PROPELLER SHAFT

DESCRIPTION

DESCRIPTION

WARNING: Due to propeller shaft imbalance concerns, the propeller shaft can only be serviced as an assembly.

AWD models utilize a "three-piece" propeller shaft to transmit torque to the rear driveline module assembly. This three-piece design consists of:

- Front center and rear shaft segments
- Plunging front CV joint.
- Center support bearings
- Rubber coupler at driveline module flange

The front shaft segment utilizes a plunging CV joint at the power transfer unit connection. The center and rear shaft segments utilize a support bearing/bracket assembly. The rear shaft segment uses a rubber coupler at the driveline module flange.

OPERATION

OPERATION

The propeller shaft is used to transmit torque from the transaxle power transfer unit (PTU) to the rear driveline module of AWD equipped models.

The propeller shaft front segment utilizes a plunging CV joint at the PTU flange. The joint is flexible, allowing for torsional movement of the powertrain.

The propeller shaft center and rear segments utilize a support bearing/bracket, which support this three-piece assembly and isolates driveline vibrations from the body. The rubber coupler at the driveline module flange dampens out propeller shaft torsional vibrations, as the driveline module it connects to is fastened to the rear suspension crossmember.

REMOVAL

REMOVAL

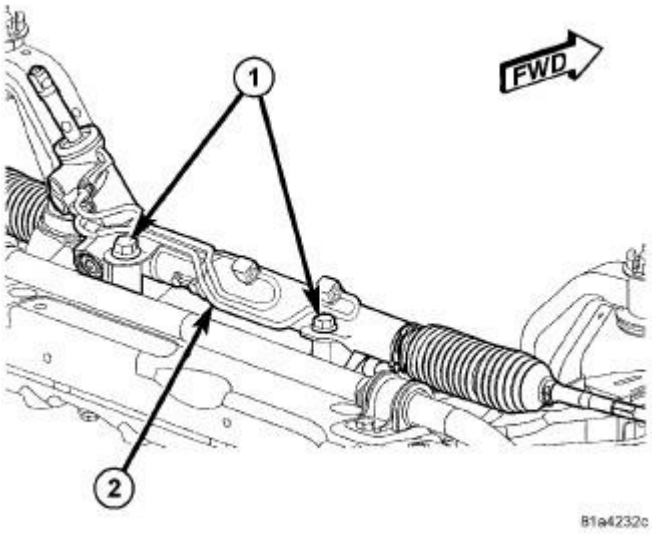

Fig. 54: Removing /Installing Propeller Shaft

CAUTION: Propeller shaft removal is a two-man operation. Never allow propeller shaft to hang from the center bearing, or while only connected to power transfer unit (PTU) or rear driveline module flanges. A helper is required. If a propshaft section is hung unsupported, damage may occur to the joint, boot, and/or center bearing from over-angulation. This may result in driveline vibrations.

NOTE: Rubber coupler is part of the propeller shaft assembly. Removing coupler from propeller shaft will result in vibration/balance issues.

1. Make sure transaxle is in neutral (N).
2. Raise vehicle on hoist.
3. Apply alignment index marks (4) on the rear axle flange (5) and rubber coupler (1).
4. Remove three rear propeller shaft rubber coupler to rear axle input flange retaining bolts (3).

CAUTION: Propeller shaft installation. Never allow propeller shaft to hang while connected to Power Transfer Unit (PTU), rear driveline module flanges or center bearings. If propeller shaft section is hung unsupported, damage may occur to joint, boot and/or center bearing from over-angulation. This may result in vibration/balance issues. A helper may be needed.

1. Make sure transaxle is in Neutral (N) position.
2. Raise vehicle on hoist.
3. Obtain a helper if needed and lift propeller shaft assembly into position. Install propeller shaft to PTU with mounting bolts and tighten to 30 N.m (22 ft. lbs.).

REAR DRIVELINE MODULE

OPERATION

OPERATION

The primary benefits of All Wheel Drive are:

- Superior straight line acceleration, and cornering on all surfaces
- Better traction and handling under adverse conditions, resulting in improved hill climbing ability and safer driving.

The electronically controlled clutch (ECC) controls torque transfer to the rear differential assembly.

ECU (Inside vehicle) uses throttle position, wheel speeds and steering angle (if equipped) to control clutch.

DIAGNOSIS AND TESTING

REAR DRIVELINE MODULE NOISE

Different sources can be the cause of noise that the rear driveline module assembly is suspected of making. Refer to the following causes for noise diagnosis.

