and outboard mounting brackets to the back of the cooling module.
9. Lift the washer reservoir straight up to disengage the mounting tabs from the cooling module.
10. Remove the washer reservoir from the left side of the cooling module.

INSTALLATION

INSTALLATION

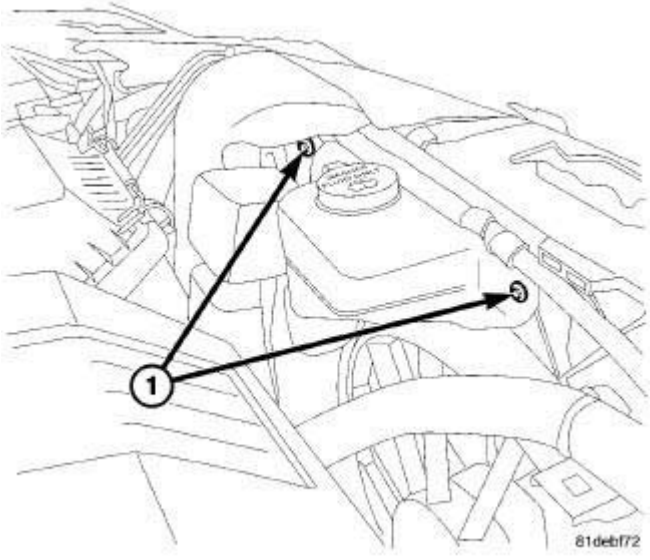

Fig. 63: Washer Reservoir Screws

Courtesy of CHRYSLER LLC

1. Position the washer reservoir to the left side of the cooling module.
2. Engage the mounting provisions at the bottom of the washer reservoir with the cooling module.
3. Install and tighten the two screws (1) that secure the washer reservoir inboard and outboard mounting brackets to the back of the cooling module. Tighten the screws securely.
4. Engage each of the Front End Module (FEM) wire harness takeouts and washer supply hoses into the integral routing provisions of the washer reservoir.

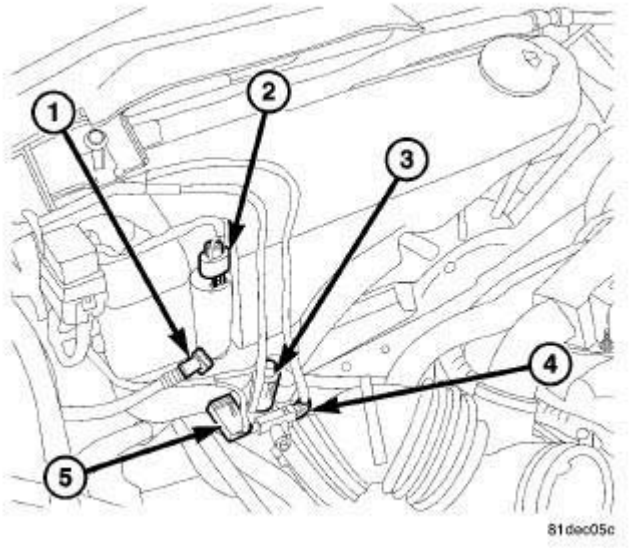

Fig. 64: Front End Module Wire Harness Connector
Courtesy of CHRYSLER LLC

5. Reconnect the FEM wire harness connector (3) and the front and rear washer supply hoses (4) to the reversible washer pump/motor unit.
6. Reconnect the FEM wire harness connector (5) to the washer fluid level switch connector receptacle on the back of the reservoir.

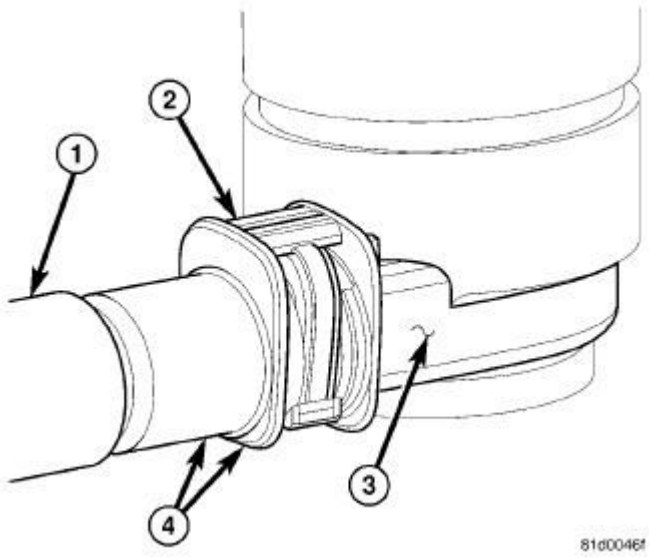

Fig. 65: Removing/Installing Hose At Headlamp Washer Nozzle Nipple
Courtesy of CHRYSLER LLC

7. If the vehicle is so equipped, reconnect the FEM wire harness connector and headlamp washer supply hose (1) to the headlamp washer pump/motor unit. To reconnect the quick connect fitting (4), first seat the molded plastic lock (2) onto the washer supply hose quick connect fitting. Next, push the quick connect fitting onto the headlamp washer pump/motor unit outlet nipple (3) until it snaps into place with an audible click.
8. If removed, reinstall the air filter housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation** .
9. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.
10. Reconnect the battery negative cable.

SWITCH, MULTIFUNCTION, RIGHT

DESCRIPTION

DESCRIPTION

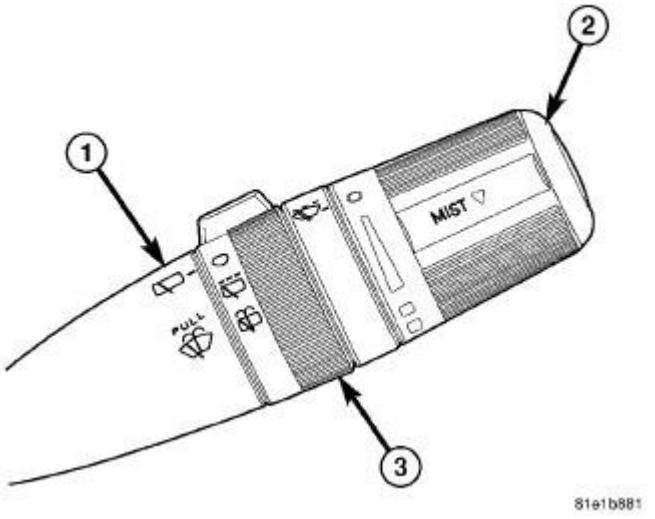

Fig. 66: Right (Wiper) Multi-Function Switch
Courtesy of CHRYSLER LLC

The right (wiper) multi-function switch is located on the right side of the steering column, just below the steering wheel. This switch is the primary control for the front and rear wiper and washer systems. The only visible components of the switch are the control stalk (1), control knob (2) and control sleeve (3) that extend through the steering column shrouds on the right side of the column. The remainder of the switch including its mounting provisions and electrical connection are concealed beneath the shrouds.

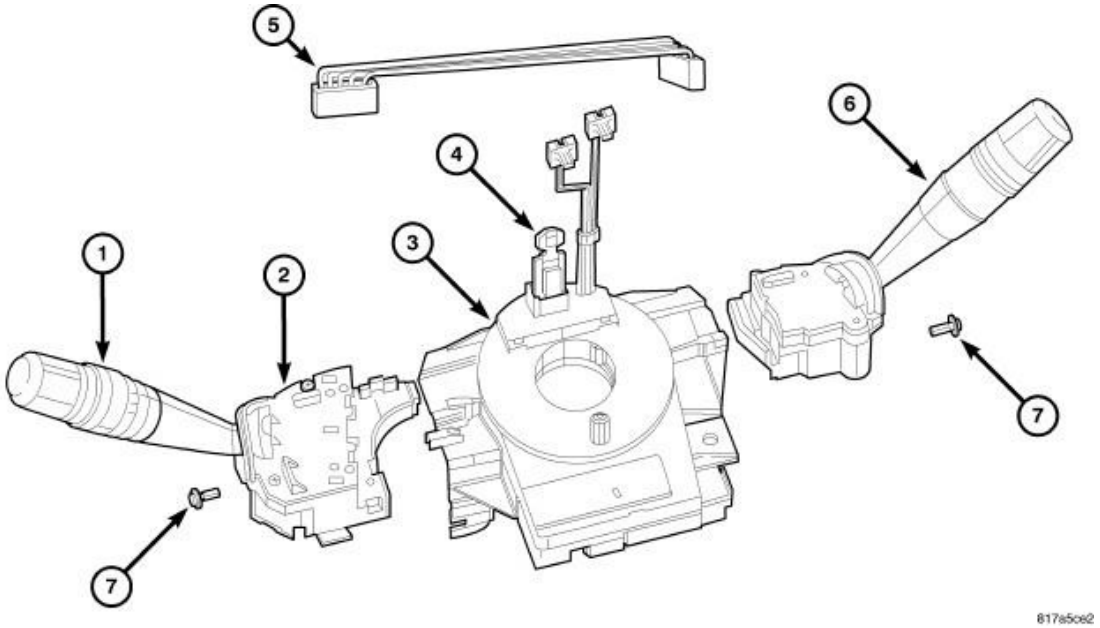

Fig. 67: Identifying Steering Control Module Components
Courtesy of CHRYSLER LLC

The switch housing and controls (6) are constructed of molded black plastic. Each of the switch controls has

white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. A single screw (7) through a mounting tab integral to the back of the switch housing, and a slide tab integral to the bottom of the switch housing secure the switch to the mounting bracket integral to the clockspring (3). A single connector receptacle containing seven terminal pins is integral to the inboard end of the switch housing and is connected by a jumper wire harness (5) directly to the Steering Control Module (SCM), which is internal to the housing (2) of the left multi-function switch (1).

The right (wiper) multi-function switch provides the vehicle operator with a control interface for the following wiper and washer system functions:

- **Continuous Front Wipers** - The right multi-function switch control knob provides detent switching for two continuous front wipe modes, low speed or high speed.
- **Intermittent Front Wipers** - The right multi-function switch control knob provides detent switching for the intermittent front wipe mode with five minor detent delay interval positions.
- **Front Wiper Mist Mode** - The right multi-function switch control stalk includes momentary switching of the front wiper motor low speed circuit to provide a mist mode features (sometimes referred to as pulse wipe), which allows the vehicle operator to momentarily operate the front wipers for one or more complete cycles.
- **Front Washer Mode** - The right multi-function switch control stalk provides momentary switching for control of the front washer system operation.
- **Intermittent Rear Wipe Mode** - The right multi-function switch control sleeve provides detent switching for a single fixed interval intermittent rear wiper mode.
- **Rear Washer Mode** - The right multi-function switch control sleeve provides one momentary switch positions for control of rear washer system operation.

The right multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire switch unit must be replaced. The clockspring (with the multi-function switch mounting bracket), the left multi-function switch (with the SCM), the right multi-function switch and the jumper wire harness are each available for separate service replacement.

OPERATION

OPERATION

The right (wiper) multi-function switch uses a combination of resistor multiplexing and conventional analog switching to control the many functions and features it provides. The switch receives a clean ground from the Steering Control Module (SCM), then provides resistor multiplexed and conventional analog return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over a Local Interface Network (LIN) data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), and the EMIC relays electronic **wiper** and **washer switch** request messages over the Controller Area Network (CAN) data bus to other electronic modules in the vehicle.

If the SCM detects no inputs from the right multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the LIN data bus. The SNA status signals the EMIC to request other electronic modules to implement a fail-safe mode of operation for the front and rear wiper systems. The fail-safe mode will maintain the last selected front and rear wiper system operation for the remainder of the current

ignition cycle, after which both wiper systems will default to OFF.

The right multi-function switch as well as the hard-wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the right multi-function switch is operated to control the many front and rear wiper and washer system functions and features it provides:

- **Front Wiper Control** - The control knob on the end of the right multi-function switch control stalk is rotated to one of the two continuous wiper detents, to one of five intermittent wiper detents, or to the OFF position to select the front wiper mode. The SCM reads the input from the right multi-function switch and sends electronic **wiper switch** status messages over the LIN data bus to the EMIC, which relays an electronic **wiper switch** request message over the CAN data bus to other electronic modules in the vehicle.
- **Front Wiper Mist Mode** - The front wiper mist mode is requested when the right multi-function switch control stalk is depressed downward towards the floor to a momentary MIST position. The front wiper motor will continue to operate, one complete cycle at a time, for as long as the control stalk is held in this position. The SCM reads the resistor multiplexed input from the right multi-function switch and sends an electronic **wiper switch** status message over the LIN data bus to the EMIC, which relays an electronic **wiper switch** request message over the CAN data bus to other electronic modules in the vehicle.
- **Front Washer Control** - The right multi-function switch control stalk is pulled rearward towards the steering wheel to a momentary WASH position to activate the washer pump/motor in the front washer mode. The washer pump/motor will continue to operate for as long as the control stalk is held in this position. The SCM reads the resistor multiplexed input from the right multi-function switch and sends an electronic **washer switch** status message over the LIN data bus to the EMIC, which relays an electronic **washer switch** request message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Wiper Control** - The rear wiper mode is selected when the right multi-function switch control sleeve is rotated to the fixed interval intermittent rear wipe detent position, or the OFF detent position. The SCM reads the input from the right multi-function switch and sends an electronic **wiper switch** status message over the LIN data bus to the EMIC, which relays an electronic **wiper switch** request message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Washer Control** - The right multi-function switch control sleeve is rotated to one of two momentary WASH positions, either fully forward or fully rearward, to activate the washer pump/motor in the rear washer mode. The washer pump/motor will continue to operate in the rear washer mode until the control sleeve is released. The SCM reads the input from the right multi-function switch and sends an electronic **washer switch** status message over the LIN data bus to the EMIC, which relays an electronic **washer switch** request message over the CAN data bus to other electronic modules in the vehicle.

DIAGNOSIS AND TESTING

RIGHT MULTI-FUNCTION SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering

wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

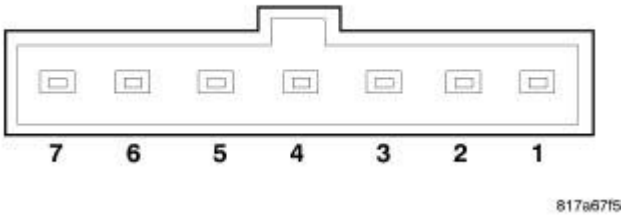

Fig. 68: Right Multi-Function Switch Connector
Courtesy of CHRYSLER LLC

The right multi-function switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** .

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Steering Control Module (SCM) or the electronic controls or communication between other modules and devices that provide some features of the front and rear wiper and washer systems. The most reliable, efficient and accurate means to diagnose the SCM or the electronic controls and communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. Remove the right multi-function switch from the integral mounting bracket on the right side of the clockspring. See **Electrical - Wipers/Washers/Wipers/Washers/SWITCH, Multifunction - Removal**.
2. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the three Function Tests tables below. For all functions except those of the control stalk the values should be either less than 100 ohms (switch CLOSED) or greater than 1 megohm (switch OPEN).

CONTROL STALK FUNCTION TESTS			
FUNCTION	PINS		RESISTANCE
	1	7	
Front Wash	X	X	10000 Ohms
Front Mist	X	X	5490 Ohms

CONTROL KNOB FUNCTION TESTS			
FUNCTION	BETWEEN PIN 7 (GROUND) AND PINS		
	4	5	6
Off	CLOSED	CLOSED	OPEN

Front Delay 1	CLOSED	CLOSED	CLOSED
Front Delay 2	CLOSED	OPEN	CLOSED
Front Delay 3	OPEN	OPEN	CLOSED
Front Delay 4	OPEN	CLOSED	CLOSED
Front Delay 5	OPEN	CLOSED	OPEN
Front Wiper Low	OPEN	OPEN	OPEN
Front Wiper High	CLOSED	OPEN	OPEN

CONTROL SLEEVE FUNCTION TESTS		
FUNCTION	**BETWEEN PIN 7 (GROUND) AND PINS**	
	2	**3**
Off	CLOSED	OPEN
Rear Wipe	CLOSED	CLOSED
Rear Wash	OPEN	CLOSED

3. If the switch fails any of the tests, replace the ineffective right multi-function switch as required. If the switch tests okay, but the switch input to the Steering Control Module (SCM) remains incorrect, be certain to check for a short or open in the jumper harness between the right multi-function switch and the SCM.

REMOVAL

REMOVAL

WARNING: To avoid personal or fatal injury, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

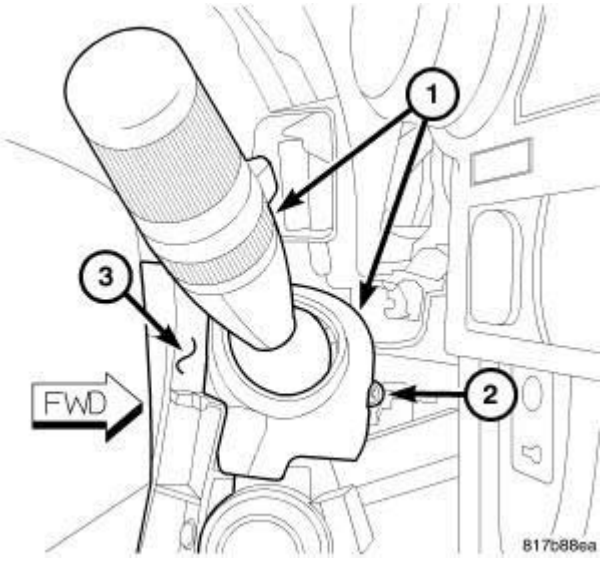

Fig. 69: Removing/Installing Right Multi-Function Switch
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove both the upper and lower shrouds from the steering column. Refer to **Steering/Column/SHROUD, Steering Column - Removal** .
3. Remove the screw (2) that secures the right multi-function switch (1) to the mounting bracket integral to the right side of the clockspring (3) on the steering column.
4. Slide the switch away from the clockspring far enough to disengage the slide tabs on the switch housing from the channel formations in the mounting bracket.

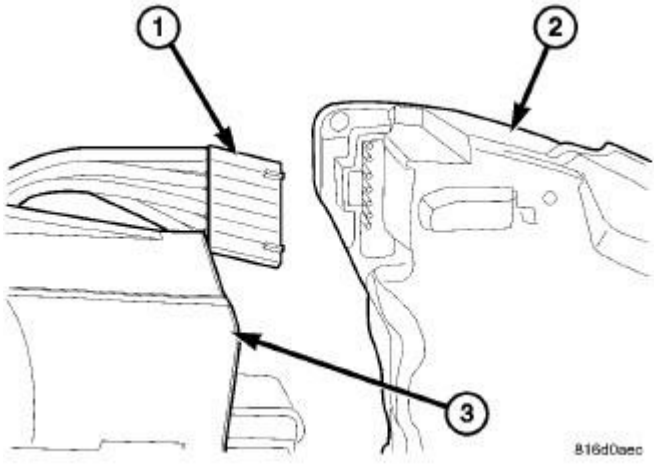

Fig. 70: Right Multi-Function Switch Harness Connector
Courtesy of CHRYSLER LLC

5. Disconnect the jumper wire harness connector (1) from the connector receptacle on the inboard end of the right multi-function switch (2).

6. Remove the switch from the clockspring (3).

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

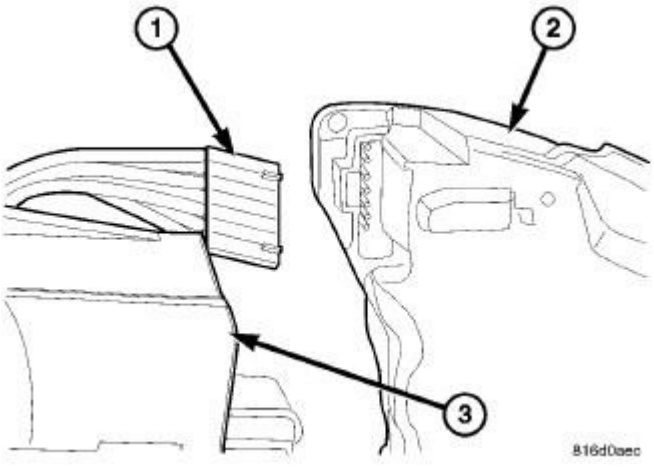

Fig. 71: Right Multi-Function Switch Harness Connector
Courtesy of CHRYSLER LLC

1. Position the right multi-function switch (2) close enough to the mounting bracket (3) integral to the right side of the clockspring to reconnect the jumper wire harness connector (1) to the connector receptacle on the inboard side of the switch housing.
2. Align the slide tabs on the switch housing with the channel formations integral to the clockspring mounting bracket, then slide the switch into the bracket until it is firmly seated.

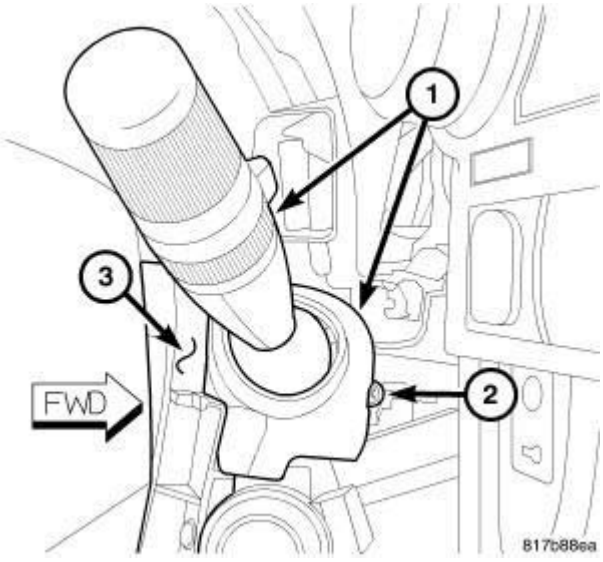

Fig. 72: Removing/Installing Right Multi-Function Switch
Courtesy of CHRYSLER LLC

3. Install and tighten the screw (2) that secures the mounting tab on the back of the right multi-function switch (1) to the mounting bracket on the clockspring (3). Tighten the screw to 1 N.m (10 in. lbs.).
4. Reinstall the upper and lower shrouds onto the steering column. Refer to **Steering/Column/SHROUD, Steering Column - Installation** .
5. Reconnect the battery negative cable.

SWITCH, WASHER FLUID LEVEL

DESCRIPTION

DESCRIPTION

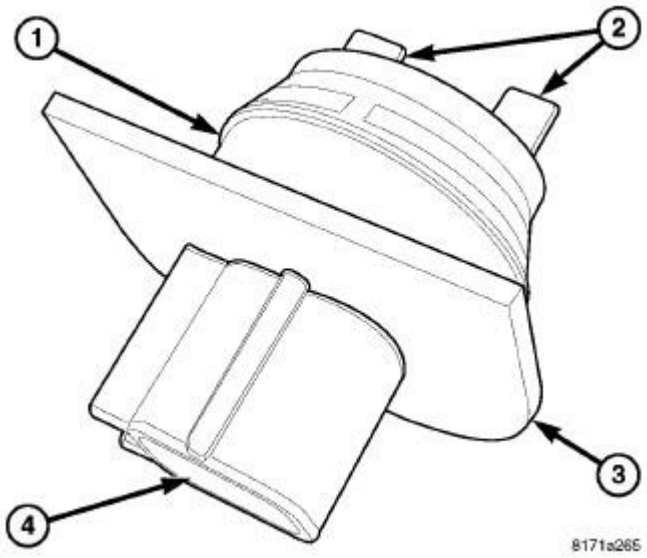

Fig. 73: Washer Fluid Level Switch
Courtesy of CHRYSLER LLC

The washer fluid level switch (3) is a two-pin conductivity sensor with no moving parts mounted on the rearward facing side of the washer reservoir on the upper left corner of the cooling module on the Front End Module (FEM). Only the molded plastic switch mounting flange and the integral connector receptacle (4) are visible when the switch is installed in the reservoir.

A short nipple formation (1) extends from the inner surface of the switch mounting flange, and a barb on the nipple is pressed through a rubber grommet seal installed in the mounting hole of the reservoir. Two over-molded pins or electrodes (2) extend from the back of the nipple formation. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the FEM wire harness.

The washer fluid level switch cannot be adjusted or repaired. If ineffective or damaged, the switch must be replaced.

OPERATION

OPERATION

The washer fluid level switch uses fluid conductivity to monitor the level of the washer fluid in the washer reservoir. Electricity is conducted between the two switch pins or electrodes only when they are immersed in the washer fluid, which closes the switch circuit. When the fluid level in the washer reservoir falls below the pins, electrical current cannot be conducted and the switch becomes an open circuit, which signals a low fluid condition.

In order to prevent an electrical charge from accumulating in the electrical leads of the switch, the switch receives current that is pulsed from the Totally Integrated Power Module (TIPM) located in the engine compartment near the battery. The TIPM monitors the switch return signal and is programmed to respond to three consecutive open switch readings by sending an electronic **washer fluid indicator lamp-ON request**

message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Controller Area Network (CAN) data bus. The EMIC responds to this message by illuminating the washer fluid indicator and by sounding an audible chime tone warning.

The washer fluid level switch is connected to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness. The switch is connected in series between a sensor return circuit and the washer fluid switch sense input to the TIPM.

The washer fluid level switch and the hard wired circuits between the switch and the TIPM may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer fluid level indicator or the electronic controls or communication between other modules and devices that provide some features of the washer system. The most reliable, efficient, and accurate means to diagnose the washer fluid level indicator or the electronic controls and communication related to washer fluid level switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

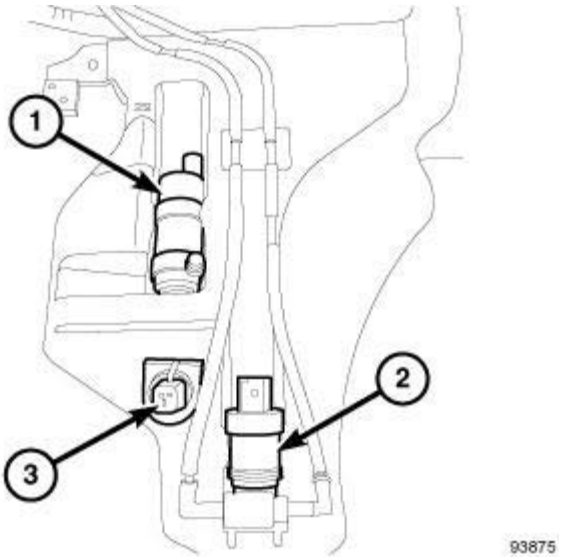

Fig. 74: Washer Pump/Motor Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the washer reservoir from the back of the cooling module on the Front End Module (FEM). See **Electrical - Wipers/Washers/Wipers/Washers/RESERVOIR, Windshield Washer - Removal**.
3. Disconnect the FEM wire harness connector from the washer fluid level switch connector receptacle (3) on the back of the reservoir.
4. Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level switch out of the rubber grommet seal in the washer reservoir. Care must be taken not to damage the reservoir.

5. Remove the switch from the washer reservoir.
6. Remove the rubber grommet seal from the switch mounting hole in the washer reservoir and discard.

INSTALLATION

INSTALLATION

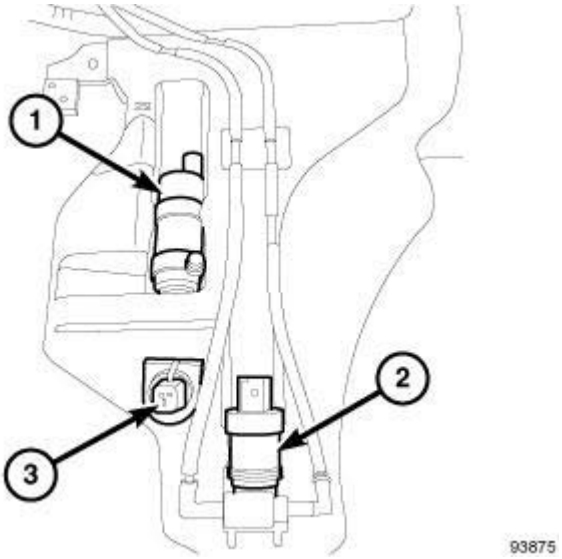

Fig. 75: Washer Pump/Motor Housing
Courtesy of CHRYSLER LLC

1. Install a new rubber grommet seal into the washer fluid level switch mounting hole of the washer reservoir. Always use a new rubber grommet seal on the reservoir.
2. Insert the nipple formation of the switch through the rubber grommet seal in the reservoir.
3. Using hand pressure, press firmly and evenly on the switch mounting flange until the barbed nipple is fully seated in the rubber grommet seal in the reservoir. The flat edge of the switch mounting flange should be oriented upward.
4. Reconnect the Front End Module (FEM) wire harness connector (3) to the switch connector receptacle.
5. Reinstall the washer reservoir onto the back of the cooling module on the FEM. See **Electrical - Wipers/Washers/Wipers/Washers/RESERVOIR, Windshield Washer - Installation**.
6. Reconnect the battery negative cable.

2009 ACCESSORIES AND EQUIPMENT

Chime/Buzzer - Service Information - Journey

DESCRIPTION

DESCRIPTION

The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the circuit board of the instrument cluster also known as the Cab Compartment Node (CCN) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants. The CCN also includes the necessary hardware and software to serve as the vehicle's electronic body control module.

The electromechanical transducer generates chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based CCN utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hard-wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the CCN allow it to control the audible outputs that are produced through its on-board transducer and relay.

The CCN is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 90 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 180 clicks per minute.
- **Single Chime Tone** - A single **chime** tone.
- **Continuous Repetitive Chime Tone** - Repeated **chime** tones that are issued continuously.

Hard-wired circuitry connects the CCN and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard-wired circuits are integral to several wire harnesses that are routed throughout the vehicle and they are retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the CCN through a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, procedures for proper wire and connector repair, further details on wire harness routing and retention, and pin-out and location views for the various wire harness connectors, splices, and grounds.

The chime warning system circuits and components cannot be adjusted or repaired. If the CCN circuitry, the on-board transducer, or the relay is damaged or ineffective, the instrument cluster assembly must be replaced.

OPERATION

OPERATION

DOOR AJAR CHIME

The Cab Compartment Node (CCN) will sound an audible chime when the key is in the ignition and the driver's door is open. This is to prevent partial closing of vehicle doors.

An audible chime will sound when the vehicle begins to move and the transmission range indicator display will indicate DOOR.

ENHANCED SEAT BELT REMINDER

If all the following are met after sixty seconds with the engine ON, then the enhanced seat belt reminder feature will be activated.

- Driver seat belt is unbuckled for ten seconds or more.
- Vehicle speed is greater than five mph (8 km/h).
- The gear positioning is not in REVERSE (except in MTX vehicles where the reverse position cannot be detected).

The seat belt indicator will periodically blink, accompanied with a continuous chime for approximately ninety-six seconds or until the driver seat belt is buckled. When the enhanced seat belt feature is not initiated or if the feature is disabled, the seat belt indicator will be turned ON continuously until the driver seat belt is buckled.

In the same ignition cycle, if the seat belt is again unbuckled for more than ten seconds with the vehicle speed greater than five mph (8 km/h), the enhanced seat belt reminder feature will again be initiated.

The enhanced seat belt reminder feature is customer programmable and can be enabled/disabled with the use of a Scan Tool, or by the customer completing a sequence of steps.

CUSTOMER PROGRAMMING OF ENHANCED SEAT BELT REMINDER FEATURE

1. With the ignition not in RUN or START, buckle the driver seat belt.
2. Turn the ignition switch to the RUN or START position and wait for the seat belt reminder check to be completed.
3. Unbuckle and then re-buckle the driver seat belt causing the indicator to go ON and OFF three or more times ending with the seat belt buckled.
4. Return the ignition switch back to a non-RUN or no-START position (the feature will toggle from the current status) and a confirmation chime will sound indicating to the customer the proper sequence to enable/disable the feature was performed.

EXTERIOR LAMPS LEFT ON

An audible chime tone that indicates the exterior lamps were left on.

FASTEN SEAT BELTS

At power up, the instrument cluster will conduct a seat belt lamp bulb check. If the driver side seat belt buckle

is unbuckled during the bulb check, an accompanying chime will sound within the duration of the bulb check.

KEY LEFT IN IGNITION

An audible chime tone that indicates the key was left in ignition.

SINGLE WARNING CHIME

After a bulb check at power-up, if any of the following indicators are still activated, the CCN will sound a single chime tone. ABS, Air Bag, Check Engine, Charging System, Engine Temperature, Low Fuel (after 10 seconds for accurate fuel information), and BRAKE (if speed is greater than 2 mph).

DIAGNOSIS AND TESTING

CHIME WARNING SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard-wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, procedures for proper wire and connector repair, details of wire harness routing and retention, connector pin-out information, and location views for the various wire harness connectors, splices, and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

2009 ACCESSORIES AND EQUIPMENT

Wiring Harness - Service Information - Journey

GROMMET

REMOVAL

GROMMET - A PILLAR

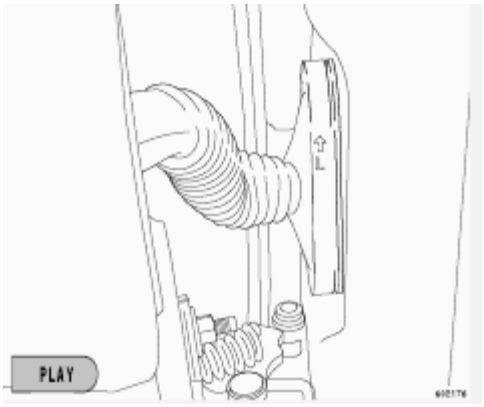

Fig. 1: A Pillar Grommet
Courtesy of CHRYSLER LLC

1. Peel the A Pillar grommet (1) off of the connector/retainer and move it up the wire harness.
2. Grasp the wire harness (2) by the convolute section of the grommet and gently pull the wire harness down towards the floor to expose the connector lock tabs.

CAUTION: Do not force the locking tab past the connector body, as damage to the connector may occur.

3. While still pulling down on the harness, use a small slotted screw driver (3) to **gently** push one of the top lock tabs until the lock feature is flush with the connector/retainer body.
4. Repeat the step 3 for the remaining top lock tab.
5. The connector should now be able to rock out of the sheet metal hole without causing any damage to the connector or sheet metal.

TRAILER TOW

STANDARD PROCEDURE

TRAILER TOW HARNESS INSTALLATION

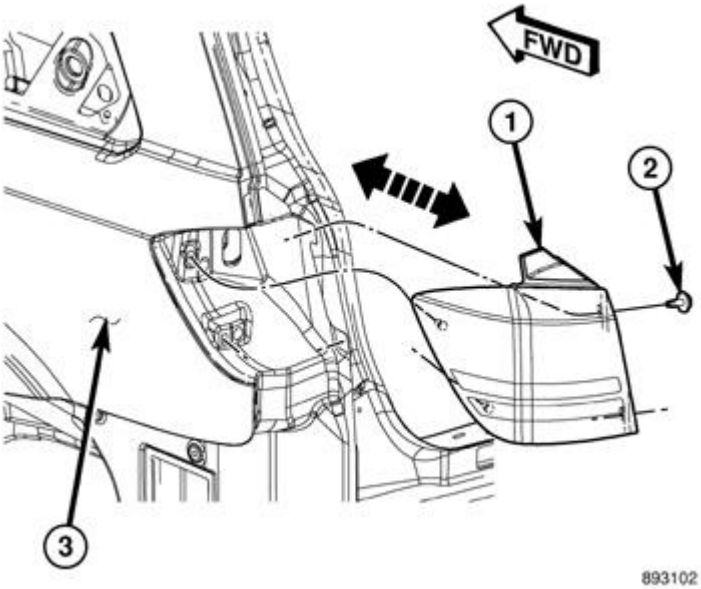

Fig. 2: Push Pin Fasteners & Rear Tail Lamp Assemblies

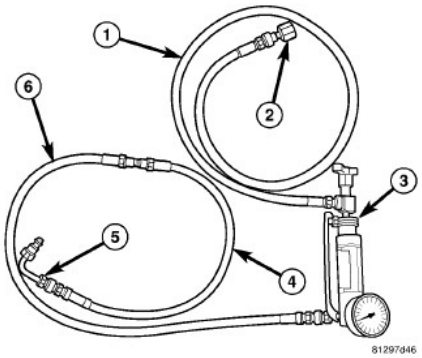
HYDRAULIC FLOW AND PRESSURE TEST

Special Tools: Click to display a list of tools used in this procedure

WARNING: **To prevent personal injury, safety goggles should be worn at all times while performing any test procedures on the power steering system.**

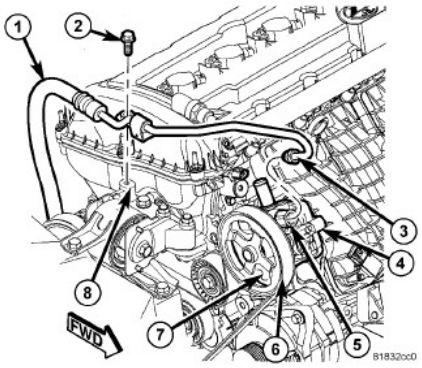
The following procedure is to be used to test the operation of the power steering system on this vehicle. This test will provide the flow rate (Gallons Per Minute (GPM)) of the power steering pump along with the maximum relief pressure. Perform this test any time a power steering system problem is present. This test will help determine if the power steering pump or power steering gear is not functioning properly. The test is performed using tools in the Power Steering Analyzer Kit 6815 with appropriate hoses and adapters. (Refer to 19 - Steering - Special Tools)

1. Check the power steering belt to ensure it is in good condition and adjusted properly.
2. Assemble the following hoses and adapters on the Flow Meter And Gauge 6800 (3):
   a. Gauge end (inlet) - Hose 6905 (6) (in 6893A kit), Hose 6713 (4) (in 6815 kit), Adapter Tube 6844 (5) (in 6893A kit)
   b. Valve end (outlet) - Hose 6959 (1), Adapter Fitting 6826 (2)

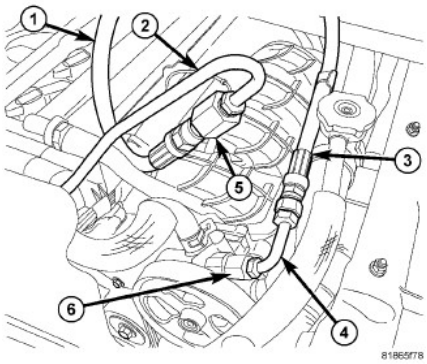


NOTE: In the following steps, figures showing the four-cylinder gas engine have been used. Pump location differs depending on engine application, but a standard pressure hose tube nut fitting is used by all.

3. Unthread the tube nut (3) and disconnect the power steering pressure hose (1) at the power steering pump pressure fitting (5).



4. Connect the vehicle's power steering pressure hose (2) to Adapter Fitting 6826 (5) (on Hose 6959 (1) leading to Analyzer outlet). Tighten the tube nut. (Refer to 19 - Steering - Specifications)
5. Connect Adapter Fitting 6844 (4) (on Hose 6713 (3) leading to Analyzer inlet), to the open power steering pump pressure fitting (6). Tighten the tube nut. (Refer to 19 - Steering - Specifications)
6. Route the hoses away from the exhaust system as well as possible.



TEST PROCEDURE

1. Completely open the valve on the Power Steering Analyzer flow meter.
2. Start the engine and let idle long enough to circulate power steering fluid through the analyzer and hoses, until the air is out of the fluid. Shut off the engine.
3. Check the power steering fluid level and add fluid as necessary. Start the engine again and let idle.
4. The analyzer gauge should read below 862 kPa (125 psi). If above, inspect the hoses for restrictions and repair as necessary. The pressure once the engine is warm should be in the range of 345-552 kPa (50-80 psi). The flow meter should read above 1.5 GPM.

CAUTION: **The following test procedure step involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.**

NOTE: Power steering pump maximum relief pressure is 10,500 to 11,900 kPa (1525 to 1725 psi).

5. Close the flow meter valve fully three times and record highest pressure indicated each time. **All three readings must be within specifications and within 690 kPa (100 psi) of each other.**

- If the power steering pump pressures are within specifications, but not within 690 kPa (100 psi) of each other, replace the power steering pump.
- If the pressures are within 690 kPa (100 psi) of each other, but are outside of specifications, replace the power steering pump.

If the power steering pump requires replacement, (Refer to 19 - Steering/Pump - Removal) .

CAUTION: **During the next step, do not force the pump to operate against the stops for more than 5 seconds at a time as pump damage may result.**

6. Completely open the valve on the Power Steering Analyzer flow meter. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest output pressure reading against one stop is not within 690 kPa (100 psi) of the highest reading at the other stop, the steering gear is leaking internally and must be replaced.

If the power steering gear requires replacement, (Refer to 19 - Steering/Gear - Removal) .

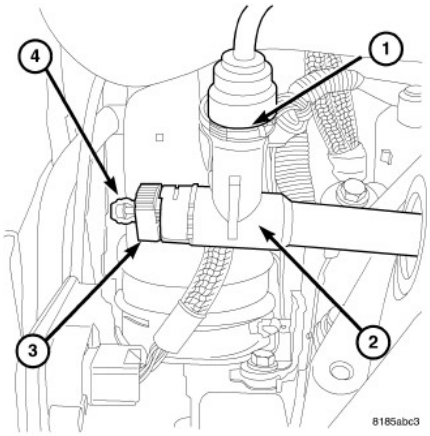
STANDARD PROCEDURE - MANUAL BLEEDING CLUTCH HYDRAULIC CIRCUIT



NOTE: An assistant is required to perform this procedure

1. Verify fluid level in clutch/brake cylinder. Top off with DOT 3 brake fluid as necessary. Leave cap off.
2. Raise vehicle on hoist.

NOTE: The container must be positioned at a lower level than the bleeder valve on the clutch slave cylinder

3. Remove the dust cap from the bleed port on the clutch slave cylinder and install suitable size and length of clear hose (4) to monitor and divert fluid into a suitable container.
4. Lower vehicle, but only enough to gain access to and fill the brake master cylinder.
5. Have the assistant press down and hold the clutch pedal until it reaches the floor.

NOTE: Do not allow clutch/brake fluid reservoir to run dry while fluid exits bleed port. If the reservoir runs dry during this procedure, it must be refilled. and this step must be repeated.

NOTE: Ensure the assistant does not release the clutch pedal from the floor while the bleed port on the clutch slave cylinder is open. Otherwise, air will enter the clutch hydraulic circuit.

6. Open the bleed port on the clutch slave cylinder enough to allow hydraulic fluid to drain. Any air in the system will escape at this time.
7. Close the bleed port on the clutch slave cylinder, and have the assistant release the clutch pedal to the full up position.
8. Repeat steps 5 through 7 at least 15 times or until air bubbles are no longer present in the clutch hydraulic fluid.
9. Slowly actuate the clutch pedal 10 times between the full up and pedal stop position.
10. **Apply parking brake**. Start engine and verify clutch operation and pedal feel. If the clutch pedal feels fine and the transaxle can be easily shifted from neutral to any gear, the clutch is operating correctly. If pedal still feels spongy or clutch does not fully disengage, excessive air is still trapped within the system, most likely at the master cylinder.
11. Disconnect the hose from the bleed port on the clutch master cylinder and install the dust cap.
12. Top off brake master cylinder fluid level with DOT 3 brake fluid as necessary.

POWER BLEEDING CLUTCH HYDRAULIC CIRCUIT

1. Remove reservoir cap and connect bleeder cap to clutch/brake fluid reservoir.**NOTE:**Use Bleeder Cap/Modified reservoir cap adapter Snap-on #901-059 or equivalent.
2. Connect service filling machine to bleeder cap.**NOTE:**Use Service Filling Machine/Brake power bleeder or equivalent.
3. Service filling machine should be pressurized between 2.0 and 2.5 bar (29 - 36 PSI).

4. Remove dust cap from bleeder valve and connect the transparent bleeder hose to bleeder valve.

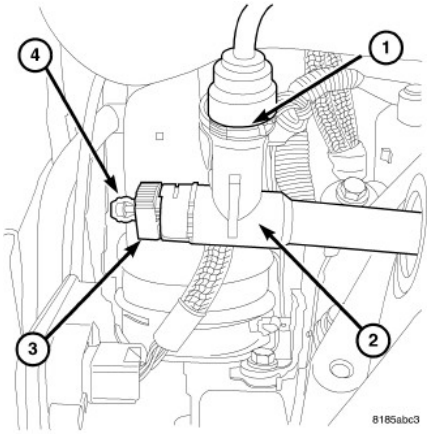
NOTE: Use Bleeder Container to capture hydraulic fluid and the Transparent Bleeder Hose to route fluid to container.

NOTE: The Container must be at a lower level than the bleeder valve on the clutch slave cylinder.

5. Place the other end of hose in the bleeder container to capture the used fluid. The end of the hose MUST be submerged in the DOT 3 brake fluid.

6. Turn on the service filling machine.

NOTE: While bleeding the system, do not allow the clutch fluid reservoir to completely empty out. If this happens, refill the clutch fluid reservoir, and repeat the procedure.



7. Open the bleeder valve (3) on the clutch slave cylinder enough to allow fluid to flow from the clutch hydraulic system.

8. Allow fluid to flow out of bleed port until no more air bubbles can be seen in the transparent bleeder hose.

9. Once fluid is free of air bubbles; make 15 quick actuations between clutch pedal stop positions.

10. Close the bleeder valve at the clutch slave cylinder and disconnect the service filling machine.

11. Check clutch pedal to see if vehicle is properly bled.

12. If vehicle is not properly bled, repeat procedure.

13. Remove bleeder cap from the clutch fluid reservoir and replace reservoir cap.

14. Disconnect transparent bleeder hose from bleeder valve and replace dust cap.

2009 Dodge JC - DODGE JOURNEY

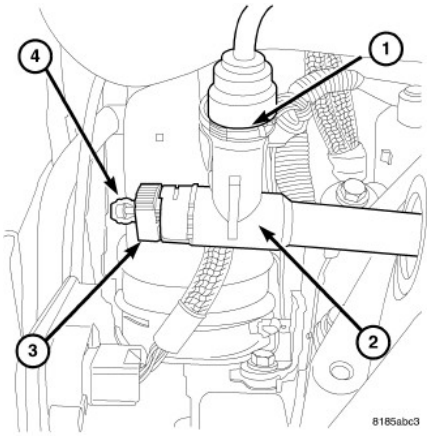
Submodel: | **Engine Type:** V6 | **Liters:** 3.5L
Fuel Delivery: MPI | **Fuel:**

STANDARD PROCEDURE - MANUAL BLEEDING CLUTCH HYDRAULIC CIRCUIT



NOTE: An assistant is required to perform this procedure

1. Verify fluid level in clutch/brake cylinder. Top off with DOT 3 brake fluid as necessary. Leave cap off.
2. Raise vehicle on hoist.

NOTE: The container must be positioned at a lower level than the bleeder valve on the clutch slave cylinder

3. Remove the dust cap from the bleed port on the clutch slave cylinder and install suitable size and length of clear hose (4) to monitor and divert fluid into a suitable container.
4. Lower vehicle, but only enough to gain access to and fill the brake master cylinder.
5. Have the assistant press down and hold the clutch pedal until it reaches the floor.

NOTE: Do not allow clutch/brake fluid reservoir to run dry while fluid exits bleed port. If the reservoir runs dry during this procedure, it must be refilled. and this step must be repeated.

NOTE: Ensure the assistant does not release the clutch pedal from the floor while the bleed port on the clutch slave cylinder is open. Otherwise, air will enter the clutch hydraulic circuit.

6. Open the bleed port on the clutch slave cylinder enough to allow hydraulic fluid to drain. Any air in the system will escape at this time.
7. Close the bleed port on the clutch slave cylinder, and have the assistant release the clutch pedal to the full up position.
8. Repeat steps 5 through 7 at least 15 times or until air bubbles are no longer present in the clutch hydraulic fluid.
9. Slowly actuate the clutch pedal 10 times between the full up and pedal stop position.
10. **Apply parking brake**. Start engine and verify clutch operation and pedal feel. If the clutch pedal feels fine and the transaxle can be easily shifted from neutral to any gear, the clutch is operating correctly. If pedal still feels spongy or clutch does not fully disengage, excessive air is still trapped within the system, most likely at the master cylinder.
11. Disconnect the hose from the bleed port on the clutch master cylinder and install the dust cap.
12. Top off brake master cylinder fluid level with DOT 3 brake fluid as necessary.

POWER BLEEDING CLUTCH HYDRAULIC CIRCUIT

1. Remove reservoir cap and connect bleeder cap to clutch/brake fluid reservoir.**NOTE:**Use Bleeder Cap/Modified reservoir cap adapter Snap-on #901-059 or equivalent.
2. Connect service filling machine to bleeder cap.**NOTE:**Use Service Filling Machine/Brake power bleeder or equivalent.
3. Service filling machine should be pressurized between 2.0 and 2.5 bar (29 - 36 PSI).

4. Remove dust cap from bleeder valve and connect the transparent bleeder hose to bleeder valve.

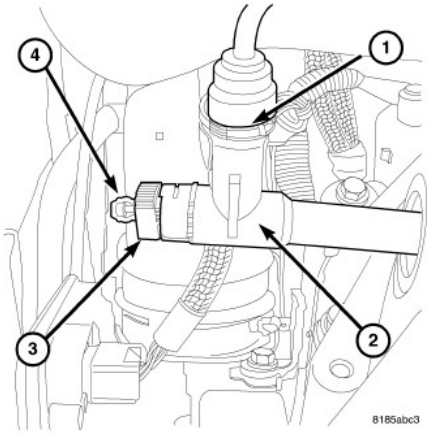
NOTE: Use Bleeder Container to capture hydraulic fluid and the Transparent Bleeder Hose to route fluid to container.

NOTE: The Container must be at a lower level than the bleeder valve on the clutch slave cylinder.

5. Place the other end of hose in the bleeder container to capture the used fluid. The end of the hose MUST be submerged in the DOT 3 brake fluid.

6. Turn on the service filling machine.

NOTE: While bleeding the system, do not allow the clutch fluid reservoir to completely empty out. If this happens, refill the clutch fluid reservoir, and repeat the procedure.



7. Open the bleeder valve (3) on the clutch slave cylinder enough to allow fluid to flow from the clutch hydraulic system.

8. Allow fluid to flow out of bleed port until no more air bubbles can be seen in the transparent bleeder hose.

9. Once fluid is free of air bubbles; make 15 quick actuations between clutch pedal stop positions.

10. Close the bleeder valve at the clutch slave cylinder and disconnect the service filling machine.

11. Check clutch pedal to see if vehicle is properly bled.

12. If vehicle is not properly bled, repeat procedure.

13. Remove bleeder cap from the clutch fluid reservoir and replace reservoir cap.

14. Disconnect transparent bleeder hose from bleeder valve and replace dust cap.

INTRODUCTION

This manual has been prepared with the assistance of service and engineering specialists to acquaint you with the operation and maintenance of your new vehicle. It is supplemented by a Warranty Information Booklet and various customer-oriented documents. You are urged to read these publications carefully. Following the instructions and recommendations in this manual will help assure safe and enjoyable operation of your vehicle.

NOTE: After you read the manual, it should be stored in the vehicle for convenient reference and remain with the vehicle when sold so that the new owner will be aware of all safety warnings.

When it comes to service, remember that your authorized dealer knows your vehicle best, has the factory-trained technicians and genuine Mopar® parts, and is interested in your satisfaction.

HOW TO USE THIS MANUAL

Consult the Table of Contents to determine which section contains the information you desire.

The detailed Index at the back of this manual contains a complete listing of all subjects.

Consult the following table for a description of the symbols that may be used on your vehicle or throughout this Owner's Manual.

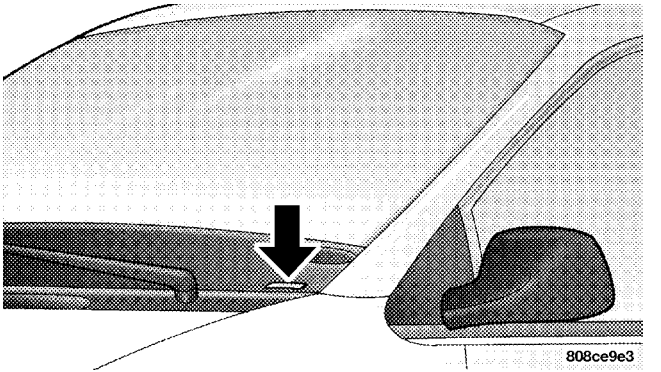
WARNINGS AND CAUTIONS

This Owners Manual contains **WARNINGS** against operating procedures that could result in an accident or bodily injury. It also contains **CAUTIONS** against procedures that could result in damage to your vehicle. If you do not read this entire Owners Manual, you may miss important information. Observe all Warnings and Cautions.

VEHICLE IDENTIFICATION NUMBER

The Vehicle Identification Number (VIN) is on the left front corner of the instrument panel and is visible from outside of the vehicle through the windshield. This number also appears on the Automobile Information Disclosure Label affixed to a window on your vehicle, the vehicle registration, and the title.



VIN Location

NOTE: It is illegal to remove the VIN.

VEHICLE MODIFICATIONS/ALTERATIONS

WARNING!
Any modifications or alterations to this vehicle could seriously affect its roadworthiness and safety and may lead to an accident resulting in serious injury or death.

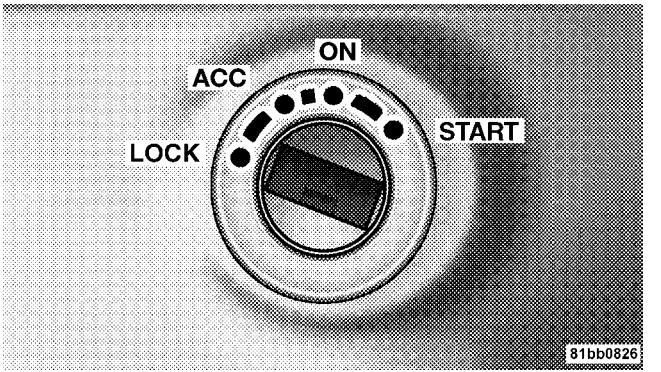
A WORD ABOUT YOUR KEYS

Your vehicle uses a keyless ignition system. This system consists of a Fob with Integrated Key and a Wireless Ignition Node (WIN) with integral ignition switch. You can insert the double-sided integrated key into the ignition switch with either side up.

Wireless Ignition Node (WIN)

The Wireless Ignition Node (WIN) operates similarly to an ignition switch. It has four operating positions, three of which are detented and one spring-loaded. The detented positions are LOCK, ACC, and ON. The START position is a spring-loaded momentary contact position. When released from the START position, the switch automatically returns to the detented ON position.



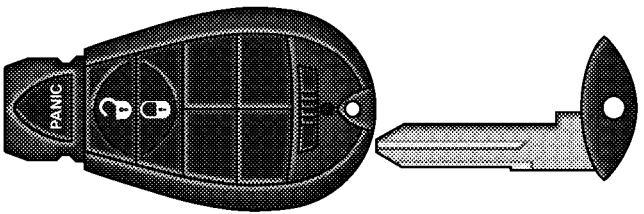
Wireless Ignition Node (WIN)

Fob With Integrated Key

The Fob with Integrated Key operates the ignition switch. It also contains the Remote Keyless Entry (RKE) transmitter and a valet key, which stores in the rear of the Fob.

The valet key allows for entry into the vehicle should the battery in the vehicle or the Fob go dead. You can keep the valet key with you when valet parking.

To remove the valet key from the Fob, slide the mechanical latch at the top of the Fob sideways with your thumb and then pull the key out of the Fob with your other hand.



81bb182d

Valet Key Removal

NOTE:

- You can insert the double-sided valet key into the lock cylinder with either side up.
- Only the drivers door is equipped with a lock cylinder.

Tip Start Feature

Do not press the accelerator. Use the Fob with Integrated Key to briefly turn the ignition switch to the START position and release it as soon as the starter engages. The starter motor will continue to run, and it will disengage automatically when the engine is running.

Ignition Key Removal

Place the shift lever in PARK. Turn the key to the LOCK position and then remove the key.

NOTE:

- For vehicles not equipped with the Electronic Vehicle Information Center (EVIC), the power window switches, radio, power sunroof (if equipped), and ignition-powered power outlets will remain active for approximately 45 seconds after the ignition switch is turned to the LOCK position. Opening either front door will cancel this feature.
- For vehicles equipped with the EVIC, the power window switches, radio, power sunroof (if equipped), and ignition-powered power outlets will remain active for up to 10 minutes after the ignition switch is turned to the LOCK position. Opening either front door will cancel this feature. The time for this feature is programmable. Refer to "Key-Off Power Delay," under "Personal Settings (Customer Programmable Features)" under "Electronic Vehicle Information Center (EVIC)" in Section 4.

WARNING!

Never leave children alone in a vehicle. Leaving unattended children in a vehicle is dangerous for a number of reasons. A child or others could be seriously or fatally injured. Don't leave the key in the ignition. A child could operate power windows, other controls, or move the vehicle.

CAUTION!

An unlocked car is an invitation to thieves. Always remove the key from the ignition and lock all doors when leaving the vehicle unattended.

Key-In-Ignition Reminder

If you open the driver's door and the key is in the ignition, a chime will sound to remind you to remove the key.

NOTE: The Key-In-Ignition reminder only sounds when the ignition key is placed in the LOCK or ACC position.

SENTRY KEY® IMMOBILIZER SYSTEM

The Sentry Key® Immobilizer system prevents unauthorized vehicle operation by disabling the engine. The system does not need to be armed or activated. Operation is automatic, regardless of whether the vehicle is locked or unlocked.

The system uses the factory-mated Remote Keyless Entry (RKE) transmitter with integrated key and Wireless Ignition Node (WIN) to prevent unauthorized vehicle operation. Therefore, only RKE transmitters that are programmed to the vehicle can be used to start and operate the vehicle. The system will not allow the engine to crank if an invalid RKE transmitter is used to operate the ignition switch.

After turning the ignition switch to the ON position, the Vehicle Security Light will turn on for three seconds for a bulb check. If the light remains on after the bulb check, it

indicates that there is a problem with the electronics. This condition will result in the engine being shut off after two seconds.

If the Vehicle Security Light turns on during normal vehicle operation (vehicle running for longer than 10 seconds), it indicates that there is a fault in the electronics. Should this occur, have the vehicle serviced as soon as possible.

NOTE:

- The Sentry Key® Immobilizer system is not compatible with aftermarket remote starting systems. Use of these systems may result in vehicle starting problems and loss of security protection.
- Exxon/Mobil Speedpass™, additional RKE transmitters, or any other transponder-equipped components on the same key chain **will not** cause a fault unless the additional part is **physically held against the transmitter** being used to start the vehicle. Cell phones, pagers, or other RF electronics will not cause interference with this system.

All of the RKE transmitters provided with your new vehicle have been programmed to the vehicle electronics.

Replacement Keys

NOTE: Only RKE transmitters that are programmed to the vehicle electronics can be used to start and operate the vehicle. Once a transmitter is programmed to a vehicle, it cannot be programmed to any other vehicle.

CAUTION!
Always remove the keys from the vehicle and lock all doors when leaving the vehicle unattended.

At the time of purchase, the original owner is provided with a four-digit Personal Identification Number (PIN). Keep the PIN in a secure location. This number is required for authorized dealer replacement of RKE transmitters. Duplication of RKE transmitters may be performed at an authorized dealer or by using the Customer Key Programming procedure. This procedure consists of programming a blank transmitter to the vehicle electronics. A blank transmitter is one that has never been programmed.

NOTE: When having the Sentry Key® Immobilizer system serviced, bring all vehicle RKE transmitters with you to the authorized dealer.

Customer Key Programming

If you have two valid RKE transmitters with integrated keys, you can program new transmitters to the system by performing the following steps:

1. Insert the first valid integrated key into the ignition switch and turn the ignition switch to the ON position for at least three seconds, but no longer than 15 seconds. Turn the ignition switch to the LOCK position and remove the first key.

2. Insert the second valid integrated key and turn the ignition switch to the ON position within 15 seconds. After 10 seconds, a chime will sound and the Vehicle Security Light will begin to flash. Turn the ignition switch to the LOCK position and remove the second key.

3. Insert a blank integrated key into the ignition switch and turn the ignition switch to the ON position within 60 seconds. After 10 seconds, a single chime will sound and the Vehicle Security Light will stop flashing, turn on again for three seconds, and then turn off.

The new integrated key is programmed. **The RKE transmitter will also be programmed during this procedure.**

Repeat this procedure to program up to eight keys. If you do not have a programmed RKE transmitter with integrated key, contact your authorized dealer for details.

NOTE: If a programmed key is lost, see your authorized dealer to have all remaining keys erased from the system's memory. This will prevent the lost key from starting your vehicle. The remaining keys must then be reprogrammed. All vehicle keys must be taken to an authorized dealer at the time of service to be reprogrammed.

General Information

The Sentry Key® system complies with FCC rules Part 15 and with RSS-210 of Industry Canada. Operation is subject to the following conditions:

- This device may not cause harmful interference.
- This device must accept any interference that may be received, including interference that may cause undesired operation.

SECURITY ALARM SYSTEM — IF EQUIPPED

The Vehicle Security Alarm (VSA) system monitors the vehicle doors and liftgate for unauthorized entry and the ignition switch for unauthorized operation. If something triggers the alarm, the system will prevent the vehicle from starting, sound the horn intermittently, flash the headlights and taillights, and flash the Vehicle Security Light in the instrument cluster.

Rearming of the System

If something triggers the alarm, and no action is taken to disarm it, the system will turn off the horn after three minutes, turn off all of the visual signals after 15 minutes, and then the system will rearm itself.

To Arm the System

1. Remove the key from the ignition switch and exit the vehicle.

2. Lock the doors and liftgate by pressing the power door LOCK switch or the LOCK button on the Remote Keyless Entry (RKE) transmitter.

NOTE: The system will not arm if you lock the doors with the manual door LOCK plungers or the door LOCK cylinder on the driver's door.

3. Close all doors. The Vehicle Security Light in the instrument cluster will flash rapidly for about 16 seconds to signal that the system is arming. During this period, opening any door or the liftgate will cancel the arming process. If the system arms successfully, the Vehicle Security Light will flash at a slower rate to indicate the alarm is set.

NOTE: For added security, whenever the Security Alarm is armed, the HomeLink®/Garage Door Opener (if equipped) is disabled as well.

To Disarm the System

Either press the UNLOCK button on the RKE transmitter or insert a valid ignition key into the ignition lock cylinder and turn the key to the ON position.

NOTE:

- Unlocking the doors with the manual door LOCK plungers or the door LOCK cylinder on the driver's door will not disarm the system.
- When the system is armed, the interior power door LOCK switches will not unlock the doors.

The Security Alarm System is designed to protect your vehicle; however, you can create conditions where the system will give you a false alarm. If the previously described arming sequence has occurred, the system will

arm regardless of whether you are inside or outside the vehicle. If you remain inside the vehicle and open a door, the alarm will sound. If this occurs, disarm the system.

Tamper Alert
If something has triggered the alarm in your absence, the horn will sound three times when you unlock the doors. Check the vehicle for tampering.

ILLUMINATED ENTRY SYSTEM

The interior lights will turn on when you press the unlock button on the Remote Keyless Entry (RKE) transmitter or open a door or the liftgate.

This feature also turns on the approach lighting (if so equipped). Refer to "Illumin Approach," under "Personal Settings (Customer Programmable Features)," under "Electronic Vehicle Information Center (EVIC)" in Section 4.

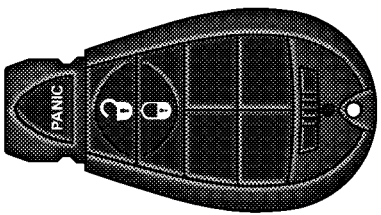
The interior lights will fade to off after about 30 seconds or they will immediately fade to off once the ignition switch is turned ON.

NOTE:
- The illuminated entry system will not operate the interior lights if the Dimmer Control is in the extreme downward (Defeat) position.

REMOTE KEYLESS ENTRY (RKE)

This system allows you to lock or unlock the doors and liftgate or activate the Panic Alarm from distances up to about 35 ft (11 m) using a hand-held radio transmitter. The transmitter need not be pointed at the vehicle to activate the system.

NOTE: Inserting the Fob with Integrated Key into the ignition switch disables all buttons on that transmitter; however, the buttons on the remaining transmitters will continue to work. Driving at speeds 5 mph (8 km/h) and above disables all transmitter buttons for all fobs.



81c6853a

Remote Keyless Entry (RKE) Transmitter

To Unlock the Doors and Liftgate

Press and release the UNLOCK button on the transmitter once to unlock the driver's door, or twice within five seconds to unlock all doors and liftgate. The turn signal lights will flash to acknowledge the unlock signal. The illuminated entry system will also turn on.

Remote Key Unlock, Driver Door/All Doors First

This feature lets you program the system to unlock either the driver's door or all doors on the first press of the UNLOCK button on the transmitter. To change the current setting, proceed as follows:

- For vehicles equipped with the Electronic Vehicle Information Center (EVIC), refer to "RKE Unlock," under "Personal Settings (Customer Programmable Features)," under "Electronic Vehicle Information Center (EVIC)" in Section 4.
- For vehicles not equipped with the EVIC, perform the following steps:

1. Press and hold the LOCK button on a programmed transmitter for at least four seconds, but no longer than 10 seconds. Then, press and hold the UNLOCK button while still holding the LOCK button.
2. Release both buttons at the same time.

3. Test the feature while outside of the vehicle by pressing the LOCK/UNLOCK buttons on the transmitter with the ignition switch in the LOCK position and the key removed.

4. Repeat these steps if you want to return this feature to its previous setting.

NOTE: Pressing the LOCK button on the transmitter while you are inside the vehicle will activate the Security Alarm. Opening a door with the Security Alarm activated will cause the alarm to sound. Press the UNLOCK button to deactivate the Security Alarm.

Flash Lights with Remote Key Lock

This feature will cause the turn signal lights to flash when the doors are locked or unlocked with the transmitter. This feature can be turned on or turned off. To change the current setting, proceed as follows:

- For vehicles equipped with the EVIC, refer to "Flash Light With Lock," under "Personal Settings (Customer Programmable Features)," under "Electronic Vehicle Information Center (EVIC)" in Section 4.
- For vehicles not equipped with the EVIC, perform the following steps:

1. Press and hold the UNLOCK button on a programmed transmitter for at least four seconds, but no longer than 10 seconds. Then, press and hold the LOCK button while still holding the UNLOCK button.

2. Release both buttons at the same time.

3. Test the feature while outside of the vehicle by pressing the LOCK/UNLOCK buttons on the transmitter with the ignition switch in the LOCK position and the key removed.

4. Repeat these steps if you want to return this feature to its previous setting.

NOTE: Pressing the LOCK button on the transmitter while you are in the vehicle will activate the Security Alarm. Opening a door with the Security Alarm activated will cause the alarm to sound. Press the UNLOCK button to deactivate the Security Alarm.

Illuminated Approach — If Equipped
This feature activates the headlights for up to 90 seconds when the doors are unlocked with the transmitter. The time for this feature is programmable on vehicles equipped with the EVIC. Refer to "Illumin Approach," under "Personal Settings (Customer Programmable Features)," under "Electronic Vehicle Information Center (EVIC)" in Section 4.

To Lock the Doors and Liftgate

Press and release the LOCK button on the transmitter to lock all doors and liftgate. The turn signal lights will flash and the horn will chirp to acknowledge the signal.

Sound Horn with Remote Key Lock
This feature will cause the horn to chirp when the doors are locked with the transmitter. This feature can be turned on or turned off. To change the current setting, proceed as follows:

- For vehicles equipped with the EVIC, refer to "Sound Horn with Lock," under "Personal Settings (Customer Programmable Features)," under "Electronic Vehicle Information Center (EVIC)" in Section 4.
- For vehicles not equipped with the EVIC, perform the following steps:

1. Press the LOCK button on a programmed transmitter for at least four seconds, but no longer than 10 seconds. Then, press the PANIC button while still holding the LOCK button.
2. Release both buttons at the same time.

3. Test the feature while outside of the vehicle by pressing the LOCK button on the transmitter with the ignition switch in the LOCK position and the key removed.

4. Repeat these steps if you want to return this feature to its previous setting.

NOTE: Pressing the LOCK button on the transmitter while you are in the vehicle will activate the Security Alarm. Opening a door with the Security Alarm activated will cause the alarm to sound. Press the UNLOCK button to deactivate the Security Alarm.

Using the Panic Alarm

To turn the Panic Alarm feature ON or OFF, press and hold the PANIC button on the transmitter for at least one second and release. When the Panic Alarm is on, the headlights and park lights will flash, the horn will pulse on and off, and the interior lights will turn on.

The Panic Alarm will stay on for three minutes unless you turn it off by either pressing the PANIC button a second time or drive the vehicle at a speed of 15 mph (24 km/h) or greater.

NOTE:

- The interior lights will turn off if you turn the ignition switch to the ACC or ON position while the Panic Alarm is activated. However, the exterior lights and horn will remain on.
- You may need to be less than 35 ft (11 m) from the vehicle when using the transmitter to turn off the Panic Alarm due to the radio frequency noises emitted by the system.

Express Down Window Feature

This feature allows you to remotely lower both front door windows at the same time. To use this feature, press and release the unlock button on the transmitter and then immediately press and hold the unlock button until the windows lower to the level desired or until they lower completely.

Programming Additional Transmitters

Refer to Sentry Key®, "Customer Key Programming." (See page 17 for more information.)

If you do not have a programmed transmitter, contact your authorized dealer for details.

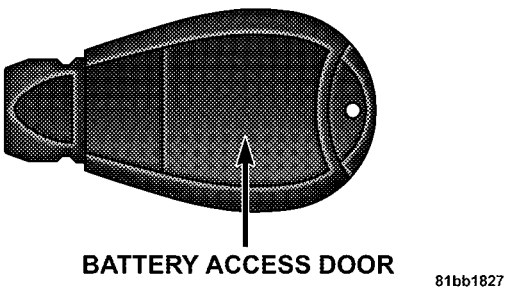
Transmitter Battery Service

The recommended replacement battery is one CR2032 battery.

NOTE:

- Perchlorate Material — special handling may apply. See www.dtsc.ca.gov/hazardouswaste/perchlorate
- Do not touch the battery terminals that are on the back housing or the printed circuit board.

1. Battery access is through a door located on the rear of the fob. Insert a small, flat blade screwdriver into the slot and gently pry open the access door.