DRIVELINE MODULE ASSEMBLY NOISE

The most important part of driveline module service is properly identifying the cause of failures and noise complaints. The cause of most driveline module failures is relatively easy to identify. The cause of driveline module noise is more difficult to identify.

If vehicle noise becomes intolerable, an effort should be made to isolate the noise. Many noises that are reported as coming from the driveline module may actually originate at other sources. For example:

- Tires
- Road surfaces
- Wheel bearings
- Engine
- Transmission
- Exhaust
- Propeller shaft (vibration)
- Vehicle body (drumming)

Driveline module noises are normally divided into two categories: gear noise or bearing noise. A thorough and careful inspection should be completed to determine the actual source of the noise before replacing the driveline module.

The rubber mounting bushings help to dampen-out driveline module noise when properly installed. Inspect to confirm that no metal contact exists between the driveline module case and the body or suspension cradle. The complete isolation of noise to one area requires expertise and experience. Identifying certain types of vehicle noise baffles even the most capable technicians. Often such practices as:

- Increase tire inflation pressure to eliminate tire noise.
- Listen for noise at varying speeds with different driveline load conditions
- Swerving the vehicle from left to right to detect wheel bearing noise.

All driveline module assemblies produce noise to a certain extent. Slight carrier noise that is noticeable only at certain speeds or isolated situations should be considered normal. Carrier noise tends to peak at a variety of vehicle speeds. Noise is **NOT ALWAYS** an indication of a problem within the carrier.

TIRE NOISE

Tire noise is often mistaken for driveline module noise. Tires that are unbalanced, worn unevenly or are worn in a saw-tooth manner are usually noisy. They often produce a noise that appears to originate in the driveline module.

Tire noise changes with different road surfaces, but driveline module noise does not. Inflate all four tires with approximately 20 psi (138 kPa) more than the recommended inflation pressure (for test purposes only). This will alter noise caused by tires, but will not affect noise caused by the differential. Rear axle noise usually ceases when coasting at speeds less than 30 mph (48 km/h); however, tire noise continues, but at a lower frequency, as the speed is reduced.

After test has been completed lower tire pressure back to recommended pressure.

GEAR NOISE (DRIVE PINION AND RING GEAR)

Abnormal gear noise is rare and is usually caused by scoring on the ring gear and drive pinion. Scoring is the result of insufficient or incorrect lubricant in the carrier housing.

Abnormal gear noise can be easily recognized. It produces a cycling tone that will be very pronounced within a given speed range. The noise can occur during one or more of the following drive conditions:

- Drive
- Road load
- Float
- Coast

Abnormal gear noise usually tends to peak within a narrow vehicle speed range or ranges. It is usually more pronounced between 30 to 40 mph (48 to 64 km/h) and 50 to 60 mph (80 to 96 km/h). When objectionable gear noise occurs, note the driving conditions and the speed range.

BEARING NOISE (DRIVE PINION AND DIFFERENTIAL)

Defective bearings produce a rough growl that is constant in pitch and varies with the speed of vehicle. Being aware of this will enable a technician to separate bearing noise from gear noise.

Drive pinion bearing noise that results from defective or damaged bearings can usually be identified by its constant, rough sound. Drive pinion front bearing is usually more pronounced during a coast condition. Drive pinion rear bearing noise is more pronounced during a drive condition. The drive pinion bearings are rotating at a higher rate of speed than either the differential side bearings or the axle shaft bearing.

Differential side bearing noise will usually produce a constant, rough sound. The sound is much lower in frequency than the noise caused by drive pinion bearings.

Bearing noise can best be detected by road testing the vehicle on a smooth road (black top). However, it is easy to mistake tire noise for bearing noise. If a doubt exists, the tire treads should be examined for irregularities that often causes a noise that resembles bearing noise.

ENGINE AND TRANSMISSION NOISE

Sometimes noise that appears to be in the driveline module assembly is actually caused by the engine or the transmission. To identify the true source of the noise, note the approximate vehicle speed and/or RPM when the noise is most noticeable. Stop the vehicle next to a flat brick or cement wall (this will help reflect the sound). Place the transaxle in **NEUTRAL** . Accelerate the engine slowly up through the engine speed that matches the vehicle speed noted when the noise occurred. If the same noise is produced, it usually indicates that the noise is being caused by the engine or transaxle.

REAR DRIVELINE MODULE OPERATION

Driveline module operation requires relatively straight-forward diagnosis. Refer to the following chart:

CONDITION	POSSIBLE CAUSES	CORRECTION
No AWD in forward or reverse directions, propeller shaft turning	1. Check ECC	1. Review ECC diagnostic information
	2. Rear differential failure	2. Replace the rear differential assembly
No AWD in forward or reverse directions, propeller shaft not turning	1. Power transfer unit failure.	1. Replace power transfer unit components as necessary
Vibration at all speeds, continuous torque transfer	1. Mis-matched tires, worn tires on front axle.	1. Replace worn or incorrect (mis-matched) tires with same make and size

NOTE: Rear suspension and drivetrain design require this procedure to be performed on a "drive-on" hoist, as the front and rear suspension needs to be compressed to ride height to facilitate rear halfshaft removal.

1. Make sure transaxle is in Neutral (N) position.
2. Raise vehicle on hoist.
3. Remove exhaust system center hanger (at propeller shaft bearing/support).
4. Disconnect exhaust system at rear-most hanger and lower at least 254 mm (10 in.). Support system with suitable wire or rope.
5. Drain differential lubricant to prevent fluid spillage upon removal. See **STANDARD PROCEDURE - DIFFERENTIAL ASSEMBLY FLUID CHANGE**.

CASE ASSEMBLY, DIFFERENTIAL

Description

DESCRIPTION

The differential gear system divides the torque between the axle shafts. It allows the axle shafts to rotate at different speeds when turning corners.

Each differential side gear is splined to an axle shaft. The pinion gears are mounted on a pinion mate shaft and are free to rotate on the shaft. The pinion gear is fitted in a bore in the differential case and is positioned at a right angle to the axle shafts.

Operation

OPERATION

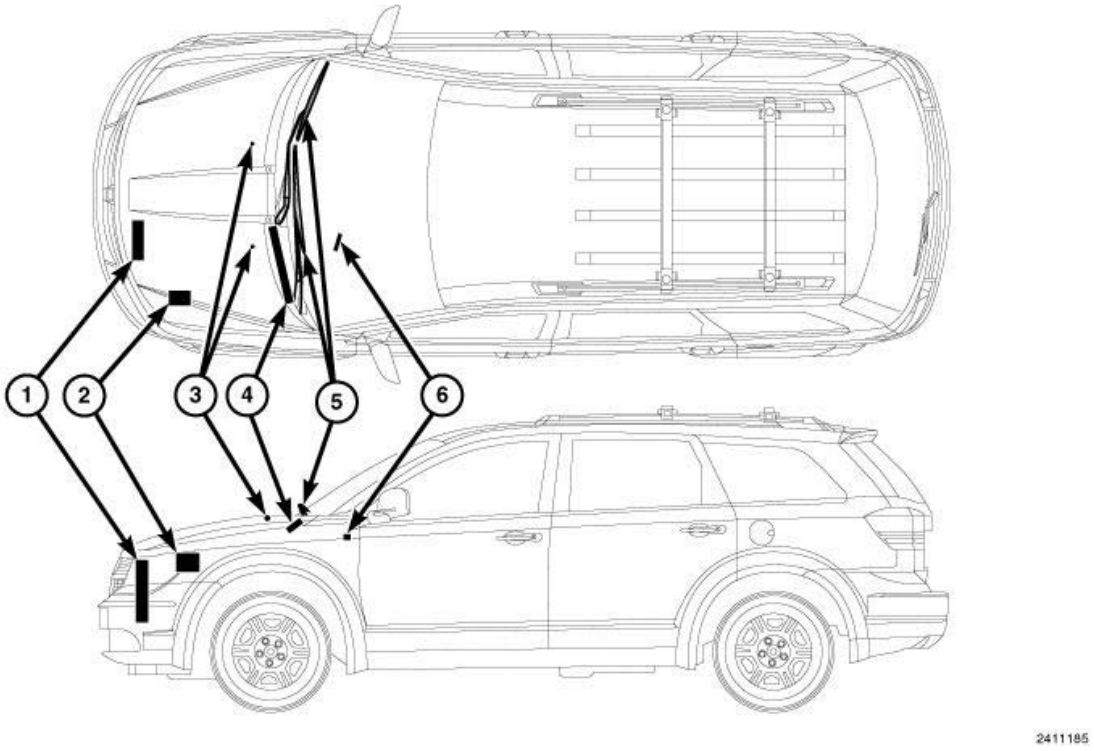

Fig. 77: Differential Operation-Straight Ahead Driving
Courtesy of CHRYSLER LLC

1 - IN STRAIGHT AHEAD DRIVING EACH WHEEL ROTATES AT 100% OF CASE SPEED
2 - PINION GEAR
3 - SIDE GEAR
4 - PINION GEARS ROTATE WITH CASE