Battery Replacement

2. Remove and replace the batteries. Avoid touching the new batteries with your fingers. Skin oils may cause battery deterioration. If you touch a battery, clean it with rubbing alcohol.

3. Reposition the access door panel over the battery opening and snap into place.

General Information

This device complies with Part 15 of the FCC rules and RSS 210 of Industry Canada. Operation is subject to the following conditions:

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.

NOTE: Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

If your RKE transmitter fails to operate from a normal distance, check for these two conditions.

1. A weak battery in the transmitter. The expected life of the battery is a minimum of three years.

2. Closeness to a radio transmitter such as a radio station tower, airport transmitter, and some mobile or CB radios.

REMOTE STARTING SYSTEM — IF EQUIPPED

This system uses the Remote Keyless Entry (RKE) transmitter to start the engine conveniently from outside the vehicle while still maintaining security. The system has a targeted range of 328 ft (100 m).

NOTE: The vehicle must be equipped with an automatic transaxle to be equipped with Remote Start.

How To Use Remote Start

All of the following conditions must be met before the engine will remote start:

- Shift lever in PARK
- Doors closed
- Hood closed
- Liftgate closed
- HAZARD switch off
- BRAKE switch inactive (brake pedal not pressed)
- Ignition key removed from ignition switch
- Battery at an acceptable charge level, and
- RKE PANIC button not pressed.

To Enter Remote Start Mode

Press and release the REMOTE START button on the RKE transmitter twice within five seconds. The parking lights will flash and the horn will honk twice (if programmed). Then, the engine will start and the vehicle will remain in the Remote Start mode for a 15-minute cycle.

NOTE:

- The park lamps will turn on and remain on during Remote Start mode.

- For security, power window and power sunroof operation (if so equipped) are disabled when the vehicle is in the Remote Start mode.
- The engine can be started two consecutive times (two 15-minute cycles) with the RKE transmitter. However, the ignition switch must be cycled to the ON position before you can repeat the start sequence for a third cycle.

To Exit Remote Start Mode without Driving the Vehicle
Allow the engine to run for the entire 15-minute cycle.

To Exit Remote Start Mode and Drive the Vehicle
Before the end of the 15-minute cycle, press and release the UNLOCK button on the RKE transmitter to unlock the doors and disarm the Vehicle Security Alarm (if equipped). Then, insert the key into the ignition switch and turn the switch to the ON position.

NOTE: The ignition switch must be in the ON position in order to drive the vehicle.

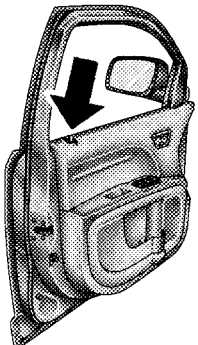
To Turn Off the Engine While in Remote Start Mode
Press and release the REMOTE START button one time.

NOTE: To avoid inadvertent shut downs, the system will disable the one time press of the REMOTE START button for two seconds after receiving a valid Remote Start request.

DOOR LOCKS

Manual Door Locks

To lock each door, push the door lock plunger on each door trim panel downward. To unlock each door, pull the door lock plunger on each door trim panel upward.



Door Lock Plunger

If the door lock plunger is down when you shut the door, the door will lock. Therefore, make sure the key is not inside the vehicle before closing the door.

NOTE: The manual door locks will not lock or unlock the liftgate.

WARNING!

- **For personal security and safety in the event of an accident, lock the vehicle doors before you drive as well as when you park and leave the vehicle.**
- **When leaving the vehicle, always remove the key from the ignition and lock your vehicle. Unsupervised use of vehicle equipment may cause severe personal injuries and death.**
- **Never leave children alone in a vehicle. Leaving unattended children in a vehicle is dangerous for a number of reasons. A child or others could be seriously or fatally injured. Do not leave the key in the ignition. A child could operate power windows, other controls, or move the vehicle.**

Power Door Locks

A power door lock switch is on each front door trim panel. Use this switch to lock or unlock the doors and liftgate.

81d10bf4

Power Door Lock Switch

To prevent you from locking your key in the vehicle, the power door lock switch will not operate when the key is in the ignition and either front door is open. A chime will sound as a reminder to remove the key.

Automatic Door Locks

The doors will lock automatically if all of the following conditions are met:

1. The Automatic Door Locks feature is enabled
2. The transaxle is in gear
3. All doors are closed
4. The throttle is pressed
5. The vehicle speed is above 15 mph (24 km/h), and
6. The doors were not previously locked using the power door lock switch or Remote Keyless Entry (RKE) transmitter

Automatic Door Locks — If Equipped
The auto door lock feature can be enabled or disabled by your authorized dealer. See your authorized dealer for programming.

Automatic Unlock Doors on Exit
The doors will unlock automatically if:

1. The Automatic Unlock Doors On Exit feature is enabled

2. The transaxle was in gear and the vehicle speed returned to 0 mph (0 km/h)

3. The transaxle is in NEUTRAL or PARK

4. The driver's door is opened

5. The doors were not previously unlocked, and

6. The vehicle speed is 0 mph (0 km/h).

Automatic Unlock Doors on Exit Programming
The Automatic Unlock Doors On Exit feature can be enabled or disabled as follows:

- For vehicles equipped with the EVIC, refer to "Personal Settings (Customer Programmable Features)" under "Electronic Vehicle Information Center (EVIC)" in Section 4.
- For vehicles not equipped with the EVIC, perform the following steps:

1. Enter the vehicle and close all doors.

2. Place the key in the ignition switch.

3. Within 15 seconds, cycle the ignition switch between LOCK and ON and then back to LOCK four times ending up in the LOCK position. **However, do not start the engine.**

4. Within 30 seconds, depress the power door unlock switch to unlock the doors.

5. A single chime will indicate the completion of the programming.

NOTE: If you do not hear the chime, it means that the system did not enter the programming mode and you will need to repeat the procedure.

6. Repeat these steps if you want to return this feature to its previous setting.

NOTE: Use the Automatic Unlock Doors On Exit feature in accordance with local laws.

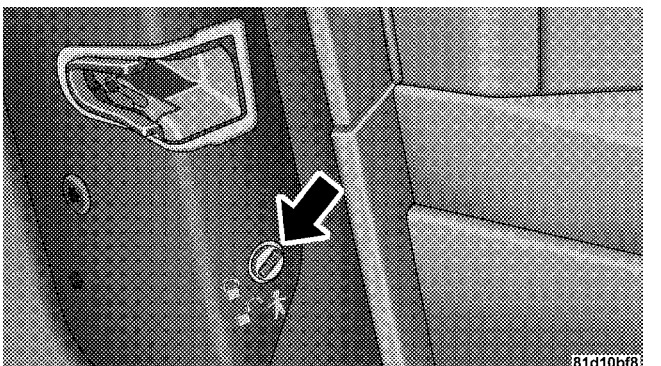
Child Protection Door Lock System (Rear Doors)

To provide a safer environment for small children riding in the rear seats, the rear doors are equipped with a Child Protection Door Lock system.

To Engage the Child Protection Door Lock System

1. Open the rear door.

2. Insert the tip of the valet key (or alike) into the child lock control and rotate it to the LOCK position.



Child Lock Control

3. Repeat Steps 1 and 2 for the opposite rear door.

NOTE: When the Child Protection Door Lock system is engaged, the door can be opened only by using the outside door handle even though the inside door lock is in the unlocked position.

WARNING!

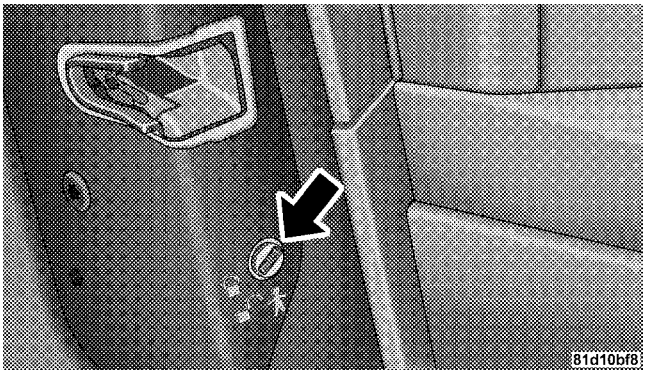
Avoid trapping anyone in a vehicle in a collision. Remember that the rear doors can only be opened from the outside when the child protection locks are engaged. Failure to follow this warning may result in serious injury or death.

NOTE:

- After engaging the Child Protection Door Lock system, always test the door from the inside to make certain it is in the desired position.
- For emergency exit with the system engaged, move the lock plunger up to the UNLOCK position, roll down the window, and open the door with the outside door handle.

To Disengage the Child Protection Door Lock System

1. Open the rear door.
2. Insert the tip of the valet key (or alike) into the child lock control and rotate it to the UNLOCK position.



Child Lock Control

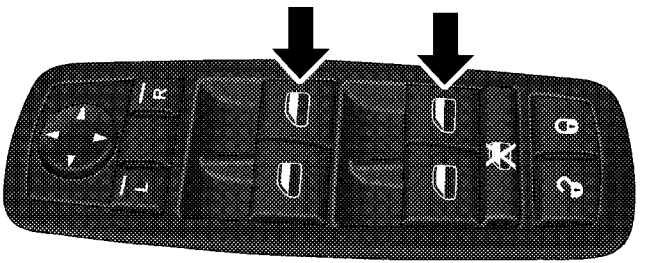
3. Repeat Steps 1 and 2 for the opposite rear door.

NOTE: After disengaging the Child Protection Door Lock system, always test the door from the inside to make certain it is in the desired position.

WINDOWS

Power windows

The window controls on the driver's door trim panel control all of the door windows.



Power Window Switches

There are single window controls on each passenger door trim panel, which operate the passenger door windows. The window controls will operate when the ignition switch is in the ON or ACC position.

NOTE:

- For vehicles not equipped with the Electronic Vehicle Information Center (EVIC), the power window switches will remain active for 45 seconds after the ignition switch is turned to the LOCK position. Opening either front door will cancel this feature.
- For vehicles equipped with the EVIC, the power window switches will remain active for up to 10 minutes after the ignition switch is turned to the LOCK position. Opening either front door will cancel this feature. The time for this feature is programmable. Refer to "Key-Off Power Delay," under "Personal Settings (Customer Programmable Features)" under "Electronic Vehicle Information Center (EVIC)" in Section 4.

WARNING!

Never leave children in a vehicle with the key in the ignition switch. Occupants, particularly unattended children, can become entrapped by the windows while operating the power window switches. Such entrapment may result in serious injury or death.

Auto-Down Feature

The driver's power window switch has an Auto-down feature. Press the window switch past the first detent, release, and the window will go down automatically.

To open the window part way, press the window switch to the first detent and release it when you want the window to stop.

To stop the window from going all the way down during the Auto-down operation, pull up on the switch briefly.

Auto-Up Feature with Anti-Pinch Protection — If Equipped

On some models, the driver's power window switch has an Auto-up feature. Pull the window switch up to the second detent, release, and the window will go up automatically.

To stop the window from going all the way up during the Auto-up operation, push down on the switch briefly.

To close the window part way, pull the window switch up to the first detent and release it when you want the window to stop.

NOTE:

- If the window runs into any obstacle during Auto-closure, it will reverse direction and then stop. Remove the obstacle and use the window switch again to close the window.
- Any impact due to rough road conditions may trigger the auto-reverse function unexpectedly during auto-closure. If this happens, pull the switch lightly to the first detent and hold to close window manually.

WARNING!

There is no anti-pinch protection when the window is almost closed. To avoid personal injury, be sure to clear your arms, hands, fingers, and objects from the window path before closing the window. Such entrapment may result in serious injury.

Window Lockout Switch

The window lockout switch on the driver's door trim panel allows you to disable the window control on the other doors. To disable the window controls, press and release the window lockout button (setting it in the down position). To enable the window controls, press and release the window lockout button again (setting it in the up position).

81d10c04

Window Lockout Switch

Reset

It may be necessary at some point in time to reactivate the Auto-up/Auto-down feature. To do so, perform the following steps:

1. Pull the window switch up to close window completely and continue to hold the switch up for an additional two seconds after the window is closed.

2. Push the window switch down firmly to the second detent to open the window completely and continue to hold the switch down for an additional two seconds after the window is fully open.

Wind Buffeting

Wind buffeting can be described as the perception of pressure on the ears or a helicopter type sound in the ears. Your vehicle may exhibit wind buffeting with the windows down, or the sunroof (if equipped) in certain open or partially open positions. This is a normal occurrence and can be minimized. If the buffeting occurs with

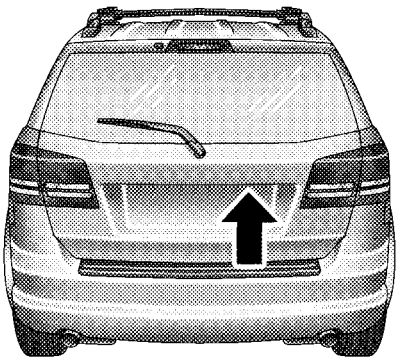
the rear windows open, then open the front and rear windows together to minimize the buffeting. If the buffeting occurs with the sunroof open, adjust the sunroof opening to minimize the buffeting or open any window.

LIFTGATE

The liftgate can be unlocked or locked with the Remote Keyless Entry (RKE) transmitter or by activating the power door lock switch located on either front door trim panel.

NOTE: The liftgate cannot be unlocked or locked with the manual door lock plungers on the door trim panels or the door lock cylinder on the driver's door.

To open the unlocked liftgate, squeeze the handle and pull the liftgate toward you. Gas props will raise and support the liftgate in the open position.



Liftgate Release

NOTE: Because the gas pressure drops with temperature, it may be necessary to assist the props when opening the liftgate in cold weather.

WARNING!

- **Driving with the liftgate open can allow poisonous exhaust gases into your vehicle. These fumes could injure you and your passengers. Keep the liftgate closed when you are operating the vehicle.**
- **If you are required to drive with the liftgate open, make sure that all windows are closed, and the blower switch on the climate control is set at high speed. DO NOT use the recirculation mode.**

OCCUPANT RESTRAINTS

Some of the most important safety features in your vehicle are the restraint systems. The following safety features are standard on your vehicle:

- Front airbags for both the driver and front passenger
- Supplemental side curtain airbags for the driver and passengers seated next to a window
- Supplemental front seat mounted side airbags
- An energy-absorbing steering column and steering wheel
- Knee Bolsters/Blockers for front seat occupants
- Three-point lap and shoulder belts for all seating positions
- Pretensioning and load-limiting retractors for the front seat belts to enhance occupant protection by managing occupant energy during an impact event.
- All seat belt systems (except the driver's and second row center position) include Automatic Locking Retractors (ALRs).

If you will be carrying children too small for adult-size belts, your seat belts or the Lower Anchors and Tether for Children (LATCH) feature can also be used to hold infant and child restraint systems.

Please pay close attention to the information in this section. It tells you how to use your restraint system properly to keep you and your passengers as safe as possible.

WARNING!

In a collision, you and your passengers can suffer much greater injuries if you are not properly buckled up. You can strike the interior of your vehicle or other passengers or you can be thrown out of the vehicle. Always be sure you and others in your vehicle are buckled up properly.

Buckle up even though you are an excellent driver, even on short trips. Someone on the road may be a poor driver and cause a collision that includes you. This can happen far away from home or on your own street.

Research has shown that seat belts save lives, and they can reduce the seriousness of injuries in a collision. Some of the worst injuries happen when people are thrown from the vehicle. Seat belts reduce the possibility of ejection and the risk of injury caused by striking the inside of the vehicle. **Everyone** in a motor vehicle should be belted at all times.

Lap/Shoulder Belts

All seating positions in your vehicle are equipped with lap/shoulder belts.

The belt webbing retractor is designed to lock during very sudden stops or impacts. This feature allows the shoulder part of the belt to move freely with you under normal conditions. However, in a collision, the belt will lock and reduce your risk of striking the inside of the vehicle or being thrown out.

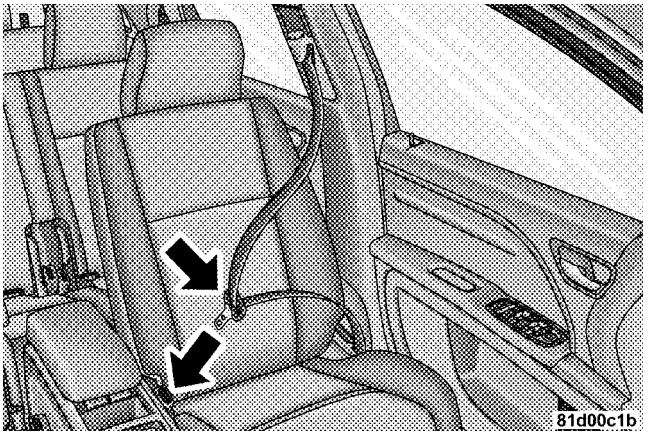
WARNING!

- **It is extremely dangerous to ride in a cargo area, inside or outside of a vehicle. In a collision, people riding in these areas are more likely to be seriously injured or killed.**
- **Do not allow people to ride in any area of your vehicle that is not equipped with seats and seat belts.**
- **Be sure everyone in your vehicle is in a seat and using a seat belt properly.**
- **Wearing a seat belt incorrectly is dangerous. Seat belts are designed to go around the large bones of your body. These are the strongest parts of your body and can take the forces of a collision best.**
- **Wearing your belt in the wrong place could make your injuries in a collision much worse. You might suffer internal injuries, or you could even slide out of part of the belt. Follow these instructions to wear your seat belt safely and to keep your passengers safe, too.**
- **Two people should never be belted into a single seat belt. People belted together can crash into one another in an accident, hurting one another badly. Never use a lap/shoulder belt or a lap belt for more than one person, no matter what their size.**

Lap/Shoulder Belt Operating Instructions

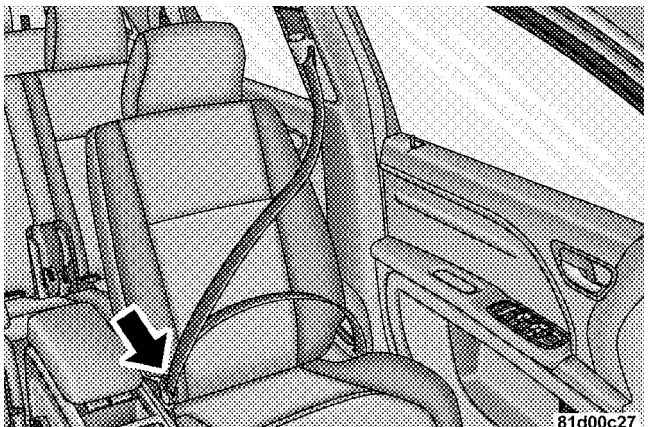
1. Enter the vehicle and close the door. Sit back and adjust the front seat.

2. The seat belt latch plate is along side the pillar near the back of your seat. Grasp the latch plate and pull out the belt. Slide the latch plate up the webbing as far as necessary to make the belt go around your lap.



Pulling Out Lap/Shoulder Belt

3. When the belt is long enough to fit, insert the latch plate into the buckle until you hear a “click.”

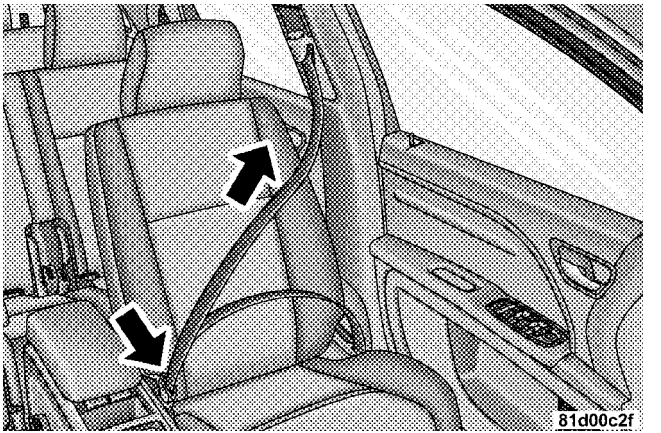


Connecting Latch Plate To Buckle

WARNING!

- **A belt that is buckled into the wrong buckle will not protect you properly. The lap portion could ride too high on your body, possibly causing internal injuries. Always buckle your belt into the buckle nearest you.**
- **A belt that is too loose will not protect you as well. In a sudden stop, you could move too far forward, increasing the possibility of injury. Wear your seat belt snugly.**
- **A belt that is worn under your arm is very dangerous. Your body could strike the inside surfaces of the vehicle in a collision, increasing head and neck injury. A belt worn under the arm can cause internal injuries. Ribs aren’t as strong as shoulder bones. Wear the belt over your shoulder so that your strongest bones will take the force in a collision.**
- **A shoulder belt placed behind you will not protect you from injury during a collision. You are more likely to hit your head in a collision if you do not wear your shoulder belt. The lap and shoulder belt are meant to be used together.**

4. Position the lap belt across your thighs, below your abdomen. To remove slack in the lap belt portion, pull up a bit on the shoulder belt. To loosen the lap belt if it is too tight, tilt the latch plate and pull on the lap belt. A snug belt reduces the risk of sliding under the belt in a collision.



Removing Slack From Belt

WARNING!

• A lap belt worn too high can increase the risk of internal injury in a collision. The belt forces won't be at the strong hip and pelvic bones, but across your abdomen. Always wear the lap belt as low as possible and keep it snug.

• A twisted belt can't do its job as well. In a collision, it could even cut into you. Be sure the belt is straight. If you can't straighten a belt in your vehicle, take it to your authorized dealer and have it fixed.

5. Position the shoulder belt on your chest so that it is comfortable and not resting on your neck. The retractor will withdraw any slack in the belt.

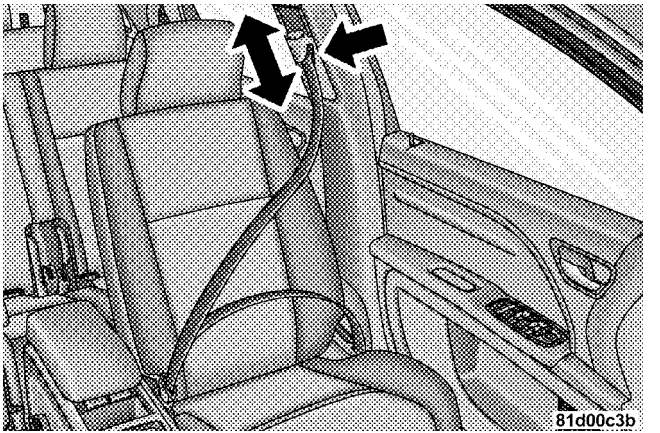
6. To release the belt, push the red button on the buckle. The belt will automatically retract to its stowed position. If necessary, slide the latch plate down the webbing to allow the belt to retract fully.

WARNING!

A frayed or torn belt could rip apart in a collision and leave you with no protection. Inspect the belt system periodically, checking for cuts, frays, or loose parts. Damaged parts must be replaced immediately. Do not disassemble or modify the system. Seat belt assemblies must be replaced after a collision if they have been damaged (bent retractor, torn webbing, etc.).

Adjustable Upper Shoulder Belt Anchorage

In the driver's seat and front passenger's seat, the shoulder belt can be adjusted upward or downward to position the belt away from your neck. Push and fully depress the button above the webbing to release the anchorage, then move it up or down to the position that fits you best.



Adjusting Upper Shoulder Belt

As a guide, if you are shorter than average you will prefer a lower position and if you are taller than average

you will prefer a higher position. When you release the anchorage try to move it up and down to make sure that it is locked in position.

In the rear seat, move toward the center of the seat to position the belt away from your neck.

Lap/Shoulder Belt Untwisting Procedure

Use the following procedure to untwist a twisted lap/shoulder belt.

1. Position the latch plate as close as possible to the anchor point.

2. At about 6 to 12 in (15 to 30 cm) above the latch plate, grasp and twist the belt webbing 180 degrees to create a fold that begins immediately above the latch plate.

3. Slide the latch plate upward over the folded webbing. The folded webbing must enter the slot at the top of the latch plate.

4. Continue to slide the latch plate up until it clears the folded webbing.

Seat Belt Pretensioners

The driver and front passenger's seat belts are equipped with pretensioning devices that are designed to remove any slack from the seat belt systems in the event of a collision. These devices improve the performance of the seat belt by assuring that the belt is tight around the occupant early in a collision. Pretensioners work for all size occupants, including those in child restraints.

NOTE: These devices are not a substitute for proper seat belt placement by the occupant. The seat belt must still be worn snugly and positioned properly.

The pretensioners are triggered by the Occupant Restraint Controller (ORC). Like the front airbags, the pretensioners are single use items. After a collision that is severe enough to deploy the airbags and pretensioners, both must be replaced.

Enhanced Seat Belt Reminder System (BeltAlert®)

If the driver's seat belt has not been buckled within 60 seconds of starting the vehicle and if the vehicle speed is greater than 5 mph (8 km/h), the Enhanced Warning System (BeltAlert®) will alert the driver to buckle the seat belt. The driver should also instruct all other occupants to buckle their seat belts. Once the warning is triggered, the BeltAlert® will continue to chime and flash the Seat Belt Reminder Light for 96 seconds or until the driver's seat belt is buckled. The BeltAlert® will be reactivated if the driver's seat belt is unbuckled for more than 10 seconds and the vehicle speed is greater than 5 mph (8 km/h).

BeltAlert® Programming

The BeltAlert® can be enabled or disabled by your authorized dealer or by performing the following steps:

NOTE: The manufacturer of this vehicle does not recommend deactivating the BeltAlert®.

1. With all doors closed, and the ignition switch in any position except ON or START, buckle the driver's seat belt.

2. Turn the ignition switch to the ON position, (engine does not need to be running). Wait for the Seat Belt Reminder Light to turn off and then proceed to the next step.

NOTE: You must perform the following steps within 60 seconds of turning the ignition switch to the ON position.

3. Unbuckle the driver's seat belt, allow the seat belt to retract, and then re-buckle the driver's seat belt at least three times, ending with the seat belt buckled.

NOTE: Watch for the Seat Belt Reminder Light to turn on while the seat belt retracts and turn off while re-buckling the seat belt. It may be necessary to completely retract the seat belt each time.

4. Turn the ignition switch to the LOCK position. A single chime will sound to signify that you have successfully completed the programming.

The BeltAlert® can be reactivated by repeating this procedure.

NOTE: When the BeltAlert® is deactivated, the Seat Belt Reminder Light will continue to illuminate as long as the driver's seat belt is unbuckled/retracted.

Automatic Locking Mode

In this mode, the shoulder belt is automatically prelocked. However, the belt will still retract to remove slack in the shoulder belt. Use The Automatic Locking mode any time a child safety seat is installed in a seating position that has a seat belt with this feature. Children 12 years old and younger should be properly restrained in the rear seat whenever possible.

How to Engage the Automatic Locking Mode

1. Buckle the combination lap and shoulder belt.

2. Grasp the shoulder portion and pull downward until the entire belt is extracted.

3. Allow the belt to retract. As the belt retracts, you will here a clicking sound. This indicates the safety belt is now in the Automatic Locking mode.

How to Disengage the Automatic Locking Mode

Unbuckle the combination lap and shoulder belt and allow it to retract completely to disengage the Automatic Locking mode and activate the vehicle sensitive (emergency) locking mode.

Seat Belts and Pregnant Women

We recommend that pregnant women use the seat belts throughout their pregnancy. Keeping the mother safe is the best way to keep the baby safe.

Pregnant women should wear the lap part of the belt across the thighs and as snug across the hips as possible. Keep the belt low so that it does not come across the abdomen. That way the strong bones of the hips will take the force if there is a collision.

Seat Belt Extender

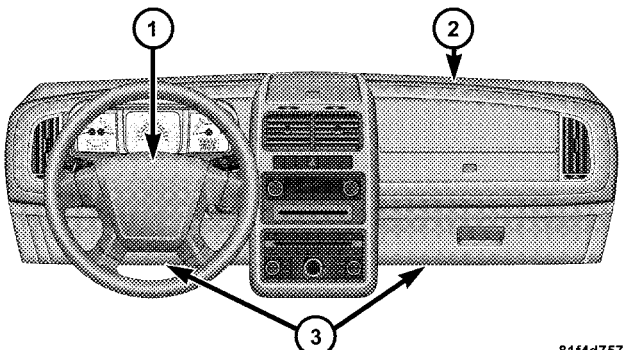
If a seat belt is too short even when fully extended and when the adjustable upper shoulder belt anchorage (if so equipped) is in its lowest position, your authorized dealer can provide you with a seat belt extender. This extender should be used only if the existing belt is not long enough. When it is not required, remove the extender and store it.

WARNING!

Using a seat belt extender when not needed can increase the risk of injury in a collision. Only use when the seat belt is not long enough when it is worn low and snug and in the recommended seating positions. Remove and store the extender when not needed.

Driver and Front Passenger Supplemental Restraint System (SRS) - Airbag

This vehicle has front airbags for both the driver and front passenger as a supplement to the seat belt restraint systems. The driver's airbag is mounted in the center of the steering wheel. The passenger's front airbag is mounted in the top of the instrument panel. The words SRS AIRBAG are embossed on the airbag covers.



1 — Driver's Airbag
2 — Front Passenger's Airbag
3 — Knee Bolsters

NOTE: The front airbags are certified to the Federal regulations that allow less forceful deployment.

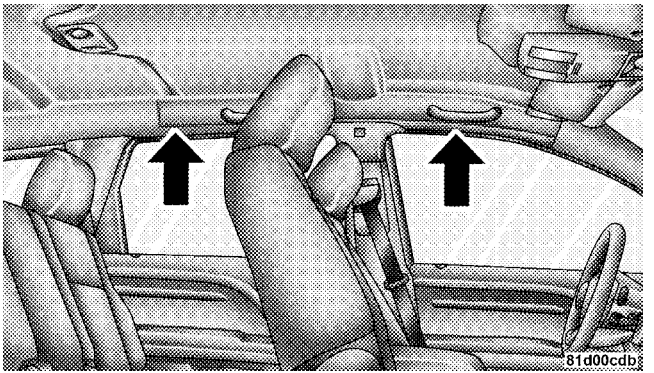
The front airbags have a multistage inflator design. This may allow the airbag to have different rates of inflation that are based on collision severity.

WARNING!

- **Do not put anything on or around the front airbag covers or attempt to open them. You may damage the airbags and you could be injured because the airbags are no longer functional. These protective covers for the airbag cushions are designed to open only when the airbags are inflating.**
- **Do not drill, cut or tamper with the knee bolster in any way.**
- **Do not mount any accessories to the knee bolster such as alarm lights, stereos, citizens band radios etc.**

This vehicle also has supplemental side curtain airbags to protect the driver and passengers sitting next to a window and supplemental front seat mounted side airbags.

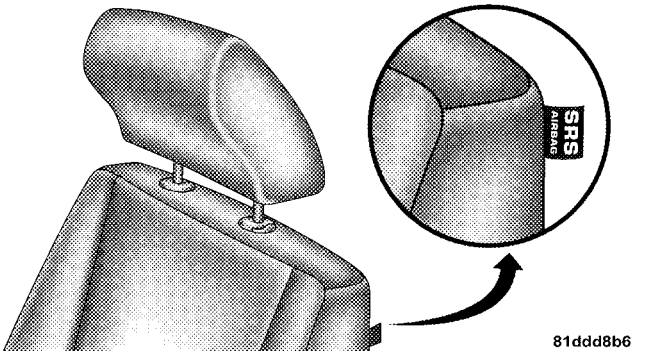
The supplemental side curtain airbags are located above the side windows. Their covers are also labeled SRS AIRBAG.



Supplemental Side Curtain Airbags

NOTE: Airbag covers may not be obvious in the interior trim, but they will open to allow airbag deployment.

The supplemental front seat mounted side airbags are marked with an SRS label sewn into the outboard side of the seat.



Seat Mounted Side Airbag Label

WARNING!

- **Do not stack luggage or other cargo up high enough to block the location of the side curtain airbag. The area where the side curtain airbag is located should remain free from any obstructions. Do not have any accessory items installed which will alter the roof, including adding a sunroof to your vehicle. Do not add roof racks that require permanent attachments (bolts or screws) for installation on the vehicle roof. Do not drill into the roof of the vehicle for any reason.**
- **Do not use accessory seat covers or place objects between you and the supplemental front seat mounted side airbags; the performance could be adversely affected and/or objects could be pushed into you, causing serious injury.**
- **Do not attach cupholders or any other objects on or around the door. The inflating supplemental front seat mounted side airbags could drive the object into occupants, causing serious injury.**

NOTE: Do not use a clothing bar mounted to the coat hooks in this vehicle. A clothing bar will impede the proper performance of the curtain airbags.

Along with the seat belts, front airbags work with the instrument panel knee bolsters to provide improved protection for the driver and front passenger. Side curtain and seat airbags also work with seat belts to improve occupant protection.

While the seat belts are designed to protect you in many types of collisions, the front airbags will deploy in moderate to severe frontal collisions. The supplemental side curtain airbag and supplemental front seat mounted side airbag on the crash side of the vehicle will also trigger in moderate to severe side collisions. However, even in collisions where the airbags deploy, you need the seat belts to keep you in the correct position for the airbags to protect you properly.

Here are some simple steps you can take to minimize the risk of harm from a deploying airbag.

1. Children 12 years old and younger should ride buckled up in the rear seat.

WARNING!

Infants in rear-facing child restraints should NEVER ride in the front seat of a vehicle with a passenger front airbag. An airbag deployment could cause severe injury or death to infants in that position.

2. Children who are not big enough to wear the vehicle seat belt properly should be secured in the rear seat in child restraints or belt-positioning booster seats. (Refer to information on Child Restraint in this section)

3. Older children who do not use child restraints or belt-positioning booster seats should ride properly buckled up in the rear seat. Never allow children to slide the shoulder belt behind them or under their arm.

4. If a child from 1 to 12 years old must ride in the front passenger's seat because the vehicle is crowded, move the seat as far back as possible and use the proper child restraint. (Refer to information on Child Restraint in this section.)

5. You should read the instructions provided with your child restraint to make sure that you are using it properly.

6. All occupants should use their seat belts properly.

7. The driver's seat and front passenger's seat should be moved back as far as practical to allow the airbags time to inflate.

8. Do not lean against the door, as the supplemental side curtain airbags and supplemental front seat mounted side airbags will inflate forcefully into the space between you and the door.

9. If the airbag system in this vehicle needs to be modified to accommodate a disabled person, contact the Customer Center. Phone numbers are provided in the "If You Need Customer Assistance" section.

WARNING!

- **Relying on the airbags alone could lead to more severe injuries in a collision. The airbags work with your seat belt to restrain you properly. In some collisions, the airbags won't deploy at all. Always wear your seat belts even though you have airbags.**
- **Being too close to the steering wheel or instrument panel during airbag deployment could cause serious injury. Airbags need room to inflate. Sit back, comfortably extending your arms to reach the steering wheel or instrument panel.**
- **Supplemental side curtain airbags and supplemental front seat mounted side airbags also need room to inflate. Do not lean against the door or window. Sit upright in the center of the seat.**

Airbag System Components

The airbag system consists of the following:

- Occupant Restraint Controller (ORC)
- Side Remote Pressure and Acceleration Sensors
- Airbag Warning Light
- Driver Airbag
- Front Passenger Airbag
- Supplemental Side Curtain Airbags
- Supplemental Front Seat Mounted Side Airbags
- Steering Wheel and Column
- Instrument Panel
- Interconnecting Wiring
- Seat Belt Reminder Light
- Knee Impact Bolsters
- Front Acceleration Sensors
- Front Seat Belt Retractor Pretensioners
- Front Seat Track Position Sensors

How the Airbag System Works

- The **Occupant Restraint Controller (ORC)** determines if a frontal collision is severe enough to require the airbags to inflate. If airbags are required, the ORC determines the necessary rate of airbag inflation for that event.
- The ORC determines if a side impact is severe enough to deploy the supplemental side curtain airbag and supplemental front seat mounted side airbag.
- The ORC detects rollover.

- The ORC and other systems monitor the readiness of the electronic components whenever the ignition switch is in the START or ON position. These include all of the items listed above except the knee impact bolsters, the instrument panel, and the steering wheel and column. Furthermore, the airbag system is not active if the key is in the LOCK position, the ACC position, or not in the ignition.

- The ORC commands Airbag Warning Light operation. The Airbag Warning Light in the instrument panel turns on for four to six seconds as a self-check when the ignition is first turned on. After the self-check, the light will turn off. If the ORC detects a malfunction in any part of the system, the light will turn on until the malfunction is corrected. A single chime will sound if the light comes on again after initial start-up.

WARNING!

Ignoring the Airbag Warning Light in your instrument panel could mean you won't have the airbags to protect you in a collision. If the light does not come on, stays on after you start the vehicle, or if it comes on as you drive, have the airbag system checked right away.

- The **Driver and Front Passenger Airbag/Inflator Units** are located in the center of the steering wheel and the passenger's side of the instrument panel. When the ORC detects a collision requiring the airbags, it signals the inflator units. A large quantity of nontoxic gas is generated to inflate the front airbags. Different airbag inflation rates may be possible based on collision severity. The steering wheel hub trim cover and the upper passenger's side of the instrument

panel separate and fold out of the way as the bags inflate to their full size. The bags fully inflate in about 50 to 70 ms. This is about half of the time that it takes to blink your eyes. The bags then quickly deflate while helping to restrain the driver and front passenger. The driver's front airbag gas is vented through vent holes in the sides of the airbag. The passenger's front airbag gas is vented through vent holes in the sides of the airbag. In this way, the airbags do not interfere with your control of the vehicle.

- The **Knee Impact Bolsters** help protect the knees of the driver and the front passenger and position everyone for the best interaction with the front airbag.
- The **Supplemental Side Impact SRS Side Curtain Airbags** are designed to activate only in certain side collisions. When the ORC detects a collision requiring the side curtain airbag to inflate, it signals the inflators on the crash side of the vehicle. A quantity of nontoxic gas is generated to inflate the side curtain airbag. The inflating side curtain airbag pushes the outside edge of the headliner out of the way and covers the window. The airbag inflates in about 30 ms (about one-quarter of the time that it takes to blink your eyes) with enough force to injure you if you are not belted and seated properly, or if items are positioned in the area where the side curtain airbag inflates. This especially applies to children. The side curtain airbag is only about 3-1/2 in (9 cm) thick when it is inflated.
- The **Supplemental Front Seat Mounted Side Airbags** are designed to activate only in certain side collisions. When the ORC (with side impact option) detects a collision requiring the front seat mounted side airbag to inflate, it signals the inflators on the crash side of the vehicle. A quantity of nontoxic gas is generated to inflate the front seat mounted side airbag. The inflating front seat mounted side airbag pushes through the seam in the seat's trim cover and opens into the space

between the occupant and the door. The airbag inflates at a very high speed and with enough force to injure you if you are not belted and seated properly, or if items are positioned in the area where the front seat mounted side airbag inflates. This especially applies to children.

The following requirements must be strictly adhered to:

- Do not make any modifications to the front seat components, assembly, or to the seat cover in any way.
- Do not use prior or future model year seat covers not designated for the specific model being repaired. Always use the correct seat cover specified for the vehicle.
- Do not replace the seat cover with an aftermarket seat cover.
- Do not add a secondary seat cover other than those approved by the manufacturer of this vehicle/Mopar®.
- At no time should any supplemental restraint system (SRS) component or SRS-related component or fastener be modified or replaced with any part except those, which are approved by the manufacturer of this vehicle/Mopar®.

WARNING!

Unapproved modifications or service procedures to the front seat assembly, its related components, or seat cover may inadvertently change the airbag deployment in case of a frontal crash. This could result in death or serious injury to the driver or front seat passenger if the vehicle is involved in an accident. A modified vehicle may not comply with required Federal Motor Vehicle Safety Standards (FMVSS).

If a Deployment Occurs

The airbag system is designed to deploy when the ORC detects a moderate to severe collision to help restrain the driver and front passenger and then to immediately deflate.

NOTE: A frontal collision that is not severe enough to need airbag protection will not activate the system. This does not mean something is wrong with the airbag system.

If you do have a collision that deploys the airbags, any or all of the following may occur:

- The nylon airbag material may sometimes cause abrasions and/or skin reddening to the driver and front passenger as the airbags deploy and unfold. The abrasions are similar to friction rope burns or those you might get sliding along a carpet or gymnasium floor. They are not caused by contact with chemicals. They are not permanent and normally heal quickly. However, if you haven't healed significantly within a few days or if you have any blistering, see your doctor immediately.

- As the airbags deflate, you may see some smoke-like particles. The particles are a normal by-product of the process that generates the nontoxic gas used for airbag inflation. These airborne particles may irritate the skin, eyes, nose, or throat. If you have skin or eye irritation, rinse the area with cool water. For nose or throat irritation, move to fresh air. If the irritation continues, see your doctor. If these particles settle on your clothing, follow the garment manufacturer's instructions for cleaning.
- It is not advisable to drive your vehicle after the airbags have been deployed. If you are involved in another collision, the airbags will not be in place to protect you.

WARNING!

Deployed airbags and seat belt pretensioners cannot protect you in another collision. Have the airbags, seat belt pretensioner, and seat belt retractor assembly replaced by an authorized dealer as soon as possible.

Enhanced Accident Response System

In the event of an impact that causes airbag deployment, with the vehicle communication network intact, and the power intact, the Enhanced Accident Response System performs the following functions:

- Cuts off fuel to the engine.
- Flashes hazard lights.

- Turns on the interior lights, which remain on as long as the battery has power or until the ignition key is removed.
- Unlocks the doors automatically.

NOTE: The interior lights can only be deactivated if the key is removed from the ignition switch or the vehicle is driven.

Maintaining Your Airbag System

WARNING!

- **Modifications to any part of the airbag system could cause it to fail when you need it. You could be injured because the airbags are not there to protect you. Do not modify the components or wiring, including adding any kind of badges or stickers to the steering wheel hub trim cover or the upper passenger's side of the instrument panel. Do not modify the front bumper, vehicle body structure, or frame.**
- **You need proper knee impact protection in a collision. Do not mount or locate any aftermarket equipment on or behind the knee impact bolster.**
- **It is dangerous to try to repair any part of the airbag system yourself. Be sure to tell anyone who works on your vehicle that it has airbags.**

NOTE: Perchlorate Material — special handling may apply. See www.dtsc.ca.gov/hazardouswaste/perchlorate.

Airbag Warning Light

You will want to have the airbags ready to inflate for your protection in an impact. While the airbag system is designed to be maintenance free, if any of the following occurs, have an authorized dealer service the system promptly:

- The Airbag Warning Light does not come on or flickers during the four to six seconds when the ignition switch is first turned ON.
- The light remains on or flickers after the four to six second interval.
- The light flickers or comes on and remains on while driving.

Event Data Recorder (EDR)

In the event of an accident, your vehicle is designed to record up to five seconds of specific vehicle data parameters (see the following list) in an event data recorder prior to the moment of airbag deployment, or near deployment, and up to a quarter second of high-speed deceleration data during and/or after airbag deployment. EDR data are ONLY recorded if an airbag deploys, or nearly deploys, and are otherwise unavailable.

NOTE:

1. A near-deployment event occurs when the airbag sensor detects severe vehicle deceleration usually indicative of a crash, but not severe enough to warrant airbag deployment.

2. Under certain circumstances, EDR data may not be recorded (e.g., loss of battery power).

In conjunction with other data gathered during a complete accident investigation, the electronic data may be used by the manufacturer of this vehicle and others to learn more about the possible causes of crashes and associated injuries in order to assess and improve vehicle performance. In addition to crash investigations initiated by the manufacturer of this vehicle, such investigations may be requested by customers, insurance carriers, government officials, and professional crash researchers, such as those associated with universities, and with hospital and insurance organizations.

In the event that an investigation is undertaken by the manufacturer of this vehicle (regardless of initiative), the company or its designated representative will first obtain permission of the appropriate custodial entity for the vehicle (usually the vehicle owner or lessee) before accessing the electronic data stored, unless ordered to download data by a court with legal jurisdiction (i.e., pursuant to a warrant). A copy of the data will be provided to the custodial entity upon request. General data that does not identify particular vehicles or crashes may be released for incorporation in aggregate crash databases, such as those maintained by the U.S. government and various states. Data of a potentially sensitive nature, such as would identify a particular driver, vehicle, or crash, will be treated confidentially. Confidential data will not be disclosed by the manufacturer of this vehicle to any third party except when:

1. Used for research purposes, such as to match data with a particular crash record in an aggregate database, provided confidentiality of personal data is thereafter preserved

2. Used in defense of litigation involving a product of the manufacturer of this vehicle

3. Requested by police under a legal warrant

4. Otherwise required by law

Data Parameters that May Be Recorded:

- Diagnostic trouble code(s) and warning light status for electronically-controlled safety systems, including the airbag system
- Airbag disable light status (if equipped)
- ″Time″ of airbag deployment (in terms of ignition cycles and vehicle mileage)
- Airbag deployment level (if applicable)
- Impact acceleration and angle
- Seat belt status
- Brake status (service and parking brakes)
- Accelerator status (including vehicle speed)
- Engine control status (including engine speed)
- Transaxle gear selection
- Cruise control status
- Traction/stability control status
- Tire Pressure Monitoring System status (if equipped)

Child Restraint

Everyone in your vehicle needs to be buckled up all the time, including babies and children. Every state in the United States and all Canadian provinces require that small children ride in proper restraint systems. This is the law, and you can be prosecuted for ignoring it.

Children 12 years and younger should ride properly buckled up in a rear seat, if available. According to crash statistics, children are safer when properly restrained in the rear seats rather than in the front.

WARNING!

In a collision, an unrestrained child, even a tiny baby, can become a missile inside the vehicle. The force required to hold even an infant on your lap could become so great that you could not hold the child, no matter how strong you are. The child and others could be badly injured. Any child riding in your vehicle should be in a proper restraint for the child's size.

There are different sizes and types of restraints for children from newborn size to the child almost large enough for an adult safety belt. Always check the child seat Owner's Manual to ensure you have the correct seat for your child. Use the restraint that is correct for your child.

Infants and Child Restraints

- Safety experts recommend that children ride rearward-facing in the vehicle until they are at least one year old **and** weigh at least 20 lbs (9 kg). Two types of child restraints can be used rearward-facing, infant carriers and convertible child seats.
- The infant carrier is only used rearward-facing in the vehicle. It is recommended for children who weigh up to about 20 lbs (9 kg). Convertible child seats can be used either rearward-facing or forward-facing in the vehicle. Convertible child seats often have a higher weight limit in the rearward-facing direction than infant carriers do, so they can be used rearward-facing by children who weigh more than 20 lbs (9 kg) but are less than one year old. Both types of child restraints are held in the vehicle by the lap/shoulder belt or the LATCH child restraint anchor system. Refer to

"LATCH — Child Seat Anchor System (Lower Anchors and Tether for CHildren)" in this section.

- Rearward-facing child seats must **NEVER** be used in the front seat of a vehicle with the front passenger airbag unless the airbag is turned off. An airbag deployment could cause severe injury or death to infants in this position.

Older Children and Child Restraints

Children who weigh more than 20 lbs (9 kg) and who are older than one year can ride forward-facing in the vehicle. Forward-facing child seats and convertible child seats used in the forward-facing direction are for children who weigh 20 to 40 lbs (9 to 18 kg) and who are older than one year. These child seats are also held in the vehicle by the lap/shoulder belt or the LATCH child restraint anchorage system. Refer to "LATCH — Child Seat Anchorage System (Lower Anchors and Tether for CHildren)" in this section.

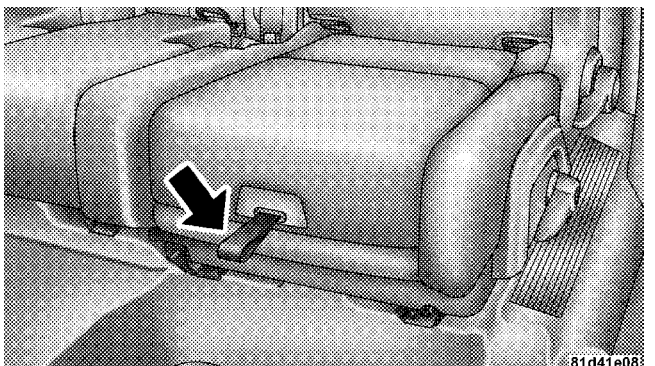
The belt-positioning booster seat is for children weighing more than 40 lbs (18 kg), but who are still too small to fit the vehicle's seat belts properly. If the child cannot sit with knees bent over the vehicle's seat cushion while the child's back is against the seatback, they should use a belt-positioning booster seat. The child and belt-positioning booster seat are held in the vehicle by the lap/shoulder belt.

Integrated Child Booster Seat — If Equipped

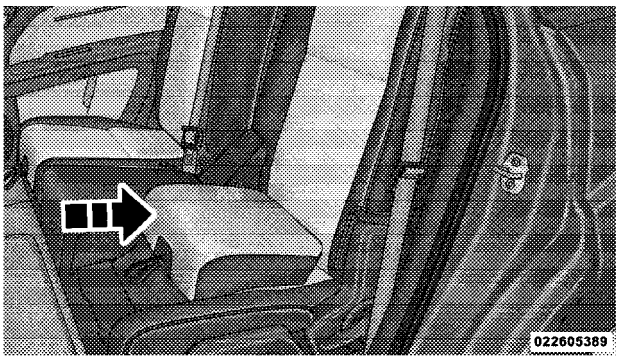
The Integrated Child Booster Seat is located in each outboard second-row passenger seat. The Booster Seat is designed for children weighing between 48 and 85 lbs (22 and 39 kg) and between 47 in (119 cm) and 57 in (145 cm) tall.

To position a child into the Integrated Child Booster Seat follow these steps:

1. Pull the release loop forward to release the latch and seat cushion.



2. Lift the seat cushion up and push back to lock it in the booster seat position.



New Integrated 1

3. Place the child upright in the seat with their back firmly against the seatback.

4. Grasp the latch plate and pull out the seat belt.

5. Slide the latch plate up the webbing as far as necessary to allow the seat belt to go around the child's lap.

NOTE: The lap portion of the seat belt should be low on the hips and as snug as possible.

6. Once the seat belt is long enough to fit properly, insert the latch plate into the buckle until you hear a "click."

7. To remove the slack from the lap belt, pull upward on the shoulder portion of the seat belt.

8. To release the seat belt, push the red button on the buckle.

WARNING!

Be certain that the seat cushion is locked securely into position before using the seat. Otherwise, the seat will not provide the proper stability for child seats and/or passengers. An improperly latched seat cushion could cause serious injury.

Children too Large for Booster Seats

Children who are large enough to wear the shoulder belt comfortably and whose legs are long enough to bend over the front of the seat when their back is against the seatback should use the lap/shoulder belt in a rear seat.

- Make sure that the child is upright in the seat.

- The lap portion should be low on the hips and as snug as possible.
- Check belt fit periodically. A child's squirming or slouching can move the belt out of position.
- If the shoulder belt contacts the face or neck, move the child closer to the center of the vehicle. Never allow a child to put the shoulder belt under an arm or behind their back.

NOTE: For additional information, refer to www.seatcheck.org or call 1–866–SEATCHECK.

WARNING!

- **Improper installation can lead to failure of an infant or child restraint. It could come loose in a collision. The child could be badly injured or killed. Follow the manufacturer's directions exactly when installing an infant or child restraint.**
- **A rearward-facing child restraint should only be used in a rear seat. A rearward-facing child restraint in the front seat may be struck by a deploying passenger airbag, which may cause severe or fatal injury to the infant.**

Here are some tips on getting the most out of your child restraint:

- Before buying any restraint system, make sure that it has a label certifying that it meets all applicable Safety Standards. We also recommend that you make sure that you can install the child restraint in the vehicle where you will use it before you buy it.
- The restraint must be appropriate for your child's weight and height. Check the label on the restraint for weight and height limits.
- Carefully follow the instructions that come with the restraint. If you install the restraint improperly, it may not work when you need it.
- Buckle the child into the seat according to the child restraint manufacturer's directions.
- When your child restraint is not in use, secure it in the vehicle with the seat belt or remove it from the vehicle. Do not leave it loose in the vehicle. In a sudden stop or collision, it could strike the occupants or seatbacks and cause serious personal injury.

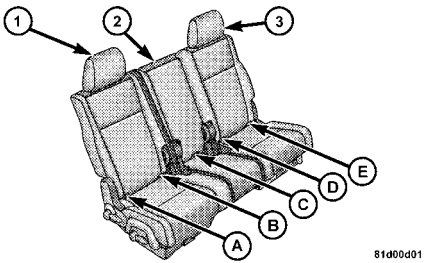
LATCH — Child Seat Anchor System (Lower Anchors and Tether for CHildren)

Your vehicle's second row passenger seats are equipped with the child restraint anchor system called LATCH. The LATCH system provides for the installation of the child restraint without using the vehicle's seat belts, instead securing the child restraint using lower anchors and upper tether straps from the child restraint to the vehicle structure.

LATCH-compatible child restraint systems are now available. However, because the lower anchors are to be introduced over a period of years, child restraint systems having attachments for those anchors will continue to have features for installation using the vehicle's seat belts. Child restraints having tether straps and hooks for

connection to the top tether anchors have been available for some time. For some older child restraints, many child restraint manufacturers offer add-on tether strap kits or retrofit kits. You are urged to take advantage of all the available attachments provided with your child restraint in any vehicle.

All three second-row passenger seating positions have lower anchors that are capable of accommodating LATCH-compatible child seats. You should **NEVER** install LATCH-compatible child seats so that two seats share a common lower anchorage. If installing child seats in adjacent seating positions, or if your child restraints are not LATCH-compatible, install the restraints using the vehicle's seat belts.



Latch Anchorages

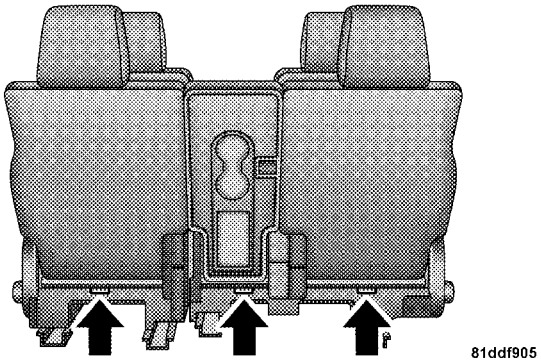
1 — Outer 60% Seating Position. Use Lower Anchor Loops A and B. If placing a second child seat in the vehicle, use the Outer 40% Seating Position and Lower Anchor Loops D and E. DO NOT USE Middle 60% Seating Position and Lower Anchorage Loops B and C.
2 — Middle 60% Seating Position. Use Lower Anchor Loops B and C. If placing a second child seat in the vehicle, use the Outer 40% Seating Position and Lower Anchor Loops D and E. DO NOT USE Outer 60% Seating Position and Lower Anchor Loops A and B.
3 — Outer 40% Seating Position. Use Lower Anchor Loops D and E. If placing a second child seat in the vehicle, use Outer 60% Seating Position and Lower Anchor Loops A and B or Middle 60% Seating Position and Lower Anchor Loops B and C.

Installing the LATCH-Compatible Child Restraint System

We urge you to follow the manufacturer's directions carefully when installing your child restraint. Not all child restraint systems will be installed as described here. Again, carefully follow the installation instructions that are provided with the child restraint system.

The lower anchors are round bars located at the rear of the seat cushion where it meets the seatback and are just visible when you lean into the rear seat to install the child restraint. You will easily feel them if you run your finger along the intersection of the seatback and seat cushion surfaces.

In addition, there are tether strap anchors located behind each rear seatback, near to the floor.



Tether Strap Anchors

Many, but not all restraint systems will be equipped with separate straps on each side, with each having a hook or connector for attachment to the lower anchor and a means of adjusting the tension in the strap. Forward-facing toddler restraints and some rear-facing infant restraints will also be equipped with a tether strap, a

hook for attachment to the tether strap anchor and a means of adjusting the tension of the strap.

You will first loosen the adjusters on the lower straps and on the tether strap so that you can more easily attach the hooks or connectors to the vehicle anchors. Next, attach the lower hooks or connectors over the top of the seatcover material. Then attach the tether strap to the anchor directly behind the seat where you are placing the child restraint, being careful to route the tether strap to provide the most direct path between the anchor and the child restraint, preferably between the head restraint posts underneath the head restraint. Finally, tighten all three straps as you push the child restraint rearward and downward into the seat, removing slack in the straps according to the child restraint manufacturer's instructions.

NOTE:

- Ensure that the tether strap does not slip into the opening between the seatbacks as you remove slack in the strap.
- When using the LATCH attaching system to install a child restraint, please ensure that all seat belts not being used for occupant restraints are stowed and out of reach of children. It is recommended that before installing the child restraint, buckle the seat belt so the seat belt is tucked behind the child restraint. This should stow the seat belt out of the reach of an inquisitive child. Remind all children in the vehicle that the seat belts are not toys and that they should not play with them. In addition, never leave unattended children in the vehicle.

WARNING!

Improper installation of a child restraint to the LATCH anchorages can lead to failure of an infant or child restraint. The child could be badly injured or killed. Follow the manufacturer's directions exactly when installing an infant or child restraint.

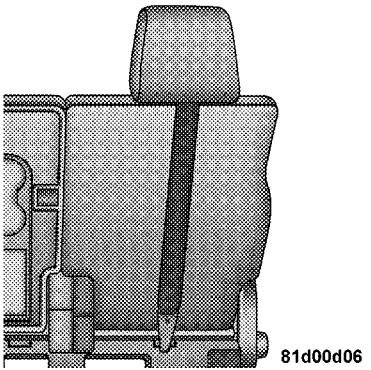
Installing Child Restraints Using the Vehicle Seat Belt

The seat belts in the passenger seating positions are equipped with either an Automatic Locking Retractor (ALR) or a cinching latch plate or both. Both types of seat belts are designed to keep the lap portion of the seat belt tight around the child restraint so that it is not necessary to use a locking clip. The ALR will make a ratcheting noise if you extract the entire belt from the retractor and then allow the belt to retract into the retractor. For additional information on ALR, refer to "Automatic Locking Mode" in this section.

To install a child restraint, first, pull enough of the seat belt webbing from the retractor to route it through the belt path of the child restraint and slide the latch plate into the buckle. Next, extract all the seat belt webbing out of the retractor and then allow the belt to retract into the retractor. Finally, pull on any excess webbing to tighten the lap portion around the child restraint. Any seat belt system will loosen with time, so check the belt occasionally, and pull it tight if necessary.

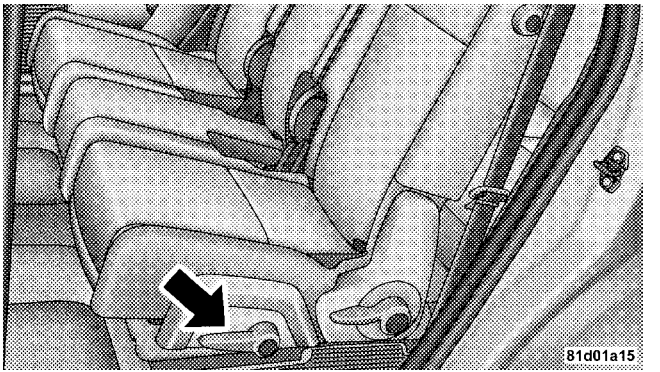
To attach a child restraint tether strap:

- Route the tether strap to provide the most direct path for the strap between the anchor and the child seat, preferably between the head restraint posts underneath the head restraint.



Tether Strap Mounting

• If necessary, move the seat forward to provide better access to the tether anchor.



Seat Track Release Lever

• Attach the tether strap hook of the child restraint to the tether anchor and remove slack in the tether strap according to the child restraint manufacturer's instructions.

NOTE: Ensure that the tether strap does not slip into the opening between the seatbacks as you remove slack in the strap.

WARNING!

An incorrectly anchored tether strap could lead to increased head motion and possible injury to the child. Use only the anchor positions directly behind the child seat to secure a child restraint top tether strap.

Transporting Pets

Airbags deploying in the front seat could harm your pet. An unrestrained pet will be thrown about and possibly injured, or injure a passenger during panic braking or in a collision.

Pets should be restrained in the rear seat in pet harnesses or pet carriers that are secured by seat belts.

ENGINE BREAK-IN RECOMMENDATIONS

A long break-in period is not required for the engine in your vehicle.

Drive moderately during the first 300 mi (500 km). After the initial 60 mi (100 km), speeds up to 50 or 55 mph (80 or 90 km/h) are desirable.

While cruising, brief full-throttle acceleration, within the limits of local traffic laws, contributes to a good break-in. Wide-open throttle acceleration in low gear can be detrimental and should be avoided.

The engine oil installed in the engine at the factory is a high-quality energy-conserving type lubricant. Oil changes should be consistent with anticipated climate conditions under which vehicle operations will occur. For the recommended viscosity and quality grades, refer to

"Maintenance Procedures" in Section 7. NON-DETERGENT OR STRAIGHT MINERAL OILS MUST NEVER BE USED.

A new engine may consume some oil during its first few thousand miles (kilometers) of operation. This should be considered as a normal part of the break-in and not interpreted as an indication of difficulty.

SAFETY TIPS

Transporting Passengers

NEVER TRANSPORT PASSENGERS IN THE CARGO AREA.

WARNING!

- **It is extremely dangerous to ride in a cargo area, inside or outside of a vehicle. In a collision, people riding in these areas are more likely to be seriously injured or killed.**
- **Do not allow people to ride in any area of your vehicle that is not equipped with seats and seat belts.**
- **Be sure everyone in your vehicle is in a seat and using a seat belt properly.**
- **On seven passenger models, do not drive the vehicle with the second row passenger seat in the easy entry/exit position (seat cushion flipped upward and seat moved forward), as this position is only intended for entering and exiting the third row seats. Failure to follow this warning may result in personal injury.**
- **On seven passenger models, do not allow a passenger to sit in a third row seat with the second row seat-back(s) folded flat. In a collision, the passenger could slide underneath the seat belt and be seriously or even fatally injured.**

Lock Your Vehicle

Always remove the key from the ignition and lock all doors when leaving the vehicle unattended, even in your own driveway or garage. Try to park your vehicle in a well-lit area and never invite theft by leaving articles of value exposed.

Exhaust Gas

WARNING!

- **Exhaust gases can injure or kill. They contain carbon monoxide (CO), which is colorless and odorless. Breathing it can make you unconscious and can eventually poison you. To avoid breathing CO follow these safety tips:**

Do not run the engine in a closed garage or in confined areas any longer than needed to move your vehicle in or out of the area.

If it is necessary to sit in a parked vehicle with the engine running, adjust your heating or cooling controls to force outside air into the vehicle. Set the blower at high speed.

If you are required to drive with the liftgate open, make sure that all windows are closed, and the blower switch on the climate control is set at high speed. DO NOT use the recirculation mode.

The best protection against carbon monoxide entry into the vehicle body is a properly maintained engine exhaust system.

Whenever a change is noticed in the sound of the exhaust system, when exhaust fumes can be detected inside the vehicle, or when the underside or rear of the vehicle is damaged, have a competent mechanic inspect the complete exhaust system and adjacent body areas for broken, damaged, deteriorated, or mispositioned parts. Open seams or loose connections could permit exhaust fumes to seep into the passenger compartment. In addition, inspect the exhaust system each time the vehicle is raised for lubrication or oil change. Replace as required.

Safety Checks You Should Make Inside The Vehicle

Seat Belts

Inspect the seat belt system periodically, checking for cuts, frays, and loose parts. Damaged parts must be replaced immediately. Do not disassemble or modify the system.

Front seat belt assemblies must be replaced after a collision. Rear seat belt assemblies must be replaced after a collision if they have been damaged (i.e., bent retractor, torn webbing, etc.). If there is any question regarding belt or retractor condition, replace the seat belt.

Airbag Warning Light

The light should turn on and remain on for four to six seconds as a bulb check when the ignition switch is first turned ON. If the light is not lit during starting, or if the light stays on, flickers, or turns on while driving, have the system checked by an authorized dealer.

Defroster

Check operation by selecting the defrost mode and place the blower control on high speed. You should be able to feel the air directed against the windshield. See your authorized dealer for service if your defroster is inoperable.

Periodic Safety Checks You Should Make Outside The Vehicle

Tires
Examine tires for excessive tread wear and uneven wear patterns. Check for stones, nails, glass, or other objects lodged in the tread. Inspect the tread and sidewall for cuts and cracks. Check the wheel nuts for tightness. Check the tires (including spare) for proper pressure.

Lights
Have someone observe the operation of exterior lights while you work the controls. Check Turn Signal and High Beam Indicator Lights on the instrument panel.

Door Latches
Check for positive closing, latching, and locking.

Fluid Leaks
Check area under vehicle after overnight parking for fuel, engine coolant, oil, or other fluid leaks. Also, if gasoline fumes are detected or if fuel, power steering fluid, or brake fluid leaks are suspected, the cause should be located and corrected immediately.

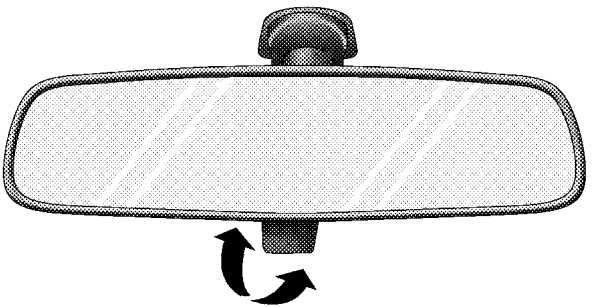
MIRRORS

Inside Day/Night Mirror

Adjust the mirror to center on the view through the rear window. A two-point pivot system allows for horizontal and vertical mirror adjustment.

Annoying headlight glare can be reduced by moving the small control under the mirror to the night position (toward the rear of the vehicle). The mirror should be adjusted while set in the day position (toward the windshield).

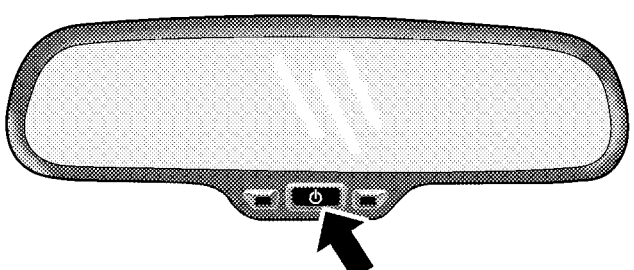


81f4d4ad

Manual Rearview Mirror

Automatic Dimming Inside Mirror — If Equipped

This mirror automatically adjusts for annoying headlight glare from vehicles behind you. You can turn the feature on or off by pressing the button at the base of the mirror. A light will illuminate next to the switch when the automatic dimming feature is activated.



81f1be98

Automatic Dimming Mirror

CAUTION!

To avoid damage to the mirror during cleaning, never spray any cleaning solution directly onto the mirror. Apply the solution onto a clean cloth and wipe the mirror clean.

Outside Mirrors

To receive maximum benefit, adjust the outside mirror(s) to center on the adjacent lane of traffic and a slight overlap of the view obtained from the inside mirror.

NOTE: The passenger-side convex outside mirror will give a much wider view to the rear, and especially of the lane next to your vehicle.

WARNING!

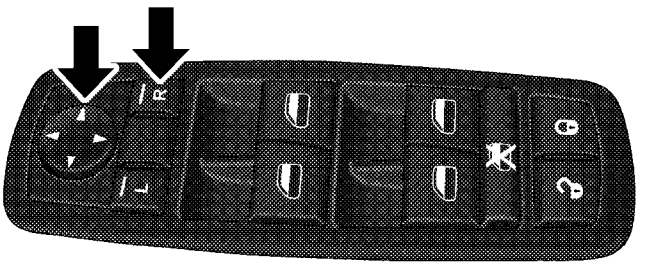
Vehicles and other objects seen in the passenger-side convex mirror will look smaller and farther away than they really are. Relying too much on your passenger-side convex mirror could cause you to collide with another vehicle or other object. Use your inside mirror when judging the size or distance of a vehicle seen in the passenger-side convex mirror. Failure to follow this warning may result in serious injury or death.

Outside Mirrors Folding Feature — If Equipped

Some models have exterior mirrors that are hinged. The hinge allows the mirror to pivot forward and rearward to resist damage. The hinge has three detent positions: forward, rearward, and normal.

Power Remote Control Mirrors

The power MIRROR switch is located on driver's door trim panel.



81d10e01

Power MIRROR Switches

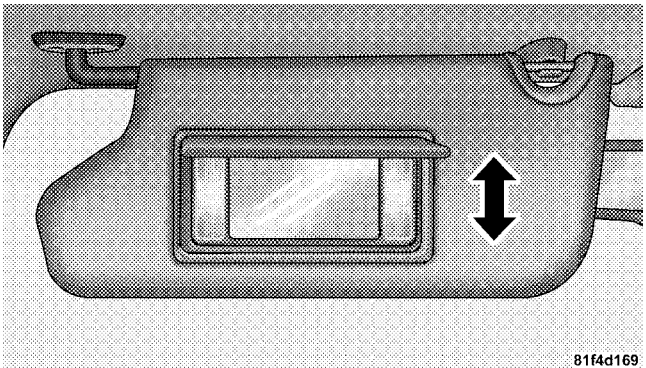
Models without Express Window Feature

Press the mirror SELECT button marked L or R and then press one of the four arrow buttons to move the mirror in the direction the arrow is pointing.

Models with Express Window Feature
Press and release the mirror SELECT button marked L or R and then press one of the four arrow buttons to move the mirror in the direction the arrow is pointing. The selection times out after 30 seconds of inactivity in order to guard against accidentally changing a mirror position following an adjustment.

Heated Remote Control Mirrors — If Equipped
These mirrors are heated to melt frost or ice. This feature is activated whenever you turn on the Electric Rear Window Defroster.

Illuminated Vanity Mirrors — If Equipped
An illuminated vanity mirror is on each sun visor. To use the mirror, rotate the sun visor downward and swing the mirror cover upward. The light will turn on automatically. Closing the mirror cover will turn off the light.



Illuminated Vanity Mirror

Sun Visor "Slide-On Rod" Feature — If Equipped
This feature allows for additional flexibility in positioning the visor to block out the sun.

1. Fold down the sun visor.
2. Unclip the visor from the center clip.

3. Pull the sun visor toward the inside rearview mirror to extend it.

PARKVIEW® REAR BACKUP CAMERA — IF EQUIPPED

The Parkview® Rear Backup Camera captures live video of the area behind the vehicle. The live video displays on the radio's display screen when backing up your vehicle.