In operation, power flow occurs as follows:

- The pinion gear (2) rotates the ring gear
- The ring gear (bolted to the differential case) rotates the case
- The differential pinion gears (mounted on the pinion mate shaft in the case) rotate the side gears
- The side gears (splined to the axle shafts) rotate the shafts

During straight-ahead driving, the differential pinion gears do not rotate on the pinion mate shaft. This occurs

because input torque applied to the gears is divided and distributed equally between the two side gears. As a result, the pinion gears revolve with the pinion mate shaft but do not rotate around it.

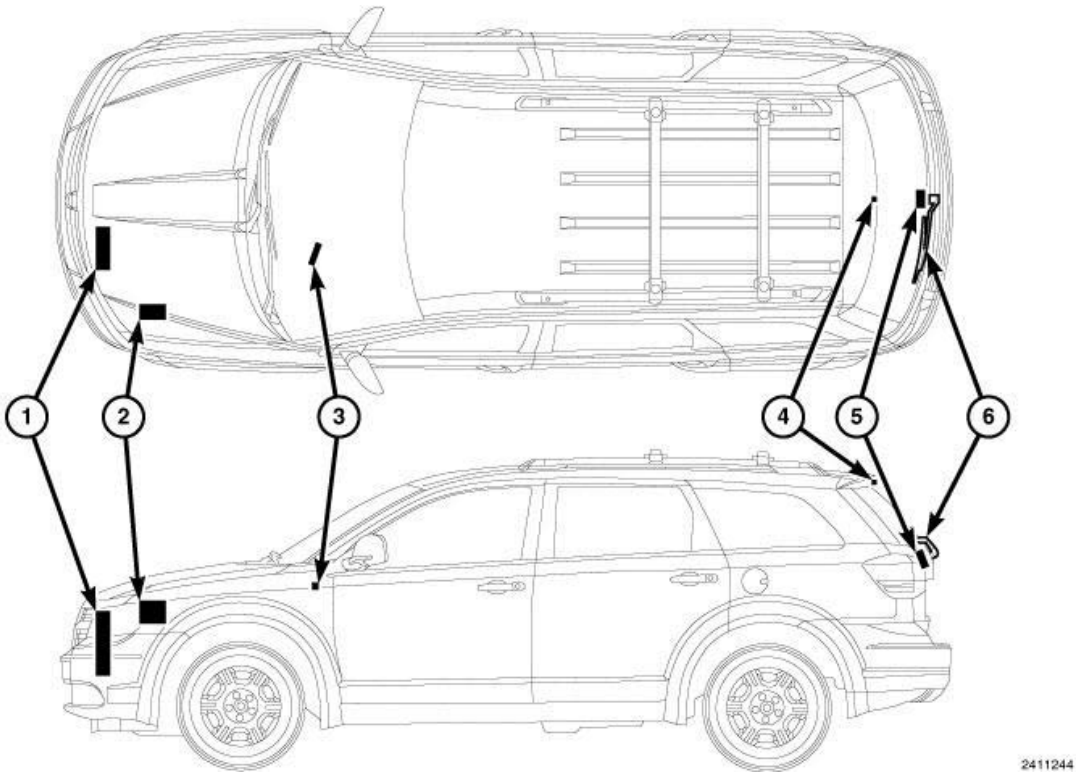

Fig. 78: Pinion Gears
Courtesy of CHRYSLER LLC

1 - PINION GEARS ROTATE ON PINION SHAFT

When turning corners, the outside wheel must travel a greater distance than the inside wheel to complete a turn. The difference must be compensated for to prevent the tires from scuffing and skidding through turns. To accomplish this, the differential allows the axle shafts to turn at unequal speeds. In this instance, the input torque applied to the pinion gears is not divided equally. The pinion gears now rotate around the pinion mate shaft in opposite directions. This allows the side gear and axle shaft attached to the outside wheel to rotate at a faster speed.