NOTE: Refer to "Setting Display Properties," under "System Settings" in the Navigation User's Manual for navigation screen brightness adjustment instructions.

To operate the Rear Backup Camera:

1. Start the engine.
2. Move the shift lever into REVERSE.
3. Wait one to two seconds and the video will display on the radio's display screen.

NOTE: The video will only display while the shift lever is in REVERSE.

WARNING!

Drivers must be careful when backing up a vehicle, even when using the Rear Backup Camera. Always check carefully for pedestrians, animals, other vehicles, obstructions, and blind spots before backing up a vehicle. You are responsible for the safety of your surroundings and must continue to pay attention while backing up a vehicle. Failure to do so can result in serious injury or death.

CAUTION!

- **To avoid vehicle damage, only use the Rear Backup Camera as a parking aid, as the camera is unable to capture every obstacle or object in your drive path.**
- **To avoid vehicle damage, drive slowly when backing up a vehicle so that you can stop in time when an obstacle comes into view. It is recommended that the driver look frequently over their shoulder when backing up a vehicle.**

NOTE: If snow, ice, mud, or anything else builds up on the camera lens, clean the lens, rinse with water, and dry with a soft cloth. Do not cover the lens.

HANDS-FREE COMMUNICATION (UConnect®) — IF EQUIPPED

NOTE: The sales code RER, REN and REU radios contain an integrated Hands-Free Communication (UConnect®) system. Refer to your "Navigation User's Manual" for UConnect® system operating instructions for these radios.

UConnect® is a voice-activated, hands-free, in-vehicle communications system. UConnect® allows you to dial a phone number with your cellular phone using simple voice commands (e.g., "Call" ... "Mike" ..."Work" or "Dial" ... "248-555-1212"). Your cellular phone's audio is transmitted through your vehicle's audio system; the system will automatically mute your radio when using the UConnect® system.

NOTE: The UConnect® system requires a cellular phone equipped with the Bluetooth® "Hands-Free Profile," Version 0.96 or higher. See the UConnect® website for supported phones.

NOTE: For UConnect® customer support, visit the following websites:

- www.chrysler.com/uconnect
- www.dodge.com/uconnect
- www.jeep.com/uconnect
- or call 1–877–855–8400

UConnect® allows you to transfer calls between the system and your cellular phone as you enter or exit your vehicle and enables you to mute the system's microphone for private conversation.

The UConnect® phonebook enables you to store up to 32 names, with four numbers per name. Each language has a separate 32-name phonebook accessible only in that language. This system is driven through your Bluetooth® "Hands-Free profile" cellular phone. UConnect® features Bluetooth® technology - the global standard that enables different electronic devices to connect to each other without wires or a docking station, so UConnect® works no matter where you stow your cellular phone (be it your purse, pocket, or briefcase), as long as your phone is turned on and has been paired to the vehicle's UConnect® system. The UConnect® system allows up to seven cellular phones to be linked to the system. Only one linked (or paired) cellular phone can be used with the system at a time. The system is available in English, Spanish, or French languages.

Phone Button

The rearview mirror contains the microphone for the system (depending on the type of mirror and radio equipped), and either the radio or the mirror has the two control buttons (PHONE Button and VOICE RECOGNITION button) that will enable you to access the system.

Voice Recognition Button

Actual button location may vary with radio. The individual buttons are described in the "Operation" section.

The UConnect® system can be used with any Hands-Free Profile certified Bluetooth® cellular phone. See the UConnect® website for supported phones. If your cellular phone supports a different profile (e.g., Headset Profile) you may not be able to use any UConnect® features. Refer to your cellular service provider or the phone manufacturer for details.

The UConnect® system is fully integrated with the vehicle's audio system. The volume of the UConnect® system can be adjusted either from the radio volume control knob or from the steering wheel radio control (right switch), if so equipped.

The radio display will be used for visual prompts from the UConnect® system such as "CELL" or caller ID on certain radios.

Operation

Voice commands can be used to operate the UConnect® system and to navigate through the UConnect® menu structure. Voice commands are required after most UConnect® system prompts. You will be prompted for a specific command and then guided through the available options.

- Prior to giving a voice command, one must wait for the beep, which follows the "Ready" prompt or another prompt.

- For certain operations, compound commands can be used. For example, instead of saying "Setup" and then "Phone Pairing," the following compound command can be said: "Setup Phone Pairing."
- For each feature explanation in this section, only the combined form of the voice command is given. You can also break the commands into parts and say each part of the command when you are asked for it. For example, you can use the combined form voice command "Phonebook New Entry," or you can break the combined form command into two voice commands: "Phonebook" and "New Entry." Please remember, the UConnect® system works best when you talk in a normal conversational tone, as if speaking to someone sitting a few feet/meters away from you.

Voice Command Tree
Refer to "Voice Tree" in this section.

Help Command
If you need assistance at any prompt, or if you want to know your options at any prompt, say "Help" following the beep. The UConnect® system will play all the options at any prompt if you ask for help.

To activate the UConnect® system from idle, simply press the PHONE button and follow the audible prompts for directions. All UConnect® system sessions begin with a press of the PHONE button on the radio control head.

Cancel Command
At any prompt, after the beep, you can say "Cancel" and you will be returned to the main menu. However, in a few instances the system will take you back to the previous menu.

Pair (Link) UConnect® System to a Cellular Phone
To begin using your UConnect® system, you must pair your compatible Bluetooth® enabled cellular phone.

To complete the pairing process, you will need to reference your cellular phone Owner's Manual. The UConnect® website may also provide detailed instructions for pairing.

The following are general phone to UConnect® system pairing instructions:

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Setup Phone Pairing."
- When prompted, after the beep, say "Pair a Phone" and follow the audible prompts.
- You will be asked to say a four-digit Personal Identification Number (PIN), which you will later need to enter into your cellular phone. You can enter any four-digit PIN. You will not need to remember this PIN after the initial pairing process.
- For identification purposes, you will be prompted to give the UConnect® system a name for your cellular phone. Each cellular phone that is paired should be given a unique phone name.
- You will then be asked to give your cellular phone a priority level between 1 and 7, with 1 being the highest priority. You can pair up to seven cellular phones to your UConnect® system. However, at any given time, only one cellular phone can be in use, connected to your UConnect® system. The priority allows the UConnect® system to know which cellular phone to use if multiple cellular phones are in the vehicle at the same time. For example, if priority 3 and priority 5 phones are present in the vehicle, the UConnect® system will use the priority 3 cellular phone when you make a call. You can select to use a lower priority cellular phone at any time (refer to "Advanced Phone Connectivity" in this section).

Dial by Saying a Number

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Dial."
- The system will prompt you to say the number you want to call.
- For example, you can say "234-567-8901." The phone number that you enter must be of valid length and combination. Based on the country in which the vehicle was purchased, the UConnect® system limits the user from dialing an invalid combination of numbers. For example, in the U.S., 234-567-890 is nine digits long, which is not a valid U.S. phone number - the closest valid phone number has 10 digits.
- The UConnect® system will confirm the phone number and then dial. The number will appear in the display of certain radios.

Call by Saying a Name

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Call."
- The system will prompt you to say the name of the person you want to call.
- After the "Ready" prompt and the following beep, say the name of the person you want to call. For example, you can say "John Doe," where John Doe is a previously stored name entry in the UConnect® phonebook. To learn how to store a name in the phonebook, refer to "Add Names to Your UConnect® Phonebook," in this section.
- The UConnect® system will confirm the name and then dial the corresponding phone number, which may appear in the display of certain radios.

Add Names to Your UConnect® Phonebook

NOTE: Adding names to the phonebook is recommended when the vehicle is not in motion.

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Phonebook New Entry."
- When prompted, say the name of the new entry. Use of long names helps the voice recognition and it is recommended. For example, say "Robert Smith" or "Robert" instead of "Bob."
- When prompted, enter the number designation (e.g., "Home," "Work," "Mobile," or "Pager"). This will allow you to store multiple numbers for each phonebook entry, if desired.
- When prompted, recite the phone number for the phonebook entry that you are adding.

After you are finished adding an entry into the phonebook, you will be given the opportunity to add more phone numbers to the current entry or to return to the main menu.

The UConnect® system will allow you to enter up to 32 names in the phonebook with each name having up to four associated phone numbers and designations. Each language has a separate 32-name phonebook accessible only in that language.

Phonebook Download

UConnect® allows the user to download entries from their phone via Bluetooth®. To use this feature, press the PHONE button and say "Phonebook Download." The system prompts, "Ready to accept "V" card entry via Bluetooth®…" The system is now ready to accept phonebook entries from your phone using the Bluetooth®

Object Exchange Profile (OBEX). Please see your phone Owner's Manual for specific instructions on how to send these entries from your phone.

NOTE:

- The phone handset must support Bluetooth® OBEX transfers of phonebook entries to use this feature.
- Some phones cannot send phonebook entries if they are already connected to any system via Bluetooth®, and you may see a message on the phone display that the Bluetooth® link is busy. In this case, the user must first disconnect or drop the Bluetooth® connection to the UConnect® system, and then send the address book entry via Bluetooth®. Please see your phone Owner's Manual for specific instructions on how to drop the Bluetooth® connection.
- If the phonebook entry is longer than 24 characters, it will only use the first 24 characters.

Edit Entries in the UConnect® Phonebook

NOTE: Editing names in the phonebook is recommended when the vehicle is not in motion.

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Phonebook Edit."
- You will then be asked for the name of the phonebook entry that you wish to edit.
- Next, choose the number designation (home, work, mobile, or pager) that you wish to edit.
- When prompted, recite the new phone number for the phonebook entry that you are editing.

After you are finished editing an entry in the phonebook, you will be given the opportunity to edit another entry in the phonebook, call the number you just edited, or return to the main menu.

"Phonebook Edit" can be used to add another phone number to a name entry that already exists in the phonebook. For example, the entry John Doe may have a mobile and a home number, but you can add "John Doe's" work number later using the "Phonebook Edit" feature.

Delete Entries in the UConnect® Phonebook

NOTE: Editing phonebook entries is recommended when the vehicle is not in motion.

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Phonebook Delete."
- After you enter the Phonebook Delete menu, you will then be asked for the name of the entry that you wish to delete. You can either say the name of a phonebook entry that you wish to delete or you can say "List Names" to hear a list of the entries in the phonebook from which you choose. To select one of the entries from the list, press the "Voice Recognition" button while the UConnect® system is playing the desired entry and say "Delete."
- After you enter the name, the UConnect® system will ask you which designation you wish to delete: home, work, mobile, pager, or all. Say the designation you wish to delete.
- Note that only the phonebook entry in the current language is deleted.

Delete All Entries in the UConnect® Phonebook

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Phonebook Erase All."
- The UConnect® system will ask you to verify that you wish to delete all the entries from the phonebook.

- After confirmation, the phonebook entries will be deleted.
- Note that only the phonebook in the current language is deleted.

List All Names in the UConnect® Phonebook

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Phonebook List Names."
- The UConnect® system will play the names of all the phonebook entries.
- To call one of the names in the list, press the "Voice Recognition" button during the playing of the desired name, and say "Call."

NOTE: The user can also exercise "Edit" or "Delete" operations at this point.

- The UConnect® system will then prompt you as to the number designation you wish to call.
- The selected number will be dialed.

Phone Call Features

The following features can be accessed through the UConnect® system if the feature(s) are available on your cellular service plan. For example, if your cellular service plan provides three-way calling, this feature can be accessed through the UConnect® system. Check with your cellular service provider for the features that you have.

Answer or Reject an Incoming Call - No Call Currently in Progress

When you receive a call on your cellular phone, the UConnect® system will interrupt the vehicle audio system, if on, and will ask if you would like to answer the call. Press the PHONE button to accept the call. To reject

the call, press and hold the PHONE button until you hear a single beep, indicating that the incoming call was rejected.

Answer or Reject an Incoming Call - Call Currently in Progress

If a call is currently in progress and you have another incoming call, you will hear the same network tones for call waiting that you normally hear when using your cell phone. Press the PHONE button to place the current call on hold and answer the incoming call.

NOTE: The UConnect® system compatible phones in the market today do not support rejecting an incoming call when another call is in progress. Therefore, the user can only answer an incoming call or ignore it.

Making a Second Call While Current Call in Progress

To make a second call while you are currently on a call, press the "Voice Recognition" button and say "Dial" or "Call" followed by the phone number or phonebook entry you wish to call. The first call will be on hold while the second call is in progress. To go back to the first call, refer to "Toggling Between Calls" in this section. To combine two calls, refer to "Conference Call" in this section.

Place/Retrieve a Call From Hold

To put a call on hold, press the PHONE button until you hear a single beep. This indicates that the call is on hold. To bring the call back from hold, press and hold the PHONE button until you hear a single beep.

Toggling Between Calls

If two calls are in progress (one active and one on hold), press the PHONE button until you hear a single beep, indicating that the active and hold status of the two calls have switched. Only one call can be placed on hold at one time.

Conference Call
When two calls are in progress (one active and one on hold), press and hold the PHONE button until you hear a double beep indicating that the two calls have been joined into one conference call.

Three-Way Calling
To initiate three-way calling, press the "Voice Recognition" button while a call is in progress, and make a second phone call, as described under "Making a Second Call While Current Call in Progress." After the second call has established, press and hold the PHONE button until you hear a double beep, indicating that the two calls have been joined into one conference call.

Call Termination
To end a call in progress, momentarily press the PHONE button. Only the active call(s) will be terminated and if there is a call on hold, it will become the new active call. If the active call is terminated by the far end, a call on hold may not become active automatically. This is cell phone-dependent. To bring the call back from hold, press and hold the PHONE button until you hear a single beep.

Redial

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Redial."
- The UConnect® system will call the last number that was dialed from your cellular phone.

NOTE: This may not be the last number dialed from the UConnect® system.

Call Continuation
Call continuation is the progression of a phone call on the UConnect® system after the vehicle ignition key has been switched to OFF. Call continuation functionality available on the vehicle can be any one of three types:

- After the ignition key is switched to OFF, a call can continue on the UConnect® system either until the call ends, or until the vehicle battery condition dictates cessation of the call on the UConnect® system and transfer of the call to the mobile phone.
- After the ignition key is switched to OFF, a call can continue on the UConnect® system for a certain duration, after which the call is automatically transferred from the UConnect® system to the mobile phone.
- An active call is automatically transferred to the mobile phone after the ignition key is switched to OFF.

UConnect® System Features

Language Selection
To change the language that the UConnect® system is using:

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say the name of the language you wish to switch to English, Espanol, or Francais.
- Continue to follow the system prompts to complete language selection.

After selecting one of the languages, all prompts and voice commands will be in that language.

NOTE: After every UConnect® language change operation, only the language-specific 32-name phonebook is usable. The paired phone name is not language-specific and usable across all languages.

Emergency Assistance
If you are in an emergency and the mobile phone is reachable:

- Pick up the phone and manually dial the emergency number for your area.

If the phone is not reachable and the UConnect® system is operational, you may reach the emergency number as follows:

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Emergency" and the UConnect® system will instruct the paired cellular phone to call the emergency number. This feature is supported in the U.S., Canada, and Mexico.

NOTE: The emergency number dialed is based on the country where the vehicle is purchased (911 for the U.S. and Canada and 060 for Mexico). The number dialed may not be applicable with the available cellular service and area.

The UConnect® system does slightly lower your chances of successfully making a phone call as to that for the cell phone directly.

Your phone must be turned on and paired to the UConnect® system to allow use of this vehicle feature in emergency situations, when the cell phone has network coverage and stays paired to the UConnect® system.

Towing Assistance
If you need towing assistance:

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Towing Assistance."

NOTE: The Towing Assistance number dialed is based on the country where the vehicle is purchased (1-800-528-2069 for the U.S., 1-877-213-4525 for Canada, 55-14-3454 for Mexico City and 1-800-712-3040 for outside Mexico City in Mexico).

Please refer to the 24-Hour "Towing Assistance" coverage details in the Warranty Information Booklet and on the 24–Hour Towing Assistance Card.

Paging
To learn how to page, refer to "Working with Automated Systems." Paging works properly except for pagers of certain companies, which time out a little too soon to work properly with the UConnect® system.

Voice Mail Calling
To learn how to access your voice mail, refer to "Working with Automated Systems."

Working with Automated Systems
This method is used in instances where one generally has to press numbers on the cellular phone keypad while navigating through an automated telephone system.

You can use your UConnect® system to access a voice mail system or an automated service, such as a paging service or automated customer service line. Some services require immediate response selection. In some instances, that may be too quick for use of the UConnect® system.

When calling a number with your UConnect® system that normally requires you to enter in a touch-tone sequence on your cellular phone keypad, you can press the "Voice Recognition" button and say the sequence you wish to enter, followed by the word "Send." For example, if required to enter your PIN followed with a pound, (3 7 4 6 #), you can press the "Voice Recognition" button and say, "3 7 4 6 # Send." Saying a number, or sequence of numbers, followed by "Send," is also to be used for navigating through an automated customer service center menu structure, and to leave a number on a pager.

You can also send stored UConnect® phonebook entries as tones for fast and easy access to voice mail and pager entries. To use this feature, dial the number you wish to call and then press the "Voice Recognition" button and say, "Send." The system will prompt you to enter the name or number and say the name of the phonebook entry you wish to send. The UConnect® system will then

send the corresponding phone number associated with the phonebook entry, as tones over the phone.

NOTE:

- You may not hear all of the tones due to cellular phone network configurations; this is normal.
- Some paging and voice mail systems have system time out settings that are too short and may not allow the use of this feature.

Barge In - Overriding Prompts

The "Voice Recognition" button can be used when you wish to skip part of a prompt and issue your voice recognition command immediately. For example, if a prompt is asking "Would you like to pair a phone, clear a...," you could press the "Voice Recognition" button and say, "Pair a Phone" to select that option without having to listen to the rest of the voice prompt.

Turning Confirmation Prompts On/Off

Turning confirmation prompts off will stop the system from confirming your choices (e.g., the UConnect® system will not repeat a phone number before you dial it).

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Setup Confirmations." The UConnect® system will play the current confirmation prompt status and you will be given the choice to change it.

Phone and Network Status Indicators

If available on the radio and/or on a premium display such as the instrument panel cluster, and supported by your cell phone, the UConnect® system will provide notification to inform you of your phone and network status when you are attempting to make a phone call using UConnect®. The status is given for roaming, network signal strength, phone battery strength, etc.

Dialing Using the Cellular Phone Keypad

You can dial a phone number with your cellular phone keypad and still use the UConnect® system (while dialing via the cell phone keypad, the user must exercise caution and take precautionary safety measures). By dialing a number with your paired Bluetooth® cellular phone, the audio will be played through your vehicle's audio system. The UConnect® system will work the same as if you dial the number using voice recognition.

NOTE: Certain brands of mobile phones do not send the dial ring to the UConnect® system to play it on the vehicle audio system, so you will not hear it. Under this situation, after successfully dialing a number the user may feel that the call did not go through even though the call is in progress. Once your call is answered, you will hear the audio.

Mute/Un-Mute (Mute Off)

When you mute the UConnect® system, you will still be able to hear the conversation coming from the other party, but the other party will not be able to hear you. In order to mute the UConnect® system:

- Press the "Voice Recognition" button.
- Following the beep, say "Mute."

In order to un-mute the UConnect® system:

- Press the "Voice Recognition" button.
- Following the beep, say "Mute off."

Advanced Phone Connectivity

Transfer Call to and from Cellular Phone

The UConnect® system allows ongoing calls to be transferred from your cellular phone to the UConnect® system without terminating the call. To transfer an ongoing call from your UConnect® paired cellular phone to the UConnect® system or vice versa, press the "Voice Recognition" button and say "Transfer Call."

Connect or Disconnect Link Between the UConnect® System and Cellular Phone

Your cellular phone can be paired with many different electronic devices, but can only be actively "connected" with one electronic device at a time.

If you would like to connect or disconnect the Bluetooth® connection between a UConnect® paired cellular phone and the UConnect® system, follow the instructions described in your cellular phone User's Manual.

List Paired Cellular Phone Names

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Setup Phone Pairing."
- When prompted, say "List Phones."
- The UConnect® system will play the phone names of all paired cellular phones in order from the highest to the lowest priority. To "select" or "delete" a paired phone being announced, press the "Voice Recognition" button and say "Select" or "Delete." Also, see the next two sections for an alternate way to "select" or "delete" a paired phone.

Select Another Cellular Phone

This feature allows you to select and start using another phone paired with the UConnect® system.

- Press the PHONE button to begin.

- After the "Ready" prompt and the following beep, say "Setup Select Phone" and follow the prompts.
- You can also press the "Voice Recognition" button at any time while the list is being played, and then choose the phone that you wish to select.
- The selected phone will be used for the next phone call. If the selected phone is not available, the UConnect® system will return to using the highest priority phone present in or near (approximately within 30 ft [9 m]) the vehicle.

Delete UConnect® Paired Cellular Phones

- Press the PHONE button to begin.
- After the "Ready" prompt and the following beep, say "Setup Phone Pairing."
- At the next prompt, say "Delete" and follow the prompts.
- You can also press the "Voice Recognition" button at any time while the list is being played, and then choose the phone you wish to delete.

Things You Should Know About Your UConnect® System

UConnect® Tutorial

To hear a brief tutorial of the system features, press the PHONE button and say "UConnect® Tutorial."

Voice Training

For users experiencing difficulty with the system recognizing their voice commands or numbers, the UConnect® system Voice Training feature may be used. To enter this training mode, follow one of the two following procedures:

From outside the UConnect® mode (e.g., from radio mode):

- Press and hold the "Voice Recognition" button for five seconds until the session begins, or,
- Press the "Voice Recognition" button and say the "Setup, Voice Training" command.

Repeat the words and phrases when prompted by the UConnect® system. For best results, the Voice Training session should be completed when the vehicle is parked with the engine running, all windows closed, and the blower fan switched OFF.

This procedure may be repeated with a new user. The system will adapt to the last trained voice only.

To restore the Voice Recognition system to factory default settings, enter the Voice Training session via the above procedure and follow the prompts.

Voice Recognition (VR)

- For best performance, adjust the rearview mirror to provide at least ½ in (1 cm) gap between the overhead console (if equipped) and the mirror.
- Always wait for the beep before speaking.
- Speak normally, without pausing, just as you would speak to a person sitting a few feet/meters away from you.
- Make sure that no one other than you is speaking during a voice recognition period.
- Performance is maximized under:
  - low-to-medium blower setting,
  - low-to-medium vehicle speed,
  - low road noise,
  - smooth road surface,

- fully closed windows,
- dry weather condition.

- Even though the system is designed for users speaking in North American English, French, and Spanish accents, the system may not always work for some.
- When navigating through an automated system such as voice mail, or when sending a page, at the end of speaking the digit string, make sure to say "Send."
- Storing names in the phonebook when the vehicle is not in motion is recommended.
- It is not recommended to store similar sounding names in the UConnect® phonebook.
- The UConnect® phonebook nametag recognition rate is optimized for the person who stored the name in the phonebook.
- You can say "O" (letter "O") for "0" (zero). "800" must be spoken "eight-zero-zero."
- Even though international dialing for most number combinations is supported, some shortcut dialing number combinations may not be supported.
- In a convertible vehicle, system performance may be compromised with the convertible top down.

Far End Audio Performance

- Audio quality is maximized under:
  - low-to-medium blower setting,
  - low-to-medium vehicle speed,
  - low road noise,
  - smooth road surface,
  - fully closed windows,

- dry weather conditions, and
- operation from the driver's seat.

- Performance, such as audio clarity, echo, and loudness to a large degree rely on the phone and network, and not the UConnect® system.
- Echo at the far end can sometimes be reduced by lowering the in-vehicle audio volume.
- In a convertible vehicle, system performance may be compromised with the convertible top down.

Bluetooth® Communication Link

Cellular phones have been found to lose connection to the UConnect® system. When this happens, the connection can generally be re-established by switching the phone off/on. Your cell phone is recommended to remain in Bluetooth® ON mode.

Power-Up

After switching the ignition key from OFF to either ON or ACC position, or after a language change, you must wait at least five seconds prior to using the system.

General Information

This device complies with Part 15 of the FCC rules and RSS 210 of Industry Canada. Operation is subject to the following conditions:

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.

VOICE RECOGNITION SYSTEM — IF EQUIPPED

Voice Recognition System (VR) Operation

This Voice Recognition System allows you to control your AM, FM radio, satellite radio, disc player, and a memo recorder.

NOTE: In a stressful situation, take care to speak into the Voice Interface System as calmly and normally as possible. The ability of the Voice Interface System to recognize user voice commands may be negatively affected by rapid speaking or a raised voice level.

WARNING!

Any voice commanded system should be used only in safe driving conditions and all attention should be kept on the roadway ahead. Failure to do so may result in an accident causing serious injury or death.

When you press the VR hard-key, you will hear a beep. The beep is your signal to give a command.

NOTE: If you do not say a command within a few seconds, the system will present you with a list of options.

If you ever wish to interrupt the system while it lists options, press the VR hard-key, listen for the beep, and say your command.

Pressing the VR hard-key while the system is speaking is known as "barging in." The system will be interrupted and you can add or change commands. This will become helpful once you start to learn the options.

NOTE: At any time, you can say the words CANCEL, HELP, or MAIN MENU.

These commands are universal and can be used from any menu. All other commands can be used depending upon the active application.

For example, if you are in the disc menu and you are listening to FM radio, you can speak commands from the disc menu or from the FM radio menu.

When using this system, you should speak clearly and at a normal speaking volume.

The system will best recognize your speech if the windows are closed, and the heater/air-conditioning fan is set to low.

At any point, if the system does not recognize one of your commands, you will be prompted to repeat it.

To hear the first available Menu, press the VR hard-key and say HELP or MAIN MENU.

Commands

The Voice Recognition System understands two types of commands. Global commands are available at all times. Local commands are available if the supported radio mode is active.

Changing the Volume

1. Start a dialogue by pressing the VR hard-key.
2. Say a command (e.g., HELP).
3. Use the ON/OFF VOLUME rotary knob to adjust the volume to a comfortable level while the voice recognition system is speaking. Please note the volume setting for VR is different then the audio system.

Main Menu
Start a dialogue by pressing the VR hard-key. You may say MAIN MENU to switch to the main menu.

In this mode, you can say the following commands:

- RADIO (to switch to the radio mode)
- DISC (to switch to the disc mode)
- MEMO (to switch to the memo recorder)

Radio AM (or Radio Long Wave or Radio Medium Wave - if equipped)
To switch to the AM band say AM or RADIO AM. In this mode, you may say the following commands:

- FREQUENCY (to change the frequency)
- NEXT STATION (to select the next station)
- PREVIOUS STATION (to select the previous station)
- RADIO MENU (to switch to the radio menu)
- MAIN MENU (to switch to the main menu)

Radio FM
To switch to the FM band say FM or RADIO FM. In this mode, you may say the following commands:

- FREQUENCY (to change the frequency)
- NEXT STATION (to select the next station)
- PREVIOUS STATION (to select the previous station)
- RADIO MENU (to switch to the radio menu)
- MAIN MENU (to switch to the main menu)

Satellite Radio
To switch to satellite radio mode say SAT or SATELLITE RADIO. In this mode, you may say the following commands:

- CHANNEL NUMBER (to change the channel by its spoken number)

- NEXT CHANNEL (to select the next channel)
- PREVIOUS CHANNEL (to select the previous channel)
- LIST CHANNEL (to hear a list of available channels)
- SELECT NAME (to say the name of a channel)
- RADIO MENU (to switch to the radio menu)
- MAIN MENU (to switch to the main menu)

Disc

To switch to the disc mode say DISC. In this mode, you may say the following commands:

- TRACK (#) (to change the track)
- NEXT TRACK (to play the next track)
- PREVIOUS TRACK (to play the previous track)
- MAIN MENU (to switch to the main menu)

Memo

To switch to the voice recorder mode say MEMO. In this mode, you may say the following commands:

- NEW MEMO (to record a new memo) — During the recording you may press the VR hard-key to stop recording. You continue by saying one of the following commands:
  - SAVE (to save the memo)
  - CONTINUE (to continue recording)
  - DELETE (to delete the recording)
- PLAY MEMOS (to play previously recorded memos) — During the playback you may press the VR hard-key to stop playing memos. You continue by saying one of the following commands:
  - REPEAT (to repeat a memo)
  - NEXT (to play the next memo)

- PREVIOUS (to play the previous memo)
- DELETE (to delete a memo)

- DELETE ALL (to delete all memos)

NOTE: Keep in mind that you have to press the VR hard-key first and wait for the beep, before speaking the "barge in" commands.

Voice Training

For users experiencing difficulty with the system recognizing their voice commands or numbers, the UConnect® system Voice Training feature may be used.

1. Press the VR hard-key, speak "System Setup" and once you are in that menu then speak "Voice Training." This will train your own voice to the system and will improve recognition.

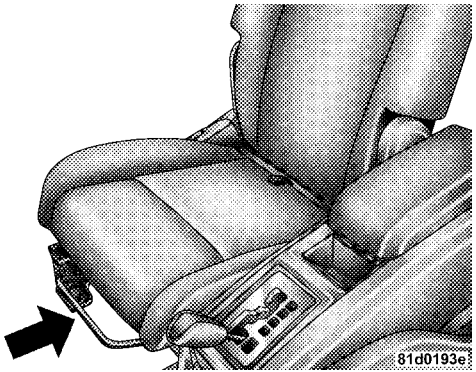
2. Repeat the words and phrases when prompted by the UConnect® System. For best results, the Voice Training session should be completed when the vehicle is parked, engine running, all windows closed, and the blower fan switched OFF. This procedure may be repeated with a new user. The system will adapt to the last trained voice only.

SEATS

Manual Front Seat Adjustments

Forward and Rearward Adjustment

The manual seat adjustment bar is at the front of the seat, near the floor. Pull the bar upward to move the seat forward or rearward. Release the bar once the seat is in the position desired. Then, using body pressure, move forward and rearward on the seat to be sure that the seat adjusters have latched.



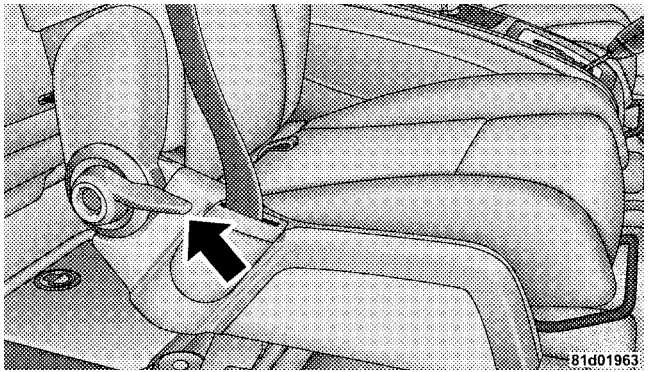
Manual Seat Adjustment

WARNING!

Adjusting a seat while the vehicle is moving is dangerous. The sudden movement of the seat could cause you to lose control. The seat belt might not be adjusted properly and you could be injured. Adjust any seat only while the vehicle is parked.

Recliner Adjustment

The control lever is on the outboard side of the seat. To recline the seat, lean forward slightly and lift the lever. Then lean back to the position desired and release the lever. To return the seatback to its normal upright position, lean forward and lift the lever. Release the lever once the seatback is in the upright position.



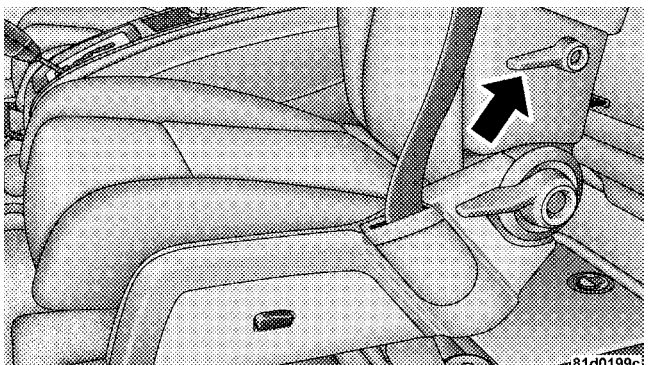
Seatback Release

WARNING!

- **Adjusting a seat while the vehicle is moving is dangerous. The sudden movement of the seat could cause you to lose control. The seat belt might not be adjusted properly and you could be injured. Adjust the seat only while the vehicle is parked.**
- **Do not ride with the seatback reclined so that the shoulder belt is no longer resting against your chest. In a collision you could slide under the seat belt and be seriously or even fatally injured. Use the recliner only when the vehicle is parked.**

Lumbar Support — If Equipped

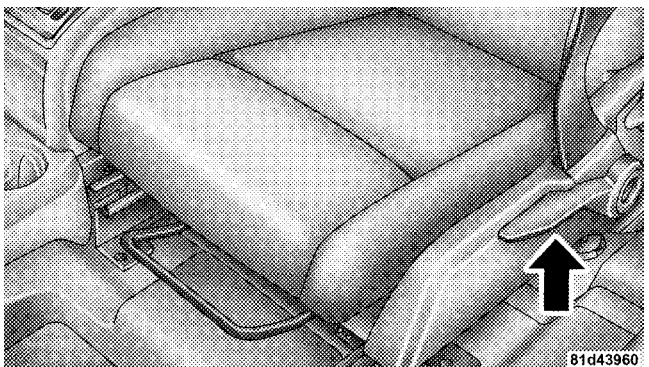
The control lever is on the outboard side of the seatback. Turn the control lever downward to increase the lumbar support or upward to decrease the lumbar support as desired.



Lumbar Control

Driver's Seat Height Adjustment — If Equipped

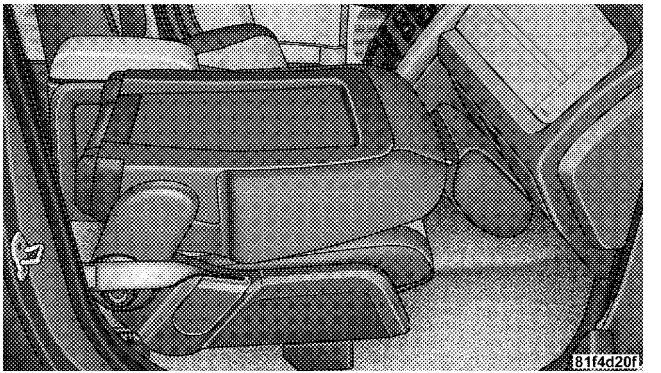
The control lever is located on the outboard side of the seat. Raise the lever to raise the seat. Lower the lever to lower the seat. The total seat travel is 2.15 in (55 mm).



Seat Height Adjustment Lever

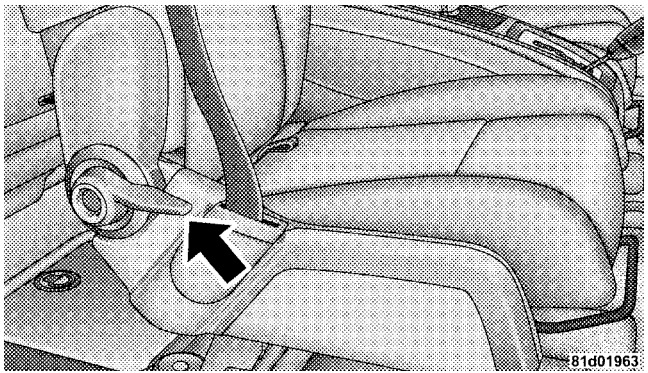
Fold Flat Front Passenger Seat — If Equipped

This feature allows for extended cargo space. When the seat is folded flat, it is an extension of the load floor surface (allowing long cargo to fit from the rear hatch up to the instrument panel). The fold-flat seatback also has a hardback surface that you can use as a work surface when the seat is folded flat and the vehicle is not in motion.



Fold Flat Seat

Pull upward on the lever to fold or unfold the seat.



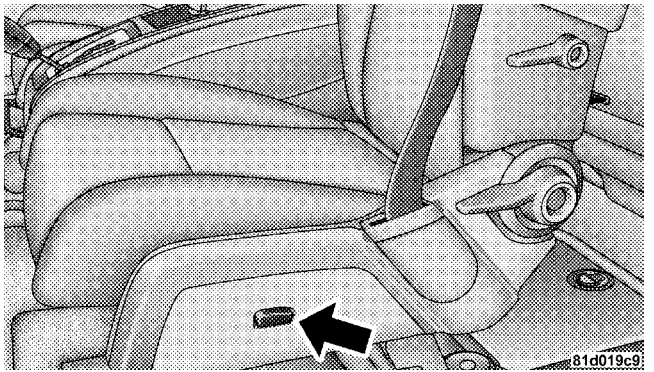
Seatback Release

WARNING!

Adjusting a seat while the vehicle is moving is dangerous. The sudden movement of the seat could cause you to lose control. Adjust any seat only while the vehicle is parked.

Power Seat — If Equipped

The power seat switch is on the outboard side of the seat near the floor. Use this switch to move the seat up, down, forward, rearward, or to tilt the seat.



Power Seat Switch

CAUTION!

Do not place any article under any seat as it may cause damage to the seat controls.

WARNING!

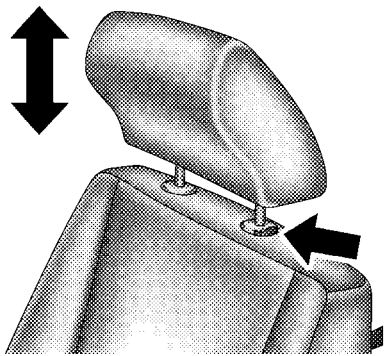
Adjusting a seat while the vehicle is moving is dangerous. The sudden movement of the seat could cause you to lose control. The seat belt might not be adjusted properly and you could be injured. Adjust any seat only while the vehicle is parked.

Head Restraints

Head restraints can reduce the risk of whiplash injury in the event of impact from the rear.

Front Seats

Adjust the head restraints so that the upper edge is as high as practical. The left sleeve that the head restraint post slides through contains a lock release button. You can raise the head restraint without pressing this button. However, you must press this button to lower the head restraint.



Adjustable Head Restraint

To remove the head restraint, you must press the lock release button on the left sleeve and the right sleeve simultaneously. To reinstall the head restraint, insert the posts into the sleeves and push the head restraint downward until it locks in place. Then, if desired, press the button on the left sleeve and lower the head restraint.

WARNING!

- **Do not sit in a seat or allow a passenger to sit in a seat without having the head restraint installed and adjusted properly. Failure to follow this warning may result in personal injury to you or your passenger in the event of an accident.**
- **Do not leave a head restraint that is removed from a seat loose in the vehicle. A loose head restraint thrown forward in a collision or hard stop could endanger the occupants of the vehicle.**

Second Row Passenger Seats

These head restraints are non-adjustable and non-removable.

Third Row Passenger Seats — Seven Passenger Models

These head restraints are non-adjustable and non-removable. However, you can fold them forward when they are not in use by passengers. Refer to "50/50 Split Third-Row Passenger Seats with Fold-Flat Feature" for operating instructions.

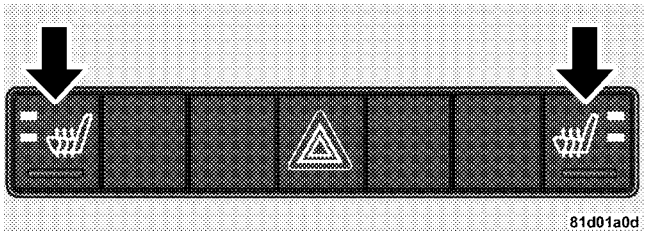
WARNING!

Do not allow a passenger to sit in a third row seat without having the head restraint unfolded and locked in place. Failure to follow this warning may result in personal injury to the passenger in the event of an accident.

Heated Seats — If Equipped

Heated seats provide comfort and warmth on cold days and can help soothe sore muscles and backs. The heaters provide the same heat level for both cushion and back. The driver's seat and front passenger's seat are heated.

The controls for each heater are located in the switch bank in the center of the instrument panel. After turning ON the ignition, you can choose from High, Low, or Off heat settings. Amber indicator lights in each switch indicate the level of heat in use. Two indicator lights will illuminate for high, one for low, and none for off.



Heated Seat Switch

Press the switch once to select high-level heating. Press the switch a second time to select low-level heating. Press the switch a third time to shut OFF the heating elements.

If high level heating is selected, the system automatically switches to low level heating and turns one indicator light off after 30 minutes of continuous operation. It will turn the heater and the remaining indicator light off after an additional 30 minutes of continuous operation. If low level heating is selected, the system automatically turns the heater and the indicator light off after 30 minutes of continuous operation.

NOTE: Once a heat setting is selected, heat will be felt within two to five minutes.

WARNING!

Persons who are unable to feel pain to the skin because of advanced age, chronic illness, diabetes, spinal cord injury, medication, alcohol use, exhaustion or other physical condition must exercise care when using the seat heater. It may cause burns even at low temperatures, especially if used for long periods. Do not place anything on the seat that insulates against heat, such as a blanket or cushion. This may cause the seat heater to overheat.

60/40 Split Second-Row Passenger Seats

To provide additional storage area, each second-row passenger seat can be folded flat. This allows for extended cargo space and still maintains some seating room if needed.

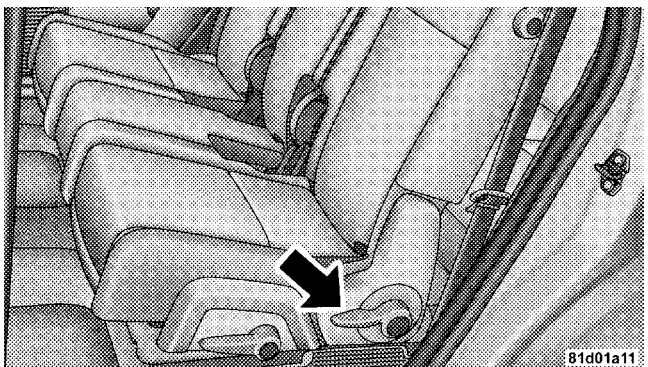
NOTE: Prior to folding the second-row passenger seat, make sure the front seatback is not in a reclined position. This will allow the seat to fold easily.

WARNING!

- **It is extremely dangerous to ride in a cargo area, inside or outside of a vehicle. In a collision, people riding in these areas are more likely to be seriously injured or killed.**
- **Do not allow people to ride in any area of your vehicle that is not equipped with seats and seat belts.**
- **Be sure everyone in your vehicle is in a seat and using a seat belt properly.**
- **On seven passenger models, do not allow a passenger to sit in a third row seat with the second row seatback(s) folded flat. In a collision, the passenger could slide underneath the seat belt and be seriously or even fatally injured.**

To Fold the Seat

1. Locate the control lever on the lower outboard side of the seat.



Seatback Release

2. Place one hand on the seatback and apply a gentle pressure.

3. Lift the control lever with the other hand, allow the seatback to move forward slightly, and then release the lever.

WARNING!

To prevent personal injury or damage to objects, keep your head, arms, and objects out of the folding path of the seatback.

4. Gently guide the seatback into the folded position.

To Unfold the Seat

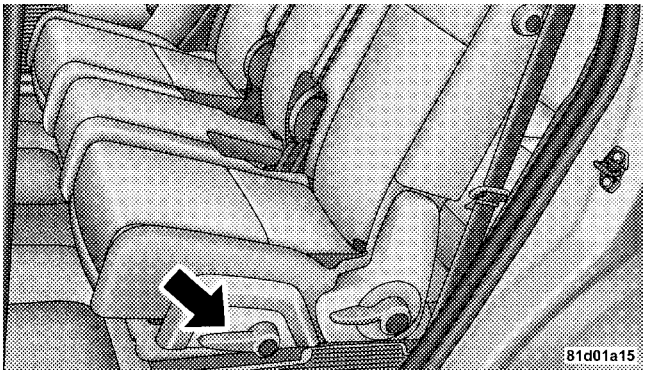
Raise the seatback and lock it in place.

WARNING!

Be certain that the seatback is locked securely into position. Otherwise, the seat will not provide the proper stability for child seats and/or passengers. An improperly latched seat could cause serious injury.

Forward and Rearward Adjustment

The control lever is on the outboard side of the seat. Lift the lever to move the seat forward or rearward. Release the lever once the seat is in the position desired. Then, using body pressure, move forward and rearward on the seat to be sure that the seat adjusters have latched.



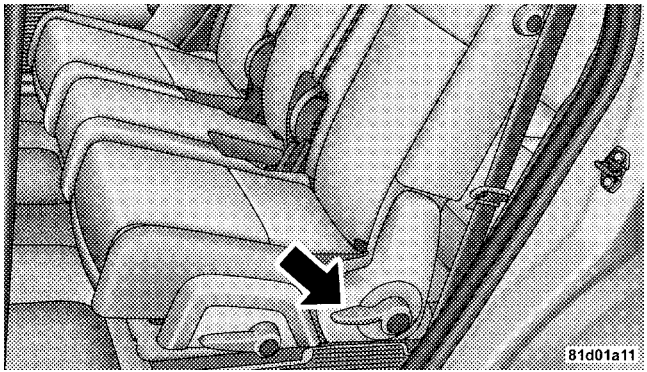
Manual Seat Adjustment

WARNING!

Adjusting a seat while the vehicle is moving is dangerous. The sudden movement of the seat could cause you to lose control. The seat belt might not be adjusted properly and you could be injured. Adjust any seat only while the vehicle is parked.

Recliner Adjustment

The control lever is on the outboard side of the seat. To recline the seat, lean back, lift the lever, position the seatback as desired, and then release the lever. To return the seatback to its normal upright position, lean back, lift the lever, lean forward, and then release the lever once the seatback is in the upright position.



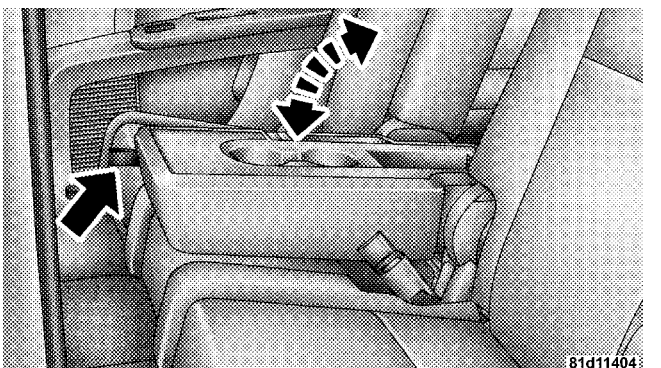
Seatback Release

WARNING!

- **Adjusting a seat while the vehicle is moving is dangerous. The sudden movement of the seat could cause you to lose control. The seat belt might not be adjusted properly and you could be injured. Adjust the seat only while the vehicle is parked.**
- **Do not ride with the seatback reclined so that the shoulder belt is no longer resting against your chest. In a collision you could slide under the seat belt and be seriously or even fatally injured. Use the recliner only when the vehicle is parked.**

20% Seatback/Armrest — Second Row Passenger Seat

The latch release-loop is located at the top of the 20% seatback/armrest. Pull the release-loop upward to release the latch and then downward to lower the 20% seatback/armrest.



Latch Release-Loop

Raise the 20% seatback/armrest and lock it in place when not in use or when additional seating area is required.

WARNING!

Keep the latch clean and free of objects and be certain that the seatback is locked securely into position. Otherwise, the seat will not provide the proper stability for child seats and/or passengers. An improperly latched seat could cause serious injury.

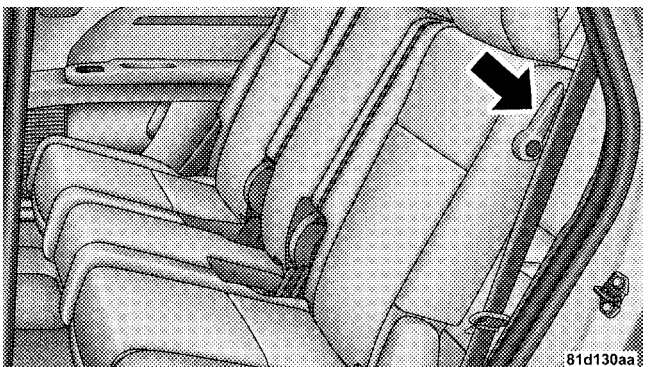
Stadium Tip 'n Slide™ (Easy Entry/Exit Seat) — Seven Passenger Models

This feature allows passengers to easily enter or exit the third-row passenger seats from either side of the vehicle.

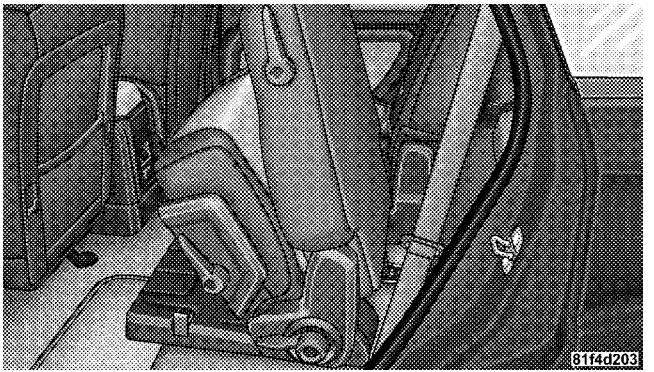
To Move the Second-Row Passenger Seat Forward

NOTE: Raise the 20% seatback/armrest before moving the 60% seat to allow for full seat travel.

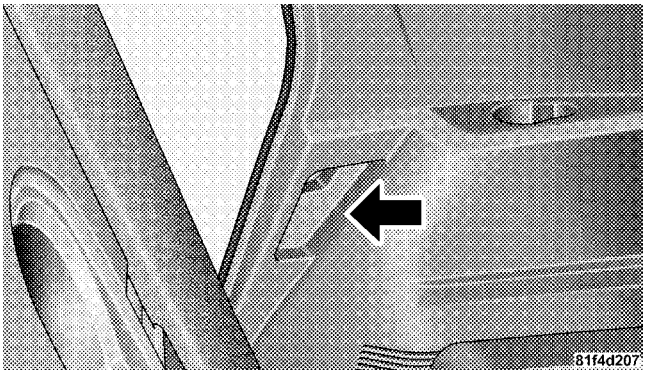
Move the control lever on the upper outboard side of the seatback forward, and in one fluid motion, the seat cushion flips upward and the seat moves forward on its tracks.



Tip 'n Slide™ Control Lever



Tip n Slide Seat™



Grab Handle

NOTE: A hand-grip is molded into the front of each quarter trim panel near the door opening to assist entry and exit from the third-row passenger seats.

WARNING!

Do not drive the vehicle with the seat in this position, as it is only intended for entering and exiting the third row seats. Failure to follow this warning may result in personal injury.

To Unfold and Move the Second-Row Passenger Seat Rearward

1. Move the seatback rearward until it locks in place and then continue sliding the seat rearward on its tracks until it locks in place.

2. Push the seat cushion downward to lock it in place.

3. Adjust the seat track position as desired. Then, using body pressure, move forward and rearward on the seat to be sure that the seat adjusters have latched.

WARNING!

Be certain that the seatback and seat are locked securely into position. Otherwise, the seat will not provide the proper stability for child seats and/or passengers. An improperly latched seat could cause serious injury.

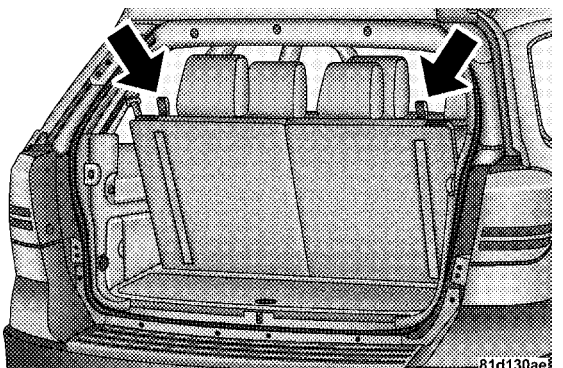
50/50 Split Third-Row Passenger Seats with Fold-Flat Feature — Seven Passenger Models

To provide additional storage area, each third-row passenger seat can be folded flat. This allows for extended cargo space and still maintains some rear seating room if needed.

NOTE: Prior to folding the third-row passenger seat, make sure the second-row passenger seat is not in a reclined position. This will allow the seat to fold easily.

To Fold the Seat

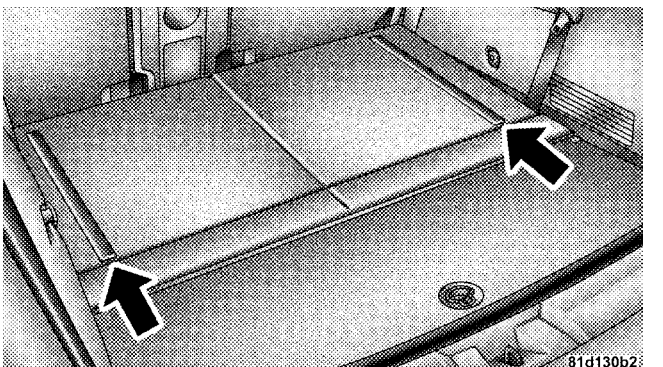
Pull the latch release-loop located at the top of the seatback upward, push the seat forward slightly, and release the release-loop. Then, continue to push the seat forward. The head restraints will fold automatically as the seat moves forward.



Seatback Release

To Unfold the Seat

Grasp the assist strap loop on the seatback and pull it toward you to raise the seatback. Continue to raise the seatback until it locks in place. Then, raise the head restraint to lock it in place.



Assist Strap

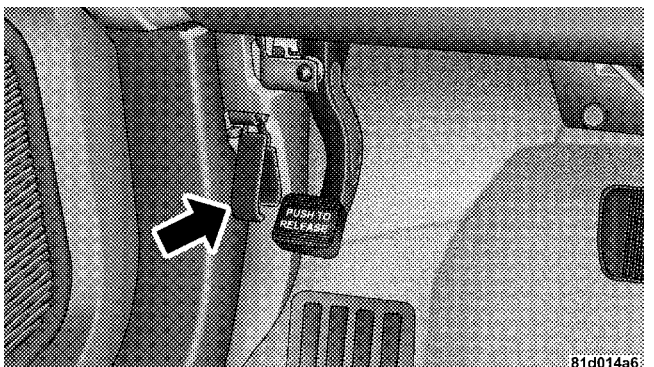
The seatback can also be locked in a reclined position. To do so, pull the latch release-loop located at the top of the seatback upward, allow the seatback to recline, and release the release-loop.

WARNING!

- **Be certain that the seatback is locked securely into position. Otherwise, the seat will not provide the proper stability for passengers. An improperly latched seat could cause serious injury.**
- **Do not allow a passenger to sit in a third row seat without having the head restraint unfolded and locked in place. Failure to follow this warning may result in personal injury to the passenger in the event of an accident.**
- **Do not allow a passenger to sit in a third row seat with the second row seatback(s) folded flat. In a collision, the passenger could slide underneath the seat belt and be seriously or even fatally injured.**

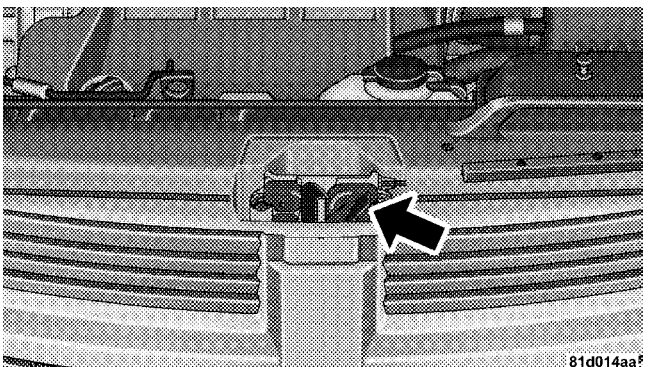
TO OPEN AND CLOSE THE HOOD

Two latches must be released to open the hood. First, pull the hood release lever located under the left side of the instrument panel.



Hood Release

Outside of the vehicle, locate the safety latch lever near the center of the grille between the grille and hood opening. Push the safety latch lever to the right and then raise the hood.



Underhood Safety Latch

Use the hood prop rod to secure the hood in the open position. Place the upper end of the prop rod in the hole on the underside of the hood.

Hood Prop Rod

To prevent possible damage:

- Before closing hood, make sure the hood prop rod is fully seated into its storage retaining clips.
- Do not slam the hood to close it. Use a firm downward push at the center front edge of the hood to ensure that both latches engage. Never drive your vehicle unless the hood is fully closed, with both latches engaged.

WARNING!

If the hood is not fully latched, it could fly up when the vehicle is moving and block your forward vision. Be sure all hood latches are fully latched before driving. Failure to follow this warning may lead to an accident resulting in serious injury or death.

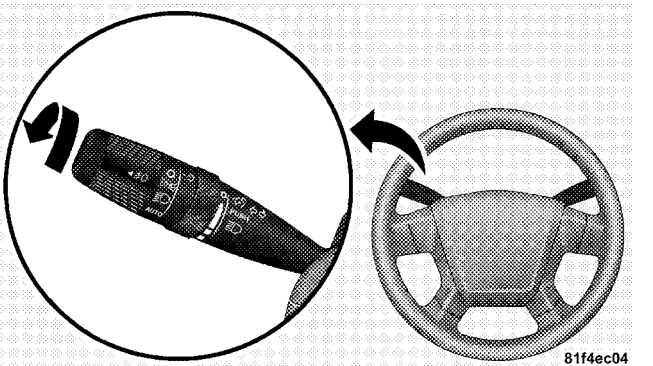
LIGHTS

Exterior and Interior Lighting Control

The multifunction lever on the left side of the steering column controls the operation of the headlights, parking lights, turn signal lights, instrument panel lights, instrument panel light dimming, interior lights, and fog lights (if equipped).

Headlights and Parking Lights

Turn the end of the multifunction lever to the first detent for parking light operation. Turn the end of the lever to the second detent for headlight operation.



Headlight Switch

Automatic Headlights — If Equipped

This system automatically turns the headlights on or off according to ambient light levels. To turn the system ON, turn the end of the multifunction lever to the AUTO position (third detent). When the system is on, the headlight time delay feature is also on. This means the headlights will stay on for up to 90 seconds after you turn the ignition switch to the LOCK position. To turn the Automatic System OFF, turn the end of the multifunction lever out of the AUTO position.

NOTE: The engine must be running before the headlights will turn on in the automatic mode.

Headlights with Wipers (Available with Auto Headlights Only)

When this feature is active, the headlights will turn on approximately 10 seconds after the wipers are turned ON if the multifunction lever is placed in the AUTO position. In addition, the headlights will turn off when the wipers are turned OFF if they were turned ON by this feature.

The Headlights with Wipers feature can be turned on or off through the Electronic Vehicle Information Center (EVIC) (if equipped). Refer to "Headlights With Wipers," under "Personal Settings (Customer Programmable Features)" under "Electronic Vehicle Information Center" in Section 4.

Headlight Time Delay — If Equipped

This feature is particularly useful when exiting your vehicle in an unlit area. It provides the safety of headlight illumination for up to 90 seconds after turning the ignition switch to the LOCK position.

To activate the delay, turn the ignition switch to the LOCK position while the headlights are still on. Then, turn OFF the headlights within 45 seconds. The delay interval begins when you turn OFF the headlights. Only the headlights will illuminate during this time.

If you turn the headlights, or parking lights, or ignition switch ON again, the system will cancel the delay.

If you turn the headlights OFF before the ignition, they will turn off in the normal manner.

The headlight delay time is programmable on vehicles equipped with the EVIC. Refer to "Headlight Off Delay," under "Personal Settings (Customer Programmable Features)," under "Electronic Vehicle Information Center (EVIC)" in Section 4.

Daytime Running Lights (DRL) — If Equipped

The high beam headlights will turn on as Daytime Running Lights (DRL) and operate at DRL (lower) intensity, whenever the ignition is ON, the engine is running, the HEADLIGHT switch is off, the parking brake is off, the turn signal is off, and the shift lever is in any position except PARK.

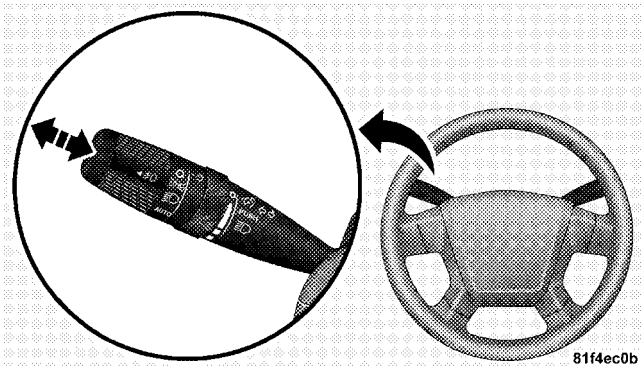
NOTE: The Daytime Running Lights will turn off automatically when the turn signal is in operation and turn on again when the turn signal is not operating.

Lights-On Reminder

If the headlights or parking lights are on after the ignition is turned to the LOCK position, a chime will sound to alert the driver when the driver's door is opened.

Fog Lights — If Equipped

To activate the front fog lights, turn ON the parking lights or the low beam headlights and pull out on the end of the multifunction lever.

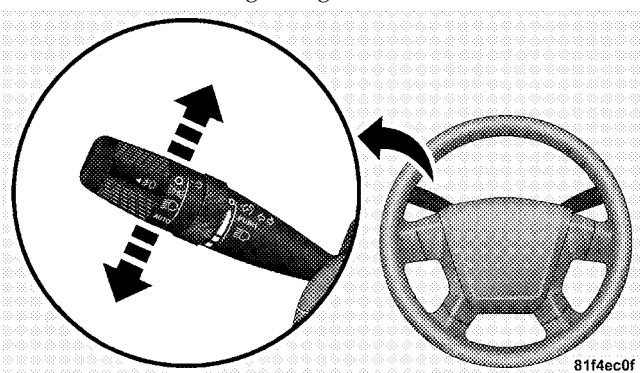


Front Fog Light

NOTE: The front fog lights will only operate with the headlights on low beam. Selecting high beam headlights will turn off the front fog lights.

Turn Signals

Move the multifunction lever upward or downward and the corresponding turn signal indicator on the instrument panel will flash to show proper operation of the front and rear turn signal lights.



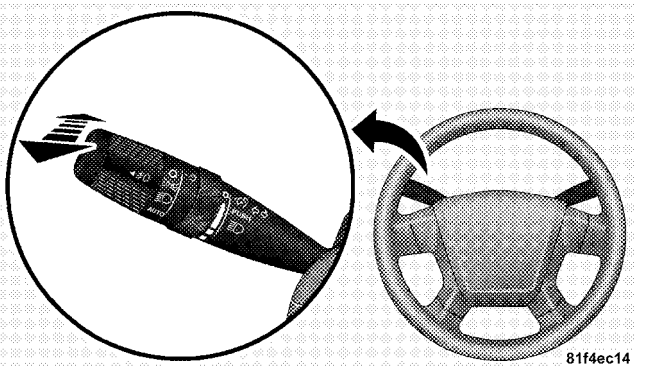
Turn Signal Control

You can signal a lane change by moving the lever upward or downward partially without moving beyond the detent.

NOTE: If either turn signal indicator has a very fast flash rate, check for an inoperative outside light bulb. If an indicator fails to light when the lever is moved, see your authorized dealer for service.

Highbeam/Lowbeam Select Switch

Push the multifunction lever away from you to switch the headlights to HIGH beam. Pull the Lever toward you, to switch the headlights back to LOW beam.



Highbeam Control

Flash to Pass

You can signal another vehicle with your headlights by lightly pulling the multifunction lever toward you. This will cause the headlights to turn on at high beam and remain on until the lever is released.

NOTE: If the multifunction lever is held in the Flash to Pass position for more than 15 seconds, the high beams will shut off. If this occurs, wait 30 seconds before activating the Flash to Pass function again.

Interior Lights

Courtesy/Reading Lights

Models with Overhead Console

These lights are mounted in the overhead console between the sun visors. They are also located in the headliner above the second row passenger seats. Press and release the lens to turn ON or turn OFF the light manually. These lights also turn on when you press the UNLOCK button on the Remote Keyless Entry (RKE) transmitter, open a door or the liftgate, or turn the Dimmer Control completely upward to the second detent. For models equipped with LED lighting, you can swivel the lens socket to direct the light as desired.

Models without Overhead Console

There are two courtesy/reading lights mounted in the headliner between the sun visors. Press and release the button next to the lens to turn ON or turn OFF the light manually. A courtesy light is also mounted in the headliner above the second row passenger seats. Press and release the lens to turn ON or turn OFF the light manually. These lights also turn on when you press the UNLOCK button on the RKE transmitter, open a door or the liftgate, or turn the Dimmer Control completely upward to the second detent.

Cargo Light

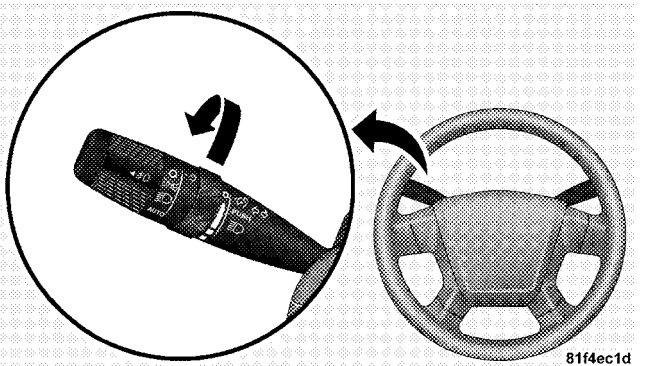
This light is mounted in the liftgate trim panel. It turns on when you press the UNLOCK button on the RKE transmitter, open a door or the liftgate, or turn the Dimmer Control completely upward to the second detent.

Battery Saver Feature

To protect the battery, the interior lights will turn off automatically within 10 minutes of turning the ignition switch to the LOCK position. This will occur if the interior lights were switched ON manually or are on because a door is open.

Dimmer Control

The Dimmer Control is part of the multifunction lever. It controls the operation of the interior lights and the brightness of the instrument panel lights.



Dimmer Control

Instrument Panel Dimming

With the parking lights or headlights on, rotate the Dimmer Control upward or downward to change the brightness of the instrument panel lights.

Parade Mode (Daytime Brightness Feature)
Rotate the Dimmer Control to the first detent to brighten the odometer and radio display when the parking lights or headlights are on during daylight conditions.

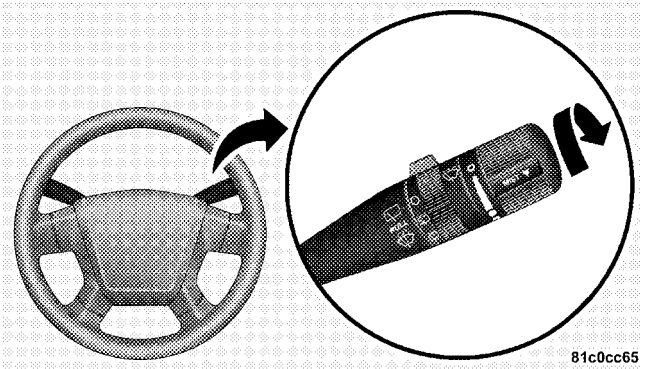
Interior Light ON
Rotate the Dimmer Control completely upward to the second detent to turn ON the interior lights.

NOTE: The Battery Saver feature will not activate until the ignition switch is in the LOCK position. Refer to "Battery Saver Feature" for additional information.

Interior Light Defeat OFF
Rotate the Dimmer Control completely downward to the (O) OFF position. The interior lights will remain off when the doors are open.

WINDSHIELD WIPERS AND WASHERS

The Windshield Wiper/Washer control lever is located on the right side of the steering column.



Windshield Wiper/Washer Lever

Rotate the end of the lever to the first detent past the intermittent settings for low speed wiper operation, or to the second detent past the intermittent settings for high speed wiper operation.

NOTE: The wipers will automatically return to the park position if you turn OFF the ignition switch while they are operating. The wipers will resume operation when you turn the ignition switch to the ON position again.

CAUTION!

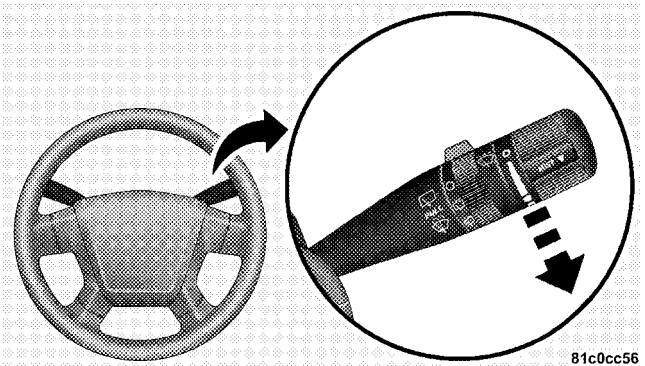
- **Turn the windshield wipers OFF when driving through an automatic car wash. Damage to the windshield wipers may result if the wiper control is left in any position other than OFF.**
- **In cold weather, always turn OFF the WIPER switch and allow the wipers to return to the park position before turning OFF the engine. If the WIPER switch is left ON and the wipers freeze to the windshield, damage to the wiper motor may occur when the vehicle is restarted.**
- **Always remove any buildup of snow that prevents the windshield wiper blades from returning to the park position. If the windshield wiper control is turned OFF and the blades cannot return to the park position, damage to the wiper motor may occur.**

Intermittent Wiper System

Use the intermittent wiper system when weather conditions make a single wiping cycle with a variable pause between cycles desirable. Rotate the end of the Windshield Wiper/Washer control lever to the first detent, and then turn the end of the lever to select the desired delay interval. There are five delay settings, which allow you to regulate the wipe interval from a minimum of two cycles every second to a maximum of approximately 36 seconds between cycles or from a minimum of one cycle every second to a maximum of approximately 18 seconds between cycles at vehicle speeds greater than 10 mph (16 km/h).

Mist Feature

Push downward on the Windshield Wiper/Washer control lever to activate a single wipe cycle to clear the windshield of road mist or spray from a passing vehicle. The wipers will continue to operate until you release the lever.



Mist Control

Headlights with Wipers (Available with Auto Headlights Only)

When this feature is active, the headlights will turn on approximately 10 seconds after the wipers are turned ON if the multifunction lever (on the left side of the steering column) is placed in the (A) AUTO position. In addition, the headlights will turn off when the wipers are turned OFF if they were turned ON by this feature.

The Headlights with Wipers feature can be turned on or off through the Electronic Vehicle Information Center (EVIC) (if equipped). Refer to "Headlights With Wipers," under "Personal Settings (Customer Programmable Features)," under "Electronic Vehicle Information Center" in Section 4.