FLUID, DIFFERENTIAL

Standard Procedure

STANDARD PROCEDURE - DIFFERENTIAL ASSEMBLY FLUID CHANGE

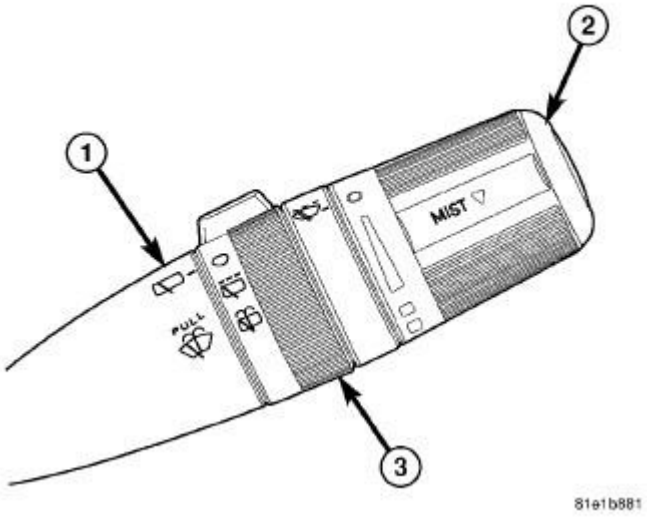

Fig. 79: Differential Assembly Fluid Change
Courtesy of CHRYSLER LLC

The drain plug (2) for the differential assembly is located in the bottom of the differential assembly case, toward the rear of the unit.

The fill plug (3) for the differential assembly is located on the left side of the assembly case.

The correct fill level is to the bottom of the fill plug hole. Be sure the vehicle is on a level surface, or is hoisted in a level manner, in order to obtain the correct fill level.

1. Raise the vehicle on a hoist.
2. Position a drain pan under the differential drain plug.
3. Remove the drain plug and allow the fluid to drain into the pan.
4. Install the drain plug and torque to 35 N.m (26 ft. lbs.).
5. Re-position the drain pan under the differential fill plug.
6. Remove the differential fill plug.
7. Using a suction gun or equivalent, fill the differential assembly with 0.7 L (0.74 Quarts) of Mopar® Gear and Axle Lubricant (75W-90).
8. Install the fill plug and torque to 35 N.m (26 ft. lbs.).

The 41TE is a four-speed transaxle that is a conventional hydraulic/mechanical assembly with an integral differential, and is controlled with adaptive electronic controls and monitors. The hydraulic system of the transaxle consists of the transaxle fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transaxle consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly
- Integral differential assembly

Control of the transaxle is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Powertrain Control Module (PCM) or Transmission Control Module (TCM).

The PCM/TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the PCM/TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The PCM/TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the scan tool.

TRANSAXLE IDENTIFICATION

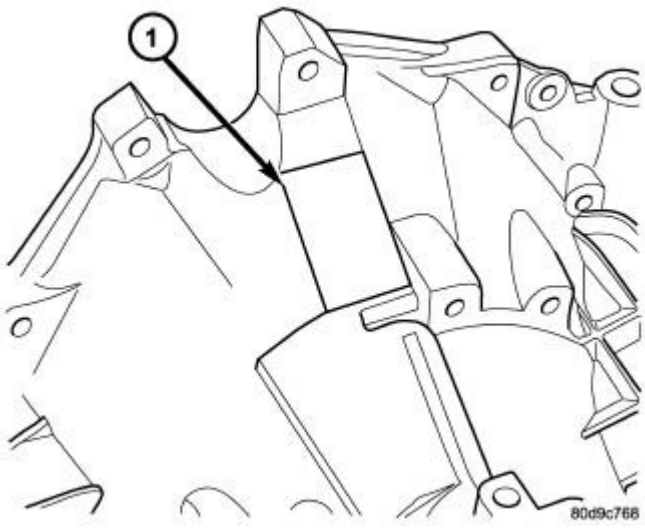

Fig. 2: Locating Transaxle Identification Label

1 - IDENTIFICATION LABEL

The 41TE transaxle is identified by a barcode label (1) that is fixed to the transaxle.

6 - LINE/SHIFT CODE (3=3RD SHIFT)
7 - BUILD SEQUENCE NUMBER
8 - LAST THREE OF P/N
9 - ALPHA
10 - TRANSAXLE PART NUMBER
11 - P=PART NUMBER

The label contains a series of digits that can be translated into useful information such as transaxle part number, date of manufacture, manufacturing origin, plant shift number, build sequence number, etc. Refer to **Fig. 3** for identification label breakdown.

If the tag is not legible or missing, the "PK" number, which is stamped into the transaxle case behind the transfer gear cover, can be referred to for identification. This number differs slightly in that it contains the entire transaxle part number, rather than the last three digits.