Windshield Washers

To use the washer, pull the Windshield Wiper/Washer control lever toward you and hold it for as long as washer spray is desired.

If you activate the washer while the wiper control is in the delay range, the wipers will operate in low speed for two wipe cycles after releasing the lever and then resume the intermittent interval previously selected.

If you activate the washer while the wiper control is in the OFF position, the wipers will operate for two wipe cycles and then turn OFF.

WARNING!

Sudden loss of visibility through the windshield could lead to an accident. You might not see other vehicles or other obstacles. To avoid sudden icing of the windshield during freezing weather, warm the windshield with the defroster before and during windshield washer use.

Adding Washer Fluid

NOTE: Refer to the "Engine Compartment" diagram in Section 7 for the location of the washer fluid reservoir.

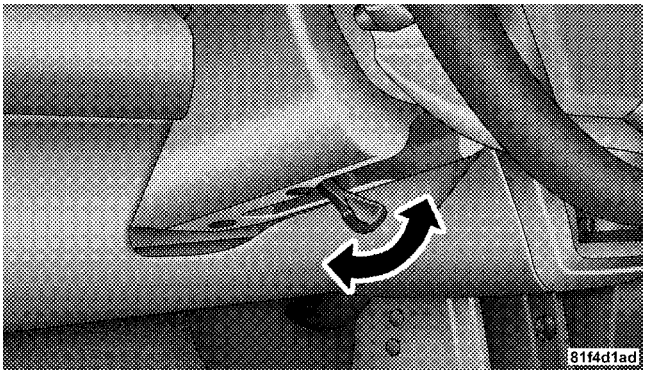
The fluid reservoir for the windshield washers is located in the engine compartment. Be sure to check the fluid level in the reservoir at regular intervals. Fill the reservoir with windshield washer solvent (not radiator antifreeze) and operate the system for a few seconds to flush out the residual water.

WARNING!

Commercially available windshield washer solvents are flammable. They could ignite and burn you. Care must be exercised when filling or working around the washer solution.

TILT/TELESCOPING STEERING COLUMN — IF EQUIPPED

This feature allows you to tilt the steering column upward or downward. It also allows you to lengthen or shorten the steering column. The tilt/telescoping control handle is located below the steering wheel at the end of the steering column.



Tilt/Telescoping Steering Wheel Lock

To unlock the steering column, push the control handle downward. To tilt the steering column, move the steering wheel upward or downward as desired. To lengthen or shorten the steering column, pull the steering wheel outward or push it inward as desired. To lock the steering column in position, pull the control handle upward until fully engaged.

WARNING!

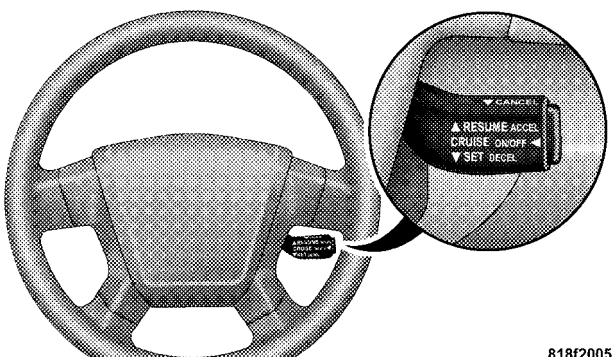
Do not adjust the steering wheel while driving. The tilt/telescoping adjustment must be locked while driving. Adjusting the steering wheel while driving or driving without the tile/telescoping adjustment locked could cause the driver to lose control of the vehicle. Failure to follow this warning may result in serious injury or death.

ELECTRONIC SPEED CONTROL — IF EQUIPPED

When engaged, this device takes over the accelerator operation at speeds greater than 25 mph (40 km/h).

Electronic Speed Control Operation

The speed control lever is located on the right side of the steering wheel.



Speed Control Lever

To Activate

Push and release the ON/OFF button located on the end of the speed control lever. The Cruise Indicator Light in the instrument cluster will illuminate. To turn the system OFF, push and release the ON/OFF button a second time. The Cruise Indicator Light will turn off. Be sure to turn the system OFF when not in use.

NOTE:

- The Electronic Speed Control System will automatically turn off when the engine is turned OFF.
- The Electronic Speed Control System is designed to shut down if you operate multiple speed control switch-functions simultaneously (i.e., Set and Cancel). If this occurs, push and release the ON/OFF button to reactivate the system and then reestablish the desired Set speed.

WARNING!

Leaving the Electronic Speed Control system on when not in use is dangerous. You could accidentally set the system or cause it to go faster than you want. You could lose control and have an accident. Always leave the system OFF when you are not using it.

To Set At A Desired Speed

When the vehicle reaches the speed desired, press downward on the lever to SET DECEL and release. Release the accelerator pedal and the vehicle will operate at the selected speed.

NOTE:

- The vehicle must be traveling at least 25 mph (40 km/h) for the speed control to set.
- The vehicle should be traveling at a steady speed and on level ground before pressing the lever to SET DECEL.

To Deactivate

A soft tap on the brake pedal, or pulling the speed control lever toward you to CANCEL, or normal brake pressure while slowing the vehicle will deactivate the speed control without erasing the set speed from memory. Pressing the ON/OFF button or turning OFF the ignition erases the set speed from memory.

To Resume Speed

If you deactivate the speed control without erasing the set speed from memory and your vehicle speed is above 20 mph (32 km/h) you can resume the previous set speed. To do so, push the lever upward to RESUME ACCEL and release, and then remove your foot from the accelerator pedal.

To Vary the Speed Setting

When the speed control is set, you can increase speed by pushing up and holding the lever in RESUME ACCEL. Release the lever when the desired speed is reached, and the new set speed will be established.

Tapping RESUME ACCEL once will result in a 1 mph (1.6 km/h) speed increase. Each time the lever is tapped, speed increases so that tapping the lever three times will increase speed by 3 mph (5 km/h), etc.

To decrease speed while the speed control is set, push downward and hold the lever in SET DECEL. Release the lever when the desired speed is reached, and the new set speed will be established.

Tapping SET DECEL once will result in a 1 mph (1.6 km/h) speed decrease. Each time the lever is tapped, speed decreases.

To Accelerate For Passing

Depress the accelerator pedal as you would normally. When the pedal is released, the vehicle will return to the set speed.

Using Speed Control on Hills

NOTE: The speed control system maintains speed up and down hills. A slight speed change on moderate hills is normal.

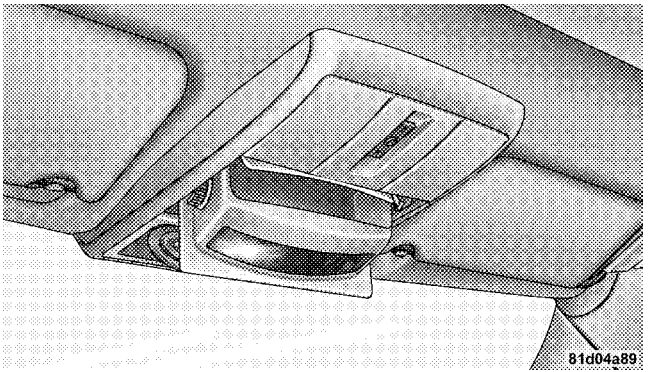
On steep hills, a greater speed loss or gain may occur so it may be preferable to drive without speed control.

WARNING!

Speed Control can be dangerous where the system can't maintain a constant speed. Your vehicle could go too fast for the conditions, and you could lose control. An accident could be the result. Don't use Speed Control in heavy traffic or on roads that are winding, icy, snow-covered, or slippery.

OVERHEAD CONSOLE

The overhead console contains courtesy/reading lights, storage for sunglasses, an interior observation mirror, and an optional power sunroof switch.



Overhead Console

Courtesy/Reading Lights

Refer to "Courtesy/Reading Lights" under "Lights" in Section 3.

Sunglasses Storage

To access the storage compartment, press on the raised bars on the compartment door in the center of the console and release and the door will swing downward.

Interior Observation Mirror

The convex interior observation mirror provides the driver and front seat passenger a wide field of view to conveniently view passengers sitting in the rear passenger seats. To use the interior observation mirror, first, press on the raised bars on the compartment door and release. The door will swing downward. Then, raise the door until it is almost closed and release. The door will latch in position to use the interior observation mirror.

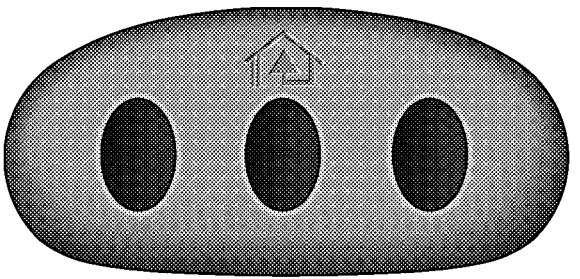
Power Sunroof Switch — If Equipped

Refer to "Power Sunroof" in Section 3.

GARAGE DOOR OPENER — IF EQUIPPED

HomeLink® replaces up to three remote controls (hand-held transmitters) that operate devices such as garage door openers, motorized gates, lighting, or home security systems. The HomeLink® unit operates off your vehicle's battery.

The HomeLink® buttons that are located in the sun visor designate the three different HomeLink® channels.



HomeLink® Buttons

NOTE: HomeLink® is disabled when the Vehicle Security Alarm is active.

WARNING!

Your motorized door or gate will open and close while you are training the Universal Transceiver. Do not train the transceiver if people or pets are in the path of the door or gate. Only use this transceiver with a garage door opener that has a "stop and reverse" feature as required by Federal safety standards. This includes most garage door opener models manufactured after 1982. Do not use a garage door opener without these safety features. Call toll-free 1–800–355–3515 or, on the Internet at www.HomeLink.com for safety information or assistance.

WARNING!

Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run your vehicle in the garage while training the transceiver. Exhaust gas can cause serious injury or death.

Programming HomeLink®

Before You Begin

If you have not trained any of the HomeLink® buttons, erase all channels before you begin training.

To do this, press and hold the two outside buttons for 20 seconds until the red indicator flashes.

It is recommended that a new battery be placed in the hand-held transmitter of the device being programmed to HomeLink® for more efficient training and accurate transmission of the radio-frequency signal.

Your vehicle should be parked outside of the garage when programming.

1. Turn the ignition switch to the ON/RUN position.

2. Hold the battery side of the hand-held transmitter away from the HomeLink® button you wish to program.

Place the hand-held transmitter 1–3 in (3-8 cm) away from the HomeLink® button you wish to program while keeping the indicator light in view.

3. Simultaneously press and hold both the chosen HomeLink® button and the hand-held transmitter button until the HomeLink® indicator changes from a slow to a rapidly blinking light, then release both the HomeLink® and hand-held transmitter buttons.

Watch for the HomeLink® indicator to change flash rates. When it changes, it is programmed. It may take up to 30 seconds, or longer in rare cases. The garage door may open and close while you train.

NOTE:

- Some gate operators and garage door openers may require you to replace Step 3 with procedures noted in the "Gate Operator/Canadian Programming" section.
- After training a HomeLink® channel, if the garage door does not operate with HomeLink® and the garage door opener was manufactured after 1995, the garage door opener may have a rolling code. If so, proceed to the heading "Programming A Rolling Code System."

4. Press and hold the just-trained HomeLink® button and observe the indicator light.

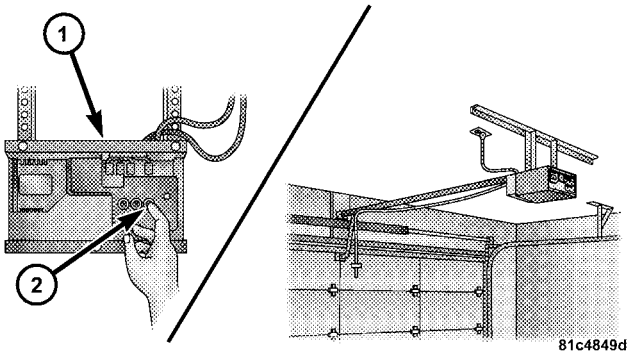
If the indicator light stays on constantly, programming is complete and the garage door (or device) should activate when the HomeLink® button is pressed.

If the indicator light blinks rapidly for two seconds, and then turns to a constant light, continue with programming for a Rolling Code.

5. PROGRAMMING A ROLLING CODE SYSTEM

At the garage door opener motor (in the garage), locate the "Learn" or "Training" button.

This can usually be found where the hanging antenna wire is attached to the garage door opener motor (it is NOT the button normally used to open and close the door).



1 — Garage Door Opener 2 — Training Button

6. Firmly press and release the "Learn" or "Training" button. The name and color of the button may vary by manufacturer.

NOTE: There are 30 seconds in which to initiate the next step after the "Learn" button has been pressed.

7. Return to the vehicle and press the programmed HomeLink® button twice (holding the button for two seconds each time). If the device is plugged in and activates, programming is complete.

If the device does not activate, press the button a third time (for two seconds) to complete the training.

If you have any problems, or require assistance, please call toll-free 1–800–355–3515 or, on the Internet at www.HomeLink.com for information or assistance.

To program the remaining two HomeLink® buttons, repeat each step for each remaining button. DO NOT erase the channels.

Gate Operator/Canadian Programming

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission – which may not be long enough for HomeLink® to pick up the signal during programming.

Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

It may be helpful to unplug the device during the cycling process to prevent possible overheating of the garage door or gate motor.

If you are having difficulties programming a garage door opener or a gate operator, replace "Programming HomeLink®" Step 3 with the following:

3. Continue to press and hold the HomeLink® button while you press and release - every two seconds ("cycle") your hand-held transmitter until HomeLink® has successfully accepted the frequency signal. The indicator light will flash slowly and then rapidly when fully trained.

If you unplugged the device for training, plug it back in at this time.

Then proceed with Step 4 under "Programming HomeLink®" earlier in this section.

Using HomeLink®

To operate, simply press and release the programmed HomeLink® button. Activation will now occur for the trained device (i.e., garage door opener, gate operator, Security system, entry door lock, home/office lighting, etc. The hand-held transmitter of the device may also be used at any time.

Reprogramming A Single HomeLink® Button

To re-program a channel that has been previously trained, follow these steps:

1. Turn the ignition switch to the ON/RUN position.

2. Press and hold the desired HomeLink® button until the indicator light begins to flash after 20 seconds. **Do not release the button.**

3. **Without releasing the button,** proceed with Programming Homelink® Step 2 and follow all remaining steps.

Security

It is advised to erase all channels before you sell or turn in your vehicle.

To do this, press and hold the two outside buttons for 20 seconds until the red indicator flashes. Note that all channels will be erased. Individual channels cannot be erased.

The HomeLink® Universal Transceiver is disabled when the Vehicle Security Alarm is active.

Troubleshooting Tips

If you are having trouble programming HomeLink®, here are some of the most common solutions:

- Replace the battery in the original transmitter.
- Press the "Learn" button on the Garage Door Opener to complete the training for a Rolling Code.
- Did you unplug the device for training, and remember to plug it back in?

If you have any problems, or require assistance, please call toll-free 1–800–355–3515 or, on the Internet at www.HomeLink.com for information or assistance.

General Information

This device complies with FCC rules Part 15 and Industry Canada RSS-210. Operation is subject to the following two conditions:

1. This device may not cause harmful interference

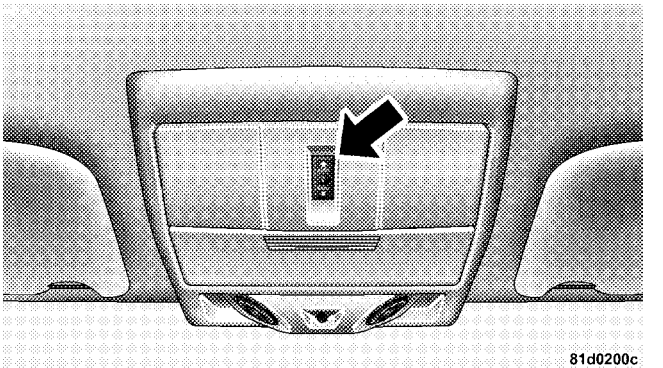
2. This device must accept any interference that may be received including interference that may cause undesired operation

NOTE: The transmitter has been tested and it complies with FCC and IC rules. Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the device.

The term IC before the certification/registration number only signifies that Industry Canada technical specifications were met.

POWER SUNROOF — IF EQUIPPED

The power sunroof switch is located between the sun visors on the overhead console.



Power sunroof Switch

WARNING!

- **Never leave children in a vehicle, with the key in the ignition switch. Occupants, particularly unattended children, can become entrapped by the power sunroof while operating the power sunroof switch. Such entrapment may result in serious injury or death.**
- **In an accident, there is a greater risk of being thrown from a vehicle with an open sunroof. You could also be seriously injured or killed. Always fasten your seat belt properly and make sure all passengers are also properly secured.**
- **Do not allow small children to operate the sunroof. Never allow fingers or other body parts, or any object to project through the sunroof opening. Injury may result.**

Opening Sunroof - Manually

Press and hold the switch in the rearward position. Release the switch when the sunroof is in the position desired and it will stop moving. If you continue to hold the switch in the rearward position, the sunroof will open fully and then stop automatically. Release the switch once the sunroof stops moving.

Opening Sunroof - Express

Press the switch rearward and release, and the sunroof will open automatically from any position. The sunroof will open fully and then stop automatically. This is called Express Open. During Express Open operation, any movement of the sunroof switch will stop the sunroof.

Closing Sunroof - Manually

Press and hold the switch in the forward position. Release the switch when the sunroof is in the position desired and it will stop moving. If you continue to hold

the switch in the forward position, the sunroof will close fully and then stop automatically. Release the switch once the sunroof stops moving.

Closing Sunroof - Express

Press the switch forward and release, and the sunroof will close automatically from any position. The sunroof will close fully and stop automatically. This is called Express Close. During Express Close operation, any movement of the sunroof switch will stop the sunroof.

Pinch Protect Feature

This feature will detect an obstruction in the opening of the sunroof during Express Close operation. If an obstruction in the path of the sunroof is detected, the sunroof will automatically retract. Remove the obstruction if this occurs. Next, press the switch forward and release to Express Close.

Pinch Protect Override

If a known obstruction (ice, debris, etc.) prevents closing, press the switch forward and hold for two seconds after the reversal occurs. This allows the sunroof to move towards the closed position.

NOTE: Pinch protection is disabled while the switch is pressed.

Venting Sunroof - Express

Press and release the ″V″ button in the center of the switch, and the sunroof will open to the vent position. This is called Express Vent, which operates regardless of sunroof position. During Express Vent operation, any movement of the sunroof switch will stop the sunroof.

Sunshade Operation

The sunshade can be opened manually. However, the sunshade will open automatically as the sunroof opens.

NOTE: The sunshade cannot be closed if the sunroof is open.

Wind Buffeting

Wind buffeting can be described as the perception of pressure on the ears or a helicopter type sound in the ears. Your vehicle may exhibit wind buffeting with the windows down, or the sunroof in certain open or partially open positions. This is a normal occurrence and can be minimized. If the buffeting occurs with the rear windows open, then open the front and rear windows together to minimize the buffeting. If the buffeting occurs with the sunroof open, then adjust the sunroof opening to minimize the buffeting or open any window.

Sunroof Maintenance

Use only a non-abrasive cleaner and a soft cloth to clean the glass panel.

Ignition Off Operation

For vehicles not equipped with the Electronic Vehicle Information Center (EVIC), the power sunroof switch will remain active for 45 seconds after the ignition switch is turned to the LOCK position. Opening either front door will cancel this feature.

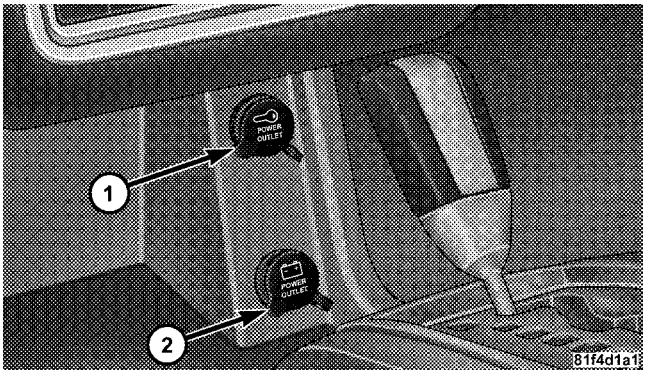
For vehicles equipped with the EVIC, the power sunroof switch will remain active for up to 10 minutes after the ignition switch is turned to the LOCK position. Opening either front door will cancel this feature. The time is programmable. Refer to “Key-Off Power Delay,” under “Personal Settings (Customer Programmable Features),” under “Electronic Vehicle Information Center (EVIC)” in Section 4.

Sunroof Fully Closed

Press the switch forward and release to ensure that the sunroof is fully closed.

ELECTRICAL POWER OUTLETS

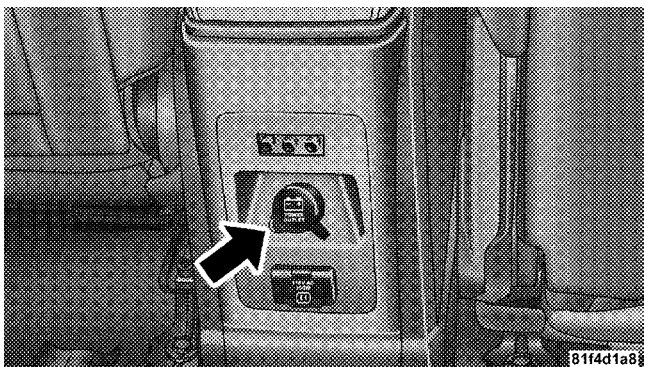
There are two fused 12-Volt power outlets located in the center console below the radio. The outlet on the top has power available when the ignition switch in the ON or ACC position. The outlet on the bottom has power available when the ignition switch is in the LOCK, ON, or ACC position.



Front Power Outlets

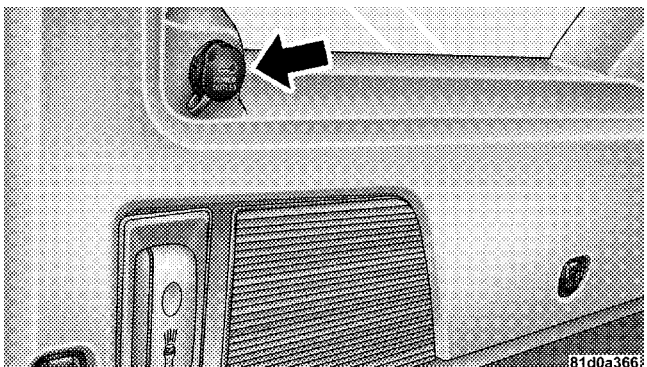
1 — Switched Power
2 — Battery Power

A third fused 12-Volt power outlet is located on the back of the center console. This outlet has power available when the ignition switch is in the LOCK, ON or ACC position.



Rear Power Outlet

A fourth fused 12-Volt power outlet is located on the left quarter trim panel in the cargo area. This outlet has power available when the ignition switch is in the ON or ACC position.



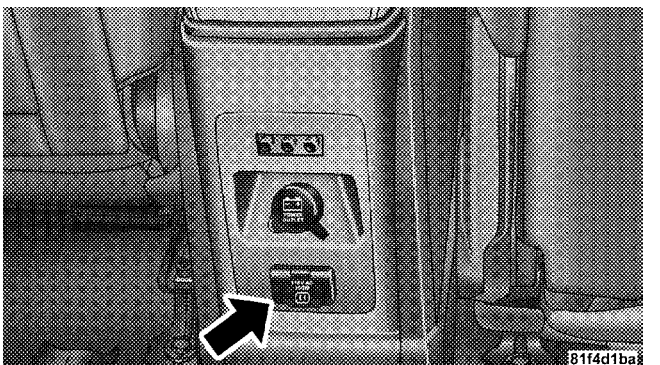
Electrical Outlet Use With Engine Off

CAUTION!

- **Many accessories that can be plugged in draw power from the vehicle's battery, even when not in use (i.e., cellular phones, etc.). Eventually, if plugged in long enough, the vehicle's battery will discharge sufficiently to degrade battery life and/or prevent engine starting.**
- **Accessories that draw higher power (i.e., coolers, vacuum cleaners, lights, etc.) will degrade the battery even more quickly. Only use these intermittently and with greater caution.**
- **After the use of high power draw accessories, or long periods of the vehicle not being started (with accessories still plugged in), the vehicle must be driven a sufficient length of time to allow the alternator to recharge the vehicle's battery.**
- **Power outlets are designed for accessory plugs only. Do not hang any type of accessory or accessory bracket from the plug.**

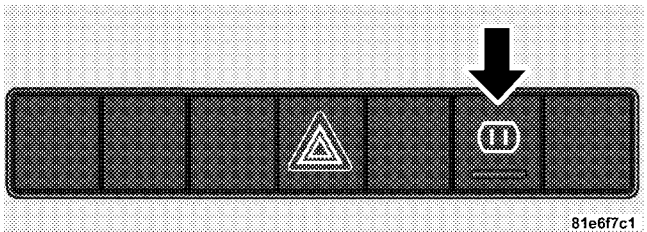
POWER INVERTER — If EQUIPPED

Your vehicle may be equipped with a 115 Volt AC (150 Watt maximum) power outlet located on the back of the center console. This outlet can power small appliances and electronic devices.



Power Inverter

The control switch for the outlet is located in the switch bank above the climate control.



Power Inverter Switch

Press and release the switch once to turn ON the power outlet. A status indicator in the switch will illuminate in approximately one second to indicate that power is available at the outlet. Press and release the switch again to turn OFF the power outlet. The status indicator will also turn off.

NOTE: Due to built-in overload protection, the power outlet will shut down if the 115 Volt AC (150 Watt maximum) power rating is exceeded.

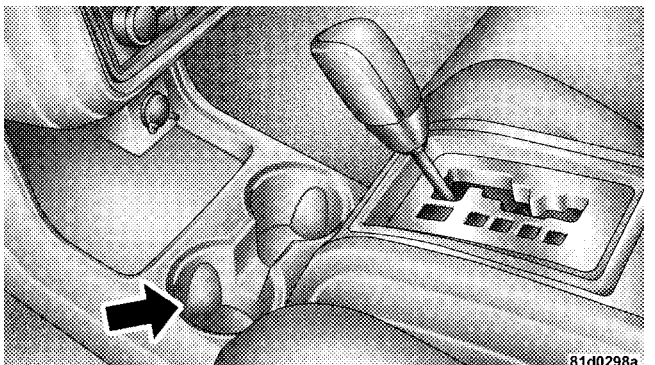
WARNING!

To Avoid Serious Injury or Death:

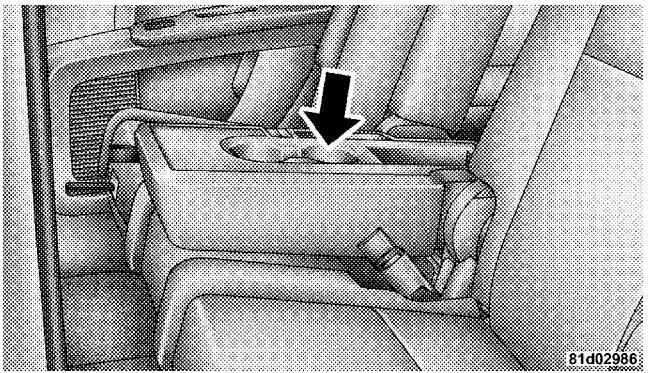
- **Do not use a three-prong adaptor.**
- **Do not insert any objects into the receptacles.**
- **Do not touch with wet hands.**
- **Close the lid when not in use.**
- **If this outlet is mishandled, it may cause an electric shock and failure.**

CUP AND BOTTLE HOLDERS

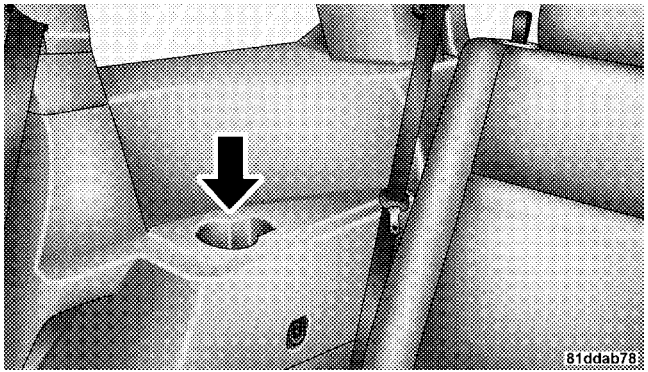
CUPHOLDERS



Center Console Cupholders

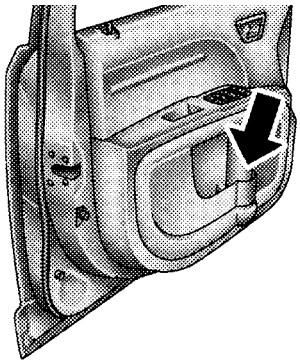


Armrest Cupholders



Quarter Trim Panel Cupholders
(Seven Passenger Models)

BOTTLE HOLDERS



Door Bottle Holder

WARNING!

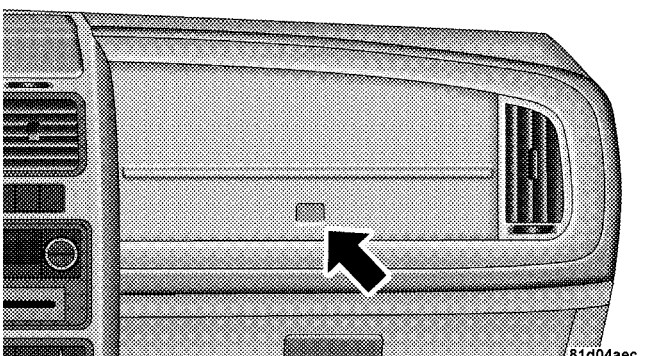
If containers of hot liquid are placed in the bottle holder, they can spill when the door is closed, burning the occupants. Be careful when closing the doors to avoid injury.

STORAGE

Beverage Cooler/Storage Compartment — If Equipped

NOTE: The Beverage Cooler can keep chilled beverages cool depending on ambient temperature and climate control setting. The cooler is intended for non-perishable beverages only.

The Beverage Cooler/Storage Compartment is located on the passenger's side of the instrument panel above the glove compartment. The beverage retainer inside the cooler is designed to hold up to two 12 oz (0.35 l) cans when placed horizontally in the retainer. The beverage retainer is removable to allow for storage of other items in the compartment when not in use as a cooler.

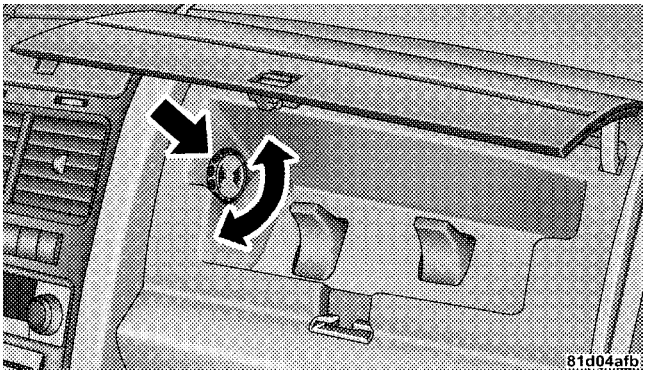


Beverage Cooler/Storage Compartment

Press and release the button on the door to open it. The large door swings upward to allow easy access to the compartment's contents.

Beverage Cooler Operation

The blower speed setting on the climate control sets the rate at which air flows into the compartment. The airflow control valve inside the compartment determines how much air flows into the compartment. Turning the valve rearward increases the airflow, turning it forward decreases the airflow, and turning it all the way forward turns off the airflow.



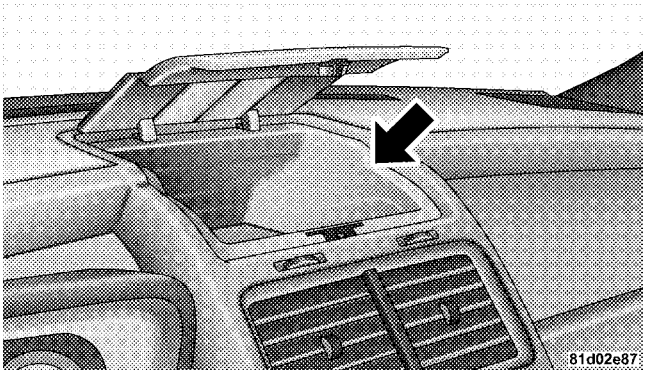
Airflow Control Valve

The compartment cools when the airflow control valve is open, the engine is running, and the Air Conditioning (A/C) is on or the Automatic Temperature Control (ATC) system (if equipped) is set for automatic operation. This allows you to cool the compartment when the climate control is in a cooling or heating mode.

NOTE: Whether operating a Manual Heating and A/C system or operating an ATC system in a manual mode, the A/C indicator must be ON to cool the compartment.

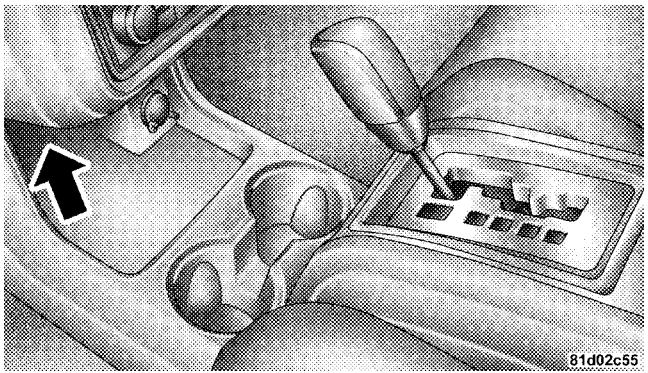
Instrument Panel Storage Compartment — If Equipped

Press and release the button on the door to open it. The door swings upward to allow easy access to the compartment.

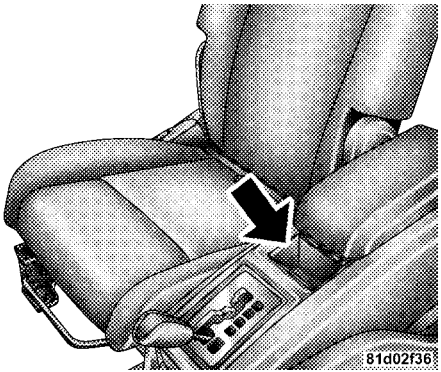


Instrument Panel Storage Compartment

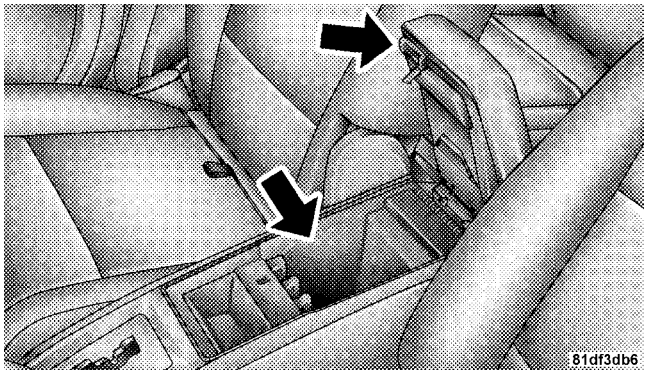
Center Console Storage



Center Stack Cubby Bin



Center Console Cubby Bin

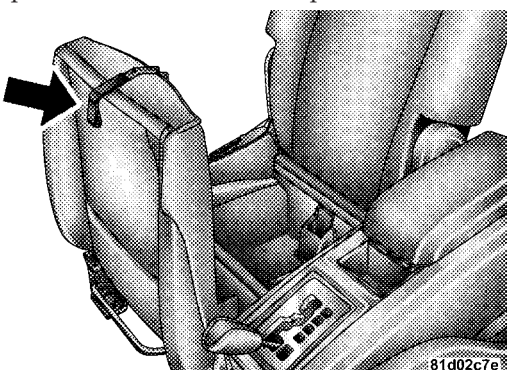


Center Console Storage Bin

NOTE: The sliding armrest (if so equipped) must be in the rearward position in order to access the release button on the front of the bin door.

Flip 'n Stow™ Front Passenger Seat Storage — If Equipped

The seat latch release-loop is located in the center of the seat cushion between the seat cushion and the seatback. Pull the loop upward to release the latch and then forward to open the seat to the detent position.



Front Passenger Seat Storage Compartment

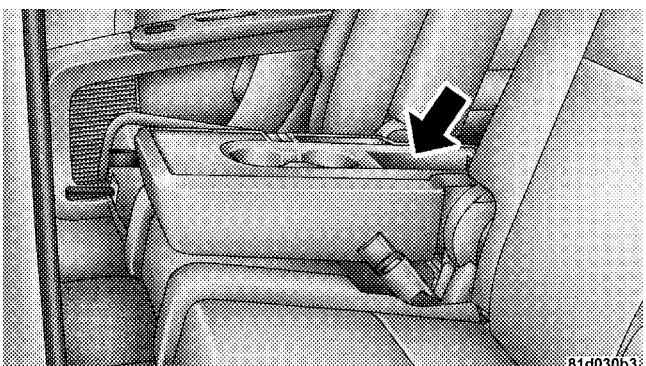
NOTE: Make sure that objects inside the bin do not interfere with the latch before closing the seat. Push the seat cushion downward after closing it to make sure it latches to the base.

WARNING!

Be certain that the seat cushion is locked securely into position before using the seat. Otherwise, the seat will not provide the proper stability for passengers. An improperly latched seat cushion could cause serious injury.

Second-Row Passenger Seat Temporary Storage Bin

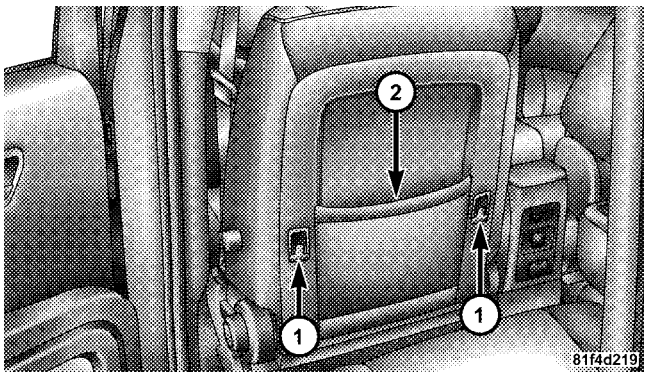
This is a temporary storage bin designed for use when the 20% seatback/armrest is down. Be sure to remove all items from this bin before raising the 20% seatback/armrest.



Armrest Cubby Bin

Second-Row Map Pocket and Grocery Retainers — If Equipped

A map storage pocket and grocery retainers are located on the back of the drivers seatback.

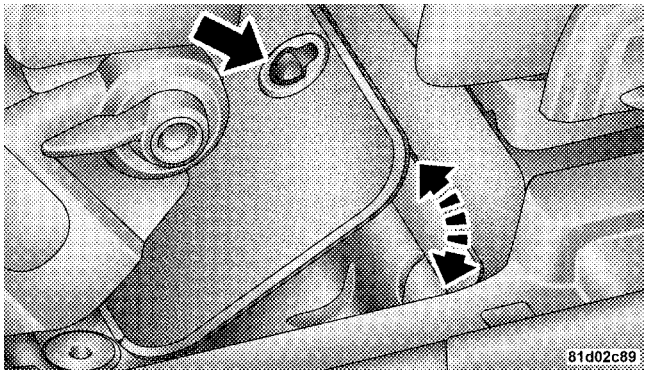


1 - Grocery Retainers
2 - Map Storage

In-Floor Storage Bin with Removable Liner

NOTE: Position the front seat to at least a mid-track position to provide easier access to the storage bin.

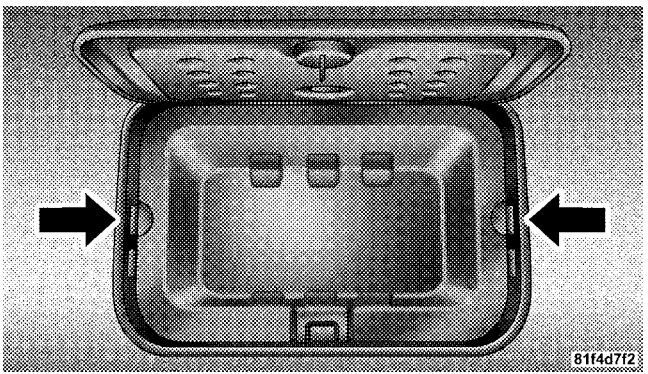
An in-floor storage bin is located behind each front seat. Each 1.6 gal (5.9 l) bin can hold up to 12, 12 oz (0.35 l) cans, plus ice, or other items. The removable bin liner allows for easy filling, emptying, and cleaning.



In-Floor Storage Bin

To access the bin, position the floor mat aside (if equipped). Pull the door latch release-loop upward to release the latch and then forward to open the bin door.

The liner can be removed for easy cleaning by lifting on the notches as shown.

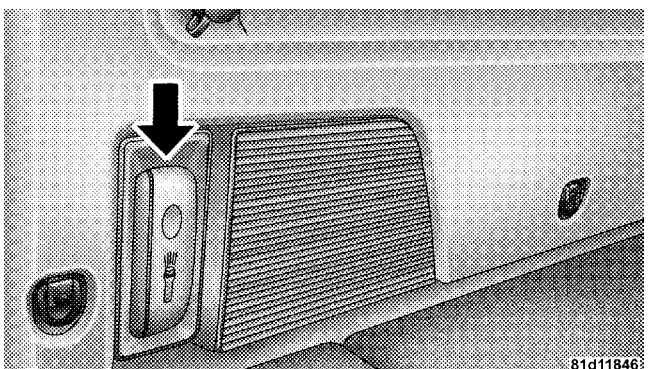


Removable Liner

CARGO AREA FEATURES

Rechargeable Flashlight — If Equipped

The rechargeable LED flashlight stores in its charging station in the left rear quarter trim panel. To remove it, press on the indent on the side of the flashlight and release.



Rechargeable Flashlight

NOTE: Be sure to return the flashlight to its charging station when not in use to ensure it is ready for operation the next time you need it.

Cargo Management System

Five Passenger System Features

- A raised load floor that sits on top of a large built-in storage bin.
- A tri-fold door built into the load floor that allows easy access to items in the built-in storage bin.
- 60/40 split second-row passenger seats with fold flat feature, which allows for extended cargo space. Refer to “Seats” in this section.
- An optional front passenger seat with fold flat feature, which extends cargo space even further. Refer to “Seats” in this section.
- Cargo tie-downs.

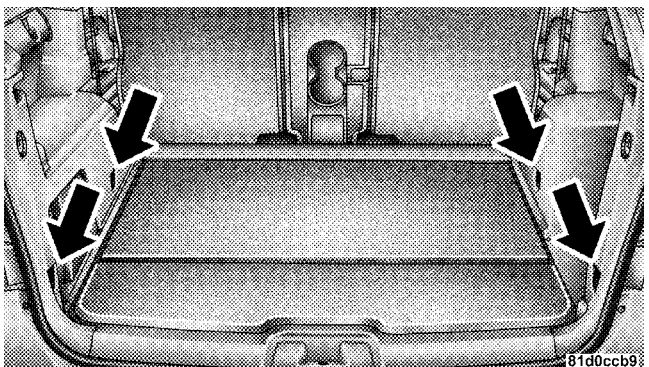
- A retractable cargo area cover (if equipped).

Seven Passenger System Features

- A large built-in storage bin with a hinged hardcover located in the floor behind the third-row passenger seats.
- 60/40 split second-row passenger seats with fold flat feature, which allows for extended cargo space. Refer to “Seats” in this section.
- 50/50 split third-row passenger seats with fold flat feature, which allows for extended cargo space. Refer to “Seats” in this section.
- An optional front passenger seat with fold flat feature, which extends cargo space even further. Refer to “Seats” in this section.
- Cargo tie-downs.

Cargo Tie-Downs

Cargo tie-downs are located on both rear trim panels. These tie-downs should be used to secure loads safely when the vehicle is moving.



Cargo Tie-Downs

WARNING!

- **Cargo tie-downs are not safe anchors for a child seat tether strap. In a sudden stop or collision, a tie-down could pull loose and allow the child seat to come loose. A child could be badly injured. Use only the anchors provided for child seat tethers.**
- **The weight and position of cargo and passengers can change the vehicle center of gravity and vehicle handling. To avoid loss of control resulting in personal injury, follow these guidelines for loading your vehicle:**

- Do not carry loads that exceed the load limits described on the label attached to the left door or left door center pillar.
- Always place cargo evenly on the cargo floor. Put heavier objects as low and as far forward as possible.
- Place as much cargo as possible in front of the rear axle. Too much weight or improperly placed weight over or behind the rear axle can cause the vehicle to sway.
- Do not pile luggage or cargo higher than the top of the seatback. This could impair visibility or become a dangerous projectile in a sudden stop or collision.

WARNING!

To help protect against personal injury, passengers should not be seated in the rear cargo area. The rear cargo space is intended for load carrying purposes only, not for passengers, who should sit in seats and use seat belts.

Retractable Cargo Area Cover (If Equipped) — Five Passenger Models

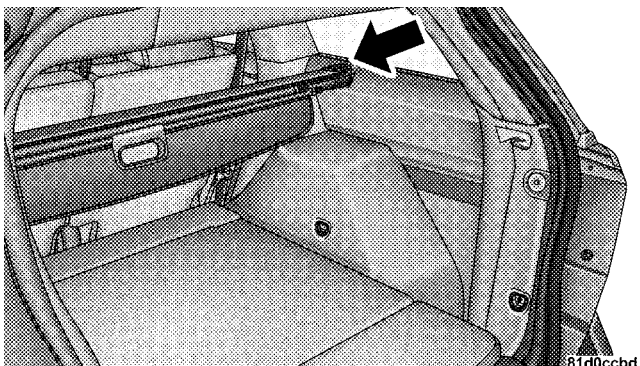
NOTE: The purpose of this cover is for privacy, not to secure loads. It will not prevent cargo from shifting or protect passengers from loose cargo.

The removable retractable cargo area cover mounts in the cargo area behind the top of the rear seats.

The cover, when extended, covers the cargo area to keep items out of sight. Notches in the trim panels near the liftgate opening secure the extended cover in place.

The cover rolls away neatly inside its housing when not in use. You can also remove the cover from the vehicle to make more room in the cargo area.

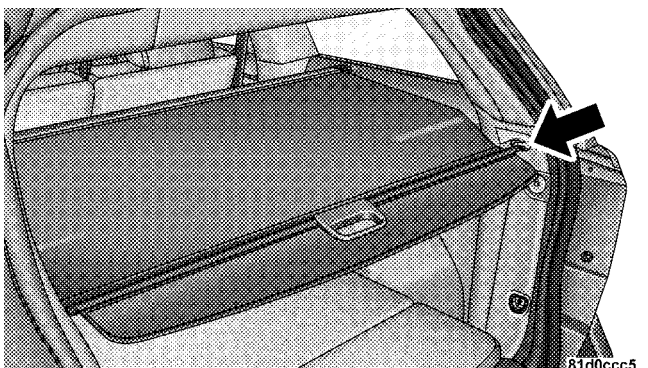
To install the cover, position it in the vehicle so that the flat side of the housing faces upward. Then, insert either the left or the right spring-loaded post (located on the ends of the cover housing) into the left attachment point or the right attachment point (shown).



Installing Retractable Cargo Area Cover

Then, insert the spring-loaded post on the opposite end of the cover housing into the attachment point on the opposite side of the vehicle.

Next, grab the cover handle and pull the cover toward you. As the cover nears the liftgate opening, guide the rear attachment posts (on both ends of the cover) into the notches in the trim panels. Then, lower the cover to position the posts into the bottom of the notches and release the handle.



Positioning Retractable Cargo Area Cover

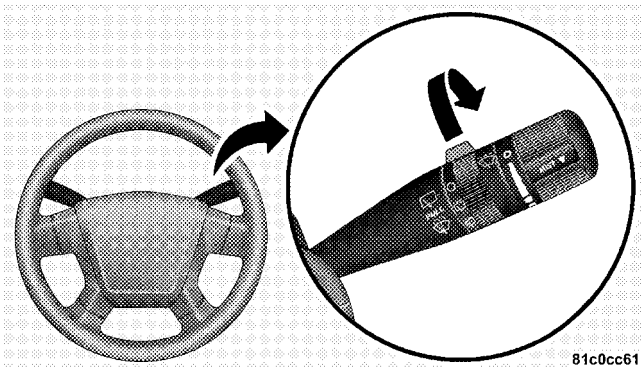
WARNING!

A cargo cover that is unsecured in the vehicle could cause injury in an accident. It could become airborne during a sudden stop and strike someone inside the vehicle. Do not store the cargo cover on the cargo floor or in the passenger compartment. Remove the cover from the vehicle when taken from its mounting. Do not store it in the vehicle.

REAR WINDOW FEATURES

Rear Window Wiper/Washer — If Equipped

The Rear Window Wiper/Washer Control is located on the right side of the steering column.



Rear Window Wiper/Washer Control

The rotary ring switch on the lever controls rear wiper and washer operation. Rotate the switch upward to the first detent to activate the rear wiper. Rotate the switch upward to the second detent to activate the rear washer. The washer will continue to operate until you release the switch. Once released, the wiper will cycle three times, return to the park position, and then resume normal operation.

NOTE: The rear wiper will automatically return to the park position if you turn OFF the ignition switch while it is operating. The rear wiper will resume operation when you turn the ignition switch to the ON position again.

CAUTION!

- **Turn the rear wiper OFF when driving through an automatic car wash. Damage to the rear wiper may result if the rear wiper switch is left in the ON position.**
- **In cold weather, always turn OFF the rear wiper switch and allow the rear wiper to return to the park position before turning OFF the engine. If the rear wiper switch is left ON and the rear wiper freezes to the window, damage to the rear wiper motor may occur when the vehicle is restarted.**
- **Always remove any buildup of snow that prevents the rear wiper blade from returning to the park position. If the rear wiper control is turned OFF and the blade cannot return to the park position, damage to the rear wiper motor may occur.**

Adding Washer Fluid

NOTE: Refer to the "Engine Compartment" diagram in Section 7 for the location of the washer fluid reservoir.

The windshield washer and rear window washer share the same fluid reservoir. The reservoir is located in the front of the engine compartment. Be sure to check the fluid level at regular intervals. Fill the reservoir with windshield washer solvent (not radiator antifreeze) and operate the system for a few seconds to flush out the residual water.

Rear Window Defroster — If Equipped

The Electric Rear Window Defroster control is located on the climate control. Press this button to turn on the rear window defroster and the heated outside rearview mirrors (if equipped). An indicator in the button will illuminate when the rear window defroster is on. The defroster automatically turns off after approximately 10 minutes. For five more minutes of operation, press the button again.

CAUTION!

- **Use care when washing the inside of the rear window. Do not use abrasive window cleaners on the interior surface of the window. Use a soft cloth and a mild washing solution, wiping parallel to the heating elements. Labels can be peeled off after soaking with warm water.**
- **Do not use scrapers, sharp instruments, or abrasive window cleaners on the interior surface of the window.**
- **Keep all objects a safe distance from the window.**

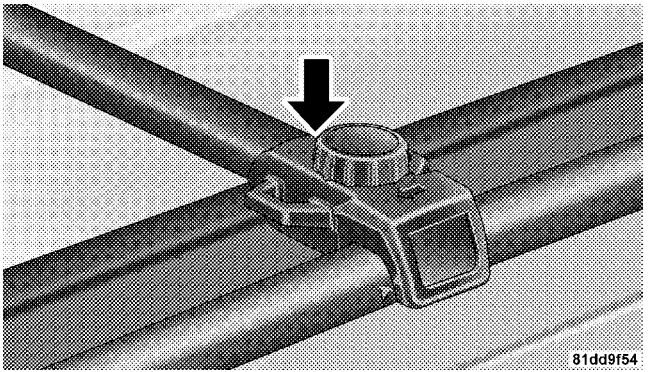
Failure to follow these cautions can cause damage to the heating elements.

ROOF LUGGAGE RACK — IF EQUIPPED

The roof rack cross rails and side rails are designed to carry cargo weight. The load must not exceed 150 lbs (68 kg), and it should be distributed uniformly over the cross rails. In addition, the roof rack does not increase the total load carrying capacity of the vehicle. Be sure the total load of cargo inside the vehicle plus that on the roof rack does not exceed the maximum vehicle load capacity.

To Move the Cross Rails

1. Loosen the knobs on top of each cross rail approximately six turns to disengage the clamp tooth from the side rail.



Roof Luggage Rack

2. Relocate the cross rails, aligning the cross rail stanchions (end pieces) with one of the vertical marks on the outboard surface of the side rail for proper positioning. There are four frontward marks for the front cross rail and four rearward marks for the rear cross rail. Make sure the cross rails remain equally spaced or parallel at any position for proper function.

3. Tighten the knobs on each cross rail to lock it in position. As you tighten the knob, make sure the clamp tooth engages completely into the side rail slot.

4. Attempt to move the cross rail to ensure that it is locked in position.

NOTE:

- To help control wind noise when installing the cross rails, make sure the arrows marked on the underside of the cross rails face the front of the vehicle.
- To help reduce the amount of wind noise when the cross rails are not in use, fasten the front cross rail in the fourth position from the front and the rear cross rail in the eighth position.

The tie down holes on the cross rail ends should always be used to tie down the load. Check the straps frequently to be sure that the load remains securely attached.

CAUTION!

- **Cross rails should remain equally spaced or parallel at any luggage rack position for proper function. Noncompliance could result in damage to the roof rack, cargo, and vehicle.**
- **To avoid damage to the roof rack and vehicle, do not exceed the maximum roof rack load capacity of 150 lbs (68 kg). Always distribute loads as evenly as possible and secure the load appropriately.**
- **Long loads, which extend over the windshield, such as wood panels or surfboards, or loads with large frontal area should be secured to both the front and rear of the vehicle.**
- **Place a blanket or other protection between the surface of the roof and the load.**
- **Travel at reduced speeds and turn corners carefully when carrying large or heavy loads on the roof rack. Wind forces, due to natural causes or nearby truck traffic, can add sudden upward lift to loads. This is especially true on large flat loads and may result in damage to the cargo or your vehicle.**

WARNING!

Cargo must be securely tied before driving your vehicle. Improperly secured loads can fly off the vehicle, particularly at high speeds, resulting in personal injury or property damage. Follow the Roof Rack Cautions when carrying cargo on your roof rack.

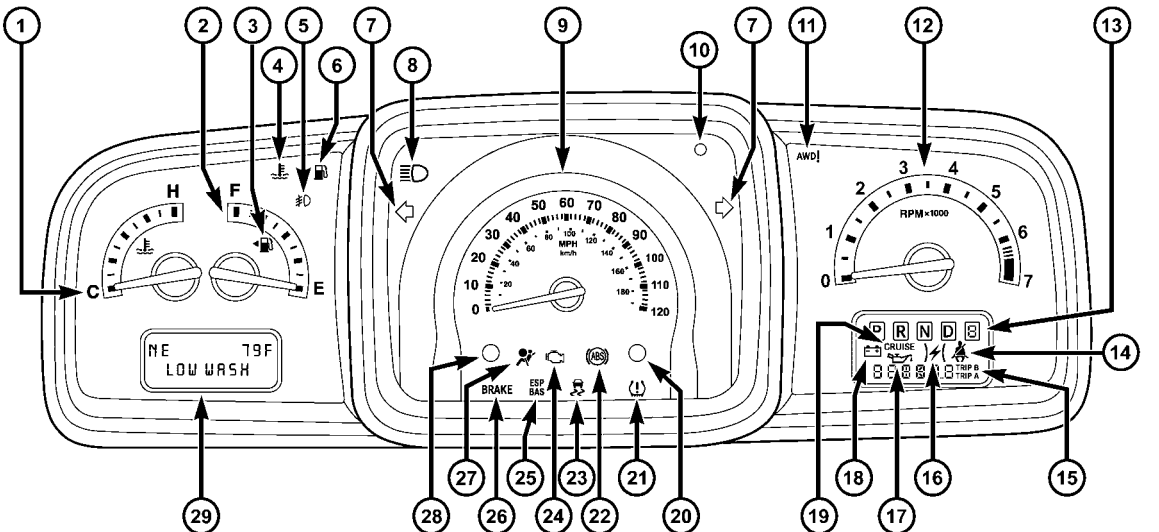
INSTRUMENT CLUSTER



INSTRUMENT CLUSTER DESCRIPTIONS

1. Coolant Temperature Gauge

The temperature gauge indicates engine coolant temperature. Any reading within the normal range indicates that the cooling system is operating satisfactorily. The gauge pointer will likely indicate a high temperature when driving in hot weather, up mountain grades, in heavy traffic, or when towing a trailer. If the pointer rises to the "H" mark, safely pull over and stop the vehicle. If the Air Conditioning A/C system is on, turn it off. Also, shift the transaxle into NEUTRAL and idle the vehicle. If the needle remains on the "H" mark, turn the engine OFF immediately and call for service. (See page 394 for more information.)

NOTE: The gauge pointer will remain near its last reading when the engine is turned off. It will return to a true reading when the engine is restarted.

CAUTION!

Do not leave your vehicle unattended with the engine running, as you would not be able to react to the temperature indicator light if the engine overheats.

2. Fuel Gauge

The fuel gauge shows the level of fuel in the tank when ignition switch is in the ON position.

3. Fuel Cap Indicator

This symbol indicates the side of the vehicle where the fuel filler cap is located.

4. Coolant Temperature Warning Light

This light warns of an overheated engine condition. If the light turns on while driving, safely pull over and stop the vehicle. If the A/C system is on, turn it off. Also, shift the transaxle into NEUTRAL and idle the vehicle. If the temperature reading does not return to normal, turn the engine off immediately and call for service. (See page 394 for more information.)

NOTE: As the coolant temperature gauge approaches "H," this indicator will illuminate and a single chime will sound. Further overheating will cause the temperature gauge to pass "H." In this case, the indicator light will flash continuously and a continuous chime will sound, until the engine is allowed to cool.

CAUTION!

Driving with a hot cooling system could damage your vehicle. If the temperature gauge reads "H," safely pull over and stop the vehicle. Idle the vehicle with the A/C turned off until the pointer drops back into the normal range. If the pointer remains on the "H," and you hear continuous chimes, turn the engine OFF immediately, and call for service.

WARNING!

A hot engine cooling system is dangerous. You or others could be badly burned by steam or boiling coolant. You may want to call a service center if your vehicle overheats. If you decide to look under the hood yourself, refer to Section 7 and follow the warnings under the Cooling System Pressure Cap paragraph.

5. Front Fog Light Indicator Light — If Equipped

This light shows when the fog lights are ON. (See page 148 for more information.)

6. Low Fuel Warning Light

This indicator lights when the fuel level drops to approximately one-eighth tank. (See page 372 for more information.)

7. Turn Signal Indicator Light

The left or right arrow will flash in unison with the corresponding front and rear turn signal lights when the turn signal switch is operated. (See page 149 for more information.)

NOTE: A chime will sound if the vehicle is driven more than 1 mi (1.6 km) with either turn signal on.

NOTE: Check for an inoperative outside light bulb if either indicator flashes at a rapid rate.

8. High Beam Indicator Light

This light shows that the headlights are on high beam. Pull the multifunction lever on the left side of the steering column toward you to switch to low beam. (See page 150 for more information.)

9. Speedometer

Shows the vehicle speed.

10. Vehicle Security Alarm (VSA) Indicator Light — If Equipped

This light will flash rapidly for approximately 16 seconds when the vehicle Security system is arming and then flash slowly when the system is armed. The light will also turn on for about three seconds when the ignition switch is first turned ON. (See page 18 for more information.)

11. All-Wheel Drive (AWD) Failure Indicator Light — If Equipped

AWD!

This light monitors the All-Wheel-Drive (AWD) system. The light will turn on for a bulb check when the ignition switch is turned to the ON position and may stay on for as long as three seconds.

When lit solid: There is an AWD system fault. AWD performance will be at a reduced level. Service the AWD system soon.

When blinking: The AWD system is temporarily disabled due to overload condition.

12. Tachometer

This gauge measures engine revolutions per minute (RPM x 1000). Before the pointer reaches the red area, ease up on the accelerator to prevent engine damage.

13. Transaxle Range Indicator

This display indicator shows automatic transaxle gear selection. (See page 311 for more information.)

14. Seat Belt Reminder Light

This light will turn on for several seconds after the ignition switch is turned ON as a reminder to "buckle up." This light will remain on as long as the driver's seat belt remains unbuckled. (See page 48 for more information.)

15. Odometer/Trip Odometer

The odometer shows the total distance the vehicle has been driven. The trip odometer shows individual trip mileage. Refer to "Trip Odometer button" for additional information.

NOTE: U.S. Federal regulations require upon transfer of vehicle ownership, the seller certify the mileage the vehicle has been driven. Therefore, if the odometer reading is changed because of repair or replacement, be sure to keep a record of the reading before and after the service so that the correct mileage can be determined.

Vehicle Warning Messages

When the appropriate conditions exist, messages such as "hood" (hood ajar), "door" (door ajar), "gATE" (liftgate ajar), "LoCOOL" (low engine coolant), "LoWASH" (low washer fluid), "gASCAP" (fuel cap fault), "ESPOFF" (ESP in partial off mode), "NoFUSE" (IOD fuse out), "HotOIL" (2.4L engine oil temp too hot), or "CHANgE OIL" will display in the odometer.

NOTE: If the instrument cluster is equipped with the optional Electronic Vehicle Information Center (EVIC), then most warnings will display in the EVIC. (See page 221 for more information.)

Hot Oil — 2.4L Engine

Refer to "Engine Oil Overheating — 2.4L Engine Only" under "If Your Engine Overheats" in Section 6.

Fuel Cap Fault Message

If the vehicle diagnostic system determines that the fuel filler cap is loose, improperly installed, or damaged, the word "gASCAP" will display in the odometer. If this occurs, tighten the fuel filler cap until a "clicking" sound is heard. Then press the TRIP ODOMETER button to turn

off the message. If the problem persists, the message will appear the next time the vehicle is started.

A loose, improperly installed, or damaged fuel filler cap may also turn on the MIL. (See page 421 for more information.)

Change Oil Message (Base And Mid Line Clusters Only)

Your vehicle is equipped with an engine oil change indicator system. The "CHANgE OIL" message will flash in the instrument cluster odometer for approximately 12 seconds after a single chime has sounded to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate dependent upon your personal driving style.

Unless reset, this message will continue to display each time you turn the ignition switch to the ON position. To turn off the message temporarily, press and release the TRIP ODOMETER button on the instrument cluster. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the ON position. (Do not start the engine).
2. Fully depress the accelerator pedal slowly three times within 10 seconds.
3. Turn the ignition switch to the LOCK position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

16. Electronic Throttle Control (ETC) Warning Light — If Equipped

This light will turn on briefly as a bulb check when the ignition switch is turned ON. This light will also turn on while the engine is running if there is a problem with the Electronic Throttle Control (ETC) system.

If the light turns on while the engine is running, safely bring the vehicle to a complete stop as soon as possible, place the shift lever in PARK, and cycle the ignition key. The light should turn off. If the light remains lit with the engine running, your vehicle will usually be drivable. However, see your authorized dealer for service as soon as possible.

If the light is flashing when the engine is running, immediate service is required. In this case, you may experience reduced performance, an elevated/rough idle or engine stall, and your vehicle may require towing. Also, have the system checked by an authorized dealer if the light does not turn on during starting.

17. Oil Pressure Warning Light

This light shows low engine oil pressure. The light will turn on and remain on when the ignition switch is turned from the LOCK or ACC position to the ON position. The light will turn off after the engine is started.

If the light does not turn on during starting, have the system checked by an authorized dealer.

If the light turns on and remains on while driving, safely bring the vehicle to a stop and shut off the engine. DO NOT OPERATE THE VEHICLE UNTIL THE CAUSE IS CORRECTED. This light does not show the quantity of oil in the engine. The engine oil level must be checked using the proper procedure. (See page 424 for more information.)

18. Charging System Warning Light

This light shows the status of the electrical charging system. The light should turn on when the ignition switch is first turned ON and remain on briefly as a bulb check. If the light stays on or turns on while driving, turn off some of the vehicle's electrical devices, such as the fog lights or rear defroster. If the light remains on, it means that the charging system is experiencing a problem. See your local authorized dealer to obtain service immediately.

19. Cruise Indicator Light — If Equipped

CRUISE

This indicator lights when the electronic speed control system is turned on. (See page 159 for more information.)

20. Trip Odometer Button

Changing the Display

Press and release this button once to change the display from odometer to "Trip A." Press and release it again to change the display from "Trip A" to "Trip B."

Resetting the Trip Odometer

Display the trip mileage that you want to reset, "Trip A" or "Trip B." Then push and hold the button (approximately two seconds) until the display resets to 0. The odometer must be in Trip Mode to reset the trip odometer.

21. Tire Pressure Monitoring Telltale Light — If Equipped

Each tire, including the spare (if provided), should be checked monthly when cold and inflated to the inflation pressure recommended by the vehicle manufacturer on the vehicle placard or tire inflation pressure label. (If your vehicle has tires of a different size than the size indicated on the vehicle placard or tire inflation pressure label, you should determine the proper tire inflation pressure for those tires.)

As an added safety feature, your vehicle has been equipped with a tire pressure monitoring system (TPMS) that illuminates a low tire pressure telltale when one or more of your tires is significantly under-inflated. Accordingly, when the low tire pressure telltale light illuminates, you should stop and check your tires as soon as possible, and inflate them to the proper pressure. Driving on a significantly under-inflated tire causes the tire to overheat and can lead to tire failure. Under-inflation also reduces fuel efficiency and tire tread life, and may affect the vehicle's handling and stopping ability.

Please note that the TPMS is not a substitute for proper tire maintenance, and it is the driver's responsibility to maintain correct tire pressure, even if under-inflation has not reached the level to trigger illumination of the TPMS low tire pressure telltale.

Your vehicle has also been equipped with a TPMS malfunction indicator to indicate when the system is not operating properly. The TPMS malfunction indicator is combined with the low tire pressure telltale. When the system detects a malfunction, the telltale will flash for approximately one minute and then remain continuously illuminated. This sequence will continue upon subsequent vehicle start-ups as long as the malfunction exists.

When the malfunction indicator is illuminated, the system may not be able to detect or signal low tire pressure as intended. TPMS malfunctions may occur for a variety of reasons, including the installation of replacement or alternate tires or wheels on the vehicle that prevent the TPMS from functioning properly. Always check the TPMS malfunction telltale light after replacing one or more tires or wheels on your vehicle to ensure that the replacement or alternate tires and wheels allow the TPMS to continue to function properly. (See page 355 for more information.)

CAUTION!

The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures and warning have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. Aftermarket wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result. (Refer to "Tire Inflation Pressures" under "Tires — General Information" and to "Tire Pressure Monitor System (TPMS)" in Section 5 for more information).

22. Anti-Lock Brake System (ABS) Warning Light

This light monitors the Anti-Lock Brake System (ABS). The light will turn on when the ignition switch is turned to the ON position and may stay on for as long as four seconds.

If the ABS light remains on or turns on while driving, it indicates that the Anti-Lock portion of the brake system is not functioning and that service is required. However, the conventional brake system will continue to operate normally if the Brake System Warning Light is not on.

If the ABS light is on, the brake system should be serviced as soon as possible to restore the benefit of Anti-Lock brakes. Furthermore, the ABS light should be checked frequently to assure that it is operating properly. If the light does not turn on, have the system checked by an authorized dealer. (See page 328 for more information.)

23. Electronic Stability Program (ESP)/Traction Control System (TCS) Indicator Light

If this indicator light flashes during acceleration, ease up on the accelerator and apply as little throttle as possible. Adapt your speed and driving to the prevailing road conditions. (See page 328 for more information.)

24. Malfunction Indicator Light (MIL)

This light is part of an Onboard Diagnostic system called OBD II. The OBD system monitors emissions, engine, and automatic transaxle control systems. The MIL will turn on when the key is in the ON position before engine start. If the MIL does not turn on when turning the key from LOCK or ACC to ON, have the condition checked promptly.

Certain conditions such as a loose or missing gas cap, poor fuel quality, etc., may illuminate the MIL after engine start. The vehicle should be serviced if the MIL

stays on through several of your typical driving cycles. In most situations, the vehicle will drive normally and will not require towing.

If the MIL flashes when the engine is running, serious conditions may exist that could lead to immediate loss of power or severe catalytic converter damage. (See page 421 for more information.)

CAUTION!

Prolonged driving with the MIL on could cause further damage to the emissions control system. It could also affect fuel economy and driveability. The vehicle must be serviced before any emissions tests can be performed.

If the MIL is flashing while the engine is running, severe catalytic converter damage and power loss will soon occur. Immediate service is required.

25. Electronic Stability Program (ESP)/Brake Assist System (BAS) Malfunction Indicator Light – If Equipped

The yellow ESP/BAS Malfunction Indicator Light will turn on when the ignition switch is turned to the ON position. The light should go out with the engine running. The system will turn the light on continuously while the engine is running if it detects a malfunction in either the ESP or the BAS or both. If this light remains on after the several ignition cycles, and the vehicle has been driven several miles (kilometers) at speeds greater than 30 mph (48 km/h), see your authorized dealer as soon as possible to have the problem diagnosed and corrected. (See page 328 for more information.)

26. Brake System Warning Light

BRAKE

This light monitors various brake functions, including brake fluid level and parking brake application. If the light turns on, it may indicate that the parking brake is applied, that the brake fluid level is low, or that there is a problem with the ABS.

The dual brake system provides a reserve braking capacity to a portion of the hydraulic system in the event of a failure. Failure of either half of the dual brake system is indicated by the Brake System Warning Light, which will turn on when the brake fluid level in the master cylinder drops below a specified level.

The light will remain on until the cause is corrected.

NOTE: The light may flash momentarily during sharp cornering maneuvers due to a change in fluid level. If so, the vehicle should have service performed and the brake fluid level checked.

Immediate repair is necessary if brake failure is indicated.

WARNING!

Driving a vehicle with the Brake System Warning Light on is dangerous. A significant decrease in braking performance or vehicle stability during braking may occur. It will take you longer to stop the vehicle or will make your vehicle harder to control. You could have an accident. Have the vehicle checked immediately.

Vehicles equipped with ABS are also equipped with Electronic Brake Force Distribution (EBD). Both the Brake Warning Light and the ABS Light will turn on in the event of an EBD failure. Immediate repair of the ABS is required in the event of an EBD failure.