DIAGNOSIS AND TESTING

40/41TE TRANSAXLE GENERAL DIAGNOSIS

NOTE: Before attempting any repair on a 40/41TE four-speed automatic transaxle, check for Diagnostic Trouble Codes (DTC's) using the scan tool. Refer to POWERTRAIN CONTROL MODULE (PCM) - ELECTRICAL DIAGNOSTICS - 40/41TE .

Transaxle malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transaxle should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transaxle cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transaxle in all selector positions.

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

SHIFT LEVER POSITION	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse

P - PARK	-	-	-	-	X
R - REVERSE	-	-	X	-	X
N - NEUTRAL	-	-	-	-	X
OD - OVERDRIVE First	- X	- -	- -	- -	- X
Second	X	-	-	X	-

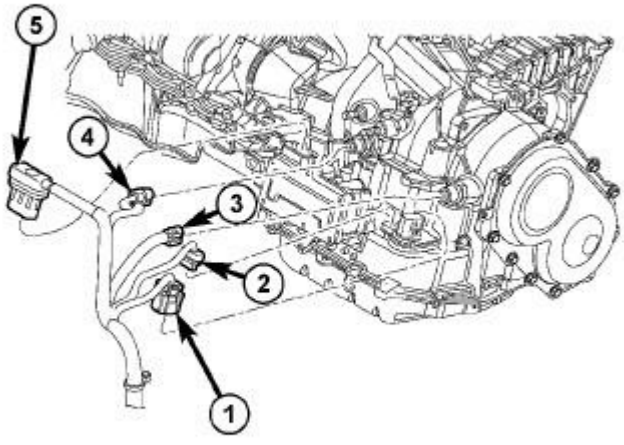
L - LOW* First	- X	- -	- -	- -	- X
Second	X	-	-	X	-
Direct	X	X	-	-	-
* Vehicle upshift and downshift speeds are increased when in these selector positions.					

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

HYDRAULIC PRESSURE TESTS



81920979

Fig. 4: Identifying Transmission Electrical Connectors
Courtesy of CHRYSLER LLC

NOTE: Before preforming the hydraulic pressure tests be certain to disconnect the Variable Line Pressure (VLP) electrical connector (2) at the transmission. Check for and clear any codes that may have been set after preforming any hydraulic pressure tests and connecting the Variable Line Pressure (VLP) electrical connector.

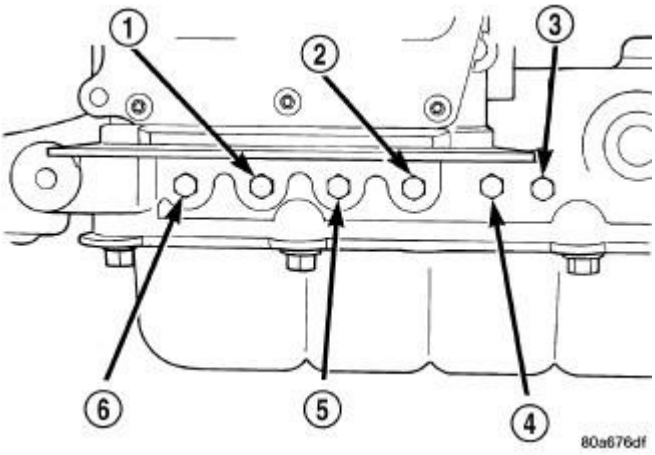


Fig. 5: Identifying Pressure Ports

1 - OVERDRIVE CLUTCH
2 - TORQUE CONVERTER OFF
3 - LOW/REVERSE CLUTCH
4 - 2/4 CLUTCH
5 - REVERSE CLUTCH
6 - UNDERDRIVE CLUTCH

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most hydraulic transaxle problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature 150 to 200 ° F. (66 to 93 ° C).

Install an engine tachometer, raise vehicle on hoist which allows front wheels to turn, and position tachometer so it can be read.

Attach 300 psi Gauge C-3293SP to port(s) (1) overdrive clutch, (2) torque converter off, (3) low/reverse clutch, (4) 2/4 clutch, (5) reverse clutch, (6) underdrive clutch required for test(s) being conducted. Use Adapter Set L-4559 to adapt gauge(s) to transaxle.

TEST ONE-SELECTOR IN LOW (1st GEAR)

1. Attach pressure gauge to the low/reverse clutch tap.
2. Move selector lever to the (L) position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.
4. Low/reverse clutch pressure should read 115 to 145 psi.
5. This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

TEST TWO-SELECTOR IN DRIVE (2nd GEAR)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the 3 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.
4. In second gear the underdrive clutch pressure should read 110 to 145 psi.

TEST TWO A-SELECTOR IN OD (4th Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the (OD) position.
3. Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.
4. Underdrive clutch pressure should read below 5 psi. If not, then either the solenoid assembly or PCM/TCM is at fault.

TEST THREE-OVERDRIVE CLUTCH CHECK (3rd and 2nd Gear)

1. Attach gauge to the overdrive clutch tap.
2. Move selector lever to the (OD) position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph. Vehicle should be in 3rd gear.
4. Overdrive clutch pressure should read 74 to 95 psi.
5. Move selector lever to the (3) position and increase indicated vehicle speed to 30 mph.
6. The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.
7. This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.

TEST FOUR-SELECTOR IN OVERDRIVE (4th Gear)

1. Attach gauge to the 2/4 clutch tap.
2. Move selector lever to the (OD) position.
3. Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in 4th gear.
4. The 2/4 clutch pressure should read 75 to 95 psi.
5. This test checks the 2/4 clutch hydraulic circuit.

TEST FIVE-SELECTOR IN OVERDRIVE (4th Gear-CC on)

1. Attach gauge to the torque converter clutch off pressure tap.
2. Move selector lever to the (OD) position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

CAUTION: Both wheels must turn at the same speed.

4. Torque converter clutch off pressure should be less than 5 psi.
5. This test checks the torque converter clutch hydraulic circuit.

TEST SIX-SELECTOR IN REVERSE

1. Attach gauges to the reverse and LR clutch tap.
2. Move selector lever to the (R) position.
3. Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 RPM.
4. Reverse and LR clutch pressure should read 165 to 235 psi.
5. This test checks the reverse clutch hydraulic circuit.

TEST RESULT INDICATIONS

1. If proper line pressure is found in any one test, the pump and pressure regulator are working properly.
2. Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.
3. Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.
4. If the overdrive clutch pressure is greater than 5 psi in 4 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.
5. If the underdrive clutch pressure is greater than 5 psi in 4 of Test Two A, a defective solenoid assembly or PCM/TCM is the cause.

CLUTCH AIR PRESSURE TESTS

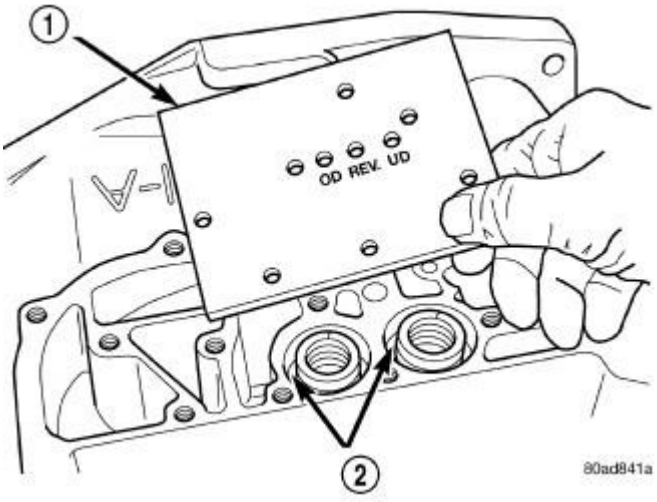

Fig. 6: Identifying Air Pressure Test Plate Tool 6056

1 - AIR PRESSURE TEST PLATE TOOL 6056

2 - ACCUMULATORS

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure using Air Pressure Test Plate 6056 (1) .

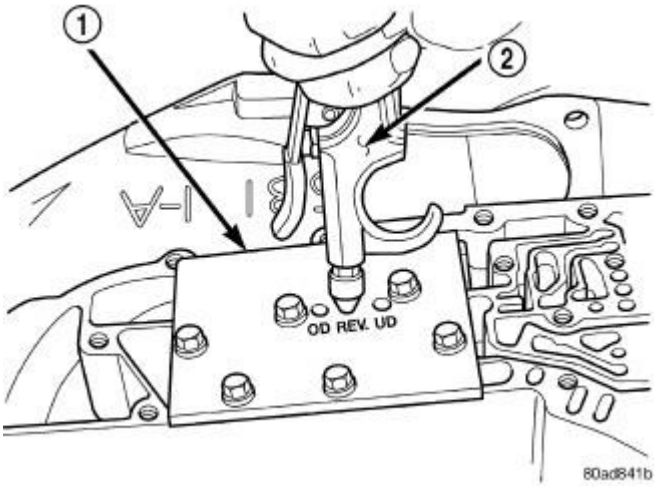

Fig. 7: Testing Clutches Using Air Pressure Test Plate 6056
Courtesy of CHRYSLER LLC