The operation of the Brake Warning Light can be checked by turning the ignition switch from the LOCK position to the ON position. The light should turn on for approximately two seconds and then turn off. The light will remain on if the parking brake is applied or if a brake fault is detected. If the parking brake is not applied and the light remains on, or if the light does not turn on, have the light inspected by an authorized dealer.

NOTE: The light will turn on when the ignition switch is in the ON position and the parking brake is applied. This light shows only that the parking brake is applied. It does not show the degree of brake application. (See page 326 for more information.)

27. Airbag Warning Light

This light will turn on for four to six seconds as a bulb check when the ignition switch is first turned ON. If the light is either not on during starting, or stays on, or turns on while driving, then have the system inspected at your authorized dealer as soon as possible. (See page 63 for more information.)

28. Compass/Temperature Display Button (Mid Line Clusters Only)

Operates the Compass/Temperature display in the Vacuum Fluorescent Display.

29. Vacuum Fluorescent Display (Mid Line And Premium Clusters Only)

On vehicles equipped with a Premium Cluster, this display shows the Electronic Vehicle Information Center (EVIC) messages when the appropriate conditions exist. (See page 221 for more information.)

On vehicles equipped with a Mid Line Cluster, this display shows the compass heading (N, S, E, W, NE, NW, SE, and SW) and the outside temperature. The COMPASS/TEMPERATURE DISPLAY button operates

this display. Press and release the button once to turn on the display. Press and release it again to turn off the display.

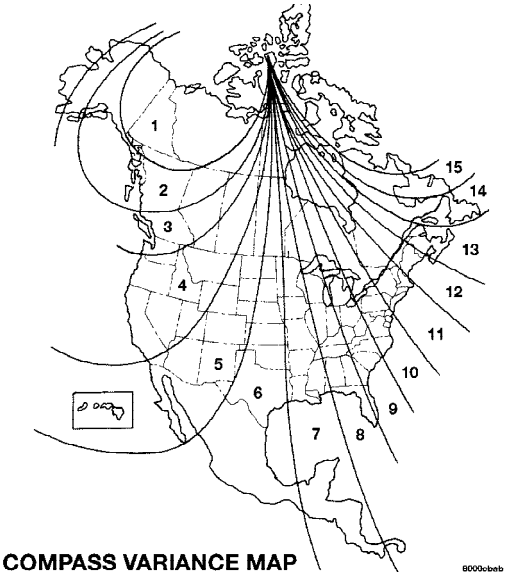
Setting Compass Variance (Mid Line Cluster Only)

Compass Variance is the difference between magnetic North and geographic North. To allow the compass module to compensate for that difference and ensure accuracy, you can set the variance in the compass module to the zone where the vehicle is located according to the Compass Variance Map. To set the variance, perform the following procedure.

NOTE:

- Magnetic materials should be kept away from the top of the instrument panel, as this is where the compass sensor is located.
- The shift lever must be in PARK to enter the variance setting mode.

  To set the variance, first, turn the ignition switch to the ON position. Next, press and hold the COMPASS/ TEMPERATURE DISPLAY button until the current variance zone number displays (approximately 10 seconds). Then, press and release the button to increment the variance value by one, until the proper variance zone is selected according to the map. Finally, turn the ignition switch to the LOCK position to exit this mode.



COMPASS VARIANCE MAP

NOTE: The default variance setting is Zone 8. When setting the variance, the numbering will wrap around from Zone 15 to Zone 1.

Calibrating the Compass (Mid Line Cluster Only)

If the compass appears erratic, inaccurate, or abnormal, you may wish to calibrate it. However, prior to calibrating the compass, make sure the proper Compass Variance value is selected.

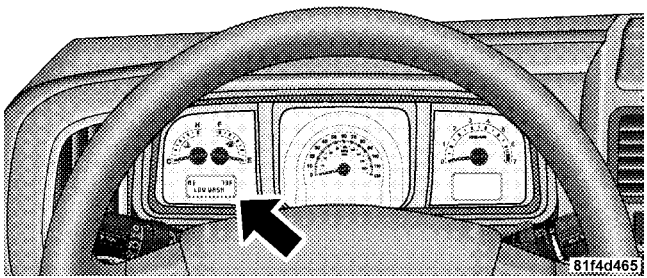
NOTE: The shift lever must be in PARK to enter the Calibration mode.

To calibrate the compass, first, start the engine. Next, press and hold the COMPASS/TEMPERATURE DISPLAY button until the current variance zone number displays (approximately 10 seconds). Then, press and hold the button again until the direction displays with the "CAL" indicator on continuously (approximately 10

seconds). Finally, drive the vehicle in one or more complete circles, at speeds under 5 mph (8 km/h), in an area free from power lines and large metallic objects, until the "CAL" indicator turns off. The compass will now function normally.

ELECTRONIC VEHICLE INFORMATION CENTER (EVIC) — IF EQUIPPED

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display. It is located in the instrument cluster below the fuel and temperature gauges. Vehicles equipped with steering wheel-mounted buttons (described in this section) are also equipped with the EVIC. The EVIC consists of the following:

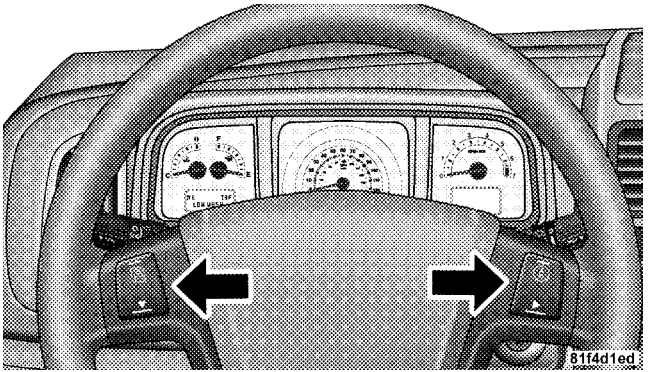


EVIC

- Compass display,
- Outside temperature display,
- Trip computer functions,

- System status, including vehicle information warning message displays, and Tire Pressure Monitor System (TPMS) displays (if equipped), and,
- Personal Settings (customer programmable features).

The system allows the driver to select information by pressing the following buttons mounted on the steering wheel.



EVIC Steering Wheel Switches

MENU Button

Press and release this button and the mode displayed will change between Compass/ Outside Temperature, Trip Functions, System Status, and Personal Settings.

RESET Button

Press this button to reset Trip Functions and change Personal Settings.

SCROLL Button

Press this button to scroll through Trip Functions (Average Fuel Economy, Distance To Empty [DTE], Elapsed Time, Units In), System Status Messages, and Personal Settings (Customer Programmable Features).

COMPASS/ TEMPERATURE Button

Press this button to display the Compass/Outside Temperature.

Electronic Vehicle Information Center (EVIC) Displays

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn Signal On (with a continuous warning chime if the vehicle is driven more than 1 mi [1.6 km] with either turn signal on)
- Left Front Turn Signal Light Out (with a single chime)
- Left Rear Turn Signal Light Out (with a single chime)
- Right Front Turn Signal Light Out (with a single chime)
- Right Rear Turn Signal Light Out (with a single chime)
- RKE Battery Low (with a single chime)
- Personal Settings Not Available – Vehicle Not in PARK

- Channel # Transmit. Refer to “Garage Door Opener” in Section 2.
- Channel # Training. Refer to “Garage Door Opener” in Section 2.
- Channel # Trained. Refer to “Garage Door Opener” in Section 2.
- Clearing Channels. Refer to “Garage Door Opener” in Section 2.
- Channels Cleared. Refer to “Garage Door Opener” in Section 2.
- Did Not Train. Refer to “Garage Door Opener” in Section 2.
- Left Front Low Pressure (with a single chime). Refer to information on “Tire Pressure” and “Tire Pressure Monitor” in Section 5.
- Left Rear Low Pressure (with a single chime). Refer to information on “Tire Pressure” and “Tire Pressure Monitor” in Section 5.
- Right Front Low Pressure (with a single chime). Refer to information on “Tire Pressure” and “Tire Pressure Monitor” in Section 5.
- Right Rear Low Pressure (with a single chime). Refer to information on “Tire Pressure” and “Tire Pressure Monitor” in Section 5.
- Check TPM System (with a single chime). Refer to information on “Tire Pressure Monitor” in Section 5.
- Low Fuel
- Cal
- Oil Change Required (with a single chime)
- Low Washer Fluid

- Coolant Low
- Key in Ignition
- Lights On

Oil Change Required

Your vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message will display in the EVIC for approximately 5 seconds after a single chime has sounded to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate dependent upon your personal driving style.

Unless reset, this message will continue to display each time you turn the ignition switch to the ON position. To turn off the message temporarily, press and release the MENU button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the ON position (Do not start the engine).
2. Fully depress the accelerator pedal slowly three times within 10 seconds.
3. Turn the ignition switch to the LOCK position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

Trip Functions

Press and release the MENU button until one of the following Trip Functions displays in the EVIC:

- Average Fuel Economy
- Distance To Empty
- Elapsed Time
- Units In

Press the SCROLL button to cycle through all the Trip Computer functions.

The Trip Functions mode displays the following information.

- *Average Fuel Economy*

Shows the average fuel economy since the last reset. When the fuel economy is reset, the display will read "RESET" or show dashes for two seconds. Then, the history information will be erased, and the averaging will continue from the last fuel average reading before the reset.

- *Distance To Empty (DTE)*

Shows the estimated distance that can be traveled with the fuel remaining in the tank. This estimated distance is determined by a weighted average of the instantaneous and average fuel economy, according to the current fuel tank level. DTE cannot be reset through the RESET button.

NOTE: Significant changes in driving style or vehicle loading will greatly affect the actual drivable distance of the vehicle, regardless of the DTE displayed value.

- When the DTE value is less than 30 mi (48 km) estimated driving distance, the DTE display will change to a text display of "LOW FUEL." This display will continue until the vehicle runs out of fuel. Adding

a significant amount of fuel to the vehicle will turn off the ″LOW FUEL″ text and a new DTE value will display.

- *Elapsed Time*

Shows the total elapsed time of travel since the last reset when the ignition switch is in the ACC position. Elapsed time will increment when the ignition switch is in the ON or START position.

- *Units In*

The EVIC, odometer, and navigation system (if equipped) can be changed between English and Metric units of measure. To make your selection, press and release the RESET button until “U.S.” or “METRIC” appears.

To Reset The Display

Reset will only occur while a resettable function is being displayed. Press and release the RESET button once to clear the resettable function being displayed. To reset all resettable functions, press and release the RESET button a second time within three seconds of resetting the currently-displayed function. (>Reset ALL will display during this three-second window).

Compass Display

COMPASS/ TEMPERATURE Button

Press and release this button to display one of eight compass readings and the outside temperature. The compass readings indicate the direction the vehicle is facing.

Automatic Compass Calibration

This compass is self-calibrating, which eliminates the need to calibrate the compass manually. When the vehicle is new, the compass may appear erratic and the EVIC will display "CAL" until the compass is calibrated. You may calibrate the compass by slowly completing one or more 360-degree turns (in an area free from large metal or metallic objects) until the "CAL" message displayed in the EVIC turns off. The compass will now function normally.

Manual Compass Calibration

If the compass appears erratic or is inaccurate, you can calibrate the compass manually by performing the following steps.

1. Turn the ignition switch ON.

2. Press and release the MENU button until Personal Settings displays in the EVIC.

3. Press the SCROLL button until "CALIBRATE COMPASS" displays in the EVIC.

4. Press and release the RESET button to start the calibration. The message "CAL" will display in the EVIC.

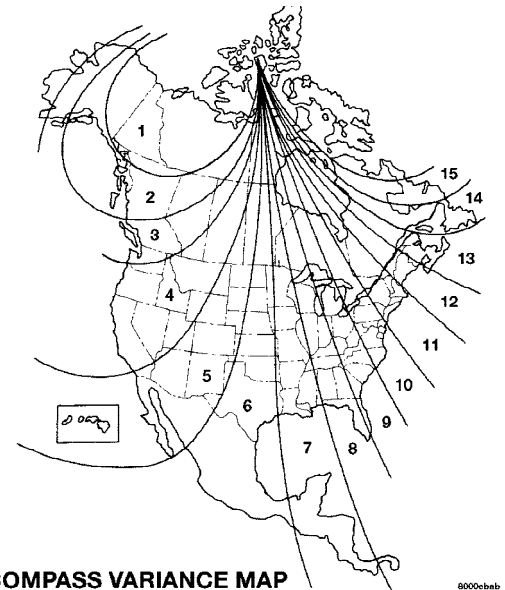
5. Slowly complete one or more 360-degree turns (in an area free from large metal or metallic objects) until the "CAL" message turns off. The compass will now function normally.

Compass Variance

Compass Variance is the difference between magnetic North and geographic North. To allow the compass module to compensate for that difference and ensure accuracy, you can set the variance in the compass module to the zone where the vehicle is located according to the Compass Variance Map. To set the variance, perform the following steps.

NOTE:

- The default variance setting is Zone 8. When setting the variance, the numbering will wrap around from Zone 15 to Zone 1.
- Magnetic materials should be kept away from the top of the instrument panel, as this is where the compass sensor is located.



COMPASS VARIANCE MAP

1. Turn the ignition switch ON.

2. Press and release the MENU button until Personal Settings displays in the EVIC.

3. Press the SCROLL button until "COMPASS VARIANCE" message and the last variance zone number displays in the EVIC.

4. Press and release RESET button until the proper variance zone is selected according to the map.

5. Press and release the COMPASS/TEMPERATURE button to exit.

Personal Settings (Customer Programmable Features)

Personal Settings allows the driver to set and recall features when the transaxle is in PARK.

Press and release the MENU button until Personal Settings displays in the EVIC.

Use the SCROLL button to display one of the following choices.

"LANGUAGE"

When in this display you may select one of three languages for all display nomenclature, including the trip functions and the navigation system (if equipped). Press the RESET button while in this display to select English, French, or Spanish. Then, as you continue, the information will display in the selected language.

NOTE: The EVIC will not change the UConnect® language selection. Refer to "Language Selection" under "Hands-Free Communication (UConnect®)" in Section 3.

"AUTO UNLK ON EXIT"

When ON is selected, all doors and the liftgate will unlock when the vehicle is stopped and the transaxle is in the PARK or NEUTRAL position and the driver's door is opened. To make your selection, press and release the RESET button until "ON" or "OFF" appears.

"RKE UNLOCK"
When **Driver Door 1st Press** is selected, only the driver's door will unlock on the first press of the Remote Keyless Entry (RKE) UNLOCK button. When Driver Door 1st Press is selected, you must press the RKE UNLOCK button twice to unlock the passenger doors and liftgate. When **All Doors 1st Press** is selected, all doors and the liftgate will unlock on the first press of the RKE UNLOCK button. To make your selection, press and release the RESET button until "Driver Door 1st Press" or "All Doors 1st Press" appears.

"SOUND HORN WITH LOCK"
When ON is selected, a short horn sound will occur when the RKE LOCK button is pressed. This feature may be selected with or without the flash lights with lock feature. To make your selection, press and release the RESET button until "ON" or "OFF" appears.

"FLASH LAMP WITH LOCK"
When ON is selected, the front and rear turn signals will flash when the doors are locked or unlocked with the RKE transmitter. This feature may be selected with or without the sound horn on lock feature selected. To make your selection, press and release the RESET button until "ON" or "OFF" appears.

"HEADLAMP OFF DELAY"
When this feature is selected, the driver can choose to have the headlights remain on for 0, 30, 60, or 90 seconds after turning the ignition to the LOCK position. To make your selection, press and release the RESET button until "0," "30," "60," or "90" appears.

"HEADLAMPS WITH WIPERS" (Available with Auto Headlights Only)
When ON is selected, and the multifunction lever is placed in the AUTO position, the headlights will turn on approximately 10 seconds after the wipers are turned

ON. The headlights will also turn off when the wipers are turned OFF if they were turned ON by this feature. To make your selection, press and release the RESET button until “ON” or “OFF” appears.

“KEY-OFF POWER DELAY”
When this feature is selected, the power window switches, radio, hands-free system (if equipped), DVD video system (if equipped), power sunroof (if equipped), and ignition powered outlets will remain active for up to 10 minutes after the ignition switch is turned OFF. Opening a vehicle door will cancel this feature. To make your selection, press and release the RESET button until “Off,” “45 sec.,” “5 min.,” or “10 min.” appears.

“ILLUMIN APPROACH”
When this feature is selected, the headlights will activate and remain on for up to 90 seconds when the doors are unlocked with the RKE transmitter. To make your selection, press and hold the RESET button until “Off,” “30 sec,” “60 sec,” or “90 sec” appears.

“DISPLAY UNITS IN”
The EVIC, odometer, and navigation system (if equipped) can be changed between English and Metric units of measure. To make your selection, press and release the RESET button until “U.S.” or “METRIC” appears.

“NAV TURN BY TURN” — If Equipped
When ON is selected, the Turn-by-Turn directions will appear in the display as the vehicle approaches a designated turn within a programmed route. To make your selection, press and release the RESET button until “ON” or “OFF” appears.

COMPASS VARIANCE
Refer to “Compass Variance” under “Compass Display.”

CALIBRATE COMPASS

Refer to “Manual Compass Calibration” under “Compass Display.”

RADIO GENERAL INFORMATION

Radio Broadcast Signals

The radio will provide excellent reception under most operating conditions. Like any system, however, car radios have performance limitations, due to mobile operation and natural phenomena, which might lead you to believe your sound system is malfunctioning. To help you understand and save you concern about these “apparent” malfunctions, you must understand a point or two about the transmission and reception of radio signals.

Two Types of Signals

There are two basic types of radio signals: AM (Amplitude Modulation), in which the transmitted sound causes the amplitude, or height, of the radio waves to vary; and FM (Frequency Modulation), in which the frequency of the wave is varied to carry the sound.

Electrical Disturbance

Radio waves may pick up electrical disturbances during transmission. They mainly affect the wave amplitude, and thus remain a part of the AM reception. They interfere very little with the frequency variations that carry the FM signal.

AM Reception

AM sound is based on wave amplitude, so AM reception can be disrupted by such things as lightning, power lines and neon signs.

FM Reception

Because FM transmission is based on frequency variations, interference that consists of amplitude variations can be filtered out, leaving the reception relatively clear, which is the major feature of FM radio.

NOTE:

- For vehicles not equipped with the Electronic Vehicle Information Center (EVIC), the radio and steering wheel radio controls (if equipped) will remain active for 45 seconds after the ignition switch is turned to the LOCK position. Opening either front door will cancel this feature.
- For vehicles equipped with the EVIC, the radio and steering wheel radio controls (if equipped) will remain active for up to 10 minutes after the ignition switch is turned to the LOCK position. Opening either front door will cancel this feature. The time is programmable. For details, refer to "Key-Off Power Delay," under "Personal Settings (Customer Programmable Features)" under "Electronic Vehicle Information Center (EVIC)" in Section 4.

SALES CODE REN — MULTIMEDIA SYSTEM — IF EQUIPPED

NOTE: The sales code is located on the lower right side of the unit's faceplate.

The REN Multimedia system contains a radio, CD/DVD player, USB port, a 30-gigabyte hard drive (HDD), and a "JukeBox" (virtual CD changer). Sirius Satellite Radio is optional. The 6.5 in (16.5 cm) touch screen allows for easy menu selection.

A 30-gigabyte HDD allows uploads of music and photos from CDs or through the USB port. The Gracenote database finds the artist, track, and title for the music.

An auxiliary input jack permits passengers to listen to a portable MP3 player through the vehicle's speakers. For vehicles equipped with the Video Entertainment System (VES)™, separate audio outputs allow passengers to listen to the vehicle speakers while different audio tracks play through the system's wireless headphones. This means rear-seat passengers can watch a DVD on the optional rear seat entertainment system, while the driver and front-seat passenger listen to the radio.

Other special features include direct tune, music type selections, easy store presets, backup camera display for vehicles equipped with a backup camera, and on some models, a dual display screen operation. Refer to your radio-specific user's manual for detailed operating instructions.

Operating Instructions — Satellite Radio (If Equipped)

Refer to your radio-specific user's manual for detailed operating instructions.

Operating Instructions — Voice Recognition System (VR) (If Equipped)

For the radio, refer to "Voice Recognition System (VR)" in Section 3.

For Hands Free Phone Communication (UConnect®) "Voice Recognition System (VR)," refer to "Hands-Free Communication (UConnect®)" in Section 3.

Operating Instructions — Hands-Free Communication (UConnect®) (If Equipped)

Refer to "Hands-Free Communication (UConnect®)" in Section 3.

Clock Setting Procedure

Setting the Clock

1. Turn on the multimedia system.

2. Touch the screen where the time is displayed. The clock setting menu will appear on the screen.

3. To move the hour forward, touch the screen where the word “Hour” with the arrow pointing upward is displayed. To move the hour backward, touch the screen where the word “Hour” with the arrow pointing downward is displayed.

4. To move the minute forward, touch the screen where the word “Min” with the arrow pointing upward is displayed. To move the minute backward, touch the screen where the word “Min” with the arrow pointing downward is displayed.

5. To save the new time setting, touch the screen where the word “Save” is displayed.

Changing Daylight Savings Time

When selected, this feature will display the time of day in daylight savings time. Proceed as follows to change the current setting:

1. Turn on the multimedia system.

2. Touch the screen where the time is displayed. The clock setting menu will appear on the screen.

3. When this feature is on, a check mark will appear in the box next to the words “Daylight Savings.” Touch the screen where the words “Daylight Savings” are displayed to change the current setting.

Show Time if Radio is Off

When selected, this feature will display the time of day on the touch screen when the multimedia system is turned off. Proceed as follows to change the current setting:

1. Turn on the multimedia system.

2. Touch the screen where the time is displayed. The clock setting menu will appear on the screen.

3. When this feature is on, a check mark will appear in the box next to the words “Show Time if Radio is Off.” Touch the screen where the words “Show Time if Radio is Off” are displayed to change the current setting.

Changing the Time Zone

1. Turn on the multimedia system.

2. Touch the screen where the time is displayed. The clock setting menu will appear on the screen.

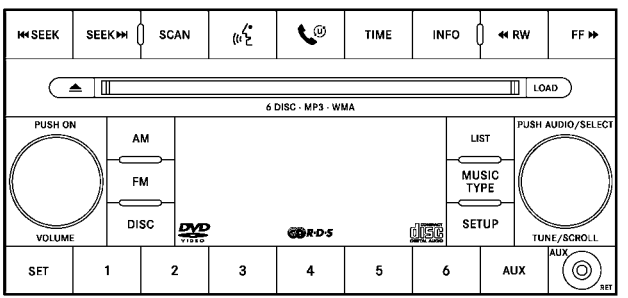
3. Touch the screen where the words “Set Time Zone” are displayed. The time zone selection menu will appear on the screen.

4. Select a time zone by touching the screen where your selection appears. If you do not see a time zone that you want to select, touch the screen where the word “Page” is displayed to view additional time zones in the menu.

5. Touch the screen where the word “Save” is displayed.

SALES CODE REQ — AM/FM STEREO RADIO AND 6–DISC CD/DVD CHANGER (MP3/WMA AUX JACK)

NOTE: The radio sales code is located on the lower right side of your radio faceplate.



RET Radio

Operating Instructions - Radio Mode

NOTE: The ignition switch must be in the ON or ACC position to operate the radio.

Power Switch/Volume Control (Rotary)
Push the ON/VOLUME control knob to turn on the radio. Press the ON/VOLUME control knob a second time to turn off the radio.

Electronic Volume Control
The electronic volume control turns continuously (360 degrees) in either direction without stopping. Turning the ON/VOLUME control knob to the right increases the volume and to the left decreases it.

When the audio system is turned ON, the sound will be set at the same volume level as last played.

SEEK Buttons
Press and release the SEEK buttons to search for the next listenable station in AM/FM mode. Press the right switch to seek up and the left switch to seek down. The radio will remain tuned to the new station until you make another selection. Holding either button will bypass stations without stopping until you release it.

SCAN Button
Pressing the SCAN button causes the tuner to search for the next listenable station, in AM, FM or Satellite (if equipped) frequencies, pausing for five seconds at each listenable station before continuing to the next. To stop the search, press the SCAN button a second time.

Voice Recognition Button (UConnect® Hands-Free Phone) — If Equipped
Press this button to operate the Hands-Free Phone (UConnect®) feature (if equipped). Refer to "Hands-Free Communication (UConnect®)" in Section 3.

If your vehicle is not equipped with or this feature is not available on your vehicle, a "Not Equipped With UConnect" message will display on the radio screen.

Phone Button (UConnect® Hands-Free Phone) — If Equipped
Press this button to operate the Hands-Free Phone (UConnect®) feature (if equipped). Refer to "Hands-Free Communication (UConnect®)" in Section 3.

If your vehicle is not equipped with or this feature is not available on your vehicle, a "Not Equipped With UConnect" message will display on the radio screen.

TIME Button
Press the TIME button and the time of day will display. In AM or FM mode, pressing the TIME button will switch between the time and frequency displays.

Clock Setting Procedure

1. Press and hold the TIME button until the hours blink.

2. Adjust the hours by turning the right side TUNE/SCROLL control knob.

3. After adjusting the hours, press the right side TUNE/SCROLL control knob to set the minutes. The minutes will begin to blink.

4. Adjust the minutes using the right side TUNE/SCROLL control knob. Press the TUNE/SCROLL control knob to save the time change.

5. To exit, press any button/knob or wait five seconds.

The clock can also be set by pressing the SETUP button and selecting the "SET HOME CLOCK" entry. Once in this display follow the above procedure, starting at step 2.

INFO Button

Press the INFO button for an RDS station (one with call letters displayed). The radio will return a Radio Text message broadcast from an FM station (FM mode only).

RW/FF

Pressing the RW (Rewind) or FF (Fast Forward) buttons causes the tuner to search for the next frequency in the direction of the arrows. This feature operates in AM, FM or Satellite (if equipped) frequencies.

TUNE Control

Turn the rotary TUNE/SCROLL control knob clockwise to increase or counterclockwise to decrease the frequency.

Setting the Tone, Balance, and Fade
Push the rotary TUNE/SCROLL control knob and BASS will display. Turn the TUNE/SCROLL control knob to the right or left to increase or decrease the bass tones.

Push the rotary TUNE/SCROLL control knob a second time and MID will display. Turn the TUNE/SCROLL control knob to the right or left to increase or decrease the mid-range tones.

Push the rotary TUNE/SCROLL control knob a third time and TREBLE will display. Turn the TUNE/SCROLL control knob to the right or left to increase or decrease the treble tones.

Push the rotary TUNE/SCROLL control knob a fourth time and BALANCE will display. Turn the TUNE/SCROLL control knob to the right or left to adjust the sound level from the right or left side speakers.

Push the rotary TUNE/SCROLL control knob a fifth time and FADE will display. Turn the TUNE/SCROLL control knob to the left or right to adjust the sound level between the front and rear speakers.

Push the rotary TUNE/SCROLL control knob again to exit setting tone, balance, and fade.

MUSIC TYPE Button
Pressing this button once will turn on the Music Type mode for five seconds. Pressing the MUSIC TYPE button or turning the TUNE/SCROLL control knob within five seconds will allow the program format type to be selected. Many radio stations do not currently broadcast Music Type information.

Toggle the MUSIC TYPE button to select the following format types:

Program Type	16-Digit Character Display
No program type or undefined	None
Adult Hits	Adlt Hit
Classical	Classicl
Classic Rock	Cls Rock
College	College
Country	Country
Foreign Language	Language
Information	Inform
Jazz	Jazz
News	News
Nostalgia	Nostalga
Oldies	Oldies
Personality	Persnlty
Public	Public
Rhythm and Blues	R & B
Religious Music	Rel Musc
Religious Talk	Rel Talk
Rock	Rock
Soft	Soft
Soft Rock	Soft Rck
Soft Rhythm and Blues	Soft R & B
Sports	Sports
Talk	Talk
Top 40	Top 40
Weather	Weather

By pressing the SEEK button when the Music Type icon is displayed, the radio will be tuned to the next frequency station with the same selected Music Type name. The Music Type function only operates when in the FM mode.

If a preset button is activated while in the Music Type (Program Type) mode, the Music Type mode will be exited and the radio will tune to the preset station.

SETUP Button
Pressing the SETUP button allows you to select between the following items:

NOTE: Turn the TUNE/SCROLL control knob to scroll through the entries. Push the AUDIO/SELECT button to select an entry and make changes.

- **DVD Enter -** When the disc is in DVD Menu mode, selecting DVD Enter will allow you to play the current highlighted selection. Use the remote control to scroll up and down the menu (if equipped).

- **DISC Play/Pause -** You can toggle between playing the DVD and pausing the DVD by pushing the SELECT button (if equipped).

- **DVD Play Options -** Selecting the DVD Play Options will display the following:
  - Subtitle – Repeatedly pressing SELECT will switch subtitles to different subtitle languages that are available on the disc (if equipped).
  - Audio Stream – Repeatedly pressing SELECT will switch to different audio languages (if supported on the disc) (if equipped).

- Angle – Repeatedly pressing SELECT will change the viewing angle if supported by the DVD disc (if equipped).

NOTE: The available selections for each of the above entries varies depending upon the disc.

NOTE: These selections can only be made while playing a DVD.

- **VES™ Power -** Allows you to turn VES™ ON and OFF (if equipped).
- **VES™ Lock -** Locks out rear VES™ remote controls (if equipped).
- **VES™ CH1/CH2 -** Allows the user to change the mode of either the IR1 or IR2, wireless headphones by pressing the AUDIO/SELECT button (if equipped).
- **Set Home Clock -** Pressing the SELECT button allows you to set the clock. Turn the TUNE/SCROLL control knob to adjust the hours and then press and turn the TUNE/SCROLL control knob to adjust the minutes. Press the TUNE/SCROLL control knob again to save changes.
- **Player Defaults -** Selecting this item will allow the user to scroll through the following items, and set defaults according to customer preference.

Menu Language — If Equipped

Selecting this item will allow the user to choose the default startup DVD menu language (effective only if language supported by disc). If you want to select a language not listed, then scroll down and select ″other.″ Enter the four-digit country code using the TUNE/SCROLL control knob to scroll up and down to select the number and then push to select.

Audio Language — If Equipped

Selecting this item allows you to choose a default audio language (effective only if the language is supported by the disc). You can select a language not listed by scrolling down and selecting "other." Enter the country code using the TUNE/SCROLL control knob to scroll up and down to select the number and then push to select.

Subtitle Language — If Equipped

Selecting this item allows you to choose a default subtitle language (effective only if the language is supported by the disc). You can select a language not listed by scrolling down and selecting "other." Enter the country code using the TUNE/SCROLL control knob to scroll up and down to select the number and then push to select.

Subtitles — If Equipped

Selecting this item allows you to choose between subtitle Off or On.

Audio DRC — If Equipped

Selecting this item allows you to limit maximum audio dynamic range. The default is set to "High," and under this setting, dialogues will play at 11 db higher than if the setting is "Normal."

Aspect Ratio — If Equipped

Selecting this item allows you to choose between wide screen, pan scan, and letter box.

AutoPlay — If Equipped

When this is set to On and a DVD video is inserted, it will bypass the DVD menu screen and automatically play the movie. In some rare cases, the DVD player may not auto-play the main title. In such cases, use the MENU button on the remote control to select desired title to play.

NOTE: The user will have to set these defaults before loading a disc. If changes are made to these settings after

a disc is loaded, changes will not be effective. Also, the defaults are effective only if the disc supports the customer-preferred settings.

AM and FM Buttons
Press the buttons to select AM or FM Modes.

SET Button — To Set the Pushbutton Memory
When you are receiving a station that you wish to commit to pushbutton memory, press the SET button. The symbol SET 1 will now show in the display window. Select the button (1-6) you wish to lock onto this station and press and release that button. If a button is not selected within five seconds after pressing the SET button, the station will continue to play but will not be stored into pushbutton memory.

You may add a second station to each pushbutton by repeating the above procedure with this exception: Press the SET button twice and SET 2 will show in the display window. Each button can be set for SET 1 and SET 2 in both AM and FM. This allows a total of 12 AM, 12 FM, and 12 Satellite (if equipped) stations to be stored into pushbutton memory. The stations stored in SET 2 memory can be selected by pressing the pushbutton twice.

Every time a preset button is used, a corresponding button number will display.

Buttons 1 - 6
These buttons tune the radio to the stations that you commit to pushbutton memory {12 AM, 12 FM, and 12 Satellite (if equipped) stations}.

DISC Button
Pressing the DISC button will allow you to switch from AM/FM modes to Disc modes.

Operation Instructions - (DISC MODE for CD and MP3/WMA Audio Play, DVD-VIDEO)

The radio DVD player and many DVD discs are coded by geographic region. These region codes must match in order for the disc to play. If the region code for the DVD disc does not match the region code for the radio DVD player, it will not play the disc. Customers may take their vehicle to an authorized dealer to change the region code of the player a maximum of five times.

CAUTION!

The radio may shut down during extremely hot conditions. When this occurs, the radio will indicate "Disc Hot" and shut off until a safe temperature is reached. This shutdown is necessary to protect the optics of the DVD player and other radio internal components.

NOTE: The ignition switch must be in the ON or ACC position to operate the radio.

LOAD Button — Loading Compact Disc(s)

Press the LOAD button and the pushbutton with the corresponding number (1-6) where the CD is being loaded. The radio will display PLEASE WAIT and prompt when to INSERT DISC. After the radio displays ″INSERT DISC,″ insert the CD into the player.

Radio display will show ″LOADING DISC″ when the disc is loading and "READING DISC" when the radio is reading the disc.

CAUTION!

This CD player will accept 4–3/4 in (12 cm) discs only. The use of other sized discs may damage the CD player mechanism.

Eject Button — Ejecting Compact Disc(s)

Press the EJECT button and the pushbutton with the corresponding number (1-6) where the CD was loaded and the disc will unload and move to the entrance for easy removal. Radio display will show ″EJECTING DISC″ when the disc is being ejected and prompt the user to remove the disc.

Press and hold the EJECT button for five seconds and all CDs will be ejected from the radio.

The disc can be ejected with the radio and ignition OFF.

SEEK Button (CD MODE)

Press the right SEEK button for the next selection on the CD. Press the left SEEK button to return to the beginning of the current selection, or return to the beginning of the previous selection if the CD is within the first second of the current selection. Pressing and holding the SEEK button will allow you to scroll through the tracks faster in CD, MP3/MWA modes.

SCAN Button (CD MODE)

Press the SCAN button to scan through each track on the CD currently playing.

TIME Button (CD MODE)

Press this button to change the display from a large CD playing time display to a small CD playing time display.

RW/FF (CD MODE)

Press and hold FF (Fast Forward) and the CD player will begin to fast forward until FF is released, or RW or another CD button is pressed. The RW (Rewind) button works in a similar manner.

AM or FM Button (CD MODE)

Switches the radio to the Radio mode.

Notes On Playing MP3/WMA Files

The radio can play MP3/WMA files; however, acceptable MP3/WMA file recording media and formats are limited. When writing MP3/WMA files, pay attention to the following restrictions.

Supported Media (Disc Types)

The MP3/WMA file recording media supported by the radio are CDDA, CD-R, CD-RW, MP3,WMA, DVD Video, DVD-R, DVD-RW, DVD+R, DVD+RW, and CDDA+MP3.

Supported Medium Formats (File Systems)

The medium formats supported by the radio are ISO 9660 Level 1 and Level 2 and includes the Joliet extension. When reading discs recorded using formats other than ISO 9660 Level 1 and Level 2, the radio may fail to read files properly and may be unable to play the file normally. UDF and Apple HFS formats are not supported.

The radio uses the following limits for file systems:

- Maximum number of directory levels: 8
- Maximum number of files: 255
- Maximum number of folders: 100
- Maximum number of characters in file/folder names:
  - Level 1: 12 (including a separator ″.″ and a three-character extension)
  - Level 2: 31 (including a separator ″.″ and a three-character extension)

Multisession disc formats are supported by the radio. Multisession discs may contain combinations of normal CD audio tracks and computer files (including MP3/WMA files). Discs created with an option such as ″keep disc open after writing″ are most likely multisession discs. The use of multisession for CD audio or MP3/WMA playback may result in longer disc loading times.

If a disc contains multi-formats, such as CD audio and MP3/WMA tracks, the radio will only play the MP3/WMA tracks on that disc.

Supported MP3/WMA File Formats

The radio will recognize only files with the MP3/WMA extension as MP3/WMA files. Non-MP3/WMA files named with the MP3/WMA extension may cause playback problems. The radio is designed to recognize the file as an invalid MP3/WMA and will not play the file.

When using the MP3/WMA encoder to compress audio data to an MP3/WMA file, the bit rate and sampling frequencies in the following table are supported. In addition, variable bit rates (VBR) are also supported. The majority of MP3/WMA files use a 44.1 kHz sampling rate and a 192, 160, 128, 96 or VBR bit rates.

MPEG Specification	Sampling Frequency (kHz)	Bit Rate (kbps)
MPEG-1 Audio Layer 3	48, 44.1, 32	320, 256, 224, 192, 160, 128, 112, 96, 80, 64, 56, 48
MPEG-2 Audio Layer 3	24, 22.05, 16	160, 128, 144, 112, 96, 80, 64, 56, 48

WMA Specification	Sampling Frequency (kHz)	Bit Rate (kbps)
WMA	44.1 and 48	48, 64, 96, 128, 160, 192 VBR

ID3 Tag information for artist, song title, and album title are supported for ID3 version 1 tags. ID3 version 2 is not supported by the radios.

Playlist files are not supported. MP3 Pro files are not supported.

Playback of MP3/WMA Files
When a medium containing MP3/WMA data is loaded, the radio checks all files on the medium. If the medium contains a lot of folders or files, the radio will take more time to start playing the MP3/WMA files.

Loading times for playback of MP3/WMA files may be affected by the following:

- Media - CD-RW media may take longer to load than CD-R media
- Medium formats - Multisession discs may take longer to load than non-multisession discs
- Number of files and folders - Loading times will increase with more files and folders

To increase the speed of disc loading, it is recommended to use CD-R media and single-session discs. To create a single-session disc, enable the "Disc at Once" option before writing to the disc.

LIST Button (DISC Mode for MP3/WMA Play)
Pressing the LIST button will bring up a list of all folders on the disc. Scrolling up or down the list is done by turning the TUNE/SCROLL control knob. Selecting a folder by pressing the TUNE/SCROLL control knob will begin playing the files contained in that folder (or the next folder in sequence if the selection does not contain playable files).

The folder list will time out after five seconds.

INFO Button (DISC Mode for MP3/WMA Play)
Pressing the INFO button repeatedly will scroll through the following TAG information: Song Title, Artist, File Name, and Folder Name (if available).

Press the INFO button once more to return to ″elapsed time″ priority mode.

Press and hold the INFO button for three seconds or more and radio will display song titles for each file.

Press and hold the INFO button again for three seconds to return to ″elapsed time″ display.

Operation Instructions - Auxiliary Mode
The auxiliary (AUX) jack is an audio input jack, which allows the user to plug in a portable device such as an MP3/WMA player, cassette player, or microphone and utilize the vehicle's audio system to amplify the source and play through the vehicle speakers.

Pressing the AUX button will change the mode to auxiliary device if the AUX jack is connected.

NOTE: The AUX device must be turned on and the device's volume set to the proper level. If the AUX audio is not loud enough, turn the device's volume up. If the AUX audio sounds distorted, turn the device's volume down.

SEEK Button (Auxiliary Mode)
No function.

SCAN Button (Auxiliary Mode)
No function.

EJECT Button (Auxiliary Mode)
No function.

TIME Button (Auxiliary Mode)
Press the TIME button to change the display from elapsed playing time to time of day. The time of day will display for five seconds.

RW/FF (Auxiliary Mode)
No function.

SET Button (Auxiliary Mode)
No function.

Operating Instructions — Voice Recognition System (VR) (If Equipped)
For the radio, refer to "Voice Recognition System (VR)" in Section 3.

For UConnect® "Voice Recognition System (VR)," refer to "Hands-Free Communication (UConnect®)" in Section 3.

Operating Instructions - Hands-Free Phone (UConnect®) (If Equipped)
Refer to "Hands-Free Communication (UConnect®)" in Section 3.

Operating Instructions - Satellite Radio Mode (If Equipped)
Refer to "Satellite Radio" in this section.

Operating Instructions - Video Entertainment System (VES)™ (If Equipped)
Refer to separate "Video Entertainment System (VES)™ Guide."

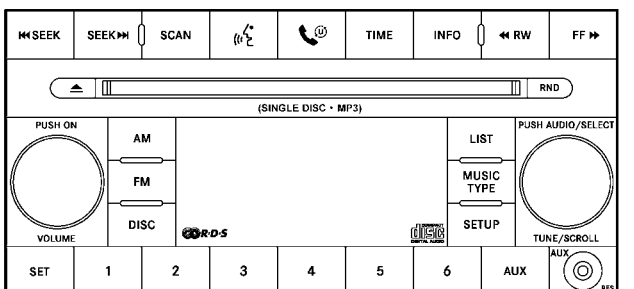
SALES CODE RES — AM/FM STEREO RADIO WITH CD PLAYER (MP3 AUX JACK)

NOTE: The radio sales code is located on the lower right side of your radio faceplate.



RES Radio (Non-Satellite Model Shown - With Satellite Similar)

Operating Instructions - Radio Mode

NOTE: The ignition switch must be in the ON or ACC position to operate the radio.

Power Switch/Volume Control (Rotary)
Push the On/Volume control knob to turn on the radio. Push the On/Volume control knob a second time to turn off the radio.

Electronic Volume Control
The electronic volume control turns continuously (360 degrees) in either direction without stopping. Turning the On/Volume control knob to the right increases the volume and to the left decreases it.

When the audio system is turned on, the sound will be set at the same volume level as last played.

SEEK Buttons
Press and release the SEEK buttons to search for the next listenable station in AM/FM mode. Press the right switch

to seek up and the left switch to seek down. The radio will remain tuned to the new station until you make another selection. Holding either button will bypass stations without stopping until you release it.

SCAN Button
Pressing the SCAN button causes the tuner to search for the next listenable station in AM or FM frequencies, pausing for five seconds at each listenable station before continuing to the next. To stop the search, press the SCAN button a second time.

Voice Recognition System (Radio) — If Equipped
Refer to "Voice Recognition System (VR)" in Section 3.

Voice Recognition Button (UConnect® Hands-Free Phone) — If Equipped
Press this button to operate the Hands-Free Phone (UConnect®) feature (if equipped). Refer to "Hands-Free Communication (UConnect®)" in Section 3.

If your vehicle is not equipped with or this feature is not available on your vehicle, a "Not Equipped With UConnect" message will display on the radio screen.

Phone Button (UConnect® Hands-Free Phone) — If Equipped
Press this button to operate the Hands-Free Phone (UConnect®) feature (if equipped). Refer to "Hands-Free Communication (UConnect®)" in Section 3.

If your vehicle is not equipped with or this feature is not available on your vehicle, a "Not Equipped With UConnect" message will display on the radio screen.

TIME Button
Press the TIME button and the time of day will display. In AM or FM mode, pressing the TIME button will switch between the time and frequency displays.

Clock Setting Procedure

1. Press and hold the TIME button, until the hours blink.

2. Adjust the hours by turning the right side Tune/Scroll control knob.

3. After adjusting the hours, press the right side Tune/Scroll control knob to set the minutes. The minutes will begin to blink.

4. Adjust the minutes using the right side Tune/Scroll control knob. Press the Tune/Scroll control knob to save time change.

5. To exit, press any button/knob or wait five seconds.

The clock can also be set by pressing the SETUP button. For vehicles equipped with satellite radio, press the SETUP button, use the Tune/Scroll control to select SET CLOCK, and then follow the above procedure, starting at Step 2. For vehicles not equipped with satellite radio, press the SETUP button and then follow the above procedure, starting at Step 2.

INFO Button

Press the INFO button for an RDS station (one with call letters displayed). The radio will return a Radio Text message broadcast from an FM station (FM mode only).

RW/FF

Pressing the RW (Rewind) or FF (Fast Forward) buttons causes the tuner to search for the next frequency in the direction of the arrows. This feature operates in either AM or FM frequencies.

TUNE Control

Turn the rotary Tune/Scroll control knob clockwise to increase or counterclockwise to decrease the frequency.

Setting the Tone, Balance, and Fade

Push the rotary Tune/Scroll control knob and BASS will display. Turn the Tune/Scroll control knob to the right or left to increase or decrease the bass tones.

Push the rotary Tune/Scroll control knob a second time and MID will display. Turn the Tune/Scroll control knob to the right or left to increase or decrease the mid-range tones.

Push the rotary Tune/Scroll control knob a third time and TREBLE will display. Turn the Tune/Scroll control knob to the right or left to increase or decrease the treble tones.

Push the rotary Tune/Scroll control knob a fourth time and BALANCE will display. Turn the Tune/Scroll control knob to the right or left to adjust the sound level from the right or left side speakers.

Push the rotary Tune/Scroll control knob a fifth time and FADE will display. Turn the Tune/Scroll control knob to the left or right to adjust the sound level between the front and rear speakers.

Push the rotary Tune/Scroll control knob again to exit setting tone, balance, and fade.

MUSIC TYPE Button

Pressing this button once will turn on the Music Type mode for five seconds. Pressing the MUSIC TYPE button or turning the Tune/Scroll control knob within five seconds will allow the program format type to be selected. Many radio stations do not currently broadcast Music Type information.

Toggle the MUSIC TYPE button to select the following format types:

Program Type	16-Digit Character Display
No program type or undefined	None
Adult Hits	Adlt Hit
Classical	Classicl
Classic Rock	Cls Rock
College	College
Country	Country

Program Type	16-Digit Character Display
Foreign Language	Language
Information	Inform
Jazz	Jazz
News	News
Nostalgia	Nostalga
Oldies	Oldies
Personality	Persnlty
Public	Public
Rhythm and Blues	R & B
Religious Music	Rel Musc
Religious Talk	Rel Talk
Rock	Rock
Soft	Soft
Soft Rock	Soft Rck
Soft Rhythm and Blues	Soft R & B
Sports	Sports
Talk	Talk
Top 40	Top 40
Weather	Weather

By pressing the SEEK button when the Music Type icon is displayed, the radio will be tuned to the next frequency station with the same selected Music Type name. The Music Type function only operates when in the FM mode.

If a preset button is activated while in the Music Type (Program Type) mode, the Music Type mode will be exited and the radio will tune to the preset station.

SETUP Button

Pressing the SETUP button allows you to select between the following items:

- **Set Clock** — Pressing the SELECT button will allow you to set the clock. Turn the Tune/Scroll control knob to adjust the hours and then press and turn the Tune/Scroll control knob to adjust the minutes. Press the Tune/Scroll control knob again to save changes.

AM and FM Buttons
Press the buttons to select AM or FM modes.

SET Button — To Set the Pushbutton Memory
When you are receiving a station that you wish to commit to pushbutton memory, press the SET button. The symbol SET 1 will now show in the display window. Select the button (1 to 6) you wish to lock onto this station and press and release that button. If a button is not selected within five seconds after pressing the SET button, the station will continue to play but will not be stored into pushbutton memory.

You may add a second station to each pushbutton by repeating the above procedure with this exception: Press the SET button twice and SET 2 will show in the display window. Each button can be set for SET 1 and SET 2 in both AM and FM. This allows a total of 12 AM and 12 FM stations to be stored into pushbutton memory. The stations stored in SET 2 memory can be selected by pressing the pushbutton twice.

Every time a preset button is used, a corresponding button number will display.

Buttons 1 - 6
These buttons tune the radio to the stations that you commit to pushbutton memory (12 AM and 12 FM stations).

DISC Button
Pressing the DISC button will allow you to switch from AM/FM modes to Disc modes.

Operation Instructions - CD MODE for CD and MP3 Audio Play

NOTE: The ignition switch must be in the ON or ACC position to operate the radio.

NOTE: This radio is capable of playing compact discs (CD), recordable compact discs (CD-R), rewritable compact discs (CD-RW), compact discs with MP3 tracks and multisession compact discs with CD and MP3 tracks.

Inserting Compact Disc(s)
Gently insert one CD into the CD player with the CD label facing up. The CD will automatically be pulled into the CD player and the CD icon will illuminate on the radio display. If a CD does not go into the slot more than 1.0 in (2.5 cm), a disc may already be loaded and must be ejected before a new disc can be loaded.

If you insert a disc with the ignition ON and the radio ON, the unit will switch from radio to CD mode and begin to play when you insert the disc. The display will show the disc number, the track number, and index time in minutes and seconds. Play will begin at the start of track 1.

CAUTION!

- **This CD player will accept 4–3/4 in (12 cm) discs only. The use of other sized discs may damage the CD player mechanism.**
- **Do not use adhesive labels. These labels can peel away and jam the player mechanism.**
- **RES is a single CD player. Do not attempt to insert a second CD if one is already loaded.**
- **Dual-media disc types (one side is a DVD, the other side is a CD) should not be used, and they can cause damage to the player.**

EJECT Button - Ejecting a CD

Press the EJECT button to eject the CD.

If you have ejected a disc and have not removed it within 10 seconds, it will be reloaded. If the CD is not removed, the radio will reinsert the CD but will not play it.

A disc can be ejected with the radio and ignition OFF.

NOTE: Ejecting with ignition OFF is not allowed on convertible or soft-top models (if equipped).

SEEK Button

Press the right SEEK button for the next selection on the CD. Press the left SEEK button to return to the beginning of the current selection, or return to the beginning of the previous selection if the CD is within the first second of the current selection. Pressing and holding the SEEK button will allow faster scrolling through the tracks in CD, MP3 modes.

SCAN Button

Press the SCAN button to scan through each track on the CD currently playing.

TIME Button

Press this button to change the display from a large CD playing time display to a small CD playing time display.

RW/FF

Press the RW button to stop the CD at the beginning of the current CD track/title.

Press and hold FF (Fast Forward) and the CD player will begin to fast forward until FF is released or RW or another CD button is pressed. The RW (Reverse) button works in a similar manner.

AM or FM Button
Switches the AM or FM radio to the opposite radio mode.

RND Button (Random Play Button)
Press this button while the CD is playing to activate Random Play. This feature plays the selections on the compact disc in random order to provide an interesting change of pace.

Press the right SEEK button to move to the next randomly selected track.

Press the RND button a second time to stop Random Play.

Notes On Playing MP3 Files

The radio can play MP3 files; however, acceptable MP3 file recording media and formats are limited. When writing MP3 files, pay attention to the following restrictions.

Supported Media (Disc Types)
The MP3 file recording media supported by the radio are CDDA, CD-R, CD-RW, MP3, and CDDA+MP3.

Supported Medium Formats (File Systems)
The medium formats supported by the radio are ISO 9660 Level 1 and Level 2 and includes the Joliet extension. When reading discs recorded using formats other than ISO 9660 Level 1 and Level 2, the radio may fail to read files properly and may be unable to play the file normally. UDF and Apple HFS formats are not supported.

The radio uses the following limits for file systems:

- Maximum number of folder levels: 8
- Maximum number of files: 255
- Maximum number of folders. (The radio display of file names and folder names is limited. For large numbers of files and/or folders, the radio may be unable to display the file name and folder name and will assign

a number instead. With a maximum number of files, exceeding 20 folders will result in this display. With 200 files, exceeding 50 folders will result in this display.)

- Maximum number of characters in file/folder names:
  - Level 1: 12 (including a separator ".″ and a three-character extension)
  - Level 2: 31 (including a separator ".″ and a three-character extension)

Multisession disc formats are supported by the radio. Multisession discs may contain combinations of normal CD audio tracks and computer files (including MP3 files). Discs created with an option such as "keep disc open after writing" are most likely multisession discs. The use of multisession for CD audio or MP3 playback may result in longer disc loading times.

Supported MP3 File Formats

The radio will recognize only files with the *.MP3 extension as MP3 files. Non-MP3 files named with the *.MP3 extension may cause playback problems. The radio is designed to recognize the file as an invalid MP3 and will not play the file.

When using the MP3 encoder to compress audio data to an MP3 file, the bit rate and sampling frequencies in the following table are supported. In addition, variable bit rates (VBR) are also supported. The majority of MP3 files use a 44.1 kHz sampling rate and a 192, 160, 128, 96 or VBR bit rates.

MPEG Specification	Sampling Frequency (kHz)	Bit Rate (kbps)
MPEG-1 Audio Layer 3	48, 44.1, 32	320, 256, 224, 192, 160, 128, 112, 96, 80, 64, 56, 48, 40, 32
MPEG-2 Audio Layer 3	24, 22.05, 16	160, 128, 144, 112, 96, 80, 64, 56, 48, 40, 32, 24, 16, 8

ID3 Tag information for artist, song title, and album title are supported for version 1 ID3 tags. ID3 version 2 is not supported by the radios.

Playlist files are not supported. MP3 Pro files are not supported.

Playback of MP3 Files

When a medium containing MP3 data is loaded, the radio checks all files on the medium. If the medium contains a lot of folders or files, the radio will take more time to start playing the MP3 files.

Loading times for playback of MP3 files may be affected by the following:

- Media - CD-RW media may take longer to load than CD-R media
- Medium formats - Multisession discs may take longer to load than non-multisession discs
- Number of files and folders - Loading times will increase with more files and folders

To increase the speed of disc loading, it is recommended to use CD-R media and single-session discs. To create a single-session disc, enable the “Disc at Once” option before writing to the disc.

LIST Button (CD Mode for MP3 Play)

Pressing the LIST button will bring up a list of all folders on the disc. Scrolling up or down the list is done by turning the Tune/Scroll control knob. Selecting a folder by pressing the Tune/Scroll control knob will begin playing the files contained in that folder (or the next folder in sequence if the selection does not contain playable files).

The folder list will time out after five seconds.

INFO Button (CD Mode for MP3 Play)

Pressing the INFO button repeatedly will scroll through the following TAG information: Song Title, Artist, File Name, and Folder Name (if available).

Press the INFO button once more to return to "elapsed time" priority mode.

Press and hold the INFO button for three seconds or more and the radio will display song titles for each file.

Press and hold the INFO button again for three seconds to return to "elapsed time" display.

Operation Instructions - Auxiliary Mode

The auxiliary (AUX) jack is an audio input jack, which allows the user to plug in a portable device such as an MP3 player, or cassette player, and utilize the vehicle's audio system to amplify the source and play through the vehicle speakers.

Pressing the AUX button will change the mode to auxiliary device if the AUX jack is connected.

NOTE: The AUX device must be turned on and the device's volume set to proper level. If the AUX audio is not loud enough, turn the device's volume up. If the AUX audio sounds distorted, turn the device's volume down.

TIME Button (Auxiliary Mode)
Press this button to change the display to time of day. The time of day will display for five seconds (when ignition is OFF).

Operating Instructions - Hands-Free Phone (UConnect®) (If Equipped)
Refer to "Hands-Free Communication (UConnect®)" in Section 3.

Operating Instructions - Satellite Radio Mode (If Equipped)
Refer to "Satellite Radio" in this section.

Operating Instructions - Video Entertainment System (VES)™ (If Equipped)
Refer to separate "Video Entertainment System (VES)™ Guide."

SALES CODE REU — MULTIMEDIA SYSTEM — IF EQUIPPED

NOTE: The sales code is located on the lower right side of the unit's faceplate.

The REU Multimedia system contains a radio, Sirius Satellite Radio player, navigation system, six disc CD/DVD player, USB port, 30-gigabyte hard drive (HDD), and the UConnect® Hands-Free Bluetooth® cellular system.

A 7 in (17.8 cm) remote screen allows easy menu selection, while the Advanced Voice Dialog System recognizes more than 1,000 words for audio, navigation, entertainment, and hands-free mobile phone use.

The satellite navigation capability combines a Global-Positioning System (GPS)-based navigation system with

a remote color screen to provide maps, turn identification, selection menus, and instructions for selecting a variety of destinations and routes.

A shared HDD for the navigation system, the database, and other radio features allows uploads of music and photos from CDs or through the USB port. The Gracenote database finds the artist, track, and title for the music.

An auxiliary input jack permits passengers to listen to a portable MP3 player through the vehicle's speakers. For vehicles equipped with the Video Entertainment System (VES)™, separate audio outputs allow passengers to listen to the vehicle speakers while different audio tracks play through the system's wireless headphones. This means rear-seat passengers can watch a DVD on the optional rear-seat entertainment system while the driver and front-seat passenger listen to the radio.

Other special features include music type selections, traffic messaging (optional), easy store presets, parental lockout for VES™ (if equipped), and a backup camera display for vehicles equipped with a backup camera. Refer to your "Navigation User's Manual" for detailed operating instructions.

Operating Instructions — Satellite Radio

Refer to your "Navigation User's Manual" for detailed operating instructions.

Operating Instructions — Hands-Free Communication (UConnect®) (If Equipped)

Refer to your "Navigation User's Manual" for detailed operating instructions.

Clock Setting Procedure

The GPS receiver in this system is synchronized to the time data being transmitted by the GPS satellites. The satellites' clock is Greenwich Mean Time (GMT). This is the worldwide standard for time. This makes the system's clock very accurate once the appropriate time zone and daylight savings information is set.

Changing the Time Zone

NOTE: You can skip Steps 2 and 3 by pressing and holding the "TIME" button on the radio for three seconds.

1. Turn on the multimedia system.
2. Press and release the "SETUP" button on the radio.
3. If "Time Setup" is highlighted on the menu, press and release the joystick in the center of the radio. Otherwise, turn the knob surrounding the joystick to select "Time Setup," and then press and release the joystick.
4. Turn the knob surrounding the joystick to scroll to "Time Zone," and then press and release the joystick.
5. If the desired time zone setting has a check mark next to it, proceed to the next step. Otherwise, turn the knob surrounding the joystick to select the desired time zone setting, and then press and release the joystick. A check mark will display next to the selection.
6. Press and release the "SETUP" button to exit the screen.

Changing Daylight Savings Time

When On is selected, this feature will display the time of day in daylight savings time. Proceed as follows to change the current setting:

NOTE: You can skip Steps 2 and 3 by pressing and holding the "TIME" button on the radio for three seconds.

1. Turn on the multimedia system.
2. Press and release the "SETUP" button on the radio.

3. If “Time Setup” is highlighted on the menu, press and release the joystick in the center of the radio. Otherwise, turn the knob surrounding the joystick to select “Time Setup,” and then press and release the joystick.

4. Turn the knob surrounding the joystick to scroll to “Daylight Savings,” and then press and release the joystick.

5. If the desired setting has a check mark next to it, proceed to the next step. Otherwise, turn the knob surrounding the joystick to select “Off” or “On,” and then press and release the joystick. A check mark will display next to the selection.

6. Press and release the “SETUP” button to exit the screen.

Setting the User Clock

If you wish to set the clock to a time different from the system clock, you can manually adjust the time by performing the following:

NOTE: You can skip Steps 2 and 3 by pressing and holding the “TIME” button on the radio for three seconds.

1. Turn on the multimedia system.

2. Press and release the “SETUP” button on the radio.

3. If “Time Setup” is highlighted on the menu, press and release the joystick in the center of the radio. Otherwise, turn the knob surrounding the joystick to select “Time Setup,” and then press and release the joystick.

4. If “User Time” has a check mark next to it, proceed to the next step. Otherwise, turn the knob surrounding the joystick to scroll to “User Time,” and then press and release the joystick.

5. Turn the knob surrounding the joystick to select “Set Hours,” and then press and release the joystick.

6. Turn the knob surrounding the joystick to set the hour highlighted on the clock on the screen. Press and release the joystick when done.

7. Turn the knob surrounding the joystick to select “Set Minutes,” and then press and release the joystick.

8. Turn the knob surrounding the joystick to set the minutes highlighted on the clock on the screen. Press and release the joystick when done.

9. Press and release the “SETUP” button to exit the screen.

Show Time if Radio is Off

When selected, this feature will display the time of day on the screen when the system is turned off. Proceed as follows to change the current setting:

NOTE: You can skip Steps 2 and 3 by pressing and holding the “TIME” button on the radio for three seconds.

1. Turn on the multimedia system.

2. Press and release the “SETUP” button on the radio.

3. If “Time Setup” is highlighted on the menu, press and release the joystick in the center of the radio. Otherwise, turn the knob surrounding the joystick to select “Time Setup,” and then press and release the joystick.

4. Turn the knob surrounding the joystick to scroll to "Clock if Radio off," and then press and release the joystick to change the current setting. A check mark will display next to "Clock if Radio off" when the feature is selected.

5. Press and release the "SETUP" button to exit the screen.

SATELLITE RADIO — IF EQUIPPED (REN/REQ/RER/RES/REU RADIOS ONLY)

Satellite radio uses direct satellite-to-receiver broadcasting technology to provide clear digital sound, coast to coast. The subscription service provider is Sirius Satellite Radio. This service offers over 130 channels of music, sports, news, entertainment, and programming for children, directly from its satellites and broadcasting studios.

NOTE: Sirius service is not available in Hawaii and has limited coverage in Alaska.

System Activation

Sirius Satellite Radio service is pre-activated, and you may begin listening immediately to the one year of audio service that is included with the factory-installed satellite radio system in your vehicle. Sirius will supply a welcome kit that contains general information, including how to setup your on-line listening account at no additional charge. For further information, call the toll-free number 888-539-7474, or visit the Sirius web site at www.sirius.com, or at www.siriuscanada.ca for Canadian residents.

Electronic Serial Number/Sirius Identification Number (ESN/SID)

Please have the following information available when calling:

1. The Electronic Serial Number/Sirius Identification Number (ESN/SID).

2. Your Vehicle Identification Number.

To access the ESN/SID, refer to the following steps:

ESN/SID Access With REQ/RES Radios
With the ignition switch in the ON/RUN or ACC position and the radio on, press the SETUP button and scroll using the Tune/Scroll control knob until Sirius ID is selected. Press the Tune/Scroll control knob and the Sirius ID number will display. The Sirius ID number display will time out in two minutes. Press any button on the radio to exit this screen.

ESN/SID Access With REN/RER Radios
While in SAT mode, press the MENU button on the radio faceplate.

Next, touch the SUBSCRIPTION tab on the touch screen. All the ESNs that apply to your vehicle will display.

ESN/SID Access With REU Radio
While in SAT mode, press the MENU button on the radio faceplate.

Next, turn the knob surrounding the joystick in the center of the radio to scroll to Subscription, and then press and release the joystick. All of the ESNs that apply to your vehicle will display.

Selecting Satellite Mode

Press the SAT button until "SAT" appears in the display. A CD may remain in the radio while in the Satellite radio mode.

Satellite Antenna

To ensure optimum reception, do not place items on the roof around the rooftop antenna location or strap items to the trunk lid around the trunk lid antenna (if equipped). Metal objects placed within the line of sight of the antenna will cause decreased performance. Larger luggage items such as bikes should be placed as far rearward

as possible, within the loading design of the rack. Do not place items directly on or above the antenna.

Reception Quality

Satellite reception may be interrupted due to one of the following reasons:

- The vehicle is parked in an underground parking structure or under a physical obstacle.
- Dense tree coverage may interrupt reception in the form of short audio mutes.
- Driving under wide bridges or along tall buildings can cause intermittent reception.
- Placing objects over or too close to the antenna can cause signal blockage.

Operating Instructions - Satellite Mode

NOTE: The ignition switch must be in the ON or ACC position to operate the radio.

SEEK Buttons

Press and release the SEEK buttons to search for the next channel in Satellite mode. Press the right switch to seek up and the left switch to seek down. The radio will remain tuned to the new channel until you make another selection. Holding either button will bypass channels without stopping until you release it.

SCAN Button

Pressing the SCAN button causes the tuner to search for the next channel, pausing for eight seconds before continuing to the next. To stop the search, press the SCAN button a second time.

INFO Button — Except REU Radio
Pressing the INFO button will cycle the display information between Artist, Song Title, and Composer (if available). Also, pressing and holding the INFO button for an additional three seconds will make the radio display the Song Title all of the time (press and hold again to return to normal display).

INFO Button — REU Radio
Pressing the INFO button will display information about Artist, Song Title, and Composer (if available). Pressing the INFO button again will close the INFO screen.

RW/FF
Pressing the RW (Rewind) or FF (Fast Forward) buttons causes the tuner to search for the next channel in the direction of the arrows.

TUNE Control (Rotary)
Turn the rotary Tune/Scroll control knob clockwise to increase or counterclockwise to decrease the channel.

MUSIC TYPE Button — Except REU Radio
Pressing this button once will turn on the Music Type mode for five seconds. Pressing the MUSIC TYPE button or turning the Tune/Scroll control knob within five seconds will allow the program format type to be selected.

Toggle the MUSIC TYPE button again to select the music type.

By pressing the SEEK button when the Music Type function is active, the radio will be tuned to the next channel with the same selected Music Type name.

If a preset button is activated while in the Music Type (Program Type) mode, the Music Type mode will be exited and the radio will tune to the preset channel.

MUSIC TYPE Button — REU Radio
Pressing this button provides a MUSIC TYPES list from which you can make a selection. Once a selection is

made, you can seek up, or down, or scan the channels and the radio will tune to the next station matching the selected format. There is no time-out for this screen. Pressing the MUSIC TYPE button again will close the MUSIC TYPE screen. Once closed, seek up, seek down, and scan will no longer be based on your selection.

SETUP Button
Pressing the SETUP button allows you to select the following items:

- Display Sirius ID number — Press the AUDIO/ SELECT button to display the Sirius ID number. This number is used to activate, deactivate, or change the Sirius subscription.

SET Button – To Set the Pushbutton Memory
When you are receiving a channel that you wish to commit to pushbutton memory, press the SET button. The symbol SET 1 will now show in the display window. Select the button (1-6) you wish to lock onto this channel and press and release that button. If a button is not selected within five seconds after pressing the SET button, the channel will continue to play but will not be stored into pushbutton memory.

You may add a second channel to each pushbutton by repeating the above procedure with this exception: Press the SET button twice and SET 2 will show in the display window. Each button can be set for SET 1 and SET 2. This allows a total of 12 Satellite channels to be stored into pushbutton memory. The channels stored in SET 2 memory can be selected by pressing the pushbutton twice.

Every time a preset button is used, a corresponding button number will display.

Buttons 1 - 6
These buttons tune the radio to the channels that you commit to pushbutton memory (12 Satellite stations).

Operating Instructions - Hands-Free Phone (If Equipped)

Refer to "Hands-Free Communication (UConnect®)" in Section 3.

Operating Instructions - Video Entertainment System (VES)™ (If Equipped)

Refer to separate "Video Entertainment System (VES)™ Guide."

SIRIUS BACKSEAT TV™ — IF EQUIPPED

Satellite video uses direct satellite receiver broadcasting technology to provide streaming video. The subscription service provider is SIRIUS Satellite Radio. SIRIUS Backseat TV™ offers three video channels for family entertainment, directly from its satellites and broadcasting studios.

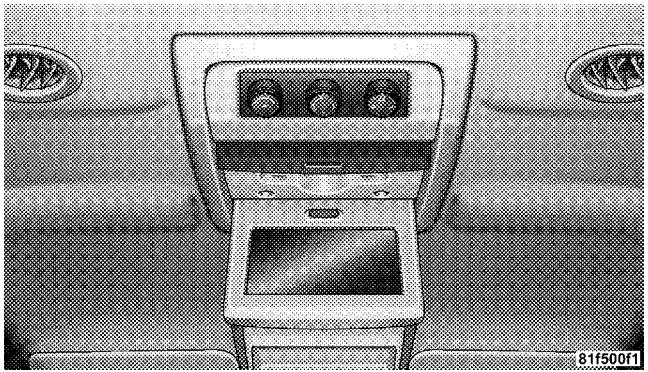
NOTE: SIRIUS service is not available in Hawaii and has limited coverage in Alaska.

Refer to your Video Entertainment System (VES)™, RER Navigation or REN Multimedia User Manual for detailed operating instructions.

VIDEO ENTERTAINMENT SYSTEM (VES)™ — IF EQUIPPED

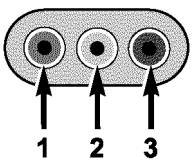
The optional Video Entertainment System (VES)™ includes the following components for rear seat entertainment:

- A diagonal 8 in (20 cm) Liquid Crystal Display (LCD) screen integrated into the center overhead console. The screen features brightness control for optimum daytime and nighttime viewing.
- The LCD Screen swings down from the console to allow the rear seat passenger(s) to view the display.



VES™ with Rear HVAC Controls

- The touch screen radio and DVD player controls allow front seat operation for easy setup in the case of younger rear seat passengers.
- A battery-powered infrared remote control that snaps into a molded compartment in the center console.
- Two wireless infrared headsets allow rear seat passengers to listen to the same or individual audio sources.



Audio/Video RCA Jacks (AUX Jacks) on the rear of the center console enable the monitor to display video directly from a video camera, connect video games for display on the screen, or play music directly from an MP3 player.

1. Video in (yellow)
2. Left audio in (white)
3. Right audio in (red)

NOTE: Refer to your "Video Entertainment System (VES)™ User Manual" for detailed operating instructions.

UNIVERSAL CONSUMER INTERFACE (UCI) — IF EQUIPPED

NOTE: This section is for sales code RES/REL and REQ/RET radios only with UConnect®. For sales code REN/REZ touch screen radio and REU/REX/RE1 radio, refer to the separate User's Manual.

This feature allows you to plug an iPod® mobile digital device into the vehicle's sound system through a connector (UCI connector) using an optional connection cable (available through MOPAR®). See your authorized dealer for details.

Using this feature,

- the iPod® audio can be played on the vehicle's sound system, providing metadata (Track Title, Artist, Album, etc.) information display on radio.
- the iPod® can be controlled using the radio buttons to Play, Browse and List the iPod® contents.
- the iPod® battery charges when plugged into the UCI connector.

Connecting The iPod® Device

Use the optional connection cable to connect an iPod® to the vehicle's UCI connector (which is located in the glove box or center console on some vehicles. This location may vary with vehicle). Once the iPod® is connected and synchronized to the vehicle system (this may take a few seconds to connect), the vehicle brand logo appears on the iPod® display, and it starts charging and is ready for use by pressing radio switches as described below.

Controlling The iPod® Using Radio Buttons

To get into the UCI (iPod®) mode and access a connected iPod®, press the AUX button on the radio faceplate. Once in the UCI (iPod®) mode, the iPod® audio track (if available from iPod®) will start playing over the vehicle audio system.

Play Mode

When switched to UCI mode the iPod® will be in Play mode. In Play mode, you may use the following buttons on the radio faceplate to control the iPod® and display data:

Tune/Scroll Knob

Use the Tune/Scroll knob to go to the next or previous track.

The Tune/Scroll knob functions similar to the scroll wheel on the iPod® mobile digital device.

Turning it clockwise (forward) by one click while playing a track skips to the next track.

Turning it counterclockwise (backward) by one click during the first two seconds of the track will jump to the previous track in the list and turning this button at any other time in the track will jump to the beginning of the current track.

RW (Rewind) Button

Press and hold the RW button to move backward in the current track. Holding the RW button long enough will take you back to the beginning of the current track.

Pressing and releasing the RW button will go back five seconds of the current track.

FF (Fast Forward) Button

Press and hold the FF button to move forward in the current track.

Pressing and releasing the FF button will go forward five seconds of the current track.

SEEK Buttons

Use the SEEK buttons to move to the previous or the next track.

If the left (down) button is pressed during the first two seconds of the current track, it will go back to the

previous track in the list; if you press this button at any other time in the current track it will go back to the beginning of the track.

If the right (up) button is pressed during Play mode, it will go to the next track in the list.

INFO Button
Press the INFO button while a track is playing to see the information (Track Title, Artist, Album, etc.) for that track. Each press of the INFO button will take you to the next screen of data for that track. Once you have seen all of the screens, the last press of the INFO button will take you back to the Play mode screen on the radio.

REPEAT Button
Press the REPEAT button to repeat the current playing track.

SCAN Button
Pressing the SCAN button will play the first five seconds of each track in the current list and then forward to the next song. To stop the SCAN mode and start playing the desired track, press the SCAN button again.

During the SCAN mode, you can also press the SEEK button to the left or right to go to the previous or next tracks.

RND (Random) Button (RES/REL Radios Only)
Pressing the RND button will switch between the shuffle on and shuffle off modes of the iPod®. If the RND icon is showing on the radio display then the Shuffle mode is on.

List or Browse Mode

During Play mode, pressing any of the following buttons will take you to List mode. List mode enables you to scroll through the list of menus and tracks on the iPod® device.

Tune/Scroll Knob

In the List mode, the Tune/Scroll knob functions in a similar manner as the scroll wheel on the iPod®.

Turning the Tune/Scroll knob clockwise (forward) and counterclockwise (backward) scrolls through lists, displaying the track detail on the radio display. Once you have the track to be played highlighted on the radio display, press the Tune/Scroll knob to select and start playing the track. By turning the Tune/Scroll knob fast, you can jump through the list faster. During fast scroll, you may notice a slight delay in updating the information on the radio display.

During all List modes, the iPod® will display all lists in "wrap-around" mode. So if the track you wish to select is at the bottom of the list, you just turn the Tune/Scroll knob backward (counterclockwise) to get to the track faster.

Radio Preset Buttons

In the List mode, the radio preset buttons are used as shortcuts to the following lists on the iPod® device.

- 1 – Playlists
- 2 – Artists
- 3 – Albums
- 4 – Genres
- 5 - Audiobooks
- 6 – Podcasts

After pressing a preset button, you will see the list you are in on the top line and the first item in that list on the second line.

To exit the List mode without selecting a track, press the same preset button again to go back to Play mode.

LIST Button

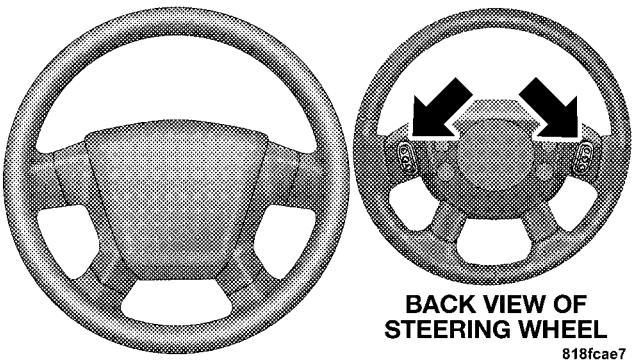
Pressing the LIST button will take to the top level menu of the iPod®. This takes you to the same top level menu as on your iPod®. Turn the Tune/Scroll knob to list the top menu item you wish to select and then press the Tune/Scroll knob. This will take you to the next sub menu list item of the iPod® and you can follow the same steps to go to the desired track in that list. Not all iPod® sub menu levels are available on this system.

MUSIC TYPE Button

The MUSIC TYPE button is another shortcut button to the genre listing on your iPod®.

REMOTE SOUND SYSTEM CONTROLS — IF EQUIPPED

The remote sound system controls are located on the rear surface of the steering wheel. The left- and right-hand controls are rocker-type switches with a pushbutton in the center of each switch. Reach behind the steering wheel to access the switches.



Remote Sound Controls

Right-Hand Switch Functions

- Press the top of the switch to increase the volume.
- Press the bottom of the switch to decrease the volume.
- Press the button in the center of the switch to change modes (i.e., AM, FM, etc.).

Left-Hand Switch Functions for Radio Operation

- Press the top of the switch to SEEK the next listenable station up from the current setting.
- Press the bottom of the switch to SEEK the next listenable station down from the current setting.
- Press the button in the center of the switch to tune to the next preset that you have programmed.

Left-Hand Switch Functions for Media (i.e., CD) Operation

- Press the top of the switch once to listen to the next track.
- Press the bottom of the switch once either to listen to the beginning of the current track or to listen to the beginning of the previous track if it is within one second after the current track begins to play.

- Press the switch up or down twice to listen to the second track, three times to listen to the third track, and so forth.
- Press the button located in the center of the switch to change to the next preset that you have programmed.

CD/DVD MAINTENANCE

To keep the CD/DVD discs in good condition, take the following precautions:

1. Handle the disc by its edge; avoid touching the surface.

2. If a disc is stained, clean the surface with a soft cloth, wiping from center to edge.

3. Do not apply paper, paper CD labels, or tape to the disc; avoid scratching a disc.

4. Do not use solvents such as benzine, thinner, cleaners, or antistatic sprays.

5. Store a disc in its case after playing.

6. Do not expose a disc to direct sunlight.

7. Do not store a disc where temperatures may become too high.

8. Do not play discs that are small in size or have irregular shapes.

RADIO OPERATION AND CELLULAR PHONES

Under certain conditions, the cellular phone being on in your vehicle can cause erratic or noisy performance from your radio. This condition may be lessened or eliminated by relocating the cellular phone antenna. This condition is not harmful to the radio. If your radio performance does not satisfactorily “clear” by the repositioning of the antenna, it is recommended that the radio volume be turned down or off during cellular phone operation.

CLIMATE CONTROLS

The air conditioning and heating system is designed to make you comfortable in all types of weather. For information about basic climate control functions, refer to "General Climate Control Functions — All Systems." For more detailed information about the climate controls in your vehicle, refer to "Single-Zone Manual Air Conditioning and Heating System," "Two- and Three-Zone Manual Air Conditioning and Heating Systems," or "Two- and Three-Zone Automatic Temperature Control (ATC) Systems."

General Climate Control Functions — All Systems

Blower Control

Use this control to regulate the amount of air forced through the ventilation system in any mode.

Temperature Control

Use this control to regulate the temperature of the air inside the cabin.

Air Conditioning (A/C) Control

Use this control to engage and disengage the A/C.

NOTE:

- The A/C compressor will not engage until the engine has been running for about 10 seconds.
- If A/C performance seems lower than expected, check the front of the A/C condenser (located in front of the radiator) for an accumulation of dirt or insects. Clean with a gentle water spray from behind the radiator and through the condenser. Fabric front fascia protectors may reduce airflow to the condenser, reducing air conditioning performance.

Mode Control (Air Direction)

Use these controls to choose from several patterns of air distribution.

- *Panel*

Air is directed through the outlets in the instrument panel. For vehicles equipped with a three-zone system, air is also directed through the outlets in the headliner, unless the climate control for the rear passengers is ON and in Floor mode.

NOTE: These outlets are adjustable to direct airflow. For maximum airflow to the rear, aim the center instrument panel outlets so that they are directed toward the rear seat passengers.

- *Bi-Level*

Air is directed through the panel and floor outlets. For vehicles equipped with a three-zone system, air is also directed through the outlets in the headliner, unless the climate control for the rear passengers is ON and in Floor mode.

NOTE: For all settings except full cold or full hot, there is a difference in temperature between the upper and lower outlets. The warmer air flows to the floor outlets. This feature gives improved comfort during sunny but cool conditions.

- *Floor*

Air is directed through the floor outlets with a small amount flowing through the defrost and side window demist outlets. For vehicles equipped with a three-zone system, air is directed through the floor outlet in the right quarter trim panel, unless the climate control for the rear passengers is ON and in Panel mode.

- *Mix*

Air is directed through the floor, defrost, and side window demist outlets. For vehicles equipped with a three-zone system, air is directed through the floor outlet in the right quarter trim panel, unless the climate control for the rear passengers is ON and in Panel mode.

NOTE: This setting works best in cold or snowy conditions that require extra heat to the windshield. This setting is good for maintaining comfort while reducing moisture on the windshield.

- *Defrost*

Air is directed through the windshield and side window demist outlets. For vehicles equipped with a three-zone system, air is directed through the floor outlet in the right quarter trim panel, unless the climate control for the rear passengers is ON and in Panel mode.

NOTE: Use this mode with maximum blower and temperature settings for best windshield and side window defrosting.

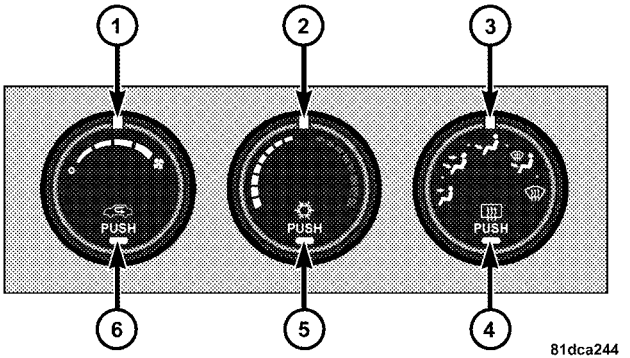
- *Recirculation Control*

Use this button to block the flow of outside air from coming into the passenger compartment.

NOTE:

- Only use the Recirculation mode as a temporary means to block out any outside odors, smoke, or dust, and to cool the interior rapidly upon initial start up in very hot or humid weather.
- Continuous use of the Recirculation mode may make the inside air stuffy and window fogging may occur. Extended use of this mode is not recommended.
- The use of the Recirculation mode in cold or damp weather will cause windows to fog on the inside, because of moisture build-up inside the vehicle. Select the outside air position for maximum defogging.

Single-Zone Manual Air Conditioning and Heating System



Single-Zone Manual Climate Control

1. Blower Control
The blower speed increases as you move the control to the right from the "O" (Off) position. There are four blower speeds.

2. Temperature Control
Turn left for cooler or right for warmer temperature settings.

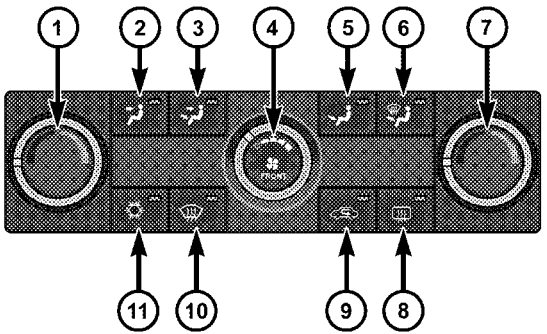
3. Mode Control
Turn to select either a primary mode as identified by the symbols on the control, or a blend of two of these modes. The closer the setting is to a particular symbol, the more air distribution you receive from that mode. See Note [1] and [2]

4. Electric Rear Window Defroster Control
Refer to "Rear Window Features" in Section 3 for more information.

5. A/C Control
Press and release to change the current setting. The indicator illuminates when ON. See Note [3]

6. Recirculation Mode Control
Press and release to change the current setting. The indicator illuminates when ON.
Note [1] - The A/C compressor operates in Mix and Defrost, or a blend of these modes, even if the A/C control is not pressed. This dehumidifies the air to help dry the windshield. To improve fuel economy, use these modes only when necessary.
Note [2] - The A/C will engage automatically to prevent fogging when the Recirculation button is pressed and the Mode control is set to Panel or Panel/Floor. The A/C can be deselected manually without disturbing the Mode control selection.
Note [3] - For maximum cooling, use A/C and recirculation at the same time. If economy mode is desired, turn OFF the A/C and turn the Temperature control to the desired temperature setting.

Two- and Three-Zone Manual Air Conditioning and Heating Systems — If Equipped



Two-Zone Manual Climate Control

1. Left Front Temperature Control
Provides left front seat occupant with independent temperature control. Turn left for cooler or right for warmer temperature settings.

2. Panel Mode Button
Press and release to select. The indicator illuminates when selected.

3. Bi-Level Mode Button
Press and release to select. The indicator illuminates when selected.

4. Front Blower Control
The blower speed increases as you move the control to the right from the "O" (Off) position. There are four blower speeds.

5. Floor Mode Button
Press and release to select. The indicator illuminates when selected.

6. Mix Mode Button
Press and release to select. The indicator illuminates when selected.

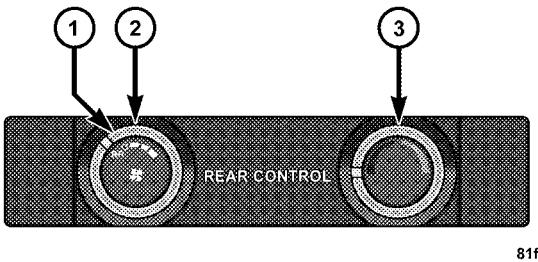
7. Right Front Temperature Control
Provides right front seat occupant with independent temperature control. Turn left for cooler or right for warmer temperature settings.

8. Electric Rear Window Defroster Button
Refer to "Rear Window Features" in Section 3 for more information.

9. Recirculation Mode Button
Press and release to change the current setting. The indicator illuminates when ON.

10. Defrost Mode Button
Press and release to select. The indicator illuminates when selected.

11. A/C Button
Press and release to change the current setting. The indicator illuminates when ON.

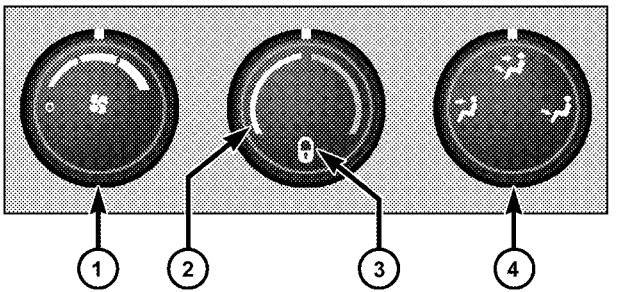


Rear-Zone Manual Climate Control

1. RR Control
Turns the climate control in the overhead console above the second row passenger seats ON and OFF. Press and release to change the current setting.

2. Rear Blower Control
The blower speed increases as you move the control to the right from the "O" (Off) position. There are three blower speeds.

3. Rear Temperature Control
Provides independent temperature control for the rear cabin. Turn left for cooler or right for warmer temperature settings in the rear cabin.



Rear-Zone Manual Climate Control

The Rear-Zone Manual Climate Control for the rear passengers is located in the overhead console above the second row passenger seats.

1. Rear Blower Control

The blower speed increases as you move the control to the right from the "O" (Off) position. There are three blower speeds.

2. Rear Temperature Control

Provides rear seat occupants with independent temperature control. Turn left for cooler or right for warmer temperature settings in the rear cabin.

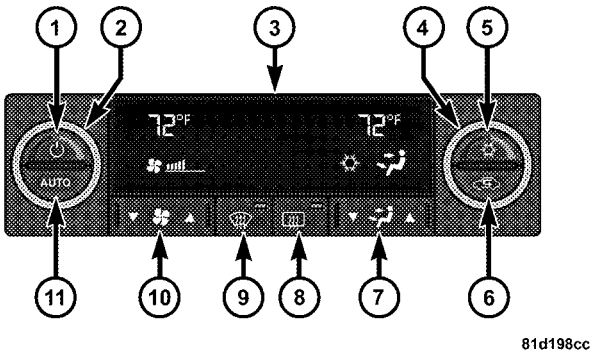
3. Lockout

This indicator illuminates when the climate control is turned OFF by the RR control on the Rear-Zone Manual Climate Control in the instrument panel.

4. Rear Mode Control

Turn to select Panel, Bi-Level, or Floor for the mode of rear cabin air distribution.

Two- and Three-Zone Automatic Temperature Control (ATC) Systems — If Equipped



Two-Zone ATC

1. ATC ON/OFF Button
Press and release to change the current setting.

2. Left Front Temperature Control
Provides left front seat occupant with independent temperature control. Turn left for cooler or right for warmer temperature settings.

3. Display Screen
Shows the current blower speed, mode, and temperature settings, and it will display an indicator when Recirculation mode is ON and when the A/C is ON.

4. Right Front Temperature Control
Provides right front seat occupant with independent temperature control. Turn left for cooler or right for warmer temperature settings.

5. A/C Button
Press and release to change the current setting.

6. Recirculation Mode Button
Press and release to change the current setting. See Note [1]

7. Mode Button
Press the DOWN or UP arrow to change the mode of air distribution to Floor, Panel, Bi-Level, or Mix.

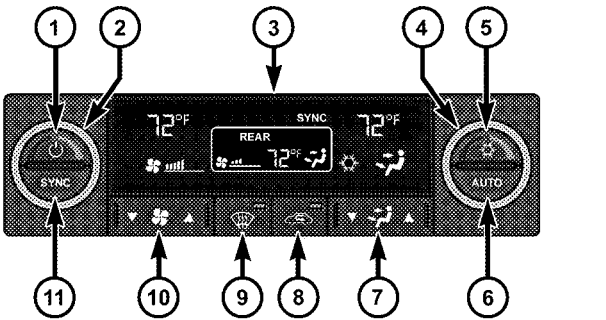
8. Electric Rear Window Defroster Button
Refer to "Rear Window Features" in Section 3 for more information.

9. Defrost Mode Button
Press and release to select. The indicator illuminates when ON.

10. Front Blower Button
Press the DOWN arrow to decrease or the UP arrow to increase blower speed.

11. AUTO Button
Controls airflow temperature, distribution, volume, and the amount of air recirculation automatically. Press and release to select. Refer to "Automatic Operation — Two- and Three-Zone ATC" for more information.

Note [1] - To prevent window fogging, Recirculation Mode will not operate when either Defrost or Mix mode is selected. Doing so will cause the indicator to blink and then turn OFF.



81f4d61d

1. ATC ON/OFF Button
Press and release to change the current setting.

2. Left Front Temperature Control
Provides left front seat occupant with independent temperature control. Turn left for cooler or right for warmer temperature settings.

3. Display Screen
Shows the current blower speed, mode, and temperature settings, and it will display an indicator when the A/C is ON.

4. Right Front Temperature Control
Provides right front seat occupant with independent temperature control. Turn left for cooler or right for warmer temperature settings.

5. A/C Button
Press and release to change the current setting.

6. AUTO Button
Controls airflow temperature, distribution, volume, and the amount of air recirculation automatically. Press and release to select. Refer to "Automatic Operation — Two- and Three-Zone ATC" for more information.

7. Mode Button
Press the DOWN or UP arrow to change the mode of air distribution to Floor, Panel, Bi-Level, or Mix.

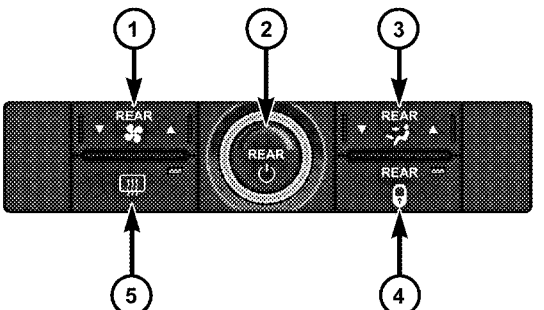
8. Recirculation Mode Button
Press and release to change the current setting. The indicator illuminates when ON. See Note [1]

9. Defrost Mode Button
Press and release to select. The indicator illuminates when ON.

10. Front Blower Control
Press the DOWN arrow to decrease or the UP arrow to increase front blower speed.

11. SYNC Button
Press and release to control the temperature setting for all three zones from the Left Front Temperature Control.

Note [1] - To prevent window fogging, Recirculation Mode will not operate when either Defrost or Mix mode is selected. Doing so will cause the indicator to blink and then turn OFF.



Three-Zone ATC Lower Control Panel

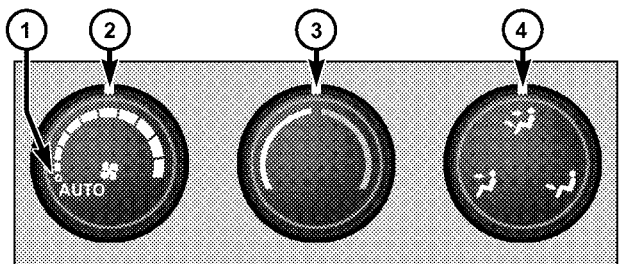
1. Rear Blower Control
Press the DOWN arrow to decrease or the UP arrow to increase rear blower speed.

2. Rear Temperature Control
Provides independent temperature control for the rear cabin. Turn left for cooler or right for warmer temperature settings in the rear cabin.

3. Rear Mode Button
Press the DOWN or UP arrow to change the mode of rear cabin air distribution to Floor, Panel, or Bi-Level.

4. REAR Button
Turns the climate control in the overhead console above the second row passenger seats ON and OFF. Press and release the button to change the current setting. The indicator illuminates when ON.

5. Electric Rear Window Defroster Button
Refer to "Rear Window Features" in Section 3 for more information.



81f4d4f1

Rear-Zone ATC

The Rear-Zone ATC for the rear passengers is in the overhead console above the second row passenger seats.

1. AUTO
Controls airflow temperature, distribution, and volume automatically. Turn to this position to select. Refer to "Automatic Operation — Rear-Zone ATC" for more information.

2. Rear Blower Control
The blower speed increases as you move the control to the right from the "O" (Off) position. There are 10 blower speeds.

3. Rear Temperature Control
Provides rear seat occupants with independent temperature control. Turn left for cooler or right for warmer temperature settings in the rear cabin. When the rear climate control is turned OFF by the rear button on the Three – Zone ATC, a red indicator will appear at the bottom of the Rear Temperature Control Knob.

4. Rear Mode Control
Turn to select Panel, Bi-Level, or Floor for the mode of rear cabin air distribution.

Automatic Operation — Two- and Three-Zone ATC
The Two- and Three-Zone ATC systems automatically maintain the climate in the cabin of the vehicle. To accomplish this, the system gathers information from the climate controls, from a dual sun-sensor located in the top of the instrument panel, from an infrared sensor located between the sun visors, and from various sensors located throughout the vehicle.

- The climate controls provide the system with operator input.
- The dual sun-sensor monitors sun load coming through the windshield.
- The infrared sensor independently measures the surface temperature of the driver and passengers.
- Other sensors take into account vehicle-speed, A/C pressure, outside temperature, and engine cooling temperature.

Using all of these inputs, the system automatically adjusts airflow temperature, airflow distribution, airflow volume, and the amount of outside air recirculation. This maintains a comfortable temperature even under changing conditions.

To select automatic operation, perform the following steps:

1. Press and release the AUTO button and the ATC displays the word "AUTO," along with current settings for temperature, mode, and blower speed. It also displays the snowflake icon if the A/C is running.

2. Turn the Left Front Temperature Control, the Right Front, and if so equipped, the Rear Temperature Control to dial in the temperature that you want the system to

maintain for each zone. On Three-Zone ATC systems, if so desired, push and release the SYNC button. Then turn the Left Front Temperature Control to dial in the temperature that you want the system to maintain for all three zones.

Once the comfort level is selected, the system will maintain that level automatically using the heating system. Should the desired comfort level require A/C, the system will automatically make the adjustment. You will experience the greatest efficiency by simply allowing the system to function automatically. 72°F (22°C) is the recommended setting for maximum comfort for the average person; however, this may vary.

NOTE:

- The temperature setting can be adjusted at anytime without affecting automatic operation.
- Pressing the A/C button, or adjusting the blower speed, or changing the mode of air distribution while in AUTO mode will cancel automatic operation.

Automatic Operation — Rear-Zone ATC

1. Press the REAR button on the Three-Zone ATC in the instrument panel to turn ON the Rear-Zone ATC in the overhead console.

2. Turn the Rear Blower control on the Rear-Zone ATC in the overhead console to the AUTO position.

3. Turn the Rear Temperature control on the Rear-Zone ATC in the overhead console to dial in the temperature that you want the system to maintain in the rear cabin.

NOTE:

- The temperature setting can be adjusted at anytime without affecting automatic operation.

Operating Tips

NOTE: Refer to the chart at the end of this section for suggested control settings for various weather conditions.

Summer Operation

The engine cooling system in air-conditioned vehicles must be protected with a high-quality antifreeze coolant to provide proper corrosion protection and to protect against engine overheating. Refer to "Cooling System" under "Maintenance Procedures" and to "Fluids, Lubricants, and Genuine Parts" in Section 7 for information pertaining to the cooling system and coolant selection.

Winter Operation

Use of the air Recirculation mode during Winter months is not recommended because it may cause window fogging.

Vacation Storage

Anytime you store your vehicle, or keep it out of service (i.e., vacation) for two weeks or more, run the air conditioning system at idle for about five minutes in the fresh air and high blower settings. This will ensure adequate system lubrication to minimize the possibility of compressor damage when the system is started again.

Window Fogging

Interior fogging on the windshield can be quickly removed by turning the mode selector to Defrost. The Defrost/Floor mode can be used to maintain a clear windshield and provide sufficient heating. If side window fogging becomes a problem, increase blower speed. Vehicle windows tend to fog on the inside in mild but rainy or humid weather.

NOTE: Recirculate without A/C should not be used for long periods as fogging may occur.

Side Window Demisters

A side window demister outlet is located at each end of the instrument panel. These non-adjustable outlets direct air toward the side windows when the system is in the Floor, Mix, or Defrost mode. The air is directed at the area of the windows through which you view the outside mirrors.

Outside Air Intake

Make sure the air intake, located directly in front of the windshield, is free of obstructions such as leaves. Leaves collected in the air intake may reduce airflow, and if they enter the plenum, they could plug the water drains. In Winter months, make sure the air intake is clear of ice, slush, and snow.

A/C Air Filter — If Equipped

The A/C Air Filter will reduce, but not eliminate, diesel and agricultural smells. The filter acts on air coming from outside the vehicle and recirculated air within the passenger compartment. Refer to "Maintenance Procedures" in Section 7 for A/C Air Filter service information or see your authorized dealer for service. Refer to the Maintenance Schedule in Section 8 for filter service intervals.

Control Setting Suggestions for Various Weather Conditions

WEATHER	CONTROL SETTINGS
HOT WEATHER AND VEHICLE INTERIOR IS VERY HOT 	Open the windows, start the vehicle, press the button to turn recirculate off. Set the Fan control to the high position. Press the button. Set the Mode control at or between and . Set the temperature control to full cool. After the hot air is pushed from the vehicle press the button to turn recirculate on and roll up the windows. Once you are comfortable, press the button to turn recirculate off and adjust the temperature control for comfort.
WARM WEATHER	Press the button to turn recirculate off. If it's sunny, set the Mode control at or near and turn the air conditioning on. If it's cloudy or dark, set the Mode control at or near .
COOL OR COLD HUMID CONDITIONS 	Press the button to turn recirculate off. If it's sunny, set the Mode control at or between and then turn the air conditioning on. If it's cloudy or dark, set the Mode control at or near and turn the air conditioning on. If the windows begin to fog, set Mode control at or between and .
COLD DRY CONDITIONS 	Set the Mode control at ot near . If it is sunny, you may want more upper air. In this case, set the Mode control at or between and . In very cold weather, if you need extra heat at the windshield, set the Mode control at or near the .

STARTING PROCEDURES

Before starting your vehicle, adjust your seat, adjust the inside and outside mirrors, fasten your seat belt, and if present, instruct all other occupants to buckle their seat belts.

WARNING!

- **Never leave children alone in a vehicle. Leaving unattended children in a vehicle is dangerous for a number of reasons. A child or others could be seriously or fatally injured. Don't leave the key in the ignition. A child could operate power windows, other controls, or move the vehicle.**
- **Do not leave animals or children inside parked vehicles in hot weather; interior heat buildup may cause serious injury or death.**
- **Be sure to turn OFF the engine and remove the key from the ignition switch if you want to rest or sleep in your car. Accidents can be caused by inadvertently moving the shift lever. Accidents can also be caused by pressing the accelerator pedal. This may cause excessive heat in the exhaust system, resulting in overheating and vehicle fire, which may cause serious or fatal injuries.**

Automatic Transaxle

The shift lever must be in the NEUTRAL or PARK position before you can start the engine. Apply the brakes before shifting into any driving gear.

CAUTION!

Damage to the transaxle may occur if the following precautions are not observed:

- **Shift into PARK only after the vehicle has come to a complete stop.**
- **Shift into or out of REVERSE only after the vehicle has come to a complete stop and the engine is at idle speed.**
- **Do not shift from REVERSE, PARK, or NEUTRAL into any forward gear when the engine is above idle speed.**
- **Before shifting into any gear, make sure your foot is firmly on the brake pedal.**

Normal Starting (Tip Start)

NOTE: Normal Starting of either a cold or a warm engine is obtained without pumping or depressing the accelerator pedal.

Do not press the accelerator. Use the Fob with Integrated Key to briefly turn the ignition switch to the START position and release it as soon as the starter engages. The starter motor will continue to run, and it will disengage automatically when the engine is running. If the engine fails to start, the starter will disengage automatically in 10 seconds. If this occurs, turn the ignition switch to the LOCK position, wait 10 to 15 seconds, then repeat the normal starting procedure.

Extremely Cold Weather (Below −20°F or −29°C)

To ensure reliable starting at these temperatures, use of an externally powered electric engine block heater (available from your authorized dealer) is recommended.

If Engine Fails To Start

WARNING!

- **Never pour fuel or other flammable liquids into the throttle body air inlet opening in an attempt to start the vehicle. This could result in a flash fire causing serious personal injury.**
- **Do not attempt to push or tow your vehicle to get it started. Vehicles equipped with an automatic transaxle cannot be started this way. Unburned fuel could enter the catalytic converter and once the engine has started, ignite and damage the converter and vehicle. If the vehicle has a discharged battery, booster cables may be used to obtain a start from a booster battery or the battery in another vehicle. This type of start can be dangerous if done improperly. Refer to Section 6 for proper jump-starting procedures and follow them carefully.**

If the engine fails to start after you have followed the "Normal Starting" or "Extreme Cold Weather" procedures, it may be flooded. To clear any excess fuel, push the accelerator pedal all the way to the floor and hold it. Then, turn the ignition switch to the START position and release it as soon as the starter engages. The starter motor will disengage automatically in 10 seconds. Once this occurs, release the accelerator pedal, turn the ignition switch to the LOCK position, wait 10 to 15 seconds, then repeat the normal starting procedure.

CAUTION!

To prevent damage to the starter, wait 10 to 15 seconds before trying again.

After Starting

The idle speed is controlled automatically and it will decrease as the engine warms up.

ENGINE BLOCK HEATER — IF EQUIPPED

The engine block heater warms engine coolant and permits quicker starts in cold weather. Connect the cord to a standard 110-115 Volt AC electrical outlet with a grounded, three-wire extension cord.

The engine block heater cord is bundled under the hood between the headlight assembly and the Totally Integrated Power Module (Fuse Box) on the driver's side of the vehicle.

WARNING!

Remember to disconnect the cord before driving. Damage to the 110-115 Volt electrical cord could cause electrocution.

AUTOMATIC TRANSAXLE

CAUTION!

Damage to the transaxle may occur if the following precautions are not observed:

- **Shift into PARK only after the vehicle has come to a complete stop.**
- **Shift into or out of REVERSE only after the vehicle has come to a complete stop and the engine is at idle speed.**
- **Do not shift from REVERSE, PARK, or NEUTRAL into any forward gear when the engine is above idle speed.**
- **Before shifting into any gear, make sure your foot is firmly on the brake pedal.**

NOTE: You MUST press and hold the brake pedal down while shifting out of PARK.

WARNING!

- **It is dangerous to move the shift lever out of PARK or NEUTRAL if the engine speed is higher than idle speed. If your foot is not firmly on the brake pedal, the vehicle could accelerate quickly forward or in reverse. You could lose control of the vehicle and hit someone or something. Only shift into gear when the engine is idling normally and when your right foot is firmly on the brake pedal.**
- **Unintended movement of a vehicle could injure those in and near the vehicle. As with all vehicles, you should never exit a vehicle while the engine is running. Before exiting a vehicle, you should always shift the vehicle into PARK, remove the key from the ignition, and apply the parking brake. Once the key is removed from the ignition, the shift lever is locked in the PARK position, securing the vehicle against unwanted movement. Furthermore, you should never leave unattended children inside a vehicle.**

Brake/Transaxle Interlock System

This vehicle is equipped with a Brake Transaxle Shift Interlock System (BTSI) that holds the shift lever in the PARK position when the ignition switch is in the LOCK position. To move the shift lever out of the PARK position, the ignition switch must be turned to the ON position, and the brake pedal must be depressed.

BTSI Override

There is an override for the BTSI that allows you to move the shift lever out of the PARK position if an electrical system malfunction occurs (i.e., dead battery). To activate the override system, perform the following steps:

1. Firmly apply the parking brake.

2. Insert the ignition key into the ignition switch and rotate it to the ON position.

3. Remove the cubby bin liner located in the center console behind the shift lever.

4. Insert a screwdriver or similar small tool into the hole at the front of the cubby bin and push the manual override release lever forward.

5. While holding the release lever forward, move the shift lever from PARK to NEUTRAL.

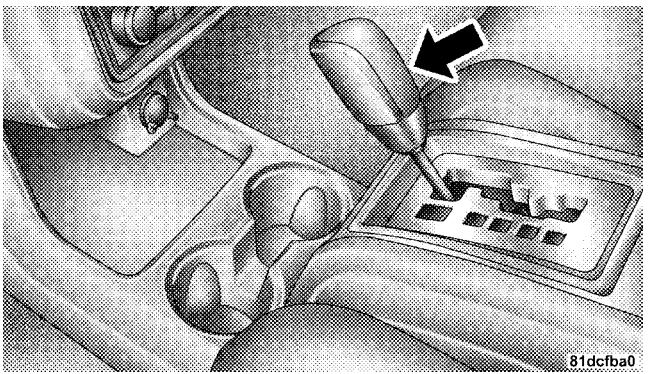
6. Release the manual override.

Automatic Transaxle Ignition Interlock System

This system prevents the key from being removed unless the shift lever is in PARK. It also prevents shifting out of PARK unless the key is in the ON position and the brake pedal is applied.

4-Speed or 6-Speed (AutoStick®) Automatic Transaxle

The electronically controlled transaxle provides a precise shift schedule. The transaxle electronics are self-calibrating; therefore, the first few shifts on a new vehicle may be somewhat abrupt. This is a normal condition, and precision shifts will develop within a few hundred miles (kilometers).



Shift Lever

Gear Ranges

PARK

PARK supplements the parking brake by locking the transaxle. The engine can be started in this range. Never attempt to use PARK while vehicle is in motion. Apply parking brake when leaving vehicle in this range.

When parking on a flat surface, place the shift lever in the PARK position first, and then apply the parking brake.

When parking on a hill, it is important to set the parking brake before placing the shift lever in PARK, otherwise the load on the transaxle locking mechanism may make it difficult to move the shift lever out of PARK. As an added precaution, turn the front wheels toward the curb on a downhill grade and away from the curb on an uphill grade.

WARNING!

Never use PARK position on an Automatic Transaxle as a substitute for the parking brake. Always apply parking brake fully when parked to guard against vehicle movement and possible injury or damage.

CAUTION!

DO NOT race the engine when shifting from PARK or NEUTRAL positions into another gear range as this can damage the drivetrain.

REVERSE

Use REVERSE for moving the vehicle rearward. Shift into REVERSE only after the vehicle has come to a complete stop.

NEUTRAL
The engine may be started in this range.

WARNING!

Do not coast in NEUTRAL and never turn off the ignition to coast down a hill. These are unsafe practices that limit your response to changing traffic or road conditions. You might lose control of the vehicle and have an accident.

DRIVE — 6-Speed Transaxle
This range should be used for most city and highway driving. It provides the smoothest upshifts, downshifts, and best fuel economy. However, use the AutoStick® mode and select the "5" range when frequent transaxle shifting occurs while using the DRIVE range, such as when operating the vehicle under heavy loading conditions, (i.e., in hilly terrain, traveling into strong head winds or while towing heavy trailers). Under these conditions, using the "5" range will improve performance and extend transaxle life by reducing excessive shifting and heat build-up.

"D" (Overdrive) — 4-Speed Transaxle
This range should be used for most city and highway driving. It provides the smoothest upshifts, downshifts, and best fuel economy. However, select the "3" range when frequent transaxle shifting occurs while using the "D" (Overdrive) range, such as when operating the vehicle under heavy loading conditions, (i.e., in hilly terrain, traveling into strong head winds or while towing heavy trailers). Under these conditions, using the "3" range will improve performance and extend transaxle life by reducing excessive shifting and heat build-up.

"3" (Drive) — 4-Speed Transaxle
This range eliminates shifts into "D" (Overdrive). The transaxle will operate normally in 1st, 2nd, and 3rd while in this range. The "3" (Drive) range should also be used when descending steep grades to prevent brake system distress.

NOTE: Using the "3" (Drive) range while operating the vehicle under heavy operating conditions will improve performance and extend transaxle life by reducing excessive shifting and heat build up.

"L" (Low) — 4-Speed Transaxle
This range should be used for engine braking when descending very steep grades. In this range, upshifts will occur only to prevent engine overspeed while downshifts occur earlier than other gear range selections.

CAUTION!

If the transaxle operating temperature exceeds acceptable limits, the vehicle computer will override "D" (Overdrive) and "5" range (for 6-speed AutoStick® transaxle) and "3" range (for 4-speed auto transaxle) by changing shift points. This is done to prevent transaxle damage due to overheating.

Reset Mode - Electronic Transaxle
The transaxle is monitored electronically for abnormal conditions. If a condition is detected that could cause damage, the transaxle automatically shifts into 2nd gear (3rd gear for 6-speed). The transaxle remains in 2nd gear (3rd gear for 6-speed) despite the forward gear selected.

PARK, REVERSE, and NEUTRAL will continue to operate. This Reset feature allows the vehicle to be driven to an authorized dealer for service without damaging the transaxle.

In the event of a momentary problem, the transaxle can be reset to regain all forward gears by performing the following steps:

1. Stop the vehicle.
2. Shift into PARK.
3. Turn the ignition switch to the LOCK position.
4. Restart the engine.
5. Shift into the desired gear range and resume driving.

NOTE: Even if the transaxle can be reset, it is recommended that you visit an authorized dealer at your earliest possible convenience. Your authorized dealer has diagnostic equipment to determine if the problem could recur.

If the transaxle cannot be reset, authorized dealer service is required.

AUTOSTICK® — IF EQUIPPED

AutoStick® is a driver-interactive transaxle that offers six manual ratio changes to provide you with more control of the vehicle. AutoStick® allows you to maximize engine braking, eliminate undesirable upshifts and downshifts, and improve overall vehicle performance. This system can also provide you with more control during passing, city driving, cold slippery conditions, mountain driving, trailer towing, and many other situations.

AutoStick® Operation

By placing the shift lever one shift-level below the DRIVE position, it can be moved from side to side. This allows the driver to select a higher or lower range of gears. Moving the shift lever to the Left (-) triggers a downshift and to the Right (+) an upshift. The gear position will display in the instrument cluster on the transaxle range indicator.

NOTE: In Autostick® mode, the transaxle will only shift up or down when the driver moves the shift lever to the Right (+) or Left (-).

AutoStick® is deactivated when the shift lever is moved out of the AutoStick (+/-) position.

AutoStick® General Information

- You can start out in 1st or 2nd gear. The system will ignore attempts to upshift at too low of a vehicle speed.
- If a ratio other than 1st is selected, and the vehicle is brought to a stop, the transaxle control logic will automatically select the 1st gear ratio.
- Starting out in 2nd gear is helpful in snow or icy conditions.
- Avoid using speed control when Autostick® is engaged.
- The transaxle will automatically shift up when maximum engine speed is reached while Autostick® is engaged.
- Transaxle shifting will be more noticeable when Autostick® is engaged.

- If a low range is selected and the engine accelerates to the rev limit, the transaxle will automatically select the next higher ratio.
- If a downshift would cause the engine to over-speed, that shift will not occur until it is safe for the engine. Mostly the transaxle will stay in the manually selected ratio, however:
  - If the system detects powertrain overheating, the transaxle will revert to the automatic shift mode and remain in that mode until the powertrain cools off.
  - If the system detects a problem, it will disable the AutoStick® mode and the transaxle will return to the automatic mode until the problem is corrected.

ALL WHEEL DRIVE (AWD) — IF EQUIPPED

This feature provides on-demand All-Wheel Drive (AWD). The system is automatic with no driver inputs or additional driving skills required. Under normal driving conditions, the front wheels provide most of the traction. If the front wheels begin to lose traction, power is shifted automatically to the rear wheels. The greater the front wheel traction loss, the greater the power transfer to the rear wheels.

Additionally, on dry pavement under heavy throttle input (where one may have no wheel spin), torque will be sent to the rear in a pre-emptive effort to improve vehicle launch and performance characteristics.

CAUTION!

All wheels must have the same size and type tires. Unequal tire sizes must not be used. Unequal tire size may cause failure of the power transfer unit.

DRIVING ON SLIPPERY SURFACES

ACCELERATION

Rapid acceleration on snow covered, wet, or other slippery surfaces may cause the front wheels to pull erratically to the right or left. This phenomenon occurs when there is a difference in the surface traction under the front (driving) wheels.

WARNING!

Rapid acceleration on slippery surfaces is dangerous. Unequal traction can cause sudden pulling of the front wheels. You could lose control of the vehicle and possibly have an accident. Accelerate slowly and carefully whenever there is likely to be poor traction (ice, snow, wet, mud, loose sand, etc.).

TRACTION

When driving on wet or slushy roads, it is possible for a wedge of water to build up between the tire and road surface. This is hydroplaning and may cause partial or complete loss of vehicle control and stopping ability. To reduce this possibility, the following precautions should be observed:

1. Slow down during rainstorms or when roads are slushy.

2. Slow down if the road has standing water or puddles.

3. Replace the tires when tread wear indicators first become visible.

4. Keep the tires properly inflated.

5. Maintain enough distance between your vehicle and the vehicle in front of you to avoid a collision in a sudden stop.

DRIVING THROUGH WATER

Driving through water more than a few inches/centimeters deep will require extra caution to ensure safety and prevent damage to your vehicle.

Flowing/Rising Water

WARNING!

Do not drive on, or cross, a road or a path where water is flowing and/or rising (as in storm run-off). Flowing water can wear away the road or path's surface and cause your vehicle to sink into deeper water. Furthermore, flowing and/or rising water can carry your vehicle away swiftly. Failure to follow this warning may result in injuries that are serious or fatal to you, your passengers, and others around you.

Shallow Standing Water

Although your vehicle is capable of driving through shallow standing water, consider the following Caution and Warning before doing so.

CAUTION!

- **Always check the depth of the standing water before driving through it. Never drive through standing water that is deeper than the bottom of the tire rims mounted on the vehicle.**
- **Determine the condition of the road or the path that is under water, and if there are any obstacles in the way, before driving through the standing water.**
- **Do not exceed 5 mph (8 km/h) when driving through standing water. This will minimize wave effects.**

CAUTION!

- **Driving through standing water may cause damage to your vehicle's drivetrain components. Always inspect your vehicle's fluids (i.e., engine oil, transmission, axle, etc.) for signs of contamination (i.e., fluid that is milky or foamy in appearance) after driving through standing water. Do not continue to operate the vehicle if any fluid appears contaminated, as this may result in further damage. Such damage is not covered by the New Vehicle Limited Warranty.**
- **Getting water inside your vehicle's engine can cause it to lock up and stall out, and cause serious internal damage to the engine. Such damage is not covered by the New Vehicle Limited Warranty.**

WARNING!

- **Driving through standing water limits your vehicle's traction capabilities. Do not exceed 5 mph (8 km/h) when driving through standing water.**
- **Driving through standing water limits your vehicle's braking capabilities, which increases stopping distances. Therefore, after driving through standing water, drive slowly and lightly press on the brake pedal several times to dry the brakes.**
- **Getting water inside your vehicle's engine can cause it to lock up and stall out, and leave you stranded.**
- **Failure to follow these warnings may result in injuries that are serious or fatal to you, your passengers, and others around you.**

PARKING BRAKE

The parking brake should always be applied when the driver is not in the vehicle.

WARNING!

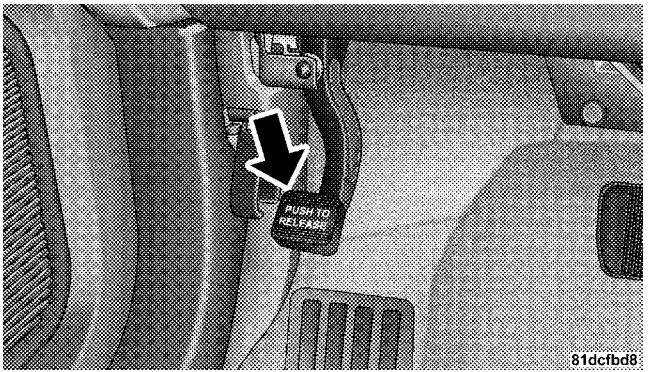
Never use PARK position on an automatic transaxle as a substitute for the parking brake. Always apply parking brake fully when parked to guard against vehicle movement and possible injury or damage.

When parking on a flat surface, place the shift lever in the PARK position first, and then apply the parking brake.

When parking on a hill, it is important to apply the parking brake before placing the shift lever in PARK, otherwise the load on the transaxle locking mechanism may make it difficult to move the shift lever out of PARK.

As an added precaution, turn the front wheels toward the curb on a downhill grade and away from the curb on an uphill grade.

The foot operated parking brake is positioned below the lower left corner of the instrument panel. To apply the parking brake, push the parking brake pedal down and then remove your foot from the pedal. To release the parking brake, push down on the parking brake pedal and then release.



Parking Brake

The brake light in the instrument cluster will turn on when the parking brake is applied and the ignition switch is in the ON position.

NOTE: This light only shows that the parking brake is applied. It does not show the degree of brake application.

BRAKE

The Brake System Warning Light in the instrument cluster will turn on when the parking brake is applied and the ignition switch is on.

NOTE: This light only shows that the parking brake is applied. It does not show the degree of brake application.

CAUTION!

If the Brake System Warning Light remains on with the parking brake released, a brake system malfunction is indicated. Have the brake system serviced by an authorized dealer immediately.

WARNING!

- **Never leave children alone in a vehicle. Leaving unattended children in a vehicle is dangerous for a number of reasons. A child or others could be seriously or fatally injured. Don't leave the keys in the ignition. A child could operate power windows, other controls, or move the vehicle.**
- **Be sure the parking brake is fully disengaged before driving: failure to do so can lead to brake failure, and an accident.**

BRAKE SYSTEM

BRAKE

Your vehicle is equipped with dual hydraulic brake systems. If either of the two hydraulic systems loses normal capability, the remaining system will still function. However, there will be some loss of overall braking effectiveness. This will be evident by increased pedal travel during application and greater pedal force required to slow or stop the vehicle. In addition, if the malfunction is caused by a leak in the hydraulic system, the Brake System Warning Light will turn on as the brake fluid level drops in the master cylinder.

In the event power assist is lost for any reason (i.e., repeated brake applications with the engine OFF) the brakes will still function. However, the effort required to brake the vehicle will be much greater than that required with the power system operating.

WARNING!

- **Riding the brakes can lead to brake failure and possibly an accident. Driving with your foot resting or riding on the brake pedal can result in abnormally high brake temperatures, excessive lining wear, and possible brake damage. You wouldn't have your full braking capacity in an emergency.**
- **Driving a vehicle with the Brake System Warning Light on is dangerous. A significant decrease in braking performance or vehicle stability during braking may occur. It will take you longer to stop the vehicle or will make your vehicle harder to control. You could have an accident. Have the vehicle checked immediately.**

Anti-Lock Brake System (ABS)

This system aids the driver in maintaining vehicle control under adverse braking conditions. The system controls hydraulic brake pressure to prevent wheel lock-up to help avoid skidding on slippery surfaces during braking. Refer to "Anti-Lock Brake System (ABS)" under "Electronic Brake Control System" in this section for more information.

WARNING!

The ABS cannot prevent the natural laws of physics from acting on the vehicle, nor can it increase the traction afforded by prevailing road conditions. ABS cannot prevent accidents, including those resulting from excessive speed in turns, driving on very slippery surfaces, or hydroplaning. Only a safe, attentive, and skillful driver can prevent accidents. The capabilities of an ABS-equipped vehicle must never be exploited in a reckless or dangerous manner, which could jeopardize the user's safety or the safety of others.

ELECTRONIC BRAKE CONTROL SYSTEM

Your vehicle is equipped with an advanced electronic brake control system commonly referred to as ESP. This system includes Anti-Lock Brake System (ABS), Brake Assist System (BAS), Traction Control System (TCS), Electronic Roll Mitigation (ERM), and Electronic Stability Program (ESP). These systems work together to enhance both vehicle stability and control in various driving conditions.

Anti-Lock Brake System (ABS)

The Anti-Lock Brake System (ABS) provides increased vehicle stability and brake performance under most braking conditions. The system automatically "pumps" the brakes during severe braking conditions to prevent wheel lock-up.

When the vehicle is driven over 7 mph (11 km/h), you may also hear a slight clicking sound as well as some related motor noises. These noises are the system performing its self check cycle to ensure that the ABS is working properly. This self check occurs each time the vehicle is started and accelerated past 7 mph (11 km/h).

ABS is activated during braking under certain road or stopping conditions. ABS-inducing conditions can include ice, snow, gravel, bumps, railroad tracks, loose debris, or panic stops.

You also may experience the following when the brake system goes into Anti-lock:

- The ABS motor running (it may continue to run for a short time after the stop),
- The clicking sound of solenoid valves,
- Brake pedal pulsations, and
- A slight drop or fall away of the brake pedal at the end of the stop.

These are all normal characteristics of ABS.

WARNING!

- **The ABS contains sophisticated electronic equipment that may be susceptible to interference caused by improperly installed or high output radio transmitting equipment. This interference can cause possible loss of anti-lock braking capability. Installation of such equipment should be performed by qualified professionals.**
- **Pumping of the Anti-Lock Brakes will diminish their effectiveness and may lead to an accident. Pumping makes the stopping distance longer. Just press firmly on your brake pedal when you need to slow down or stop.**
- **The ABS cannot prevent the natural laws of physics from acting on the vehicle, nor can it increase braking or steering efficiency beyond that afforded by the condition of the vehicle brakes and tires or the traction afforded.**
- **The ABS cannot prevent accidents, including those resulting from excessive speed in turns, following another vehicle too closely, or hydroplaning. Only a safe, attentive, and skillful driver can prevent accidents.**
- **The capabilities of an ABS equipped vehicle must never be exploited in a reckless or dangerous manner, which could jeopardize the user's safety or the safety of others.**

All vehicle wheels and tires must be the same size and type and tires must be properly inflated to produce accurate signals for the computer.

Anti-Lock Brake Light

The Anti-Lock Brake Light monitors the ABS. The light will turn on when the ignition switch is turned to the ON position and may stay on for as long as four seconds.

If the ABS Light remains on or comes on while driving, it indicates that the Anti-Lock portion of the brake system is not functioning and that service is required. However, the conventional brake system will continue to operate normally if the Brake System Warning Light is not on.

If the ABS Light is on, the brake system should be serviced as soon as possible to restore the benefits of Anti-Lock brakes. If the ABS Light does not come on when the ignition switch is turned to the ON position, have the light repaired as soon as possible.

If both the Brake System Warning Light and the ABS Light remain on, the ABS and Electronic Brake Force Distribution (EBD) systems are not functioning. Immediate repair to the ABS system is required.

Brake Assist System (BAS)

The BAS is designed to optimize the vehicle's braking capability during emergency braking maneuvers. The system detects an emergency braking situation by sensing the rate and amount of brake application and then applies optimum pressure to the brakes. This can help reduce braking distances. The BAS complements the ABS. Applying the brakes very quickly results in the best BAS assistance. To receive the benefit of the system, you must apply continuous braking pressure during the stopping sequence, (do not "pump" the brakes). Do not reduce brake pedal pressure unless braking is no longer desired. Once the brake pedal is released, the BAS is deactivated.

WARNING!

BAS cannot prevent the natural laws of physics from acting on the vehicle, nor can it increase the traction afforded by prevailing road conditions. BAS cannot prevent accidents, including those resulting from excessive speed in turns, driving on very slippery surfaces, or hydroplaning. Only a safe, attentive, and skillful driver can prevent accidents. The capabilities of a BAS-equipped vehicle must never be exploited in a reckless or dangerous manner, which could jeopardize the user's safety or the safety of others.

Traction Control System (TCS)

This system monitors the amount of wheel spin of each of the driven wheels. If wheel spin is detected, brake pressure is applied to the slipping wheel(s) and engine power is reduced to provide enhanced acceleration and stability. A feature of the TCS functions similar to a limited slip differential and controls the wheel spin across a driven axle. If one wheel on a driven axle is spinning faster than the other, the system will apply the brake of the spinning wheel. This will allow more engine torque to be applied to the wheel that is not spinning. This feature remains active even if TCS and ESP are in the "Partial Off" mode. Refer to "ESP (Electronic Stability Program)" in this section for more information.

Electronic Roll Mitigation (ERM)

This system anticipates the potential for wheel lift by monitoring the driver's steering wheel input and the speed of the vehicle. When ERM determines that the rate of change of the steering wheel angle and vehicle's speed are sufficient to potentially cause wheel lift, it then applies the appropriate brake and may also reduce engine power to lessen the chance that wheel lift will occur. ERM will only intervene during very severe or evasive driving maneuvers. ERM can only reduce the chance of wheel lift occurring during severe or evasive driving maneuvers. It cannot prevent wheel lift due to other factors, such as road conditions, leaving the roadway, or striking objects or other vehicles.

WARNING!

Many factors, such as vehicle loading, road conditions, and driving conditions, influence the chance that wheel lift or rollover may occur. ERM cannot prevent all wheel lift or rollovers, especially those that involve leaving the roadway or striking objects or other vehicles. Only a safe, attentive, and skillful driver can prevent accidents. The capabilities of an ERM-equipped vehicle must never be exploited in a reckless or dangerous manner, which could jeopardize the user's safety or the safety of others.

Electronic Stability Program (ESP)

This system enhances directional control and stability of the vehicle under various driving conditions. ESP corrects for over-steering and under-steering the vehicle by applying the brake of the appropriate wheel. Engine power may also be reduced to help the vehicle maintain the desired path.

The ESP uses sensors in the vehicle to determine the path that the driver intends to steer the vehicle and compares it to the actual path of the vehicle. When the actual path does not match the intended path, the ESP applies the brake of the appropriate wheel to assist in counteracting the condition of over-steer or under-steer.

- Over-steer - when the vehicle is turning more than appropriate for the steering wheel position.
- Under-steer - when the vehicle is turning less than appropriate for the steering wheel position.

ESP/TCS Indicator Light

The ESP/TCS Indicator Light located in the instrument cluster, starts to flash as soon as the tires lose traction and the ESP system becomes

active. The ESP/TCS Indicator Light also flashes when TCS is active. If the ESP/TCS Indicator Light begins to flash during acceleration, ease up on the accelerator and apply as little throttle as possible. Be sure to adapt your speed and driving to the prevailing road conditions.

WARNING!

ESP cannot prevent the natural laws of physics from acting on the vehicle, nor can it increase the traction afforded by prevailing road conditions. ESP cannot prevent accidents, including those resulting from excessive speed in turns, driving on very slippery surfaces, or hydroplaning. Only a safe, attentive, and skillful driver can prevent accidents. The capabilities of an ESP-equipped vehicle must never be exploited in a reckless or dangerous manner, which could jeopardize the user's safety or the safety of others.

ESP Operating Modes

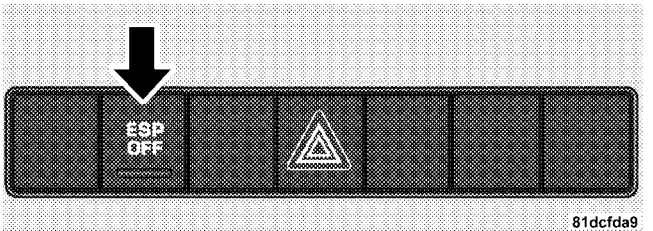
The ESP system has two available operating modes.

Full On

This is the normal operating mode for ESP. Whenever the vehicle is started the system will be in this mode. This mode should be used for most driving situations. ESP should only be turned to "Partial Off" for specific reasons as noted. Refer to "Partial Off" for additional information.

Partial Off

The ESP OFF button is located in the switch bank above the climate Control. To enter the "Partial Off" mode, momentarily depress the ESP OFF button and the ESP/TCS Indicator Light will illuminate. To turn the ESP on again, momentarily depress the ESP OFF button and the ESP/TCS Indicator Light will turn off. This will restore the normal "ESP On" mode of operation.



ESP OFF Button

NOTE: To improve the vehicle's traction when driving with snow chains, or when starting off in deep snow, sand, or gravel, it may be desirable to switch to the "Partial Off" mode by momentarily depressing the ESP OFF button. Once the situation requiring "Partial Off" mode is overcome, turn ESP back on by momentarily depressing the ESP OFF button. This may be done while the vehicle is in motion.

ESP/BAS Warning Light and ESP/TCS Indicator Light

ESP
BAS

The malfunction indicator for the ESP is combined with the BAS indicator. The ESP/BAS Malfunction Indicator Light and the ESP/TCS Indicator Light in the instrument cluster both turn on when the ignition switch is turned to the ON position. They should both turn off with the engine running. If the ESP/BAS Malfunction Indicator Light turns on continuously with the engine running, a malfunction has been detected in either the ESP or the BAS system, or both. If this light remains on after several ignition cycles, and the vehicle has been driven several miles (kilometers) at speeds greater than 30 mph (48 km/h), see your authorized dealer as soon as possible to have the problem diagnosed and corrected.

NOTE:

- ″The ESP/TCS Indicator Light and the ESP/BAS Malfunction Indicator Light will turn on momentarily each time the ignition switch is turned ON.
- Each time the ignition is turned ON, the ESP System will be ON even if it was turned off previously.
- The ESP Control System will make buzzing or clicking sounds when it is active. This is normal; the sounds will stop when ESP becomes inactive following the maneuver that caused the ESP activation.

Trailer Sway Control (TSC)

TSC uses sensors in the vehicle to recognize an excessively swaying trailer. TSC activates automatically once the excessively swaying trailer is recognized. When TSC is functioning, the ESP/TCS Indicator Light will flash, the engine power will be reduced, and you will feel the brake being applied to individual wheels in an attempt to stop the trailer from swaying.

NOTE: The TSC is disabled when the ESP system is in the "Partial Off" mode.

WARNING!

- **TSC cannot stop all trailers from swaying. Always use caution when towing a trailer and follow the tongue weight recommendations. Refer to ″Vehicle Loading" and "Trailer Towing" in this section for more information before towing a trailer with your vehicle.**
- **If TSC activates while towing a trailer, stop the vehicle at the nearest safe location and adjust the trailer load to eliminate the trailer sway.**
- **Failure to follow these warnings can result in an accident or serious personal injury.**

POWER STEERING

The standard power steering system will give you good vehicle response and increased ease of maneuverability in tight spaces. The system will provide mechanical steering capability if power assist is lost.

If for some reason the power assist is interrupted, it will still be possible to steer your vehicle. Under these conditions, you will observe a substantial increase in steering effort, especially at very low vehicle speeds and during parking maneuvers.

NOTE: Increased noise levels at the end of the steering wheel travel are considered normal and do not indicate that there is a problem with the power steering system.

Upon initial start-up in cold weather, the power steering pump may make noise for a short amount of time. This is due to the cold, thick fluid in the steering system. This noise should be considered normal, and it does not in any way damage the steering system.

WARNING!

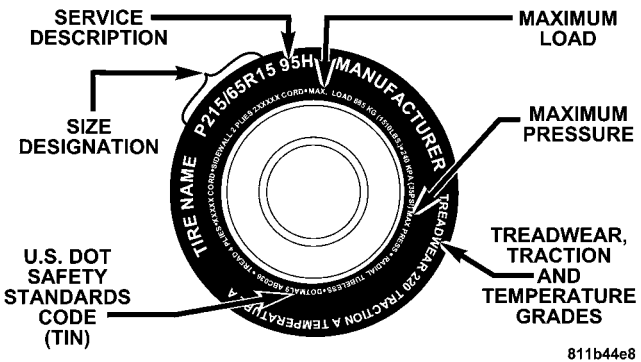
Continued operation with reduced power steering assist could pose a safety risk to yourself and others. Service should be obtained as soon as possible.

CAUTION!

Prolonged operation of the steering system at the end of the steering wheel travel will increase the steering fluid temperature and it should be avoided when possible. Damage to the power steering pump may occur.

TIRE SAFETY INFORMATION

TIRE MARKINGS



NOTE:

- P (Passenger) - Metric tire sizing is based on U.S. design standards. P-Metric tires have the letter "P" molded into the sidewall preceding the size designation. Example: P215/65R15 95H.
- European-Metric tire sizing is based on European design standards. Tires designed to this standard have the tire size molded into the sidewall beginning with the section width. The letter ″P″ is absent from this tire size designation. Example: 215/65R15 96H.
- LT (Light Truck) - Metric tire sizing is based on U.S. design standards. The size designation for LT-Metric tires is the same as for P-Metric tires except for the letters "LT" that are molded into the sidewall preceding the size designation. Example: LT235/85R16.
- Temporary spare tires are high-pressure compact spares designed for temporary emergency use only. Tires designed to this standard have the letter "T" molded into the sidewall preceding the size designation. Example: T145/80D18 103M.
- High flotation tire sizing is based on U.S. design standards, and it begins with the tire diameter molded into the sidewall. Example: 31x10.5 R15 LT.

5

Tire Sizing Chart

TIRE SIZING TERMS
Size Designation:
P = Passenger Car tire size based on U.S. design standards **″....blank....″** = Passenger Car tire based on European design standards **LT** = Light Truck tire based on U.S. design standards **T** = Temporary spare tire **31** = Overall diameter in inches (in)
215 = Section width in millimeters (mm)
65 = Aspect ratio in percent (%) — Ratio of section height to section width of tire **10.5** = Section width in inches (in)
R = Construction code — ″R″ means radial construction —″D″ means diagonal or bias construction
15 = Rim diameter in inches (in)

TIRE SIZING TERMS
Service Description:
95 = Load Index — A numerical code associated with the maximum load a tire can carry
H = Speed Symbol — A symbol indicating the range of speeds at which a tire can carry a load corresponding to its load index under certain operating conditions — The maximum speed corresponding to the speed symbol should only be achieved under specified operating conditions (i.e., tire pressure, vehicle loading, road conditions, and posted speed limits)
Load Identification:
"....blank...." = Absence of any text on the sidewall of the tire indicates a Standard Load (SL) Tire
Extra Load (XL) = Extra load (or reinforced) tire
Light Load = Light load tire
C, D, E = Load range associated with the maximum load a tire can carry at a specified pressure
Maximum Load — Maximum load indicates the maximum load this tire is designed to carry
Maximum Pressure — Maximum pressure indicates the maximum permissible cold tire inflation pressure for this tire

TIRE IDENTIFICATION NUMBER (TIN)

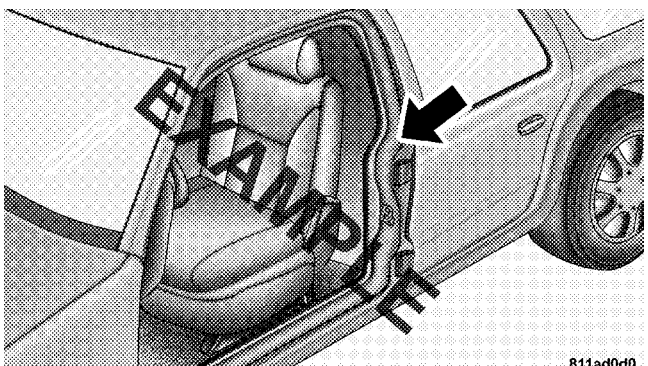
The TIN may be found on one or both sides of the tire, however, the date code may only be on one side. Tires with white sidewalls will have the full TIN, including the date code, located on the white sidewall side of the tire. Look for the TIN on the outboard side of black sidewall tires as mounted on the vehicle. If the TIN is not found on the outboard side, then you will find it on the inboard side of the tire.

TIRE IDENTIFICATION NUMBER
EXAMPLE: DOT MA L9 ABCD 0301
DOT = Department of Transportation — This symbol certifies that the tire is in compliance with the U.S. Department of Transportation tire safety standards, and is approved for highway use
MA = Code representing the tire manufacturing location (two digits)
L9 = Code representing the tire size (two digits)
ABCD = Code used by the tire manufacturer (one to four digits)
03 = Number representing the week in which the tire was manufactured (two digits) —03 means the 3rd week.
01 = Number representing the year in which the tire was manufactured (two digits) —01 means the year 2001 — Prior to July 2000, tire manufacturers were only required to have one number to represent the year in which the tire was manufactured. Example: 031 could represent the 3rd week of 1981 or 1991

TIRE LOADING AND TIRE PRESSURE

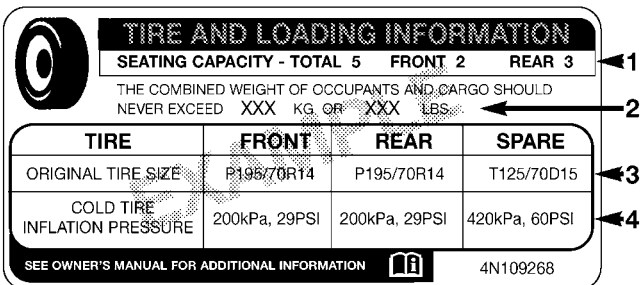
Tire Placard Location

NOTE: The proper cold tire inflation pressure is listed on either the face of the driver's door or the driver's side B-Pillar.



Tire Placard Location

Tire and Loading Information Placard



811b5a9a

Tire And Loading Information Placard

This placard tells you important information about the:

1) number of people that can be carried in the vehicle

2) total weight your vehicle can carry

3) tire size designed for your vehicle

4) cold tire inflation pressures for the front, rear, and spare tires.

Loading

The vehicle maximum load on the tire must not exceed the load carrying capacity of the tire on your vehicle. You will not exceed the tire's load carrying capacity if you adhere to the loading conditions, tire size, and cold tire inflation pressures specified on the Tire and Loading Information placard and in the "Vehicle Loading" section of this manual.

NOTE: Under a maximum loaded vehicle condition, gross axle weight ratings (GAWRs) for the front and rear axles must not be exceeded. For further information on GAWRs, vehicle loading, and trailer towing, refer to "Vehicle Loading" in this section.

To determine the maximum loading conditions of your vehicle, locate the statement "The combined weight of occupants and cargo should never exceed XXX kg or XXX lbs." on the Tire and Loading Information placard. The combined weight of occupants, cargo/luggage and trailer tongue weight (if applicable) should never exceed the weight referenced here.

Steps for Determining Correct Load Limit

1. Locate the statement "The combined weight of occupants and cargo should never exceed XXX kg or XXX lbs" on your vehicle's placard.

2. Determine the combined weight of the driver and passengers that will be riding in your vehicle.

3. Subtract the combined weight of the driver and passengers from XXX kg or XXX lbs.

4. The resulting figure equals the available amount of cargo and luggage load capacity. For example, if "XXX" amount equals 1,400 lbs (635 kg) and there will be five 150 lb (68 kg) passengers in your vehicle, the amount of

available cargo and luggage load capacity is 650 lbs (295 kg) (since 5 x 150 = 750, and 1400 – 750 = 650 lbs [295 kg]).

5. Determine the combined weight of luggage and cargo being loaded on the vehicle. That weight may not safely exceed the available cargo and luggage load capacity calculated in Step 4.

6. If your vehicle will be towing a trailer, load from your trailer will be transferred to your vehicle. Consult this manual to determine how this reduces the available cargo and luggage load capacity of your vehicle.

NOTE: The following table shows examples on how to calculate total load, cargo/luggage, and towing capacities of your vehicle with varying seating configurations and number and size of occupants. This table is for illustration purposes only and may not be accurate for the seating and load carry capacity of your vehicle.

NOTE: For the following example, the combined weight of occupants and cargo should never exceed 865 lbs (392 kg).

WARNING!

Overloading of your tires is dangerous. Overloading can cause tire failure, affect vehicle handling, and increase your stopping distance. Use tires of the recommended load capacity for your vehicle. Never overload them.

TIRES — GENERAL INFORMATION

Tire Pressure

Proper tire inflation pressure is essential to the safe and satisfactory operation of your vehicle. Three primary areas are affected by improper tire pressure:

1. Safety—

WARNING!

•Improperly inflated tires are dangerous and can cause accidents.

•Under-inflation increases tire flexing and can result in tire failure.

WARNING!

•Over-inflation reduces a tire's ability to cushion shock. Objects on the road and chuckholes can cause damage that result in tire failure.

•Over-inflated or under-inflated tires can affect vehicle handling and can fail suddenly, resulting in loss of vehicle control.

WARNING!

•Unequal tire pressures can cause steering problems. You could lose control of your vehicle.

•Unequal tire pressures from one side of the vehicle to the other can cause the vehicle to drift to the right or left.

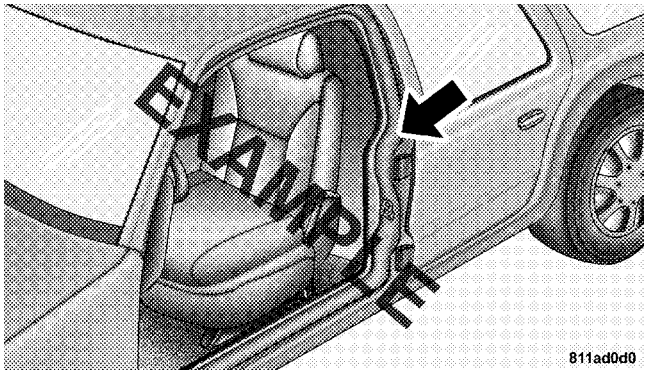
•Always drive with each tire inflated to the recommended cold tire inflation pressure.

2. Economy—
Improper inflation pressures can cause uneven wear patterns to develop across the tire tread. These abnormal wear patterns will reduce tread life resulting in a need for earlier tire replacement. Under-inflation also increases tire rolling resistance and results in higher fuel consumption.

3. Ride Comfort and Vehicle Stability—
Proper tire inflation contributes to a comfortable ride. Over-inflation produces a jarring and uncomfortable ride.

Tire Inflation Pressures
The proper cold tire inflation pressure is listed either on the face of the driver's door or on the driver's side "B" pillar.

Some vehicles may have Supplemental Tire Pressure Information for vehicle loads that are less than the maximum loaded vehicle condition. These pressure conditions will be found in the "Supplemental Tire Pressure Information" section of this manual.



Tire Placard Location

The pressure should be checked and adjusted as well as inspecting for signs of tire wear or visible damage at least once a month. Use a good quality pocket-type gauge to check tire pressure. DO NOT make a visual judgement when determining proper inflation. Radial tires may look properly inflated even when they are under-inflated.

CAUTION!

After inspecting or adjusting the tire pressure, always reinstall the valve stem cap (if equipped). This will prevent moisture and dirt from entering the valve stem, which could damage the valve stem.

Inflation pressures specified on the placard are always "cold tire inflation pressure." Cold tire inflation pressure is defined as the tire pressure after the vehicle has not been driven for at least three hours, or driven less than 1 mi (1.6 km) after a three hour period. The cold tire inflation pressure must not exceed the maximum inflation pressure molded into the tire sidewall.

Check tire pressures more often if subject to a wide range of outdoor temperatures, as tire pressures vary with temperature changes.

Tire pressures change by approximately 1 psi (7 kPa) per 12°F (7°C) of air temperature change. Keep this in mind when checking tire pressure inside a garage, especially in the Winter.

Example: If garage temperature = 68°F (20°C) and the outside temperature = 32°F (0°C) then the cold tire inflation pressure should be increased by 3 psi (21 kPa), which equals 1 psi (7 kPa) for every 12°F (7°C) for this outside temperature condition.

Tire pressure may increase from 2 to 6 psi (13 to 40 kPa) during operation. DO NOT reduce this normal pressure build up or your tire pressure will be too low.

Tire Pressures for High Speed Operation

The manufacturer advocates driving at safe speeds within posted speed limits. Where speed limits or conditions are such that the vehicle can be driven at high speeds, maintaining correct tire inflation pressure is very important. Increased tire pressure and reduced vehicle loading may be required for high-speed vehicle operation. Refer to original equipment or an authorized tire dealer for recommended safe operating speeds, loading and cold tire inflation pressures.

WARNING!

High speed driving with your vehicle under maximum load is dangerous. The added strain on your tires could cause them to fail. You could have a serious accident. Don't drive a vehicle loaded to the maximum capacity at continuous speeds above 75 mph (120 km/h).

Radial Ply Tires

WARNING!

Combining radial ply tires with other types of tires on your vehicle will cause your vehicle to handle poorly. The instability could cause an accident. Always use radial ply tires in sets of four (or six, in case of trucks with dual rear wheels). Never combine them with other types of tires.

Cuts and punctures in radial tires are repairable only in the tread area because of sidewall flexing. Consult your authorized tire dealer for radial tire repairs.

Compact Spare Tire — If Equipped

The compact spare is for temporary emergency use with radial tires. It is engineered to be used on your style vehicle only. Since this tire has limited tread life, the original tire should be repaired (or replaced) and reinstalled at the first opportunity.

WARNING!

- **Temporary use spare tires are for emergency use only. With these tires, DO NOT drive more than 50 mph (80 km/h).**
- **Temporary-use spare tires have limited tread life. When the tread is worn to the tread wear indicators, the temporary use spare tire needs to be replaced.**
- **Be sure to follow the warnings, which apply to your spare. Failure to do so could result in spare tire failure and loss of vehicle control.**

DO NOT install a wheel cover or attempt to mount a conventional tire on the compact spare wheel, since the wheel is designed specifically for the compact spare.

DO NOT install more than one compact spare tire/wheel on the vehicle at any given time.

CAUTION!

Because of the reduced ground clearance, DO NOT take your vehicle through an automatic car wash with the compact spare installed. Damage to the vehicle may result.

Limited-Use Spare — If Equipped

The limited-use spare tire is for temporary emergency use on your vehicle. This tire is identified by a limited-use spare tire warning label located on the limited-use spare tire and wheel assembly. This tire may look like the original equipped tire on the front or rear axle of your vehicle, but it is not. Installation of this limited-use spare tire affects vehicle handling. Since it is not the same tire, replace (or repair) the original tire and reinstall on the vehicle at the first opportunity.

WARNING!

The limited-use spare tires are for emergency use only. Installation of this limited-use spare tire affects vehicle handling. With this tire, DO NOT drive more than 50 mph (80 km/h). Keep inflated to the cold tire inflation pressure listed on either your tire placard or limited-use spare tire and wheel assembly. Replace (or repair) the original tire at the first opportunity and reinstall it on your vehicle. Failure to do so could result in loss of vehicle control.

Tire Spinning

When stuck in mud, sand, snow, or ice conditions, DO NOT spin your vehicle's wheels faster than 30 mph (48 km/h) or for longer than 30 seconds continuously without stopping when you are stuck.

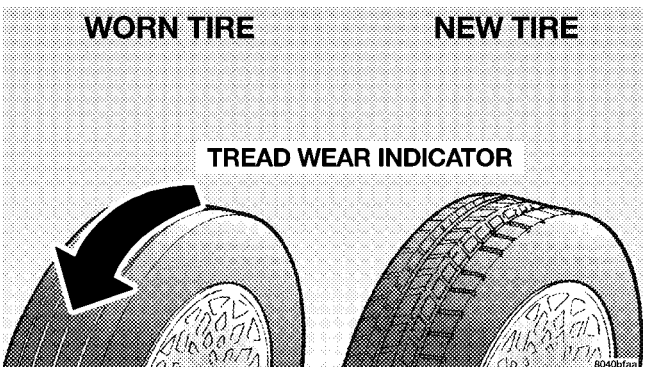
For additional information, refer to "Freeing A Stuck Vehicle" in Section 6.

WARNING!

Fast spinning tires can be dangerous. Forces generated by excessive wheel speeds may cause tire damage or failure. A tire could explode and injure someone. DO NOT spin your vehicle's wheels faster than 30 mph (48 km/h) or for more than 30 seconds continuously when you are stuck, and don't let anyone near a spinning wheel, no matter what the speed.

Tread Wear Indicators

Tread wear indicators are in the original equipment tires to help you in determining when your tires should be replaced.



These indicators are molded into the bottom of the tread grooves. They will appear as bands when the tread depth becomes 1/16 in (2 mm). When the tread is worn to the tread wear indicators, the tire should be replaced.

Many states have laws requiring tire replacement at this point.

Life of Tire

The service life of a tire is dependent upon varying factors including, but not limited to:

- Driving style
- Tire pressure
- Distance driven

WARNING!

Tires and the spare tire should be replaced after six years, regardless of the remaining tread. Failure to follow this warning can result in sudden tire failure. You could lose control and have an accident resulting in serious injury or death.

Keep dismounted tires in a cool, dry place with as little exposure to light as possible. Protect tires from contact with oil, grease, and gasoline.

Replacement Tires

The tires on your new vehicle provide a balance of many characteristics. They should be inspected regularly for wear and correct cold tire inflation pressure. The manufacturer strongly recommends that you use tires equivalent to the originals in size, quality and performance when replacement is needed. (Refer to the paragraph on

"Tread Wear Indicators"). Refer to the "Tire and Loading Information" placard for the size designation of your tire. The service description and load identification will be found on the original equipment tire. Failure to use equivalent replacement tires may adversely affect the safety, handling, and ride of your vehicle. We recommend that you contact your original equipment or an authorized tire dealer with any questions you may have on tire specifications or capability.

WARNING!

DO NOT use a tire, wheel size or rating other than that specified for your vehicle. Some combinations of unapproved tires and wheels may change suspension dimensions and performance characteristics, resulting in changes to steering, handling, and braking of your vehicle. This can cause unpredictable handling and stress to steering and suspension components. You could lose control and have an accident resulting in serious injury or death. Use only the tire and wheel sizes with load ratings approved for your vehicle.

WARNING!

- **NEVER use a tire with a smaller load index or capacity, other than what was originally equipped on your vehicle. Using a tire with a smaller load index could result in tire overloading and failure. You could lose control and have an accident.**
- **Failure to equip your vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.**

CAUTION!

Replacing original tires with tires of a different size may result in false speedometer and odometer readings.

Alignment And Balance

Poor suspension alignment may result in:

- Fast tire wear.
- Uneven tire wear, such as feathering and one-sided wear.
- Vehicle pull to right or left.

Tires may also cause the vehicle to pull to the left or right. Alignment will not correct this condition. See your authorized dealer for proper diagnosis.

Improper alignment will not cause vehicle vibration. Vibration may be a result of tire and wheel out-of-balance. Proper balancing will reduce vibration and avoid tire cupping and spotty wear.

TIRE CHAINS

Due to limited clearance, tire chains are not recommended.

CAUTION!
Damage to the vehicle may result if tire chains are used.

SNOW TIRES

Some areas of the country require the use of snow tires during the winter. Standard tires are of the all season type and satisfy this requirement as indicated by the M+S designation on the tire sidewall.

If you need snow tires, select tires equivalent in size and type to the original equipment tires. Use snow tires only in sets of four. Failure to do so may adversely affect the safety and handling of your vehicle.

Snow tires generally have lower speed ratings than what was originally equipped with your vehicle and should not be operated at sustained speeds over 75 mph (120 km/h).

TIRE PRESSURE MONITOR SYSTEM (TPMS) — IF EQUIPPED

- The Tire Pressure Monitor System (TPMS) will warn the driver of a low tire pressure based on the vehicle recommended cold placard pressure.
- The tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure. This is defined as the tire pressure after the vehicle has not been driven for at least three hours, or driven less than 1 mi (1 km) after a three hour period. The cold tire inflation pressure must not exceed the maximum inflation pressure molded into the tire sidewall. Refer to the "Tires – General Information" in this section for information on

how to properly inflate the vehicle's tires. The tire pressure will also increase as the vehicle is driven. This is normal and there should be no adjustment for this increased pressure.

- The TPMS will warn the driver of a low tire pressure if the tire pressure falls below the low-pressure warning limit for any reason, including low temperature effects and natural pressure loss through the tire.
- The TPMS will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off until the tire pressure is at or above the recommended cold placard pressure. Once the low tire pressure warning (Tire Pressure Monitoring Telltale light) illuminates, you must increase the tire pressure to the recommended cold placard pressure in order for the Tire Pressure Monitoring Telltale light to turn off. The system will automatically update and the Tire Pressure Monitoring Telltale light will turn off once the system receivesthe updated tire pressures. The vehicle may need to be driven for up to 10 minutes above 15 mph (25 km/h) in order for the TPMS to receive this information.

  – For example, your vehicle may have a recommended cold (parked for more than three hours) placard pressure of 33 psi (227 kPa). If the ambient temperature is 68°F (20°C) and the measured tire pressure is 28 psi (193 kPa), a temperature drop to 20°F (-7°C) will decrease the tire pressure to approximately 24 psi (165 kPa). This tire pressure is low enough to turn ON the Tire Pressure Monitoring Telltale light. Driving the vehicle may cause the tire pressure to rise to approximately 28 psi (193 kPa), but the Tire Pressure Monitoring Telltale light will still be on. In this situation, the Tire Pressure Monitoring Telltale light will turn off only after the tires are inflated to the vehicle's recommended cold placard pressure value.

CAUTION!

- **The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures and warning have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. Aftermarket wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.**
- **After inspecting or adjusting the tire pressure, always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.**

NOTE:

- The TPMS is not intended to replace normal tire care and maintenance, or to provide warning of a tire failure or condition.
- The TPMS should not be used as a tire pressure gauge while adjusting your tire pressure.
- Driving on a significantly under-inflated tire causes the tire to overheat and can lead to tire failure. Under-inflation also reduces fuel efficiency and tire tread life, and may affect the vehicle's handling and stopping ability.
- The TPMS is not a substitute for proper tire maintenance, and it is the driver's responsibility to maintain correct tire pressure using an accurate tire pressure gauge, even if under-inflation has not reached the level to trigger illumination of the Tire Pressure Monitoring Telltale light.

- Seasonal temperature changes will affect tire pressure, and the TPMS will monitor the actual tire pressure in the tire.

Base System — If Equipped

The Tire Pressure Monitor System (TPMS) uses wireless technology with wheel rim mounted electronic sensors to monitor tire pressure levels. Sensors, mounted to each wheel as part of the valve stem, transmit tire pressure readings to the receiver module.

NOTE: It is particularly important for you to check the tire pressure in all of the tires on your vehicle monthly and to maintain the proper pressure.

The TPMS consists of the following components:

- Receiver Module
- Four Tire Pressure Monitoring Sensors
- Tire Pressure Monitoring Telltale light

Tire Pressure Monitoring Low Pressure Warnings

The Tire Pressure Monitoring Telltale light will illuminate in the instrument cluster and a chime will sound when tire pressure is low in one or more of the four active road tires. Should this occur, you should stop as soon as possible, check the inflation pressure of each tire on your vehicle, and inflate each tire to the vehicle's recommended cold placard pressure value. Once the system receives the updated tire pressures, the system will automatically update and the Tire Pressure Monitoring Telltale light will turn off. The vehicle may need to be driven for up to 10 minutes above 15 mph (25 km/h) in order for the TPMS to receive this information.

Check TPMS Warning

When a system fault is detected, the Tire Pressure Monitoring Telltale light will flash on and off for 75 seconds and then remain on solid. The system fault will also sound a chime. If the ignition key is cycled, this sequence

will repeat, providing the system fault still exists. The Tire Pressure Monitoring Telltale light will turn off when the fault condition no longer exists. A system fault can occur due to any of the following:

1. Jamming due to electronic devices or driving next to facilities emitting the same Radio Frequencies as the TPMS sensors.

2. Installing some form of aftermarket window tinting that affects radio wave signals.

3. Lots of snow or ice around the wheels or wheel housings.

4. Using tire chains on the vehicle.

5. Using wheels/tires not equipped with TPMS sensors.

NOTE:

1. The compact spare tire does not have a tire pressure monitoring sensor. Therefore, the TPMS will not monitor the pressure in the compact spare tire.

2. If you install the compact spare tire in place of a road tire that has a pressure below the low-pressure warning limit, a chime will sound and the TPMS Telltale light will turn on upon the next ignition key cycle.

3. After driving the vehicle for up to 10 minutes above 15 mph (25 km/h), the TPMS Telltale light will flash on and off for 75 seconds and then remain on solid.

4. For each subsequent ignition key cycle, a chime will sound and the TPMS Telltale light will flash on and off for 75 seconds and then remain on solid.

5. Once you repair or replace the original road tire and reinstall it on the vehicle in place of the compact spare, the TPMS will update automatically and the TPMS Telltale light will turn off, as long as no tire pressure is below the low-pressure warning limit in any of the four active road tires. The vehicle may need to be driven for up to 10 minutes above 15 mph (25 km/h) in order for the TPMS to receive this information.

Premium System — If Equipped

The Tire Pressure Monitor System (TPMS) uses wireless technology with wheel rim mounted electronic sensors to monitor tire pressure levels. Sensors, mounted to each wheel as part of the valve stem, transmit tire pressure readings to the receiver module.

NOTE: It is particularly important for you to check the tire pressure in all of the tires on your vehicle monthly and to maintain the proper pressure.

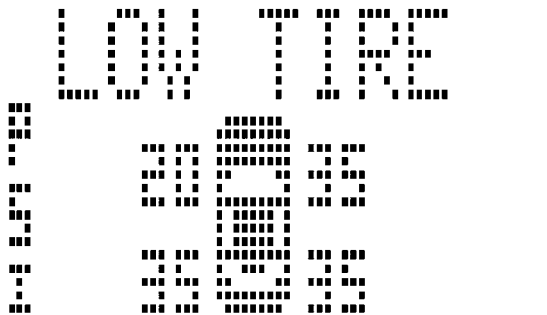
The TPMS consists of the following components:

- Receiver module
- Four Tire Pressure Monitoring Sensors
- Three Trigger modules (mounted in three of the four wheel-wells)
- Various Tire Pressure Monitoring System messages, which display in the Electronic Vehicle Information Center (EVIC)
- Tire Pressure Monitoring Telltale light

Tire Pressure Monitoring Low Pressure Warnings

The Tire Pressure Monitoring Telltale light will illuminate in the instrument cluster and a chime will sound when tire pressure is low in one or more of the four active road tires. In addition, the

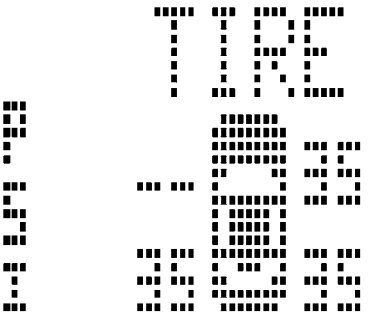
Electronic Vehicle Information Center (EVIC) will display a graphic showing the pressure values of each tire with the low tire pressure values flashing.



Should this occur, you should stop as soon as possible and inflate the tires with low pressure (those flashing in the EVIC graphic) to the vehicle's recommended cold placard pressure value. Once the system receives the updated tire pressures, the system will automatically update, the graphic display in the EVIC will stop flashing, and the Tire Pressure Monitoring Telltale light will turn off. The vehicle may need to be driven for up to 10 minutes above 15 mph (25 km/h) in order for the TPMS to receive this information.

Check TPMS Warning

When a system fault is detected, the Tire Pressure Monitoring Telltale light will flash on and off for 75 seconds and then remain on solid. The system fault will also sound a chime. In addition, the EVIC will display a ″CHECK TPM SYSTEM″ message for three seconds and then display dashes (- -) in place of the pressure value to indicate which sensor is not being received.



If the ignition key is cycled, this sequence will repeat, providing the system fault still exists. If the system fault no longer exists, the Tire Pressure Monitoring Telltale light will no longer flash, and the "CHECK TPM SYSTEM" message will no longer display, and a pressure value will display in place of the dashes. A system fault can occur due to any of the following:

1. Jamming due to electronic devices or driving next to facilities emitting the same radio frequencies as the TPMS sensors.

2. Installing some form of aftermarket window tinting that affects radio wave signals.

3. Lots of snow or ice around the wheels or wheel housings.

4. Using tire chains on the vehicle.

5. Using wheels/tires not equipped with TPMS sensors.

NOTE:
1. The compact spare tire does not have a tire pressure monitoring sensor. Therefore, the TPMS will not monitor the pressure in the compact spare tire.

2. If you install the compact spare tire in place of a road tire that has a pressure below the low-pressure warning limit, upon the next ignition key cycle, the TPMS Telltale

light will remain on and a chime will sound. In addition, the graphic in the EVIC will still display a flashing pressure value.

3. After driving the vehicle for up to 10 minutes above 15 mph (25 km/h), the TPMS Telltale light will flash on and off for 75 seconds and then remain on solid. In addition, the EVIC will display a "CHECK TPM SYSTEM" message for three seconds and then display dashes (- -) in place of the pressure value.

4. For each subsequent ignition key cycle, a chime will sound, the TPMS Telltale light will flash on and off for 75 seconds and then remain on solid, and the EVIC will display a "CHECK TPM SYSTEM" message for three seconds and then display dashes (- -) in place of the pressure value.

5. Once you repair or replace the original road tire and reinstall it on the vehicle in place of the compact spare, the TPMS will update automatically. In addition, the TPMS Telltale light will turn off and the graphic in the EVIC will display a new pressure value instead of dashes (- -), as long as no tire pressure is below the low-pressure warning limit in any of the four active road tires. The vehicle may need to be driven for up to 10 minutes above 15 mph (25 km/h) in order for the TPMS to receive this information.

General Information

This device complies with Part 15 of the FCC rules and RSS 210 of Industry Canada. Operation is subject to the following conditions:

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.

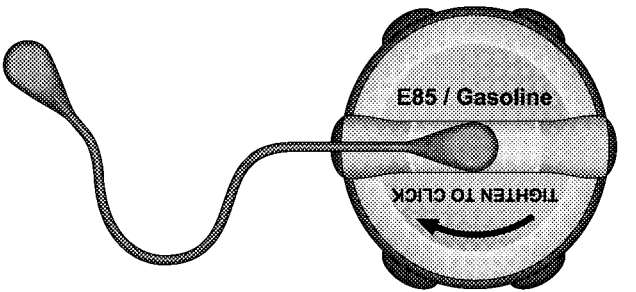
The tire pressure sensors are covered under one of the following licenses:

United States KR5S120123
Canada 2671-S120123

FLEXIBLE FUEL— 2.7L ENGINES ONLY (EXCEPT CALIFORNIA EMISSION STATES)

E-85 GENERAL INFORMATION

The information in this section is for Flexible Fuel vehicles only. This section only covers those subjects that are unique to these vehicles. Please refer to the other sections of this manual for information on features that are common between Flexible Fuel and gasoline only powered vehicles.



E-85 Fuel Cap

CAUTION!
Only vehicles with the special E-85 fuel filler cap can operate on E-85.

Along with the special E-85 fuel filler cap, your vehicle may display a badge, which also indicates it can operate on E-85.

81ae46a9

E-85 Badge

ETHANOL FUEL (E-85)

E-85 is a mixture of approximately 85% fuel ethanol and 15% unleaded gasoline.

WARNING!

Ethanol vapors are extremely flammable and could cause serious personal injury. Never have any smoking materials lit in or near the vehicle when removing the fuel filler tube cap (gas cap) or filling the tank. Do not use E-85 as a cleaning agent and never use it near an open flame.

FUEL REQUIREMENTS

If your vehicle is E-85 compatible, it will operate on unleaded gasoline with an octane rating of 87, or E-85 fuel, or any mixture of these two fuels.

For best results, a refueling pattern that avoids alternating between E-85 and unleaded gasoline is recommended.

When you do switch fuel types it is recommended that:

- you do not add less than 5 gal (19 L) when refueling
- you drive the vehicle immediately after refueling for at least 5 miles (8 km)

Observing these precautions will avoid possible hard starting and/or significant deterioration in driveability during warm up.

NOTE: Use seasonally adjusted E-85 fuel (ASTM D5798). With non-seasonally adjusted E-85 fuel you may experience hard starting and rough idle following start up even if the above recommendations are followed, especially when the ambient temperature is below 32°F (0°C).

Engine Block Heater (if equipped)
Block heater usage is beneficial for E-85 startability when the ambient temperature is less than 32°F (0°C).

SELECTION OF ENGINE OIL FOR FLEXIBLE FUEL VEHICLES (E-85) AND GASOLINE VEHICLES

FFV vehicles operated on E–85 require specially formulated engine oils. These special requirements are included in Mopar® engine oils, and in equivalent oils meeting Chrysler Specification MS-6395. The manufacturer only recommends engine oils that are API Certified and meet the requirements of Material Standard MS-6395. MS-6395 contains additional requirements, developed during extensive fleet testing, to provide additional protection to the manufacturer's engines. Use Mopar® or an equivalent oil meeting the specification MS-6395.

NOTE: Your engine oil filler cap also describes the correct engine oil to use.

STARTING

The characteristics of E-85 fuel make it unsuitable for use when ambient temperatures fall below 0°F (-18°C). In the range of 0°F (-18°C) to 32°F (0°C), you may experience an increase in the time it takes for your engine to start, and a deterioration in driveability (sags and/or hesitations) until the engine is fully warmed up.

CRUISING RANGE

Because E-85 fuel contains less energy per gallon than gasoline, you will experience an increase in fuel consumption. You can expect your fuel economy and driving range to decrease by about 30% compared to gasoline operation.

REPLACEMENT PARTS

Many components in your Flexible Fuel Vehicle (FFV) are designed to be compatible with ethanol. Always be sure that your vehicle is serviced with correct ethanol compatible parts.

CAUTION!

Replacing fuel system components with non-ethanol compatible components can damage your vehicle.

MAINTENANCE

CAUTION!

Do not use ethanol mixture greater than 85% in your vehicle. It will cause difficulty in cold starting and may affect driveability.

FUEL REQUIREMENTS

2.4L and 2.7L Engines

800dfab6

2.4L and 2.7L Engines are designed to meet all emissions regulations and provide excellent fuel economy and performance when using high-quality unleaded "regular" gasoline having an octane rating of 87. The use of premium gasoline is not recommended. Under normal conditions, the use of premium gasoline will not provide a benefit over high-quality unleaded regular gasolines, and in some circumstances may result in poorer performance.

3.5L Engine

800dfab6

800dfab7

The 3.5L Engine is designed to meet all emissions regulations and provide satisfactory fuel economy and performance when using high-quality unleaded gasoline having an octane range of 87 to 89. The manufacturer recommends the use of 89 octane for optimum performance. The use of premium gasoline is not recommended. Under normal conditions, the use of premium gasoline will not provide a benefit over high-quality regular and mid-grade gasolines, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Poor quality gasoline can cause problems such

as hard starting, stalling, and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers worldwide have issued and endorsed consistent gasoline specifications (the World Wide Fuel Charter, WWFC) which define fuel properties necessary to deliver enhanced emissions, performance, and durability for your vehicle. The manufacturer recommends the use of gasolines that meet the WWFC specifications, if they are available.

Reformulated Gasoline

Many areas of the country require the use of cleaner burning gasoline referred to as reformulated gasoline. Reformulated gasolines contain oxygenates and are specifically blended to reduce vehicle emissions and improve air quality.

The manufacturer supports the use of reformulated gasolines. Properly blended reformulated gasolines will provide excellent performance and durability of engine and fuel system components.

Gasoline/Oxygenate Blends

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the Winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION!

For vehicles equipped with a 2.4L or 3.5L engine, DO NOT use gasoline containing Methanol or E85 Ethanol. Use of these blends may result in starting and driveability problems and may damage critical fuel system components.

NOTE: The **2.7L engine** is now rated for E85 Ethanol use **(EXCEPT CALIFORNIA EMISSION STATES).** Only vehicles with the E-85 fuel filler door label can operate on E-85. For more information, refer to "Flexible Fuel" in this section.

Problems that result from using methanol/gasoline or E85 ethanol blends are not the responsibility of the manufacturer. While MTBE is an oxygenate made from Methanol, it does not have the negative effects of methanol.

MMT In Gasoline

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provides no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduces spark plug life and reduces emission system performance in some vehicles. The manufacturer recommends that gasoline without MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump, therefore, you should ask your gasoline retailer whether the gasoline contains MMT. It is even more important to look for gasoline without MMT in Canada, because MMT can be used at levels higher than those allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

Materials Added to Fuel

All gasoline sold in the United States is required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions and they would result in additional cost. Therefore, you should not have to add anything to the fuel.

Fuel System Cautions

CAUTION!

Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance and damage the emissions control system.
- An out-of-tune engine or certain fuel or ignition malfunctions can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your authorized dealer for service assistance.
- The use of fuel additives, which are now being sold as octane enhancers, is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of the manufacturer.

NOTE: Intentional tampering with the emissions control system can result in civil penalties being assessed against you.

Carbon Monoxide Warnings

WARNING!

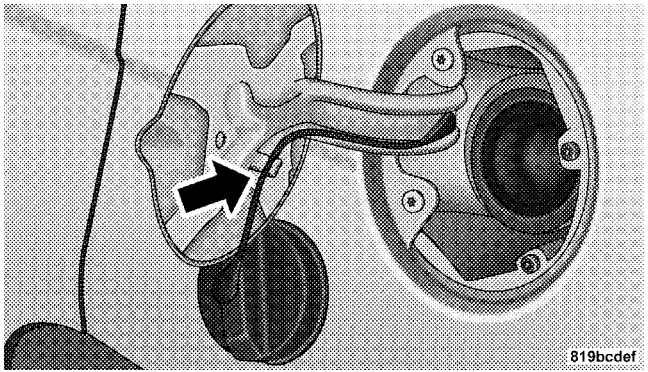
Carbon monoxide (CO) in exhaust gases is deadly. Follow the precautions below to prevent carbon monoxide poisoning:

- Do not inhale exhaust gases. They contain carbon monoxide, a colorless and odorless gas, which can kill. Never run the engine in a closed area, such as a garage, and never sit in a parked vehicle with the engine running for an extended period. If the vehicle is stopped in an open area with the engine running for more than a short period, adjust the ventilation system to force fresh, outside air into the vehicle.
- Guard against carbon monoxide with proper maintenance. Have the exhaust system inspected every time the vehicle is raised. Have any abnormal conditions repaired promptly. Until repaired, drive with all side windows fully open.
- Keep the liftgate closed when driving your vehicle to prevent carbon monoxide and other poisonous exhaust gases from entering the vehicle.

ADDING FUEL

Fuel Filler Cap (Gas Cap)

The gas cap is located behind the fuel filler door on the left side of the vehicle. If the gas cap is lost or damaged, be sure the replacement cap has been designed for use with this vehicle.



Fuel Filler Cap (Gas Cap)

NOTE: When removing the fuel filler cap, lay the cap tether in the hook, located on the fuel filler door reinforcement.

CAUTION!

- **Damage to the fuel system or emissions control system could result from using an improper fuel tank filler tube cap (gas cap).**
- **A poorly fitting gas cap could let impurities into the fuel system.**
- **A poorly fitting gas cap may cause the Malfunction Indicator Light (MIL) to turn on.**
- **To avoid fuel spillage and overfilling, do not "top off" the fuel tank after filling. When the fuel nozzle "clicks" or shuts off, the fuel tank is full.**

WARNING!

- **Never have any smoking materials lit in or near the vehicle when the gas cap is removed or the tank filled.**
- **Never add fuel to the vehicle when the engine is running.**
- **A fire may result if gasoline is pumped into a portable container that is inside of a vehicle. You could be burned. Always place gas containers on the ground while filling.**
- **Failure to follow this warning may result in serious injury or death.**

NOTE:

- Tighten the gas cap until you hear a "clicking" sound. This is an indication that the gas cap is tightened properly. The MIL in the instrument cluster may turn on if the gas cap is not secured properly. Make sure that the gas cap is tightened each time the vehicle is refueled.
- When the fuel nozzle "clicks" or shuts off, the fuel tank is full.

Loose Fuel Filler Cap Message

If the vehicle diagnostic system determines that the fuel filler cap in loose, improperly installed, or damaged, the word "gASCAP" will display in the odometer. If this occurs, tighten the fuel filler cap until a "clicking" sound is heard and press the TRIP ODOMETER button to turn off the message. If the problem persists, the message will appear the next time the vehicle is started.

A loose, improperly installed, or damaged fuel filler cap may also turn on the MIL. Refer to "Onboard Diagnostic System — OBD II" in Section 7.

VEHICLE LOADING

The load carrying capacity of your vehicle is shown on the "Vehicle Certification Label." This information should be used for passenger and luggage loading as indicated.

Do not exceed the specified Gross Vehicle Weight Rating (GVWR) or the Gross Axle Weight Rating (GAWR).

Vehicle Certification Label

Your vehicle has a Vehicle Certification Label affixed to the rear of the driver's door.

The label contains the following information:

- Name of manufacturer
- Month and year of manufacture
- Gross Vehicle Weight Rating (GVWR)
- Gross Axle Weight Rating (GAWR) front
- Gross Axle Weight Rating (GAWR) rear
- Vehicle Identification Number (VIN)
- Type of Vehicle
- Month Day and Hour of Manufacture (MDH)

The bar code allows a computer scanner to read the VIN.

Gross Vehicle Weight Rating (GVWR)

The GVWR is the total allowable weight of your vehicle. This includes driver, passengers, and cargo. The total load must be limited so that you do not exceed the GVWR.

Gross Axle Weight Rating (GAWR)

The GAWR is the maximum capacity of the front and rear axles. Distribute the load over the front and rear axles evenly. Make sure that you do not exceed either front or rear GAWR.

WARNING!

Because the front wheels steer the vehicle, it is important that you do not exceed the maximum front or rear GAWR. A dangerous driving condition can result if either rating is exceeded. You could lose control of the vehicle and have an accident.

Overloading

The load carrying components (axle, springs, tires, wheels, etc.) of your vehicle will provide satisfactory service as long as you do not exceed the GVWR and the front and rear GAWR.

The best way to figure out the total weight of your vehicle is to weigh it when it is fully loaded and ready for operation. Weigh it on a commercial scale to ensure that it is not over the GVWR.

Figure out the weight on the front and rear of the vehicle separately. It is important that you distribute the load evenly over the front and rear axles.

Overloading can cause potential safety hazards and shorten useful service life. Heavier axles or suspension components do not necessarily increase the vehicle's GVWR.

Loading

To load your vehicle properly, first figure out its empty weight, axle-by-axle and side-by-side. Store heavier items down low and be sure you distribute their weight as evenly as possible. Stow all loose items securely before driving. If weighing the loaded vehicle shows that you have exceeded either GAWR, but the total load is within the specified GVWR, you must redistribute the weight. Improper weight distribution can have an adverse effect on the way your vehicle steers and handles and the way the brakes operate.

A loaded vehicle is shown in the illustration. Note that neither the GVWR nor the GAWR capacities have been exceeded.

EXAMPLE ONLY	Front Axle	Rear Axle
Empty Weight	2054 lbs (932 kg)	1805 lbs (819 kg)
Load (including driver, passengers, and cargo)	271 lbs (123 kg)	579 lbs (263 kg)
Total	2325 lbs (1055 kg)	2384 lbs (1081 kg)
GAWR	2546 lbs (1155 kg)	2708 lbs (1228 kg)

NOTE: Refer to the "Vehicle Certification Label" affixed to the rear of the driver's door for your vehicle's GVWR and GAWRs. This table is only an example.

TRAILER TOWING

In this section, you will find safety tips and information on limits to the type of towing you can reasonably do with your vehicle. Before towing a trailer, carefully review this information to tow your load as efficiently and safely as possible.

To maintain warranty coverage, follow the requirements and recommendations in this manual concerning vehicles used for trailer towing.

Common Towing Definitions

The following trailer towing related definitions will assist you in understanding the following information:

Gross Vehicle Weight Rating (GVWR)

The Gross Vehicle Weight Rating (GVWR) is the total allowable weight of your vehicle. This includes driver, passengers, cargo, and tongue weight. The total load must be limited so that you do not exceed the GVWR.

Gross Trailer Weight (GTW)
The Gross Trailer Weight (GTW) is the weight of the trailer plus the weight of all cargo, consumables, and equipment (permanent or temporary) loaded in or on the trailer in its "loaded and ready for operation" condition. The recommended way to measure GTW is to put your fully loaded trailer on a vehicle scale. The entire weight of the trailer must be supported by the scale.

Gross Combination Weight Rating (GCWR)
The Gross Combination Weight Rating (GCWR) is the total permissible weight of your vehicle and trailer when weighed in combination. (Note that GCWR ratings include a 150 lbs (68 kg) allowance for the presence of a driver.)

Gross Axle Weight Rating (GAWR)
The Gross Axle Weight Rating (GAWR) is the maximum capacity of the front and rear axles. Distribute the load over the front and rear axles evenly. Make sure that you do not exceed either front or rear GAWR.

WARNING!

It is important that you do not exceed the maximum front or rear GAWR. A dangerous driving condition can result if either rating is exceeded. You could lose control of the vehicle and have an accident.

Tongue Weight (TW)
Tongue weight (TW) is the downward force exerted on the hitch ball by the trailer. In most cases, it should not be less than 10% or more than 15% of the trailer load. You must consider this as part of the load on your vehicle.

Frontal Area
Frontal area is the maximum height and maximum width of the front of a trailer.

Trailer Sway Control — Electronic
Refer to "TSC (Trailer Sway Control)" under "Electronic Brake Control System" in this section for information on this system.

Trailer Sway Control — Mechanical
The trailer sway control is a telescoping link that can be installed between the hitch receiver and the trailer tongue that typically provides adjustable friction associated with the telescoping motion to dampen any unwanted trailer swaying motions while traveling.

Weight-Carrying Hitch
A weight-carrying hitch supports the trailer tongue weight, just as if it were luggage located at a hitch ball or some other connecting point of the vehicle. These kinds of hitches are the most popular on the market today and they are commonly used to tow small- and medium-sized trailers.

Weight-Distributing Hitch
A weight-distributing system works by applying leverage through spring (load) bars. They are typically used for heavier loads to distribute trailer tongue weight to the tow vehicle's front axle and the trailer axle(s). When used in accordance with the manufacturers directions, it provides for a more level ride, offering more consistent steering and brake control thereby enhancing towing safety. The addition of a friction / hydraulic sway control also dampens sway caused by traffic and crosswinds and contributes positively to tow vehicle and trailer stability. Trailer sway control and a weight distributing (load equalizing) hitch are recommended for heavier Tongue Weights (TW) and may be required depending on vehicle and trailer configuration / loading to comply with Gross Axle Weight Rating (GAWR) requirements.

WARNING!

- **An improperly adjusted weight distributing hitch system may reduce handling, stability, braking performance, and could result in an accident.**
- **Weight distributing systems may not be compatible with surge brake couplers. Consult with your hitch and trailer manufacturer or a reputable recreational vehicle dealer for additional information.**

Improper Adjustment of Weight Distributing System

Trailer Hitch Classification

Your vehicle may be factory equipped for safe towing of trailers weighing over 2,000 lbs (907 kg) with the optional Trailer Tow Prep Package. See your authorized dealer for package content.

The following chart provides the industry standard for the maximum trailer weight a given trailer hitch class can tow and should be used to assist you in selecting the correct trailer hitch for your intended towing condition.

Trailer Hitch Classification Definitions	
Class	**Max. Trailer Hitch Industry Standards**
Class I - Light Duty	2,000 lbs (907 kg)
Class II - Medium Duty	3,500 lbs (1587 kg)
Class III - Heavy Duty	5,000 lbs (2268 kg)
Class IV - Extra Heavy Duty	10,000 lbs (4540 kg)
Refer to the "Trailer Towing Weights (Maximum Trailer Weight Ratings)" chart for the Maximum Gross Trailer Weight (GTW) towable for your given drivetrain.	

All trailer hitches should be professionally installed on your vehicle.

5

Trailer Towing Weights (Maximum Trailer Weight Ratings)

The following chart provides the maximum trailer weight ratings towable for your given drivetrain.

Engine/ Transaxle	GCWR (Gross Combined Wt. Rating)	Frontal Area	Max. GTW (Gross Trailer Wt.)	Max. Tongue Wt.
2.4L Automatic	6,000 lbs (2,722 kg)	22 sq ft (2.0 sq m)	1,000 lbs (454 kg) which includes up to 5 persons & Luggage	100 lbs (45 kg)
2.7L/3.5L (without Trailer Tow Prep Package (AHT)	7,300 lbs (3,311 kg)	32 sq ft (3.0 sq m)	2,000 lbs (907 kg) which includes 1 to 2 persons & Luggage	200 lbs (91 kg)
	7,300 lbs (3,311 kg)	32 sq ft (3.0 sq m)	1,500 lbs (680 kg) which includes 3 to 4 persons & Luggage	150 lbs (68 kg)
	7,300 lbs (3,311 kg)	32 sq ft (3.0 sq m)	1,000 lbs (454 kg) which includes 5 to 7 persons & Luggage	100 lbs (45 kg) *Except for AWD models.
2.7L (with Trailer Tow Prep Package (AHT)	8,300 lbs (3,765 kg)	40 sq ft (3.7 sq m)	3,000 lbs (1,361 kg) which includes up to 5 persons & Luggage	300 lbs (136 kg)
	8,300 lbs (3,765 kg)	40 sq ft (3.7 sq m)	1,000 lbs (454 kg) which includes 6 to 7 persons & Luggage	100 lbs (91 kg)

Engine/ Transaxle	GCWR (Gross Combined Wt. Rating)	Frontal Area	Max. GTW (Gross Trailer Wt.)	Max. Tongue Wt.
3.5L (with Trailer Tow Prep Package (AHT)	8,300 lbs (3,765 kg)	40 sq ft (3.7 sq m)	3,500 lbs (1,588 kg) which includes 1 to 2 persons & Luggage	350 lbs (159 kg)
	8,300 lbs (3,765 kg)	40 sq ft (3.7 sq m)	3,000 lbs (1,361 kg) which includes 3 to 4 persons & Luggage	300 lbs (136 kg)
	8,300 lbs (3,765 kg)	40 sq ft (3.7 sq m)	2,500 lbs (1,134 kg) which includes 5 to 6 persons & Luggage	250 lbs (113 kg) *Except for AWD models.
	8,300 lbs (3,765 kg)	40 sq ft (3.7 sq m)	2,500 lbs (1,134 kg) which includes 7 persons & Luggage	100 lbs (113 kg) *Except for AWD models.

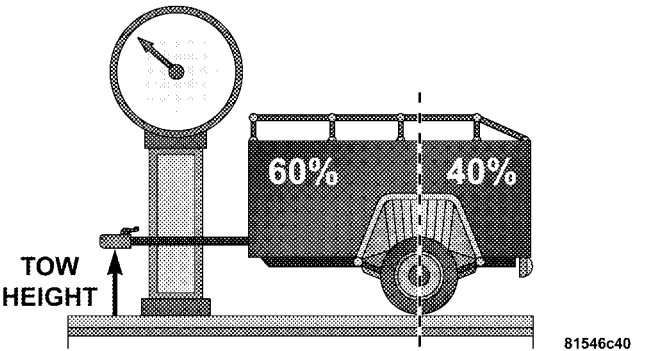
NOTE: The trailer tongue weight must be considered as part of the combined weight of occupants and cargo, and should never exceed the weight referenced on the Tire and Loading Information placard. Refer to the Tire–Safety Information Section in this manual.

NOTE: * For All Wheel Drive (AWD) models carrying 5 to 7 persons and luggage will exceed the rear Gross Axle Weight Rating (GAWR) and therefore should not be attempted.

Trailer and Tongue Weight

Always load a trailer with 60% to 65% of the weight in the front of the trailer. This places 10% to 15% of the Gross Trailer Weight (GTW) on the tow hitch of your vehicle. Loads balanced over the wheels or heavier in the rear can cause the trailer to sway **severely** side to side which will cause loss of control of the vehicle and trailer. Failure to load trailers heavier in front is the cause of many trailer accidents.

Never exceed the maximum tongue weight stamped on your bumper or trailer hitch.



Consider the following items when computing the weight on the rear axle of the vehicle:

- The tongue weight of the trailer.
- The weight of any other type of cargo or equipment put in or on your vehicle.
- The weight of the driver and all passengers.

NOTE: Remember that everything put into or on the trailer adds to the load on your vehicle. Also, additional factory-installed options or authorized dealer-installed options must be considered as part of the total load on your vehicle. Refer to the "Tire and Loading Information" placard for the maximum combined weight of occupants and cargo for your vehicle.

Towing Requirements

To promote proper break-in of your new vehicle drivetrain components the following guidelines are recommended:

CAUTION!

- **Avoid towing a trailer for the first 500 mi (805 km) of vehicle operation. Doing so may damage your vehicle.**
- **During the first 500 mi (805 km) of trailer towing, limit your speed to 50 mph (80 km/h).**

Perform the maintenance listed in Section 8. When towing a trailer, never exceed the GAWR, or GCWR, ratings.

WARNING!

Improper towing can lead to an injury accident. Follow these guidelines to make your trailer towing as safe as possible:

Make certain that the load is secured in the trailer and that it will not shift during travel. When trailering cargo that is not fully secured, dynamic load shifts can occur that may be difficult for the driver to control. You could lose control of your vehicle and have an accident.

- When hauling cargo or towing a trailer, do not overload your vehicle or trailer. Overloading can cause a loss of control, poor performance, or damage to brakes, axle, engine, transaxle, steering, suspension, chassis structure, or tires.
- Safety chains must always be used between your vehicle and trailer. Always connect the chains to the frame or hook retainers of the vehicle hitch. Cross the chains under the trailer tongue and allow enough slack for turning corners.
- Vehicles with trailers should not be parked on a grade. When parking, apply the parking brake on the tow vehicle. Put the tow vehicle automatic transaxle in PARK. Always, block or "chock" the trailer wheels.
- GCWR must not be exceeded.
- **Total weight must be distributed between the tow vehicle and the trailer such that the following four ratings are not exceeded:**

  1. GVWR
  2. GTW
  3. GAWR

4. Tongue weight rating for the trailer hitch utilized. (This requirement may limit the ability to always achieve the 10% to 15% range of tongue weight as a percentage of total trailer weight.)

Towing Requirements — Tires

– Do not attempt to tow a trailer while using a compact spare tire.

– Proper tire inflation pressures are essential to the safe and satisfactory operation of your vehicle. Refer to "Tires–General Information" in this section for information on tire pressures and for proper tire inflation procedures.

– Also, check the trailer tires for proper tire inflation pressures before trailer usage.

– Check for signs of tire wear or visible tire damage before towing a trailer. Refer to "Tires–General Information" in this section for information on tread wear indicators and for the proper inspection procedure.

– When replacing tires, refer to "Tires–General Information" in this section for information on replacement tires and for the proper tire replacement procedures. Replacing tires with a higher load carrying capacity will not increase the vehicle's GVWR and GAWR limits.

Towing Requirements — Trailer Brakes

– Do **not** interconnect the hydraulic brake system or vacuum system of your vehicle with that of the trailer. This could cause inadequate braking and possible personal injury.

– An electronically actuated trailer brake controller is required when towing a trailer with electronically

actuated brakes. When towing a trailer equipped with a hydraulic surge actuated brake system, an electronic brake controller is not required.

– Trailer brakes are recommended for trailers over 1,000 lbs (454 kg) and required for trailers in excess of 2,000 lbs (907 kg).

CAUTION!

If the trailer weighs more than 1,000 lbs (454 kg) loaded, it should have its own brakes, and they should be of adequate capacity. Failure to do this could lead to accelerated brake lining wear, higher brake pedal effort, and longer stopping distances.

WARNING!

Do not connect trailer brakes to your vehicle's hydraulic brake lines. It can overload your brake system and cause it to fail. You might not have brakes when you need them and could have an accident.

Towing any trailer will increase your stopping distance. When towing, you should allow for additional space between your vehicle and the vehicle in front of you. Failure to do so could result in an accident.

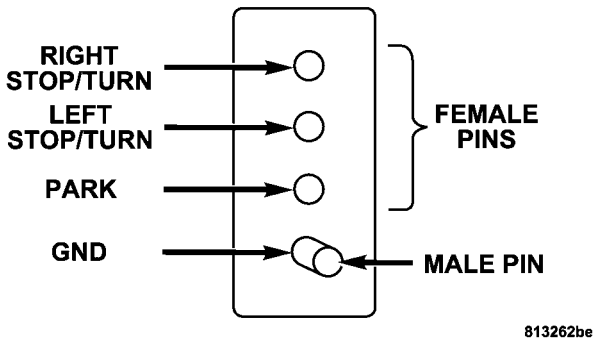
Towing Requirements — Trailer Lights and Wiring

Whenever you pull a trailer, regardless of the trailer size, stoplights and turn signals on the trailer are required for motoring safety.

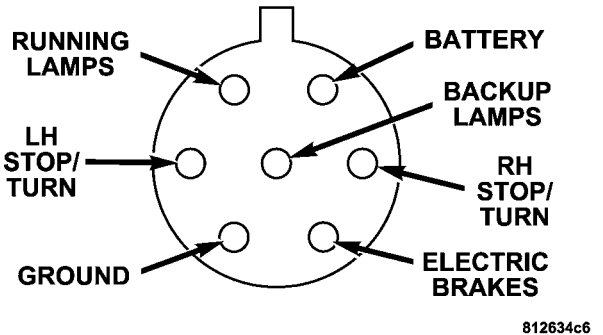
The Trailer Tow Package may include a 4- and 7-pin wiring harness. Use a factory approved trailer harness and connector.

NOTE: Do not cut or splice wiring into the vehicles wiring harness.

The electrical connections are all complete to the vehicle but you must mate the harness to a trailer connector. Refer to the following illustrations.



4-Pin Connector



7-Pin Connector

Towing Tips

Before setting out on a trip, practice turning, stopping, and backing up the trailer in an area located away from heavy traffic.

Towing Tips — Automatic Transaxle

The DRIVE range can be selected when towing. However, if frequent shifting occurs while in this range, select the "3" range for 4-speed automatic or the "5" range for 6-speed automatic.

NOTE: Using the "3" or "5" range while operating the vehicle under heavy operating conditions will improve performance and extend transaxle life by reducing excessive shifting and heat build up. This action will also provide better engine braking.

If you REGULARLY tow a trailer for more than 45 minutes of continuous operation, then change the automatic transaxle fluid and filter according to the interval specified for "police, taxi, fleet, or frequent trailer towing" in the Maintenance Schedule.

NOTE: Check the 4-speed automatic transaxle fluid level before towing. The 6-speed transaxle is sealed and the fluid level cannot be checked. See your authorized dealer for assistance.

Towing Tips — Electronic Speed Control (If Equipped)

- Don't use in hilly terrain or with heavy loads.
- When using the speed control, if you experience speed drops greater than 10 mph (16 km/h), disengage until you can get back to cruising speed.
- Use speed control in flat terrain and with light loads to maximize fuel efficiency.

Towing Tips — Autostick® (If Equipped)

- By using the Autostick® modes and selecting a specific gear range, frequent shifting can be avoided. The highest gear range should be selected that allows for adequate performance. For example, choose "4" if the desired speed can be maintained. Choose "3" or "2" if needed to maintain the desired speed.
- Extended driving at high RPM should be avoided to prevent excess heat generation. A reduction in vehicle speed may be required to avoid extended driving at high RPM. Return to a higher gear range or vehicle speed when road conditions and RPM level allows.

Towing Tips — Cooling System
To reduce potential for engine and transaxle overheating, take the following actions:

– *City Driving*
When stopped for short periods, put transaxle in NEUTRAL and increase engine idle speed.

– *Highway Driving*
Reduce speed.

– *Air Conditioning*
Turn off temporarily.

– Refer to "Cooling System" under "Maintenance Procedures" in Section 7.

RECREATIONAL TOWING (BEHIND MOTORHOME, ETC.)

TOWING THIS VEHICLE BEHIND ANOTHER VEHICLE (Flat Towing With All Four Wheels On The Ground)

Recreational towing for this vehicle is not recommended.

NOTE: If the vehicle requires towing, make sure all four wheels are off the ground.

HAZARD WARNING FLASHER

The HAZARD switch is located in the instrument panel switch bank above the climate controls.

Push and release the switch to turn on the hazard warning flashers. When the hazard warning is activated, all directional turn signals will flash on and off to warn oncoming traffic of an emergency. Push and release the switch a second time to turn off the flashers.

This is an emergency warning system and it should not be used when the vehicle is in motion. Use it when your vehicle is disabled and it is creating a safety hazard for other motorists.

When you must leave the vehicle to seek assistance, the hazard warning flashers will continue to operate even though the ignition switch is in the LOCK position.

NOTE: With extended use, the hazard warning flashers may wear down your battery.

IF YOUR ENGINE OVERHEATS

In any of the following situations, you can reduce the potential for overheating by taking the appropriate action.

- On the highways — Slow down.
- In city traffic — While stopped, put the transaxle in NEUTRAL, but do not increase engine idle speed.

NOTE: There are steps that you can take to slow down an impending overheat condition. If your Air Conditioning A/C system is on, turn it off. The A/C system adds heat to the engine cooling system and turning off the A/C system removes this heat. You can also turn the Temperature control to maximum heat, the Mode control to floor, and the Blower control to High. This allows the heater core to act as a supplement to the radiator and aids in removing heat from the engine cooling system.

CAUTION!

Driving with a hot cooling system could damage your vehicle. If the temperature gauge reads "H," safely pull over and stop the vehicle. Idle the vehicle with the A/C turned off until the pointer drops back into the normal range. If the pointer remains on the "H," and you hear continuous chimes, turn the engine OFF immediately, and call for service.

WARNING!

A hot engine cooling system is dangerous. You or others could be badly burned by steam or boiling coolant. You may want to call a service center if your vehicle overheats. If you decide to look under the hood yourself, refer to Section 7 and follow the warnings under the Cooling System Pressure Cap paragraph.

Engine Oil Overheating — 2.4L Gas and 2.0L Diesel Engines Only (If Equipped)

On hot days the engine oil temperature may become too hot during sustained high-speed driving or if towing a trailer up long grades. If this happens, a HOTOIL message will flash in the odometer and the vehicle speed will be reduced to 48 mph (77 km/h) maximum until the engine oil temperature is reduced.

NOTE: Although the maximum vehicle speed is reduced to 48 mph (77 km/h), you may of course reduce vehicle speed further as needed.

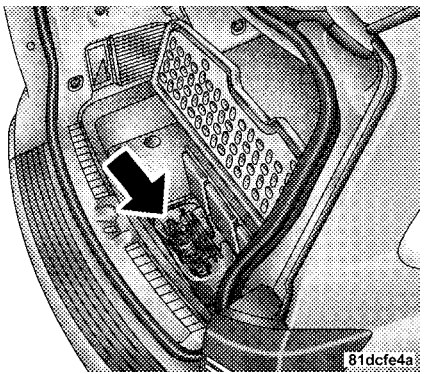
JACKING AND TIRE CHANGING

WARNING!

- **Do not attempt to change a tire on the side of the vehicle close to moving traffic. Pull far enough off the road to avoid the danger of being hit when operating the jack or changing the wheel.**
- **Getting under a jacked-up vehicle is dangerous. The vehicle could slip off the jack and fall on you. You could be crushed. Never get any part of your body under a vehicle that is on a jack. Never start or run the engine while the vehicle is on a jack. If you need to get under a raised vehicle, take it to a service center where it can be raised on a lift.**
- **The jack is designed to use as a tool for changing tires only. The jack should not be used to lift the vehicle for service purposes. The vehicle should be jacked on a firm level surface only. Avoid ice or slippery areas.**
- **A loose tire or jack thrown forward in a collision or hard stop could endanger the occupants of the vehicle. Always stow the jack parts and the spare tire in the places provided.**

Jack Location

The jack and jack-handle are stowed underneath a cover in the rear storage bin in the cargo area.



Jack Storage Location

Spare Tire Location

The spare tire is stowed underneath the rear of the vehicle and is held in place by means of a cable winch mechanism.

Preparations For Jacking

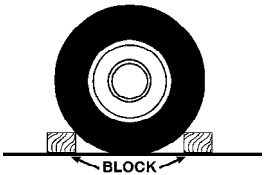
1. Park the vehicle on a firm level surface as far from the edge of the roadway as possible. Avoid icy or slippery areas.

2. **Set the parking brake** and place the shift lever in PARK.

3. Turn OFF the ignition.

4. Turn ON the hazard warning flashers.

5. Passengers should not remain in the vehicle when the vehicle is being jacked.

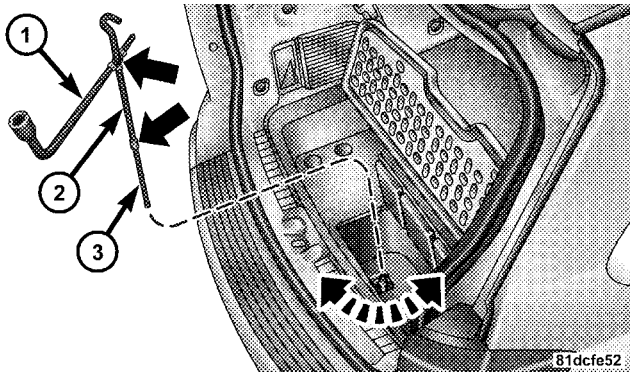


6. Block both the front and rear of the wheel diagonally opposite the jacking position. For example, if changing the right front tire, block the left rear wheel.

Spare Tire Removal

NOTE: On Seven-Passenger Models, fold the third-row passenger seats flat. This will provide more space when accessing the jacking tools and when operating the winch mechanism.

1. Remove the jack-handle components 1, 2, and 3 from storage and assemble them.



Lowering/Raising Spare Tire

NOTE: Assemble components 2 and 3 by seating the small ball at the end of component 2 in the small hole at the end of component 3. This will lock these components together. Assemble components 1 and 2 so that the wheel nut socket at the end of component 1 faces upward when seated on component 2. This will make it easier to rotate the assembly when operating the winch mechanism.

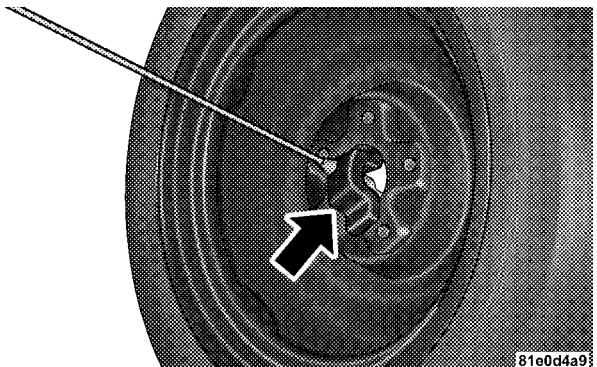
2. Fit the assembled jack-handle over the winch drive nut located in the jack storage area. Rotate the jack-handle assembly counterclockwise until the spare tire is on the ground with enough cable slack to allow you to pull the spare tire out from underneath the vehicle.

CAUTION!

The winch mechanism is designed for use with the jack-handle only. Use of an air wrench or other power tools is not recommended and it can damage the winch.

3. Pull the spare tire out from underneath the vehicle and raise it upright so the tire's tread is on the ground.

4. Tilt the retainer at the end of the winch cable and remove it from the center of the wheel.

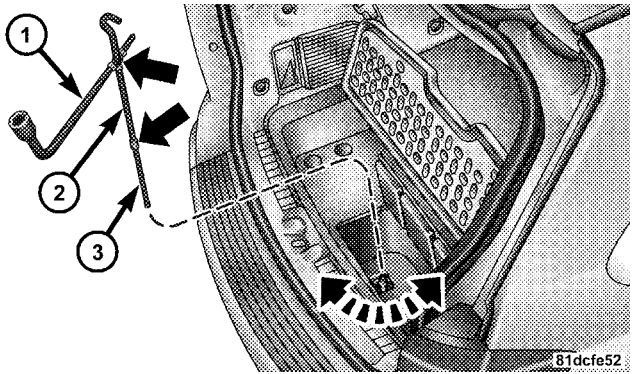


Spare Tire Retainer

Spare Tire Stowage

NOTE: On Seven-Passenger Models, fold the third-row passenger seats flat. This will provide more space when accessing the jacking tools and when operating the winch mechanism.

1. Remove the jack-handle components 1, 2, and 3 from storage and assemble them.



Lowering/Raising Spare Tire

NOTE: Assemble components 2 and 3 by seating the small ball at the end of component 2 in the small hole at the end of component 3. This will lock these components together. Assemble components 1 and 2 so that the wheel nut socket at the end of component 1 faces upward when seated on component 2. This will make it easier to rotate the assembly when operating the winch mechanism.

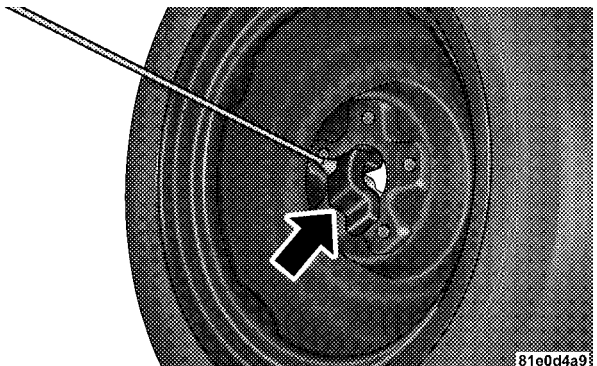
2. Fit the assembled jack-handle over the winch drive nut located in the jack storage area. Rotate the jack-handle assembly counterclockwise until there is enough cable slack to allow you to pull the cable and retainer out from underneath the vehicle.

CAUTION!

The winch mechanism is designed for use with the jack-handle only. Use of an air wrench or other power tools is not recommended and it can damage the winch.

3. Place the spare tire near to the winch cable. Hold the spare upright so that the tire's tread is on the ground and the valve stem is at the top of the wheel and facing away from the rear of the vehicle.

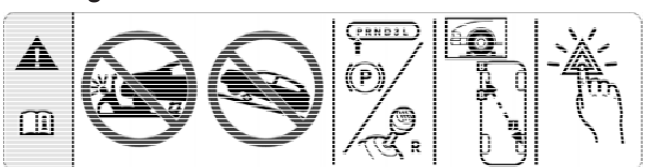
4. Tilt the retainer at the end of the winch cable and drop it through the center of the wheel. Then place the spare tire with the cable and retainer underneath the vehicle.



Spare Tire Retainer

5. Fit the assembled jack-handle over the winch drive nut. Rotate the jack-handle assembly clockwise to raise the spare tire into the storage area. Continue to rotate the jack-handle assembly until you hear the winch mechanism click three times. It cannot be over tightened. Push against the tire several times to be sure it is held securely in place.

Jacking Instructions



Jack Warning Label

WARNING!

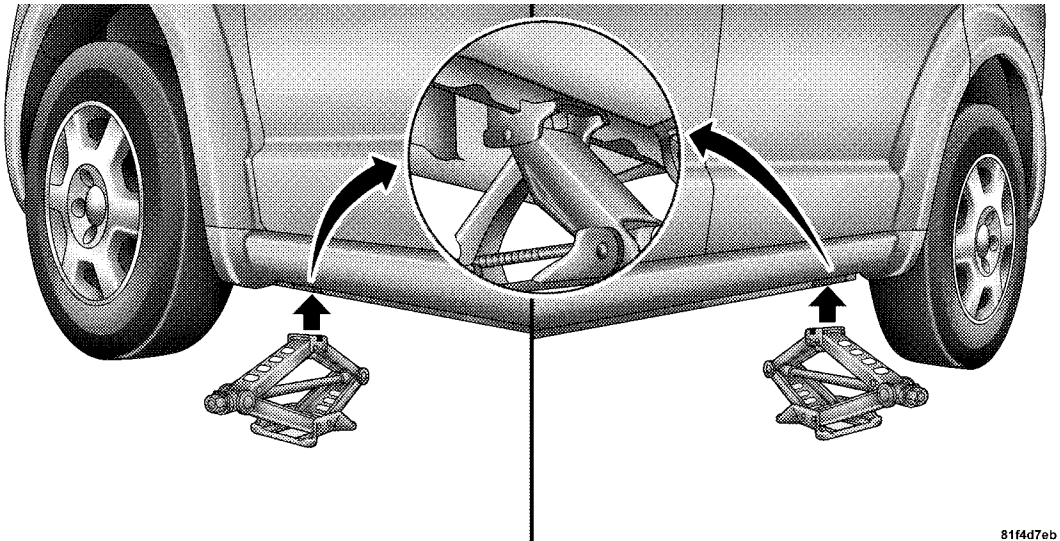
Carefully follow these tire changing warnings to help prevent personal injury or damage to your vehicle:

- **Always park on a firm, level surface as far from the edge of the roadway as possible before raising the vehicle.**
- **Block the wheel diagonally opposite the wheel to be raised.**
- **Set the parking brake firmly and set an automatic transaxle in PARK; a manual transaxle in REVERSE.**
- **Never start or run the engine with the vehicle on a jack.**
- **Do not let anyone sit in the vehicle when it is on a jack.**
- **Do not get under the vehicle when it is on a jack.**
- **Only use the jack in the positions indicated and for lifting this vehicle during a tire change.**
- **If working on or near a roadway, be extremely careful of motor traffic.**
- **To assure that spare tires, flat or inflated are securely stowed, spares must be stowed with the valve stem facing the ground.**
- **Turn on the Hazard warning flasher.**

1. Remove the spare tire, jack, and jack-handle from stowage.

2. Loosen, but do not remove, the wheel nuts on the wheel with the flat tire. Turn the wheel nuts counter-clockwise one turn while the wheel is still on the ground.

3. Place the jack underneath the lift area that is closest to the flat tire. Turn the jack screw clockwise to firmly engage the jack saddle with the lift area of the sill flange.



Jack Engagement Locations

4. Raise the vehicle by turning the jack screw clockwise with the jack handle. Raise the vehicle until the tire just clears the road surface and enough clearance is obtained to install the spare tire. Minimum tire lift provides maximum stability.

WARNING!

Raising the vehicle higher than necessary can make the vehicle less stable. It could slip off the jack and hurt someone near it. Raise the vehicle only enough to remove the tire.

5. Remove the wheel nuts. For vehicles so equipped, remove the wheel cover from the wheel by hand. Do not pry the wheel cover off. Then pull the wheel off the hub.

WARNING!

To avoid possible personal injury, handle the wheel covers with care to avoid contact with any sharp edges.

NOTE: For vehicles so equipped, the wheel cover is held on the wheel by the wheel nuts. When reinstalling the original wheel, properly align the wheel cover to the valve stem, place the wheel cover onto the wheel, and then install the wheel nuts.

6. Install the spare tire.

NOTE:

- For vehicles so equipped, do not attempt to install a center cap or wheel cover on the compact spare.

- Refer to “Compact Spare Tire” and to “Limited-Use Spare” under “Tires — General Information” in Section 5 for additional warnings, cautions, and information about the spare tire, its use, and operation.

7. Install the wheel nuts with the cone shaped end of the nut toward the wheel. Lightly tighten the wheel nuts.

WARNING!

To avoid the risk of forcing the vehicle off the jack, do not tighten the wheel nuts fully until the vehicle has been lowered. Failure to follow this warning may result in personal injury or death.

8. Lower the vehicle by turning the jack screw counterclockwise with the jack handle.

9. Finish tightening the wheel nuts. Push down on the wrench while tightening for increased leverage. Alternate wheel nuts until each nut has been tightened twice. Correct wheel nut tightness is 95 ft lbs (130 N·m). If in doubt about the correct tightness, have them checked with a torque wrench by your authorized dealer or at a service station.

10. Lower the jack to its fully closed position.

WARNING!

A loose tire or jack, thrown forward in a collision or hard stop could endanger the occupants of the vehicle. Always stow the jack parts and the spare tire in the places provided. Have the deflated (flat) tire repaired or replaced immediately.

11. Place the deflated (flat) tire in the cargo area. **Do not stow the deflated tire in the spare tire stowage location.** Have the deflated (flat) tire repaired or replaced as soon as possible.

12. To stow the winch cable and retainer, fit the assembled jack-handle over the winch drive nut. Rotate the jack-handle assembly clockwise until you hear the winch mechanism click three times. It cannot be over tightened.

13. Stow the jack-handle and jack.

14. Check the tire pressure as soon as possible. Adjust the tire pressure as required.

Wheel Nuts

Tighten all wheel nuts occasionally to eliminate the possibility of wheel studs being sheared or the bolt holes in the wheels becoming elongated. This is especially important during the first few hundred miles (kilometers) of operation and after changing a tire. This allows the wheel nuts to seat properly. All wheel nuts should first be firmly seated against the wheel. The wheel nuts should then be tightened to recommended torque. Tighten the wheel nuts to the final torque in increments. Progress around the bolt circle, tightening the nut opposite of the one you previously tightened until the final torque is achieved. Recommended torque is 95 ft lbs (130 N·m).

JUMP-STARTING PROCEDURES

WARNING!

- **Take care to avoid the radiator cooling fan whenever the hood is raised. It can start anytime the ignition switch is ON. You can be hurt by the fan.**
- **Do not attempt to push or tow your vehicle to get it started. Vehicles equipped with an automatic transaxle cannot be started this way. Unburned fuel could enter the catalytic converter and once the engine has started, ignite and damage the converter and vehicle. If the vehicle has a discharged battery, booster cables may be used to obtain a start from another vehicle. This type of start can be dangerous if done improperly, so follow this procedure carefully.**
- **Do not use a booster battery or any other booster source with an output that exceeds 12 Volts.**

WARNING!

- **Battery fluid is a corrosive acid solution; do not allow battery fluid to contact eyes, skin, or clothing. Don't lean over battery when attaching clamps or allow the clamps to touch each other. If acid splashes in eyes or on skin, flush contaminated area immediately with large quantities of water.**
- **A battery generates hydrogen gas, which is flammable and explosive. Keep flame or spark away from the vent holes.**

The battery is stored in a compartment that is located behind the left front fender and is accessible through the wheel well. Remote jump-start terminals are located in the engine compartment.

1. Wear eye protection and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

2. When boosting from a battery in another vehicle, park that vehicle within booster cable reach, but without allowing the vehicles to touch. Set parking brake, place automatic transaxle in PARK, and turn ignition to LOCK for both vehicles.

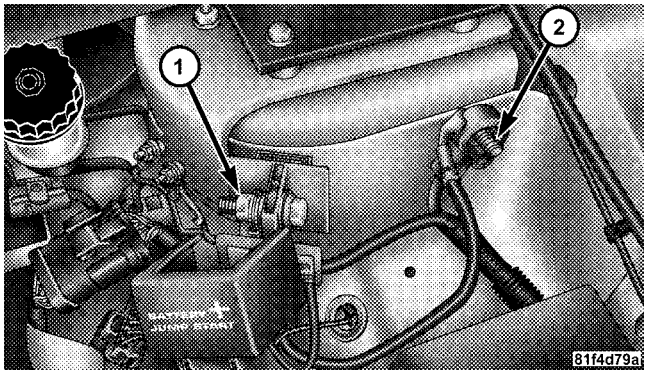
WARNING!

Do not permit vehicles to touch each other as this could establish a ground connection and personal injury could result.

3. Turn off the heater, radio, and all unnecessary electrical loads.

4. Remove the protective cover over the remote jump-start positive battery post **(+)** in the engine compartment. Connect one end of the jumper cable to the positive battery post. Connect the other end of the same cable to the positive terminal of the booster battery. Refer to the following illustration for jump-starting connections.

5. Connect the other cable, first to the negative terminal of the booster battery and **then to the engine ground (-) of the vehicle with the discharged battery.** Make sure you have a good contact on the engine ground. Refer to the following illustration for jump-starting connections.



1 — Positive Terminal
2 — Negative Terminal

6. If the vehicle is equipped with Sentry Key Immobilizer, turn the ignition switch to the ON position for three seconds before moving the ignition switch to the START position.

7. Start the engine in the vehicle that has the booster battery, let the engine idle a few minutes, and then start the engine in the vehicle with the discharged battery.

8. When removing the jumper cables, reverse the sequence exactly. Be careful of the moving belts and fan.

9. Reinstall the protective cover over the remote jump-start positive battery post.

WARNING!

During cold weather when temperatures are below freezing point, electrolyte in a discharged battery may freeze. Do not attempt jump-starting because the battery could rupture or explode. The battery temperature must be brought up above freezing point before attempting jump-start.

NOTE: Refer to "Maintenance Procedures" in Section 7 for information on accessing the battery for service or replacement.

WARNING!

Any procedure other than above could result in:

1. Personal injury caused by electrolyte squirting out the battery vent;

2. Personal injury or property damage due to battery explosion;

3. Damage to charging system of booster vehicle or of immobilized vehicle.

FREEING A STUCK VEHICLE

If your vehicle becomes stuck in mud, sand, or snow, it can often be moved by a rocking motion. Turn your steering wheel right and left to clear the area around the front wheels. Then shift back and forth between REVERSE and 1st gear. Usually the least accelerator pedal pressure to maintain the rocking motion without spinning the wheels is most effective.

NOTE:

If your vehicle is equipped with Traction Control, turn the system OFF before attempting to "rock" the vehicle. Refer to "Partial Off Mode" under "Electronic Stability Program (ESP)" in Section 5.

WARNING!

Fast spinning tires can be dangerous. Forces generated by excessive wheel speeds may cause axle and tire damage or failure. A tire could explode and injure someone. Do not spin your vehicle's wheels faster than 30 mph (48 km/h) or for longer than 30 seconds continuously without stopping when you are stuck, and don't let anyone near a spinning wheel, no matter what the speed.

CAUTION!

Racing the engine or spinning the wheels too fast may lead to transaxle overheating and failure. It can also damage the tires. Do not spin the wheels above 30 mph (48 km/h). Do not spin the wheels continuously for more than 30 seconds.

TOWING A DISABLED VEHICLE

Without The Ignition Key

Front Wheel Drive (FWD)
Special care must be taken when the vehicle is towed with the ignition in the LOCK position. Flat bed towing is the preferred towing method. However, if a flat bed towing vehicle is not available, a wheel lift towing vehicle may be used. Furthermore, rear towing is not recommended with the front wheels on the ground, as transaxle damage can result. If rear towing is the only alternative, a front end dolly must be used. Proper towing equipment is necessary to prevent damage to the vehicle.

All Wheel Drive (AWD)
Your vehicle must be transported on a flat bed truck.

Towing This Vehicle Behind Another Vehicle (Flat Towing With The Key In The Ignition And All Four Wheels On The Ground)

CAUTION!

- **If the vehicle being towed requires steering, the ignition switch must be in the ON position, not in the LOCK or ACC position.**
- **Do not attempt to tow this vehicle from the front with sling type towing equipment. Damage to the front fascia will result.**
- **Do not push or tow this vehicle with another vehicle as damage to the bumper fascia and transaxle may result.**

If you must use the accessories (wipers, defrosters, etc.) while being towed, the key must be in the ON position, not the ACC position. Make certain the transaxle remains in NEUTRAL.

Front Wheel Drive (FWD)
Your vehicle may be towed under the following conditions: The shift lever must be in NEUTRAL, the distance to be traveled must not exceed 15 mi (25 km), and the towing speed must not exceed 25 mph (40 km/h). Exceeding these towing limits may cause a transaxle failure. If the transaxle is not operative, or if the vehicle is to be towed more than 15 mi (25 km), the vehicle must be transported either with a flat bed truck or with the front wheels off the ground.

All Wheel Drive (AWD)
Your vehicle may be towed under the following conditions: The shift lever must be in NEUTRAL, the distance to be traveled must not exceed 15 mi (25 km), the towing speed must not exceed 25 mph (40 km/h), and both front and rear wheels must be on the ground. Exceeding these towing limits may cause a transaxle failure. If the transaxle is not operative, or if the vehicle is to be towed more than 15 mi (25 km), the vehicle must be transported on a flat bed truck.

Towing This Vehicle Behind Another Vehicle With A Tow Dolly

Front Wheel Drive (FWD)
Rear towing is not recommended with the front wheels on the ground, as transaxle damage can result. If rear towing is the only alternative, **a front end dolly must be used.** Proper towing equipment is necessary to prevent damage to the vehicle.

All Wheel Drive (AWD)

CAUTION!

The manufacturer does not recommend towing an All-Wheel Drive (AWD) on a tow dolly. Vehicle damage may occur.

ONBOARD DIAGNOSTIC SYSTEM — OBD II

Your vehicle is equipped with a sophisticated Onboard Diagnostic system called OBD II. This system monitors the performance of the emissions, engine, and automatic transaxle control systems. When these systems are operating properly, your vehicle will provide excellent performance and fuel economy, as well as engine emissions well within current government regulations.

If any of these systems require service, the OBD II system will turn on the Malfunction Indicator Light (MIL). It will also store diagnostic codes and other information to assist your service technician in making repairs. Although your vehicle will usually be drivable and not need towing, see your authorized dealer for service as soon as possible.

CAUTION!

- **Prolonged driving with the MIL on could cause further damage to the emissions control system. It could also affect fuel economy and driveability. The vehicle must be serviced before any emissions tests can be performed.**
- **If the MIL is flashing while the engine is running, severe catalytic converter damage and power loss will soon occur. Immediate service is required.**

Loose Fuel Filler Cap Message

If the vehicle diagnostic system determines that the fuel filler cap in loose, improperly installed, or damaged, the word “gASCAP” will display in the odometer. If this occurs, tighten the fuel filler cap until a “clicking” sound is heard and press the TRIP ODOMETER button to turn

off the message. If the problem persists, the message will appear the next time the vehicle is started.

A loose, improperly installed, or damaged fuel filler cap may also turn on the MIL.

EMISSIONS INSPECTION AND MAINTENANCE PROGRAMS

In some localities, it may be a legal requirement to pass an inspection of this vehicle's emissions control system. Failure to pass could prevent vehicle registration.

For states that require an Inspection and Maintenance (I/M), this check verifies the Malfunction Indicator Light (MIL) is functioning and is not on when the engine is running, and that the OBD II system is ready for testing.

Normally, the OBD II system will be ready. The OBD II system may **not** be ready if the vehicle was recently serviced, recently had a dead battery, or a battery replacement. If the OBD II system should be determined not ready for the I/M test, the vehicle may fail the test.

This vehicle has a simple ignition key-actuated test, which you can use prior to going to the test station. To check if this vehicle's OBD II system is ready, you must do the following:

1. Insert the ignition key into the ignition switch.

2. Turn the ignition to the ON position, but do not crank or start the engine.

3. If you crank or start the engine, you will have to start this test over.

4. As soon as you turn the ignition key to the ON position, you will see the MIL symbol come on as part of a normal bulb check.

5. Approximately 15 seconds later, one of two things will happen:

a. The MIL will flash for about 10 seconds and then return to being fully illuminated until you turn OFF the ignition key or start the engine. This means that the vehicle's OBD II system is **not ready** and you should **not** proceed to the I/M station.

b. The MIL will not flash at all and will remain fully illuminated until you turn OFF the ignition key or start the engine. This means that the vehicle's OBD II system is **ready,** and you can proceed to the I/M station.

If the OBD II system is **not ready,** you should see an authorized dealer or repair facility. If this vehicle was recently serviced or had a battery failure or replacement, you may need to do nothing more than drive the vehicle as you normally would in order for the OBD II system to update. A recheck with the above test routine may then indicate that the system is now ready.

Regardless of whether the vehicle's OBD II system is ready or not ready, if the MIL is illuminated during normal vehicle operation, you should have the vehicle serviced before going to the I/M station. The I/M station can fail the vehicle because the MIL is on with the engine running.

REPLACEMENT PARTS

Use of genuine Mopar® parts for normal/scheduled maintenance and repairs is highly recommended to ensure the designed performance. Damage or failures caused by the use of non-Mopar® parts for maintenance and repairs will not be covered by the manufacturer's warranty.

AUTHORIZED DEALER SERVICE

Your authorized dealer has the qualified service personnel, special tools, and equipment to perform all service operations in an expert manner. Service manuals are available which include detailed service information for your vehicle. Refer to these service manuals before attempting any procedure yourself.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

WARNING!

You can be badly injured working on or around a motor vehicle. Only do service work for which you have the knowledge and the proper equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

MAINTENANCE PROCEDURES

The pages that follow contain the **required** maintenance services determined by the engineers who designed your vehicle.

Besides the maintenance items for which there are fixed maintenance intervals, there are other items that should operate satisfactorily without periodic maintenance. However, if a malfunction of these items does occur, it could adversely affect the engine or vehicle performance. These items should be inspected if a malfunction is observed or suspected.

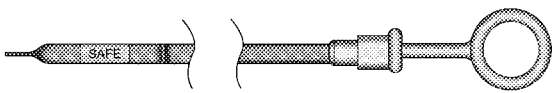
Engine Oil

Checking Oil Level

To assure proper engine lubrication, the engine oil must be maintained at the correct level. Check the oil level at regular intervals, such as every fuel stop.

The best time to check the engine oil level is about five minutes after a fully warmed engine is shut off. Do not check oil level before starting the engine after it has sat overnight. Checking engine oil level when the engine is cold will give you an incorrect reading.

Checking the oil while the vehicle is on level ground and only when the engine is hot, will improve the accuracy of the oil level readings. Maintain the oil level between the range markings on the dipstick. Either the range markings consist of a crosshatch zone marked SAFE or a crosshatch zone marked with MIN at the low end of the range and MAX at the high end of the range. Adding 1.0 qt (1.0 l) of oil when the reading is at the low end of the range marking will raise the oil level to the high end of the range marking.



818168a4

Engine Oil Dipstick

CAUTION!

Do not overfill the engine. Overfilling the engine will cause oil aeration, which can lead to loss of oil pressure and an increase in oil temperature. This could damage your engine.

Change Engine Oil

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance. Refer to the Maintenance Schedule in Section 8 for information on this system.

NOTE: Under no circumstances should oil change intervals exceed 6,000 mi (10 000 km) or six months, whichever occurs first.

Engine Oil Selection

For best performance and maximum protection under all types of operating conditions, the manufacturer only recommends engine oils that are API Certified and meet the requirements of Chrysler Material Standard MS-6395.

American Petroleum Institute (API) Engine Oil Identification Symbol

This symbol means that the oil has been certified by the American Petroleum Institute (API). The manufacturer only recommends API Certified engine oils.

Engine Oil Viscosity (SAE Grade) — 2.4L and 2.7L Engines
SAE 5W-20 engine oil is recommended for all operating temperatures. This engine oil improves low temperature starting and vehicle fuel economy.

The engine oil filler cap also shows the recommended engine oil viscosity for your engine. For information on engine oil filler cap location, refer to the "Engine Compartment" illustration in this section.

Lubricants that do not have both, the engine oil certification mark and the correct SAE viscosity grade number should not be used.

Engine Oil Viscosity (SAE Grade) — 3.5L Engine
SAE 10W-30 engine oil is preferred for use in 3.5L Engines for all operating temperatures.

The engine oil filler cap also shows the recommended engine oil viscosity for your engine. For information on engine oil filler cap location, refer to the "Engine Compartment" illustration in this section.

Lubricants that do not have both, the engine oil certification mark and the correct SAE viscosity grade number should not be used.

Synthetic Engine Oils
You may use synthetic engine oils provided the recommended oil quality requirements are met, and the recommended maintenance intervals for oil and filter changes are followed.

Materials Added to Engine Oil
The manufacturer strongly recommends against the addition of any additives (other than leak detection dyes) to the engine oil. Engine oil is an engineered product and its performance may be impaired by supplemental additives.

Disposing of Used Engine Oil and Oil Filters

Care should be taken in disposing of used engine oil and oil filters from your vehicle. Used oil and oil filters, indiscriminately discarded, can present a problem to the environment. Contact your authorized dealer, service station, or governmental agency for advice on how and where used oil and oil filters can be safely discarded in your area.

Engine Oil Filter

The engine oil filter should be replaced at every engine oil change.

Engine Oil Filter Selection

This manufacturer's engines have a full-flow type disposable oil filter. Use a filter of this type for replacement. The quality of replacement filters varies considerably. Only high quality filters should be used to assure most efficient service. Mopar® Engine Oil Filters are high quality oil filters and are recommended.

Drive Belts — Check Condition and Tension

Belt tension is controlled by means of an automatic tensioner. Therefore, no belt tension adjustments are required. However, belt and belt tensioner condition should be inspected periodically and replaced if required. Improper belt tension can cause belt slippage and failure. Low generator belt tension can cause battery failure.

Inspect belts for evidence of cuts, cracks, glazing, or frayed cords and replace if there is indication of damage that could result in belt failure. Also, check belt routing to make sure there is no interference between the belts and other engine components. Refer to the Maintenance Schedule in Section 8 for specified service intervals. See your authorized dealer for service.

Spark Plugs

Spark plugs must fire properly to assure engine performance and emissions control. New plugs should be installed at the specified mileage. The entire set should be replaced if there is any malfunction due to a faulty spark plug. Refer to "Fluids, Lubricants, and Genuine Parts" in this section for the proper type of spark plug for use in your vehicle.

Engine Air Cleaner Filter

Refer to the Maintenance Schedule in Section 8 for engine air cleaner filter service intervals.

NOTE: Be sure to follow the "dusty or off-road conditions" maintenance interval if applicable.

WARNING!

The air induction system (air cleaner, hoses, etc.,) can provide a measure of protection in the case of engine backfire. Do not remove the air induction system (air cleaner, hoses, etc.,) unless such removal is necessary for repair or maintenance. Make sure that no one is near the engine compartment before starting the vehicle with the air induction system (air cleaner, hoses, etc.,) removed. Failure to do so can result in serious personal injury.

Catalytic Converter

The catalytic converter requires the use of unleaded fuel only. Leaded gasoline will destroy the effectiveness of the catalyst as an emissions control device.

Under normal operating conditions, the catalytic converter will not require maintenance. However, it is important to keep the engine properly tuned to assure proper catalyst operation and prevent possible catalyst damage.

CAUTION!

Damage to the catalytic converter can result if your vehicle is not kept in proper operating condition. In the event of engine malfunction, particularly involving engine misfire or other apparent loss of performance, have your vehicle serviced promptly. Continued operation of your vehicle with a severe malfunction could cause the converter to overheat, resulting in possible damage to the converter and the vehicle.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

WARNING!

A hot exhaust system can start a fire if you park over materials that can burn. Such materials might be grass or leaves coming into contact with your exhaust system. Do not park or operate your vehicle in areas where your exhaust system can contact anything that can burn.

In unusual situations involving grossly malfunctioning engine operation, a scorching odor may indicate severe and abnormal catalyst overheating. If this occurs, safely bring the vehicle to a complete stop, shut the engine OFF, and allow the vehicle to cool. Thereafter, obtain service, including a tune-up to manufacturer's specifications immediately.

To minimize the possibility of catalyst damage:

- Do not shut OFF the engine or interrupt the ignition when the transaxle is in gear and the vehicle is in motion.
- Do not try to start the engine by pushing or towing the vehicle.
- Do not idle the engine with any ignition coil connectors disconnected for prolonged periods.

Maintenance-Free Battery

You will never have to add water, nor is periodic maintenance required.

NOTE: The battery is stored in a compartment that is located behind the left front fender and is accessible through the wheel well. The wheel and tire assemble do not need to be removed to access the compartment. Remote battery terminals are located in the engine compartment for jump-starting.

To access the battery, turn the steering wheel fully to the right and remove the access panel from the inner fender shield.

WARNING!

- **Battery fluid is a corrosive acid solution and can burn or even blind you. Don't allow battery fluid to contact your eyes, skin, or clothing. Don't lean over a battery when attaching clamps. If acid splashes in eyes or on skin, flush the area immediately with large amounts of water.**
- **Battery gas is flammable and explosive. Keep flame or sparks away from the battery. Don't use a booster battery or any other booster source with an output greater than 12 Volts. Don't allow cable clamps to touch each other.**
- **Battery posts, terminals, and related accessories contain lead and lead compounds. Wash hands after handling.**

CAUTION!

- **It is essential when replacing the cables on the battery that the positive cable is attached to the positive post and the negative cable is attached to the negative post. Battery posts are marked positive (+) and negative (-) and identified on the battery case. Cable clamps should be tight on the terminal posts and free of corrosion.**
- **If a "fast charger" is used while the battery is in the vehicle, disconnect both vehicle battery cables before connecting the charger to the battery. Do not use a "fast charger" to provide starting voltage as battery damage can result.**

Air Conditioner Maintenance

For best possible performance, your air conditioner should be checked and serviced by an authorized dealer at the start of each warm season. This service should include cleaning of the condenser fins and a performance test. Drive belt tension should also be checked at this time.

WARNING!

- **Use only refrigerants and compressor lubricants approved by the manufacturer for your air conditioning system. Some unapproved refrigerants are flammable and can explode, injuring you. Other unapproved refrigerants or lubricants can cause the system to fail, requiring costly repairs. Refer to Section 3 of the Warranty Information book for further warranty information.**
- **The air conditioning system contains refrigerant under high pressure. To avoid risk of personal injury or damage to the system, adding refrigerant or any repair requiring lines to be disconnected should be done by an experienced technician.**

Refrigerant Recovery and Recycling

R-134a Air Conditioning Refrigerant is a hydrofluorocarbon (HFC) that is endorsed by the Environmental Protection Agency and is an ozone-saving product. However, the manufacturer recommends that air conditioning service be performed by authorized dealers or other service facilities using recovery and recycling equipment.

NOTE: Use only manufacturer approved A/C system sealers, stop leak products, seal conditioners, compressor oil, and refrigerants.

A/C Air Filter — If Equipped

Refer to the Maintenance Schedule in Section 8 for A/C air filter service intervals.

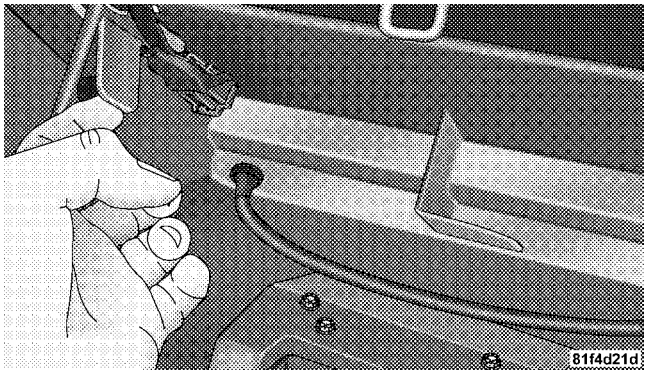
WARNING!

Do not remove the A/C air filter while the blower is operating or personal injury may result.

The A/C air filter is located in the fresh air inlet behind the glove box. Perform the following steps to replace the filter:

1. Open the glove box and remove all contents.

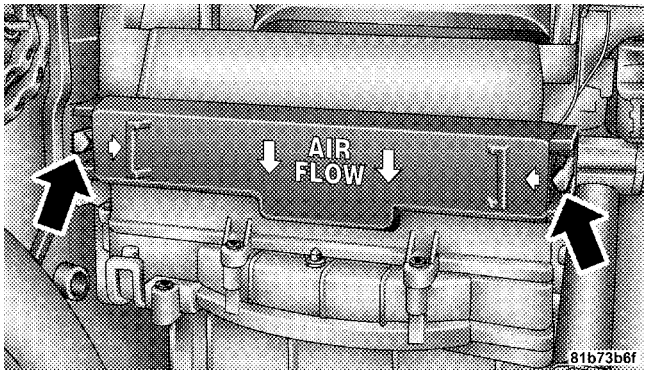
2. Push the retaining tab on each side of the glove box inward while gently pulling the glove box door outward until both tabs clear the door opening in the instrument panel.



Glove Box Removal

3. Pivot the glove box downward.

4. Disengage the two retaining tabs that secure the filter cover to the HVAC housing and remove the cover.



A/C Air Filter Replacement

5. Remove the A/C air filter by pulling it straight out of the housing.

6. Install the A/C air filter with the arrow on the filter pointing toward the floor. When installing the filter cover, make sure the retaining tabs fully engage the cover.

CAUTION!

The A/C air filter is labeled with an arrow to indicate airflow direction through the filter. Failure to install the filter properly will result in the need to replace it more often.

7. Reinstall the glove box door. Make sure that the hinges are seated fully as you raise the door. Otherwise, the door latch will not align properly.

Power Steering — Fluid Check

Checking the power steering fluid level at a defined service interval is not required. The fluid should only be checked if a leak is suspected, abnormal noises are apparent, and/or the system is not functioning as anticipated. Coordinate inspection efforts through an authorized dealer. No chemical flushes should be used in any power steering system; only the approved lubricant may be used.

WARNING!

Fluid level should be checked on a level surface and with the engine OFF to prevent injury from moving parts and to ensure accurate fluid level reading. Do not overfill. Use only manufacturer's recommended power steering fluid.

If necessary, add fluid to restore to the proper indicated level. With a clean cloth, wipe any spilled fluid from all surfaces. Refer to "Fluids, Lubricants, and Genuine Parts" in this section for the correct fluid type.

Front Suspension Ball Joints

There are two front suspension lower ball joints that are permanently lubricated. Inspect these ball joints when other maintenance is performed. A damaged seal and the corresponding potentially damaged ball joint must be replaced.

Steering Linkage

The tie rod end ball joints should be inspected for external leakage and damage when other maintenance is performed.

Body Lubrication

Locks and all body pivot points, including seat tracks, door hinges, liftgate hinges, and hood hinges, should be lubricated periodically to assure quiet, easy operation and to protect against rust and wear. Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit; after lubricating, excess oil and grease should be removed. Particular attention should also be given to hood latching components to ensure proper function. When performing other underhood services, the hood latch, release mechanism, and safety catch should be cleaned and lubricated.

The external lock cylinders should be lubricated twice a year, preferably in the Fall and Spring. Apply a small amount of a high quality lubricant such as Mopar® Lock Cylinder Lubricant or equivalent directly into the lock cylinder.

Wiper Blades

Clean the rubber edges of the wiper blades and the windshield and rear window periodically with a sponge or soft cloth and a mild nonabrasive cleaner. This will remove accumulations of salt, waxes, or road film, and help reduce streaking and smearing.

Operation of the wipers on dry glass for long periods may cause deterioration of the wiper blades. Always use washer fluid when using the wipers to remove salt or dirt from a dry windshield or rear window.

Avoid using the wiper blades to remove frost or ice from the windshield or rear window. Make sure that they are not frozen to the glass before turning them on to avoid damaging the blade. Keep the blade rubber out of contact with petroleum products such as engine oil, gasoline, etc.

NOTE: Always refer to the wiper blade packaging for specific installation instructions. Many wiper blade replacements fit multiple vehicles.

Windshield Washers/Rear Window Washer

NOTE: Refer to the appropriate "Engine Compartment" diagram in Section 7 for the location of the washer fluid reservoir.

The windshield washer and the rear window washer share the same fluid reservoir. The fluid reservoir is located in the engine compartment. Be sure to check the fluid level in the reservoir at regular intervals. Fill the reservoir with windshield washer solvent (not radiator antifreeze) and operate the system for a few seconds to flush out the residual water.

When refilling the washer fluid reservoir, apply some washer fluid to a cloth or towel and wipe the wiper blades clean. This will help blade performance.

To prevent freeze-up of your windshield washer system in cold weather, select a solution or mixture that meets or exceeds the temperature range of your climate. This rating information can be found on most washer fluid containers.

The fluid reservoir will hold nearly 1 gal (4 l) of washer fluid when the message "LoWASH" appears in the instrument cluster.

WARNING!

Commercially available windshield washer solvents are flammable. They could ignite and burn you. Care must be exercised when filling or working around the washer solution.

Exhaust System

The best protection against carbon monoxide entry into the vehicle body is a properly maintained engine exhaust system.

Whenever a change is noticed in the sound of the exhaust system, when exhaust fumes can be detected inside the vehicle, or when the underside or rear of the vehicle is damaged, have a competent technician inspect the complete exhaust system and adjacent body areas for broken, damaged, deteriorated, or mispositioned parts. Open seams or loose connections could permit exhaust fumes to seep into the passenger compartment. In addition, inspect the exhaust system each time the vehicle is raised for lubrication or oil change. Replace as required.

WARNING!

Exhaust gases can injure or kill. They contain carbon monoxide (CO), which is colorless and odorless. Breathing it can make you unconscious and can eventually poison you. To avoid breathing CO, refer to "Exhaust Gas" under "Safety Tips" in Section 2.

Cooling System

WARNING!

- **When working near the radiator cooling fan, disconnect the fan motor lead or turn the ignition switch to the LOCK position. The fan is temperature controlled and can start at any time the ignition switch is in the ON position.**
- **You or others can be badly burned by hot coolant or steam from your radiator. If you see or hear steam coming from under the hood, don't open the hood until the radiator has had time to cool. Never try to open a cooling system pressure cap when the radiator is hot.**

Coolant Checks

Check engine coolant (antifreeze) protection every 12 months (before the onset of freezing weather, where applicable). If coolant is dirty or rusty in appearance, the system should be drained, flushed, and refilled with fresh coolant. Check the front of the A/C condenser for any accumulation of bugs, leaves, etc. If dirty, clean by gently spraying water from a garden hose vertically down the face of the condenser.

Check the coolant recovery bottle tubing for brittle rubber, cracking, tears, cuts, and tightness of the connection at the bottle and radiator. Inspect the entire system for leaks.

Cooling System — Drain, Flush, and Refill
The system should be drained, flushed, and refilled at the intervals shown in the Maintenance Schedule in Section 8.

If the solution is dirty or contains a considerable amount of sediment, clean and flush with a reliable cooling system cleaner. Follow with a thorough rinsing to remove all deposits and chemicals. Properly dispose of old antifreeze solution.

Selection of Coolant
Use only the manufacturer's recommended coolant. Refer to "Fluids, Lubricants, and Genuine Parts" in this section for the correct coolant type.

CAUTION!

- **Mixing of coolants other than specified HOAT engine coolants, may result in engine damage and may decrease corrosion protection. If a non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.**
- **Do not use plain water alone or alcohol-based engine coolant (antifreeze) products. Do not use additional rust inhibitors or antirust products, as they may not be compatible with the radiator engine coolant and may plug the radiator.**
- **This vehicle has not been designed for use with propylene glycol-based coolants. Use of propylene glycol-based coolants is not recommended.**

Adding Coolant

Your vehicle has been built with an improved engine coolant that allows extended maintenance intervals. This coolant can be used up to five years or 100,000 mi (160 000 km) before replacement. To prevent reducing this extended maintenance period, it is important that you use the same coolant throughout the life of your vehicle. Please review these recommendations for using Hybrid Organic Additive Technology (HOAT) coolant.

When adding coolant:

- The manufacturer recommends using Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology).
- Mix a minimum solution of 50% HOAT engine coolant and distilled water. Use higher concentrations (not to exceed 70%) if temperatures below −34°F (−37°C) are anticipated.
- Use only high purity water such as distilled or deionized water when mixing the water/engine coolant solution. The use of lower quality water will reduce the amount of corrosion protection in the engine cooling system.

Please note that it is the owner's responsibility to maintain the proper level of protection against freezing according to the temperatures occurring in the area where the vehicle is operated.

NOTE: Mixing coolant types will decrease the life of the engine coolant and will require more frequent coolant changes.

Cooling System Pressure Cap

The cap must be fully tightened to prevent loss of coolant, and to ensure that coolant will return to the radiator from the coolant recovery bottle.

The cap should be inspected and cleaned if there is any accumulation of foreign material on the sealing surfaces.

WARNING!

- **The warning words "DO NOT OPEN HOT" on the cooling system pressure cap are a safety precaution. Never add coolant when the engine is overheated. Do not loosen or remove the cap to cool an overheated engine. Heat causes pressure to build up in the cooling system. To prevent scalding or injury, do not remove the pressure cap while the system is hot or under pressure.**
- **Do not use a pressure cap other than the one specified for your vehicle. Personal injury or engine damage may result.**

Disposal of Used Coolant

Used ethylene glycol-based engine coolant is a regulated substance requiring proper disposal. Check with your local authorities to determine the disposal rules for your community. To prevent ingestion by animals or children, do not store ethylene glycol-based engine coolant in open containers or allow it to remain in puddles on the ground. If ingested by a child, contact a physician immediately. Clean up any ground spills immediately.

Coolant Level

Four Cylinder Engines — the coolant bottle provides a quick visual method for determining that the coolant level is adequate. With the engine idling and warm to normal operating temperature, the level of the coolant in the bottle should be between the "ADD" and "FULL" lines, shown on the bottle.

Six Cylinder Engines — the level of the coolant in the pressurized coolant bottle should be between the "COLD" and "FULL" range on the bottle when the engine is cold.

The radiator normally remains completely full, so there is no need to remove the radiator cap unless checking for coolant freeze point or replacing coolant. Advise your service attendant of this. As long as the engine operating temperature is satisfactory, the coolant bottle need only be checked once a month. When additional coolant is needed to maintain the proper level, it should be added to the coolant bottle. Do not overfill.

Points to Remember

NOTE: When the vehicle is stopped after a few miles (kilometers) of operation, you may observe vapor coming from the front of the engine compartment. This is normally a result of moisture from rain, snow, or high humidity accumulating on the radiator and being vaporized when the thermostat opens, allowing hot coolant to enter the radiator.

If an examination of your engine compartment shows no evidence of radiator or hose leaks, the vehicle may be safely driven. The vapor will soon dissipate.

- Do not overfill the coolant recovery bottle.
- Check coolant freeze point in the radiator and in the coolant recovery bottle. If antifreeze needs to be added, contents of coolant recovery bottle must also be protected against freezing.
- If frequent coolant additions are required, or if the level in the coolant recovery bottle does not drop when the engine cools, the cooling system should be pressure tested for leaks.

- Maintain coolant concentration at 50% HOAT engine coolant (minimum) and distilled water for proper corrosion protection of your engine, which contains aluminum components.
- Make sure that the radiator and coolant recovery bottle overflow hoses are not kinked or obstructed.
- Keep the front of the radiator clean. If your vehicle is equipped with air conditioning, keep the front of the condenser clean, also.
- Do not change the thermostat for Summer or Winter operation. If replacement is ever necessary, install ONLY the correct type thermostat. Other designs may result in unsatisfactory coolant performance, poor gas mileage, and increased emissions.

Hoses and Vacuum/Vapor Harnesses

Inspect surfaces of hoses and nylon tubing for evidence of heat and mechanical damage. Hard or soft spots, brittle rubber, cracking, tears, cuts, abrasions, and excessive swelling indicate deterioration of the rubber

Pay particular attention to the hoses nearest to high heat sources such as the exhaust manifold. Inspect hose routing to be sure hoses do not touch any heat source or moving component that may cause heat damage or mechanical wear.

Ensure nylon tubing in these areas has not melted or collapsed

Inspect all hose connections such as clamps and couplings to make sure they are secure and no leaks are present.

Components should be replaced immediately if there is any evidence of wear or damage that could cause failure.

Fuel System

The Electronic Fuel Injection high-pressure fuel system's hoses and fittings have unique material characteristics that provide adequate sealing and resist attack by deteriorated gasoline.

You are urged to use only the manufacturer's specified hoses and fittings, or their equivalent in material and specification, in any fuel system servicing. It is mandatory to replace any damaged hoses or fittings that have been removed during service. Care should be taken with installing fittings to ensure they are properly installed and fully connected. See your authorized dealer for service.

Brake System

In order to assure brake system performance, all brake system components should be inspected periodically. Suggested service intervals can be found in the "Maintenance Schedule" in Section 8.

WARNING!

Riding the brakes can lead to brake failure and possibly an accident. Driving with your foot resting or riding on the brake pedal can result in abnormally high brake temperatures, excessive lining wear, and possible brake damage. You wouldn't have your full braking capacity in an emergency.

Brake and Power Steering Hoses

When servicing the vehicle for scheduled maintenance, inspect the surface of the hoses and nylon tubing for evidence of heat and mechanical damage. Hard and brittle rubber, cracking, tears, cuts, abrasions, and excessive swelling suggest deterioration of the rubber. Particular attention should be made to examining those hose surfaces nearest to high heat sources, such as the exhaust manifold.

Ensure nylon tubing in these areas has not melted or collapsed.

Inspect all hose clamps and couplings to make sure they are secure and no leaks are present.

NOTE:

- Often, fluids such as oil, power steering fluid, and brake fluid are used during assembly plant operations to ease the assembly of hoses to couplings. Therefore, oil wetness at the hose-coupling area is not necessarily an indication of leakage. Actual dripping of hot fluid when systems are under pressure (during vehicle operation) should be noted before a hose is replaced based on leakage.
- Inspect the brake hoses whenever the brake system is serviced and at every engine oil change. Inspect hydraulic brake hoses for surface cracking, scuffing, or worn spots. If there is any evidence of cracking, scuffing, or worn spots, the hose should be replaced immediately. Eventual deterioration of the hose can take place, resulting in a possibility of a burst failure.

WARNING!

Worn brake hoses can burst and cause brake failure. You could have an accident. If you see any signs of cracking, scuffing, or worn spots, have the brake hoses replaced immediately.

Master Cylinder - Brake Fluid Level Check

Check the fluid level in the master cylinder immediately if the Brake System Warning Light indicates system failure.

Check the fluid level in the master cylinder when performing underhood services.

Clean the top of the master cylinder area before removing the cap. If necessary, add fluid to bring the fluid level up to the requirements described on the brake fluid reservoir.

Overfilling of fluid is not recommended because it may cause leaking in the system.

Fluid level can be expected to fall as the brake pads wear. Brake fluid level should be checked when pads are replaced. However, low fluid level may be caused by a leak and a checkup may be needed.

Use only manufacturer's recommended brake fluid. Refer to "Fluids, Lubricants, and Genuine Parts" in this section for the correct fluid type.

WARNING!

- **Overfilling the brake fluid reservoir can result in spilling brake fluid on hot engine parts and the brake fluid catching fire.**
- **Use of a brake fluid that may have a lower initial boiling point, or is unidentified as to specification, may result in sudden brake failure during hard prolonged braking. You could have an accident.**

Use only brake fluid that has been in a tightly closed container to avoid contamination from foreign matter or moisture.

CAUTION!

Do not allow petroleum-based fluid to contaminate the brake fluid. Seal damage may result.

Automatic Transaxle

The automatic transaxle and differential assembly are contained within a single housing.

The fluid level in the automatic transaxle should be checked whenever the vehicle is serviced. Operation with an improper fluid level will greatly reduce the life of the transaxle and the fluid.

Fluid Level Check — Vehicles with 3.5L Engine

The automatic transaxle has no dipstick and is dealer serviced only.

Fluid Level Check — Vehicles with 2.4L and 2.7L Engines

Use the following procedure to check the automatic transaxle fluid level properly:

1. Park the vehicle on level ground.
2. Run the engine at curb idle speed for a minimum of 60 seconds.
3. Apply the parking brake fully.
4. Place the shift lever momentarily in each gear position ending with the lever in PARK.
5. Wipe the area around the dipstick clean to eliminate the possibility of dirt entering the transaxle.

6. Remove the dipstick and determine if the fluid is hot or cold. Hot fluid is approximately 180°F (82°C), which is the normal operating temperature after the vehicle is driven at least 15 mi (24 km). Hot fluid cannot be held comfortably between the fingertips. Cold fluid is at a temperature below 80°F (27°C).

7. Wipe the dipstick clean and reinsert until seated. Then, remove dipstick and note the reading.

a. If the fluid is hot, the reading should be in the crosshatched area marked "HOT" (between the upper two holes in the dipstick).

b. If the fluid is cold, the fluid level should be between the lower two holes in the area marked "COLD."

If the fluid level is low, add sufficient fluid through the filler (dipstick) tube to bring it to the proper level. Do not overfill.

CAUTION!

- **Using a transmission fluid other than the manufacturer's recommended fluid may cause deterioration in transmission shift quality and/or torque converter shudder. Using a transmission fluid other than that recommended by the manufacturer will result in more frequent fluid and filter changes. Refer to "Fluids, Lubricants, and Genuine Parts" for the correct fluid type.**
- **Dirt and water in the transaxle can cause serious damage. To prevent dirt and water from entering the transaxle after checking or replenishing fluid, make certain that the dipstick cap is re-seated properly.**

Fluid and Filter Changes
Change the automatic transaxle fluid and filter at the intervals shown in the "Maintenance Schedule" in this manual.

In addition, change the fluid and filter if the transaxle is disassembled for any reason.

Selection of Lubricant
It is important that the proper lubricant is used in the transaxle to assure optimum transaxle performance. Use only manufacturer's recommended transmission fluid. Refer to "Fluids, Lubricants, and Genuine Parts" in this section for the correct fluid type. It is important that the transmission fluid be maintained at the prescribed level using the recommended fluid. No chemical flushes should be used in any transaxle; only the approved lubricant may be used.

Special Additives
Automatic Transmission Fluid (ATF) is an engineered product and its performance may be impaired by supplemental additives. Therefore, do not add any fluid additives to the transaxle. The only exception to this policy is the use of special dyes to aid in detecting fluid leaks. In addition, avoid using transmission sealers as they may adversely affect seals.

Front and Rear Wheel Bearings

Front and rear wheel bearings are permanently sealed. No regular maintenance is required for these components.

Appearance Care and Protection from Corrosion

Protection of Body and Paint from Corrosion

Vehicle body care requirements vary according to geographic locations and usage. Chemicals that make roads passable in snow and ice and those that are sprayed on trees and road surfaces during other seasons are highly corrosive to the metal in your vehicle. Outside parking, which exposes your vehicle to airborne contaminants, road surfaces on which the vehicle is operated, extreme hot or cold weather and other extreme conditions will have an adverse effect on paint, metal trim, and underbody protection.

The following maintenance recommendations will enable you to obtain maximum benefit from the corrosion resistance built into your vehicle.

What Causes Corrosion?

Corrosion is the result of deterioration or removal of paint and protective coatings from your vehicle.

The most common causes are:

- Road salt, dirt, and moisture accumulation.
- Stone and gravel impact.
- Insects, tree sap, and tar.
- Salt in the air near seacoast localities.
- Atmospheric fallout/industrial pollutants.

Washing

- Wash your vehicle regularly. Always wash your vehicle in the shade using Mopar® Car Wash or a mild car wash soap, and rinse the panels completely with clear water.
- If insects, tar, or other similar deposits have accumulated on your vehicle, use Mopar® Super Kleen Bug and Tar Remover to remove.

- Use Mopar® Cleaner Wax to remove road film, stains and to protect your paint finish. Take care never to scratch the paint.
- Avoid using abrasive compounds and power buffing that may diminish the gloss or thin out the paint finish.

CAUTION!

Do not use abrasive or strong cleaning materials such as steel wool or scouring powder that will scratch metal and painted surfaces.

Special Care

- If you drive on salted or dusty roads or if you drive near the ocean, hose off the undercarriage at least once a month.
- It is important that the drain holes in the lower edges of the doors, rocker panels, and cargo area be kept clear and open.
- If you detect any stone chips or scratches in the paint, touch them up immediately. The cost of such repairs is considered the responsibility of the owner.
- If your vehicle is damaged due to an accident or similar cause, which destroys the paint and protective coating, have your vehicle repaired as soon as possible. The cost of such repairs is considered the responsibility of the owner.
- If you carry special cargo such as chemicals, fertilizers, de-icer salt, etc., be sure that such materials are well packaged and sealed.
- If a lot of driving is done on gravel roads, consider mud or stone shields behind each wheel.

- Use Mopar® touch up paint on scratches as soon as possible. Your authorized dealer has touch up paint to match the color of your vehicle.

Wheel and Wheel Trim Care

All wheels and wheel trim, especially aluminum and chrome plated wheels should be cleaned regularly with a mild soap and water to prevent corrosion. To remove heavy soil and/or excessive brake dust, use Mopar® Wheel Cleaner (05066247AB) or equivalent or select a nonabrasive, non-acidic cleaner. Do not use scouring pads, steel wool, a bristle brush, or metal polishes. Only Mopar® or equivalent is recommended. Do not use oven cleaner. Avoid automatic car washes that use acidic solutions or harsh brushes that may damage the wheels' protective finish.

Interior Care

Instrument Panel Cover

The instrument panel cover has a low glare surface, which minimizes reflections in the windshield. Do not use protectants or other products, which may cause undesirable reflections. Use soap and warm water to restore the low glare surface.

Cleaning Interior Trim

Interior Trim should be cleaned starting with a damp cloth, a damp cloth with Mopar® Total Clean, then Mopar® Spot & Stain Remover if absolutely necessary. Do not use harsh cleaners or Armorall®. Use Mopar® Total Clean to clean vinyl upholstery

Cleaning Leather Upholstery

Mopar® Total Clean is specifically recommended for leather upholstery.

Your leather upholstery can be best preserved by regular cleaning with a damp soft cloth. Small particles of dirt can act as an abrasive and damage the leather upholstery and should be removed promptly with a damp cloth. Stubborn soils can be removed easily with a soft cloth and Mopar® Total Clean. Care should be taken to avoid soaking your leather upholstery with any liquid. Please do not use polishes, oils, cleaning fluids, solvents, detergents, or ammonia-based cleaners to clean your leather upholstery. Application of a leather conditioner is not required to maintain the original condition.

WARNING!

Do not use volatile solvents for cleaning purposes. Many are potentially flammable, and if used in closed areas they may cause respiratory harm.

YES Essentials® Fabric Cleaning Procedure – If Equipped

YES Essentials® seats may be cleaned in the following manner:

- Remove as much of the stain as possible by blotting with a clean, dry towel.
- Blot any remaining stain with a clean, damp towel.
- For tough stains, apply Mopar® Total Clean or a mild soap solution to a clean, damp cloth and remove stain. Use a fresh, damp towel to remove soap residue.
- For grease stains, apply Mopar® Multi-Purpose Cleaner to a clean, damp cloth and remove stain. Use a fresh, damp towel to remove soap residue.
- Do not use any solvents or protectants on Yes Essentials® products.

Cleaning Headlights

Your vehicle has plastic headlights that are lighter and less susceptible to stone breakage than glass headlights.

Plastic is not as scratch resistant as glass and therefore different lens cleaning procedures must be followed.

To minimize the possibility of scratching the lenses and reducing light output, avoid wiping with a dry cloth. To remove road dirt, wash with a mild soap solution followed by rinsing.

Do not use abrasive cleaning components, solvents, steel wool or other aggressive material to clean the lenses.

Glass Surfaces

All glass surfaces should be cleaned on a regular basis with Mopar® Glass Cleaner or any commercial household-type glass cleaner. Never use an abrasive type cleaner. Use caution when cleaning the inside rear window equipped with an electric defroster. Do not use scrapers or other sharp instruments that may scratch the elements.

When cleaning the rear view mirror, spray cleaner on the towel or rag that you are using. Do not spray cleaner directly on the mirror.

Cleaning Plastic Instrument Cluster Lenses

The lenses in front of the instruments in this vehicle are molded in clear plastic. When cleaning the lenses, care must be taken to avoid scratching the plastic.

1. Clean with a wet soft rag. A mild soap solution may be used, but do not use high alcohol content or abrasive cleaners. If soap is used, wipe clean with a clean damp rag.
2. Dry with a soft tissue.

Seat Belt Maintenance

Do not bleach, dye, or clean the belts with chemical solvents or abrasive cleaners. This will weaken the fabric. Sun damage can also weaken the fabric.

If the belts need cleaning, use a mild soap solution or lukewarm water. Do not remove the belts from the car to wash them.

Replace the belts if they appear frayed or worn or if the buckles do not work properly.

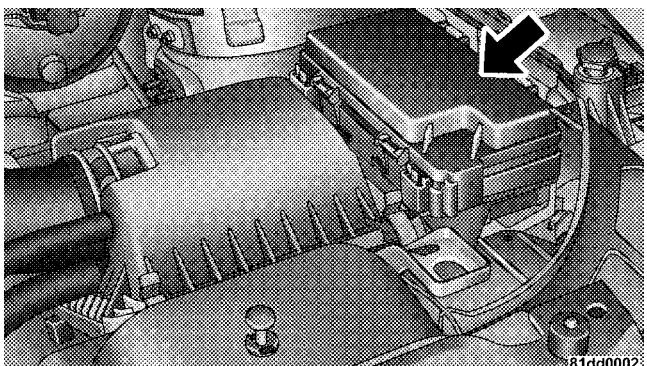
Dry with a soft tissue.

Cleaning The Cupholders

Clean with a damp cloth or towel using a mild detergent.

FUSES (TOTALLY INTEGRATED POWER MODULE)

The Totally Integrated Power Module (TIPM) is located in the engine compartment near the air cleaner assembly. This center contains fuses and relays.



Totally Integrated Power Module (TIPM)

CAUTION!

- **When installing the power module cover, it is important to ensure the cover is properly positioned and fully latched. Failure to do so may allow water to get into the TIPM, and possibly result in an electrical system failure.**
- **When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.**

Cavity	Cartridge Fuse	Mini-Fuse	Description
J1	40 Amp Green	—	Power Folding Seat
J2	30 Amp Pink	—	Transfer Case Module - if equipped
J3	30 Amp Pink	—	Rear Door Module

VEHICLE STORAGE

If you will not be using your vehicle for more than 21 days you may want to take steps to preserve your battery. You may:

- Remove the IOD (Ignition Off-Draw) mini-fuses from the Totally Integrated Power Module located in the engine compartment.
- Or, disconnect the batter negative cable.

REPLACEMENT BULBS

All the inside bulbs are brass or glass wedge base. Aluminum base bulbs are not approved and should not be used for replacement.

LIGHT BULBS — Interior	Bulb Number
Courtesy/Reading Lights (Incandescent)	578
Courtesy/Reading Lights (Optional LED)	LED (Serviced at Authorized Dealer)
Glove Box Light	194
Cargo Light	579
Optional Door Map Pocket/Cupholder Lighting	LED (Serviced at Authorized Dealer)

NOTE: For lighted switches, see your authorized dealer for replacement instructions.

LIGHTS BULBS — Outside	Bulb No.
Low Beam Headlight	9006
High Beam Headlight	9005
Front Park/Turn Signal	3757AK
Side Marker Light	168
Front Fog Light	9145//H10
Center High Mounted Stop Light (CHMSL)	LED (Serviced at Authorized Dealer)
Rear Tail/Stop	3157K
Rear Turn Signal	3757A
Rear Tail	3157K
Backup Light	3157K
License Light	168

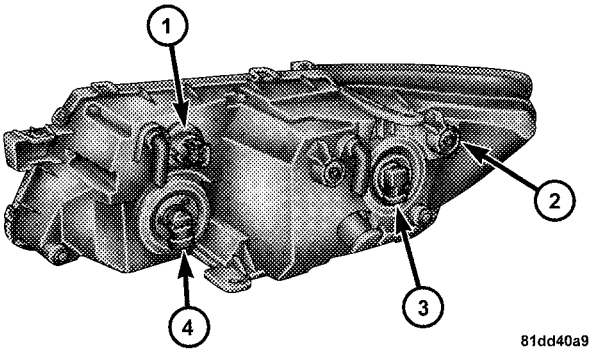
BULB REPLACEMENT

Low Beam Headlight, High Beam Headlight, Front Turn Signal/Park Light, Side Marker Light

1. Open the hood.

NOTE: It may be necessary to remove the air cleaner filter housing and position the Totally Integrated Power Module (TIPM) aside to replace certain the lights in the left headlight housing.

2. Rotate the applicable bulb and connector assembly ¼ turn counterclockwise and remove the assembly from the headlight housing.



1 — Front Turn Signal/Park Light Bulb
2 — Side Marker Light Bulb
3 — Low Beam Headlight Bulb
4 — High Beam Headlight Bulb

3. Disconnect the bulb from the harness connector and then connect the replacement bulb.

CAUTION!

Do not touch the new bulb with your fingers. Oil contamination will severely shorten bulb life. If the bulb comes in contact with any oily surface, clean the bulb with rubbing alcohol.

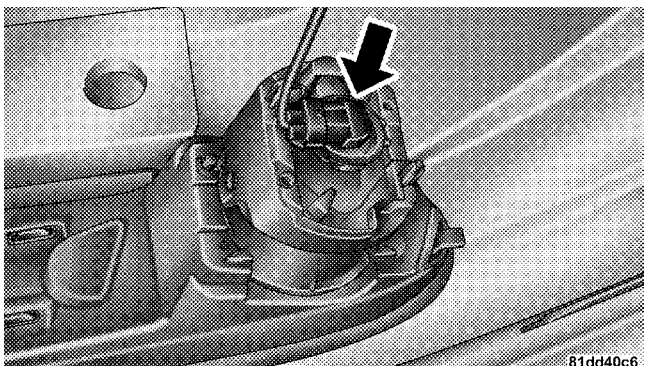
4. Install the bulb and connector assembly into the headlight housing and rotate it ¼ turn clockwise to lock it in place.

Front Fog Light

NOTE: Turn the steering wheel to the right if replacing the left front fog light or to the left if replacing the right front fog light to allow for easier access to the front of the wheel well.

1. Remove the fasteners retaining the front lower wheel well access panel and remove the access panel.

2. Rotate the bulb's electrical connector ¼ turn counterclockwise and remove it from the fog light housing.



3. Remove the bulb from the connector socket and install the replacement bulb.

CAUTION!

Do not touch the new bulb with your fingers. Oil contamination will severely shorten bulb life. If the bulb comes in contact with an oily surface, clean the bulb with rubbing alcohol.

4. Install the bulb and connector assembly into the fog light housing and rotate the connector ¼ turn clockwise to lock it in place.

5. Reinstall the front lower wheel well access panel and fasteners.

Tail/Stop Light, Rear Turn Signal Light, Tail Light, Backup Light

The taillights are a two-piece design. The tail/stop lights and rear turn signal lights are located in the rear corner body panels. The tail and backup lights are located in the liftgate.

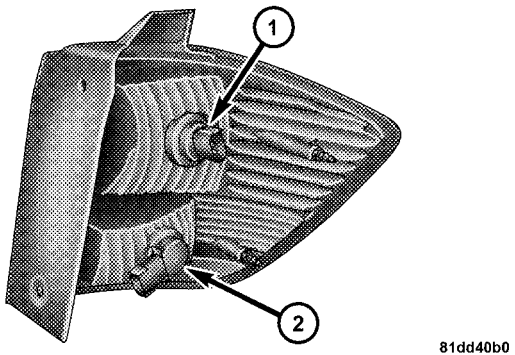
Changing the Tail/Stop Light or Rear Turn Signal Light

1. Open the liftgate.

2. Remove the two fasteners from the inboard side of the taillight housing.

3. Carefully insert a trim stick (plastic flat-blade tool) between the body panel and the outboard side of the taillight housing with one hand and grasp the flange on the inboard side of the taillight housing with the other hand. Use the trim stick and hand pressure together to disengage the taillight housing from the vehicle.

4. Rotate the applicable bulb's electrical connector ¼ turn counterclockwise and remove it from the taillight housing.



1 — Tail/Stop Light Bulb
2 — Rear Turn Signal Light Bulb

5. Remove the bulb from the connector socket and install the replacement bulb.

6. Install the bulb and connector assembly into the taillight housing and rotate the connector ¼ turn clockwise to lock it in place.

7. Reinstall the taillight housing and fasteners.

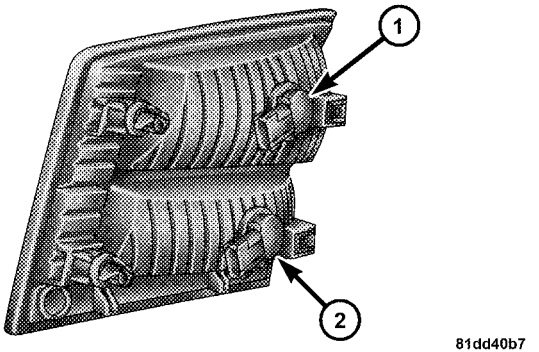
Changing the Tail Light or Backup Light

1. Open the liftgate.

2. Remove the two fasteners retaining the taillight housing to the liftgate from the inboard face of the liftgate.

3. Carefully insert a trim stick (plastic flat-blade tool) between the taillight housing and the liftgate. Use the trim stick and hand pressure together to disengage the taillight housing from the liftgate.

4. Rotate the applicable bulb's electrical connector ¼ turn counterclockwise and remove it from the housing.



1 — Tail Light Bulb
2 — Backup Light Bulb

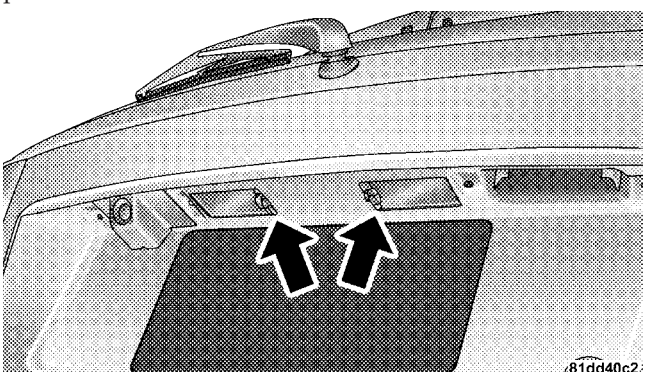
5. Remove the bulb from the connector socket and install the replacement bulb.

6. Install the bulb and connector assembly into the housing and rotate the connector ¼ turn clockwise to lock it in place.

7. Reinstall the taillight housing and fasteners.

License Plate Light

1. Push the small locking tab sticking out of the end of the lens toward the side of the vehicle and hold it in that position.



License Light

2. Insert a small flat-blade tool between the end of the lens with the locking tab and the surrounding housing and then pivot the tool to separate the lens from the housing.

3. Hold the lens with one hand and rotate the bulb's electrical connector ¼ turn counterclockwise with the other hand and then separate the bulb and connector assembly from the lens.

4. Remove the bulb from the connector socket and install the replacement bulb.

5. Install the bulb and connector assembly into the lens and rotate the connector ¼ turn clockwise to lock it in place.

6. Insert the end of the lens without the locking tab into the housing on the liftgate and then push the opposite end of the lens into the housing, making sure it locks in the housing.

FLUIDS AND CAPACITIES

Component	U.S.	Metric
Fuel (approximate)		
Front Wheel Drive (FWD) Models with 2.4 Liter PZEV Engine	18.5 gal	70 l
FWD Models without 2.4 Liter PZEV Engine	20.5 gal	77.6 l
All-Wheel Drive Models	21.1 gal	79.8 l
Engine Oil with Filter		
2.4 Liter Engine (SAE 5W-20, API Certified)	4.5 qts	4.26 l
2.7 Liter Engine (SAE 5W-20, API Certified)	5.5 qts	5.2 l
3.5 Liter Engine (SAE 10W-30, API Certified)	5.5 qts	5.2 l
Cooling System *		
2.4 Liter Engine and Single- or Dual-Zone Climate Control System (Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula) or equivalent	7.9 qts	7.5 l
2.4 Liter Engine and Three-Zone Climate Control System (Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula) or equivalent	9.8 qts	9.3 l

Component	U.S.	Metric
2.7 Liter Engine and Single- or Dual-Zone Climate Control System (Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula) or equivalent	9.8 qts	9.3 l
2.7 Liter Engine and Three-Zone Climate Control System (Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula) or equivalent	12 qts	11.4 l
3.5 Liter Engine and Single- or Dual-Zone Climate Control System (Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula) or equivalent	9.8 qts	9.3 l
3.5 Liter Engine and Three-Zone Climate Control System (Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula) or equivalent	12 qts	11.4 l
* Includes heater and coolant recovery bottle filled to MAX level.		

FLUIDS, LUBRICANTS, AND GENUINE PARTS

Engine

Component	Fluids, Lubricants, and Genuine Parts
Engine Coolant	Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology) or equivalent
Engine Oil (2.4L)	Use API Certified SAE 5W-20 Engine Oil meeting the requirements of Chrysler Material Standard MS-6395. Refer to the engine oil fill cap for correct SAE grade.
Engine Oil (2.7L)	Use API Certified SAE 5W-20 Engine Oil meeting the requirements of Chrysler Material Standard MS-6395. Refer to the engine oil fill cap for correct SAE grade.
Engine Oil (3.5L)	Use API Certified SAE 10W-30 Engine Oil meeting the requirements of Chrysler Material Standard MS-6395. Refer to the engine oil fill cap for correct SAE grade.
Oil Filter (2.4L)	Mopar® 04884900AB or equivalent
Oil Filter (2.7L)	Mopar® 04884899AB or equivalent
Oil Filter (3.5L)	Mopar® 04884899AB or equivalent
Spark Plugs (2.4L)	ZFR5F-11 (Gap.044 in [1.12 mm])

Component	Fluids, Lubricants, and Genuine Parts
Spark Plugs (2.7L)	TE10MCC5 (Gap.050 in [1.27 mm])
Spark Plugs (3.5L)	ZFR5LP-13G (Gap.050 in [1.27 mm])
Fuel Selection (2.4L)	87 Octane
Fuel Selection (2.7L)	87 Octane
Fuel Selection (2.7L - EXCEPT CALIFORNIA EMISSION STATES)	E-85 Ethanol
Fuel Selection (3.5L)	87 to 89 Octane

Chassis

Component	Fluids, Lubricants and Genuine Parts
Automatic Transaxle	Mopar® ATF+4 Automatic Transmission Fluid
Power Transfer Unit (PTU)	Mopar® Gear Lubricant 75W-90 or equivalent
Rear Drive Assembly (RDA)	Mopar® Gear Lubricant 75W-90 or equivalent.
Brake Master Cylinder	Mopar® DOT 3, SAE J1703 or equivalent should be used. If DOT 3 brake fluid is not available, then DOT 4 is acceptable. Use only recommended brake fluids.
Power Steering Reservoir	Mopar® Power Steering Fluid + 4, Mopar® ATF+4 Automatic Transmission Fluid

MAINTENANCE SCHEDULES

CONTENTS

■ Emissions Control System Maintenance 478
■ Maintenance Schedule 478
□ Required Maintenance Intervals 481

EMISSIONS CONTROL SYSTEM MAINTENANCE

The Scheduled Maintenance services listed in **bold type,** must be done at the times or mileages specified to ensure the continued proper functioning of the Emissions Control System. These, and all other maintenance services included in this manual, should be done to provide best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving.

Inspection and service should also be done anytime a malfunction is suspected.

NOTE: Maintenance, replacement, or repair of the emissions control devices and systems on your vehicle may be performed by any automotive repair establishment or individual using any automotive part that has been certified pursuant to U.S. EPA or in the State of California, California Air Resources Board regulations.

MAINTENANCE SCHEDULE

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles, “Oil Change Required” will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

On Non-EVIC equipped vehicles, “Change Oil” will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

Based on engine operation conditions, the oil change indicator message will illuminate. This means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 500 mi (805 km).

NOTE:

- The oil change indicator message will not monitor the time since the last oil change. Change your vehicles oil if it has been six months since your last oil change, even if the oil change indicator message is NOT illuminated.
- Change your engine oil more often if you drive your vehicle off-road for an extended period of time.
- Under no circumstances should oil change intervals exceed 6,000 mi (10,000 km) or six months, whichever comes first.

Your authorized dealer will reset the oil change indicator message after completing the scheduled oil change. If this scheduled oil change is performed by someone other than your authorized dealer, the message can be reset by referring to the steps described under "Oil Change Required" under "Electronic Vehicle Information Center (EVIC)" in Section 4 or under "Odometer/Trip Odometer" under "Instrument Cluster Descriptions" in Section 4.

At Each Stop for Fuel

- Check the engine oil level. Refer to "Engine Oil" under "Maintenance Procedures" in Section 7.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering, and transaxle, and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

CAUTION!

Failure to perform the required maintenance items may result in damage to the vehicle.

Required Maintenance Intervals

Maintenance Items	Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)		
	Miles	Kilometers	or Months
Change the engine oil and engine oil filter.	6,000	10 000	6
Rotate the tires.	6,000	10 000	6
If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary.	12,000	20 000	12
Inspect the brake linings, and replace if necessary.	12,000	20 000	12
Replace the air conditioning filter (if equipped).	12,000	20 000	12
Inspect the CV Joints. Perform the first inspection at 12,000 mi (20 000 km) or 12 months.	24,000	40 000	24
Inspect the exhaust system. Perform the first inspection at 12,000 mi (20 000 km) or 12 months.	24,000	40 000	24
Inspect the front suspension, tie rod ends and boot seals, and replace if necessary.	24,000	40 000	24
Replace the engine air cleaner filter.	30,000	50 000	30

Maintenance Items	Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)		
	Miles	**Kilometers**	**or Months**
Replace the spark plugs on 2.4L and 2.7L engines.	30,000	50 000	30
Change Rear Drive Assembly (RDA) fluid.	60,000	100 000	60
Change Power Transfer Unit (PTU) fluid.	60,000	100 000	60
Change the automatic transaxle fluid and filter if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing.	60,000	100 000	60
Inspect and replace PCV valve if necessary. †	90,000	150 000	90
Flush and replace the engine coolant.	102,000	170 000	60
Replace the spark plugs on 3.5L engines.	102,000	170 000	102
Replace the timing belt on 3.5L engines.	102,000	170 000	102
Change the automatic transaxle fluid and filter.	120,000	200 000	120
Replace the accessory drive belt on 2.4L and 2.7L engines.	120,000	200 000	120

† This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

WARNING!

You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

SUGGESTIONS FOR OBTAINING SERVICE FOR YOUR VEHICLE

Prepare For The Appointment

If you're having warranty work done, be sure to have the right papers with you. Take your warranty folder. All work to be performed may not be covered by the warranty. Discuss additional charges with the service manager. Keep a maintenance log of your vehicle's service history. This can often provide a clue to the current problem.

Prepare A List

Make a written list of your vehicle's problems or the specific work you want done. If you've had an accident or work done that is not on your maintenance log, let the service advisor know.

Be Reasonable With Requests

If you list a number of items and you must have your vehicle by the end of the day, discuss the situation with the service advisor and list the items in order of priority. At many authorized dealers, you may obtain a rental vehicle at a minimal daily charge. If you need a rental, it is advisable to make these arrangements when you call for an appointment.

IF YOU NEED ASSISTANCE

The manufacturer and its authorized dealers are vitally interested in your satisfaction. We want you to be happy with our products and services.

Warranty service must be done by an authorized dealer. We strongly recommend that you take the vehicle to an authorized selling dealer. They know you and the vehicle best, and are most concerned that you get prompt and

high quality service. The manufacturer's authorized dealers have the facilities, factory-trained technicians, special tools, and the latest information to ensure the vehicle is fixed correctly and in a timely manner.

This is why you should always talk to an authorized dealer's service manager first. Most matters can be resolved with this process.

- If for some reason you are still not satisfied, talk to the general manager or owner of the authorized dealership. They want to know if you need assistance.
- If an authorized dealership is unable to resolve the concern, you may contact the Manufacturer's Customer Center.

Any communication to the Manufacturer's Customer Center should include the following information:

- Owner's name and address
- Owner's telephone number (home and office)
- Authorized dealership name
- Vehicle Identification Number (VIN)
- Vehicle delivery date and mileage

Chrysler LLC Customer Center
P.O. Box 21–8004
Auburn Hills, MI 48321–8004
Phone: (800) 992-1997

Chrysler Canada Inc. Customer Center
P.O. Box 1621
Windsor, Ontario N9A 4H6
Phone: (800) 465–2001

In Mexico contact:

Av. Prolongacion Paseo de la Reforma, 1240
Sante Fe C.P. 05109
Mexico, D. F.
In Mexico City: 5081-4568
Outside Mexico City: 1-800-505-1300

Customer Assistance For The Hearing Or Speech Impaired (TDD/TTY)

To assist customers who have hearing difficulties, the manufacturer has installed special TDD (Telecommunication Devices for the Deaf) equipment at its Customer Center. Any hearing or speech impaired customer, who has access to a TDD or a conventional teletypewriter (TTY) in the United States, can communicate with the manufacturer by dialing 1–800–380–CHRY.

Service Contract

You may have purchased a service contract for an vehicle to help protect you from the high cost of unexpected repairs after the manufacturer's New Vehicle Limited Warranty expires. The manufacturer stands behind only the manufacturer's Service Contracts. If you purchased a manufacturer's Service Contract, you will receive Plan Provisions and an Owner Identification Card in the mail within three weeks of the vehicle delivery date. If you have any questions about the service contract, call the manufacturer's Service Contract National Customer Hotline at 1-800-521-9922.

The manufacturer will not stand behind any service contract that is not the manufacturer's Service Contract. It is not responsible for any service contract other than the manufacturer's Service Contract. If you purchased a service contract that is not a manufacturer's Service

Contract, and you require service after the manufacturer's New Vehicle Limited Warranty expires, please refer to the contract documents, and contact the person listed in those documents.

We appreciate that you have made a major investment when you purchased the vehicle. An authorized dealer has also made a major investment in facilities, tools, and training to assure that you are absolutely delighted with the ownership experience. You'll be pleased with their sincere efforts to resolve any warranty issues or related concerns.

WARNING!

Engine exhaust, some of its constituents, and certain vehicle components contain, or emit, chemicals known to the State of California to cause cancer and birth defects or other reproductive harm. In addition, certain fluids contained in vehicles and certain products of component wear contain, or emit, chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

WARRANTY INFORMATION (U.S. Vehicles Only)

See the Warranty Information Booklet for the terms and provisions of Chrysler LLC warranties applicable to this vehicle.

MOPAR® PARTS

Mopar® fluids, lubricants, parts, and accessories are available from an authorized dealer. They will help keep the vehicle operating at its best.

REPORTING SAFETY DEFECTS

In The 50 United States And Washington, D.C.

If you believe that your vehicle has a defect that could cause a crash or cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying the manufacturer.

If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your authorized dealer, and the manufacturer.

To contact NHTSA, you may either call the Auto Safety Hotline toll free at 1–888–327–4236 (TTY: 1–800–424– 9153), or go to http://www.safercar.gov; or write to: Administrator, NHTSA, 400 Seventh Street, SW., Washington, D.C. 20590. You can also obtain other information about motor vehicle safety from http://www.safercar.gov.

In Canada

If you believe that your vehicle has a safety defect, you should contact the Customer Service Department immediately. Canadian customers who wish to report a safety defect to the Canadian government should write to: Transport Canada, Motor Vehicle Defect Investigations and Recalls, 2780 Sheffield Road, Ottawa, Ontario K1B 3V9.

PUBLICATION ORDER FORMS

To order the following manuals, you may use either the website or the phone numbers listed below. Visa, Mastercard, American Express, and Discover orders are accepted. If you prefer mailing your payment, please call for an order form.

NOTE: A street address is required when ordering manuals (no P.O. Boxes).

- *Service Manuals*

  These comprehensive Service Manuals provide the information that students and professional technicians need in diagnosing/troubleshooting, problem solving, maintaining, servicing, and repairing Chrysler LLC vehicles. A complete working knowledge of the vehicle, system, and/or components is written in straightforward language with illustrations, diagrams, and charts.

- *Diagnostic Procedure Manuals*

  Diagnostic Procedure Manuals are filled with diagrams, charts and detailed illustrations. These practical manuals make it easy for students and technicians to find and fix problems on computer-controlled vehicle systems and features. They show exactly how to find and correct problems the first time, using step-by-step troubleshooting and drivability procedures, proven diagnostic tests and a complete list of all tools and equipment.

- *Owner's Manuals*

  These Owner's Manuals have been prepared with the assistance of service and engineering specialists to acquaint you with specific Chrysler LLC vehicles. Included are starting, operating, emergency and maintenance procedures as well as specifications, capabilities and safety tips.

Call toll free at:

- **1–800–890–4038 (U.S.)**
- **1–800–387–1143 (Canada)**

DEPARTMENT OF TRANSPORTATION UNIFORM TIRE QUALITY GRADES

The following tire grading categories were established by the National Highway Traffic Safety Administration. The specific grade rating assigned by the tire's manufacturer in each category is shown on the sidewall of the tires on your vehicle.

All passenger car tires must conform to Federal safety requirements in addition to these grades.

Treadwear

The Treadwear grade is a comparative rating, based on the wear rate of the tire when tested under controlled conditions on a specified government test course. For example, a tire graded 150 would wear one and one-half times as well on the government course as a tire graded 100. The relative performance of tires depends upon the actual conditions of their use, however, and may depart significantly from the norm due to variations in driving habits, service practices, and differences in road characteristics and climate.

Traction Grades

The Traction grades, from highest to lowest, are AA, A, B, and C. These grades represent the tire's ability to stop on wet pavement, as measured under controlled conditions on specified government test surfaces of asphalt and concrete. A tire marked C may have poor traction performance.

WARNING!

The traction grade assigned to this tire is based on straight-ahead braking traction tests, and does not include acceleration, cornering, hydroplaning, or peak traction characteristics.

Temperature Grades

The temperature grades are A (the highest), B, and C, representing the tire's resistance to the generation of heat and its ability to dissipate heat, when tested under controlled conditions on a specified indoor laboratory test wheel. Sustained high temperature can cause the material of the tire to degenerate and reduce tire life, and excessive temperature can lead to sudden tire failure. The grade C corresponds to a level of performance, which all passenger car tires must meet under the Federal Motor Vehicle Safety Standard No. 109. Grades B and A represent higher levels of performance on the laboratory test wheel, than the minimum required by law.

WARNING!

The temperature grade for this tire is established for a tire that is properly inflated and not overloaded. Excessive speed, under-inflation, or excessive loading, either separately or in combination, can cause heat buildup and possible tire failure.

YES Essentials® Fabric Cleaning Procedure 455

INSTALLATION OF RADIO TRANSMITTING EQUIPMENT

Special design considerations are incorporated into this vehicle's electronic system to provide immunity to radio frequency signals. Mobile two-way radios and telephone equipment must be installed properly by trained personnel. The following must be observed during installation.

The positive power connection should be made directly to the battery and fused as close to the battery as possible. The negative power connection should be made to body sheet metal adjacent to the negative battery connection. This connection should not be fused.

Antennas for two-way radios should be mounted on the roof or the rear area of the vehicle. Care should be used in mounting antennas with magnet bases. Magnets may affect the accuracy or operation of the compass on vehicles so equipped.

The antenna cable should be as short as practical and routed away from the vehicle wiring when possible. Use only fully shielded coaxial cable.

Carefully match the antenna and cable to the radio to ensure a low Standing Wave Ratio (SWR).

Mobile radio equipment with output power greater than normal may require special precautions.

All installations should be checked for possible interference between the communications equipment and the vehicle's electronic systems.