1 - AIR PRESSURE TEST PLATE 6056
2 - AIR NOZZLE

The clutches may be tested by applying air pressure (2) to their respective passages. The valve body must be removed and Air Pressure Test Plate 6056 (1) installed. To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

Remove oil pan and valve body. See **Transmission and Transfer Case/Automatic - 41TE/VALVE BODY - Removal**.

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer. Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole (rear of case, between 2 bolt holes). Then, look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Air pressure is applied to the low/reverse and the 2/4 clutches. This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

TORQUE CONVERTER HOUSING FLUID LEAKAGE

2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak. The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources inspect pump seal (1), pump vent (2), pump bolts (3), pump gasket (4), converter housing (5), converter (6) and a rear main seal leak (7). Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump O-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing.

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (1) .
- Torque converter hub weld (2).

REMOVAL

REMOVAL

    a. With output gear removed, install a 4.50 mm (0.177 in.) gauging shim on the rear carrier assembly hub, using grease to hold the shim in place.
    b. Using Holder 6259, install output gear and bearing assembly. Torque to 271 N.m (200 ft. lbs.).
    c. Measure bearing end play. Attach Gear Checking Plate L-4432 (1) to the gear.
    d. Push and pull the gear while rotating back and forth to ensure seating of bearing rollers.
    e. Using a dial indicator mounted to the transaxle case, measure output gear end play.
    f. Refer to **OUTPUT GEAR BEARING SHIM CHART** for the required shim to obtain proper bearing setting.
    g. Use Holder 6259 to remove the output gear retaining bolt and washer. To remove the output gear, use Gear Puller L-4407A.
    h. Remove the gauging shim and install the proper shim determined by the chart. Use grease to hold the shim in place.

The 41TE underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston (2), seal rings (3) return spring(s) (1) and a cover or plug. The overdrive and underdrive accumulators are located within the transaxle case, and are retained by the valve body.

The low reverse accumulator (1) is also located within the transaxle case, but the assembly is retained by a cover and a snap-ring.

The 2/4 accumulator is located in the valve body (1) . It is retained by a cover and retaining screws.

OPERATION

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and spring(s). The intended result is a smooth, firm clutch application.

ASSEMBLY, TRANSMISSION SOLENOID AND PRESSURE SWITCH

DESCRIPTION

DESCRIPTION

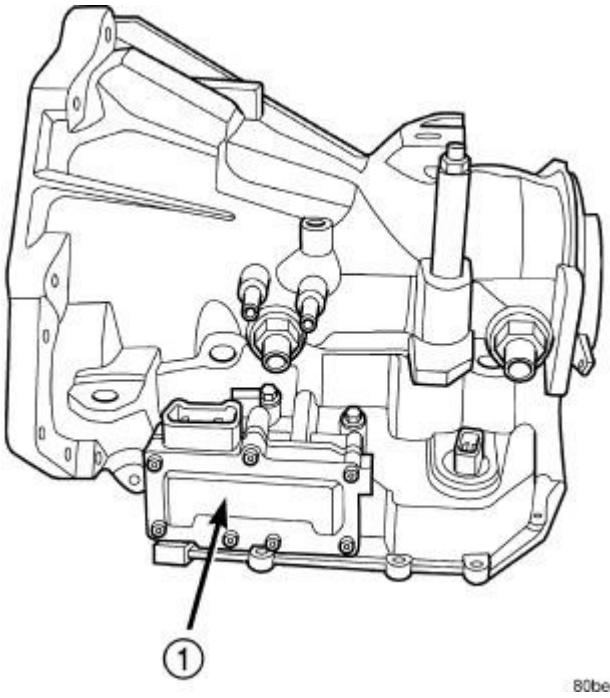

Fig. 297: Identifying Solenoid/Pressure Switch Assembly
Courtesy of CHRYSLER LLC

1 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

The Solenoid/Pressure Switch Assembly (1) is external to the transaxle and mounted to the transaxle case. The assembly consists of four solenoids that control hydraulic pressure to the LR/CC, 2/4, OD, and UD friction elements. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the PCM/TCM. Likewise, the pressure switches can only be service by replacing the assembly.

OPERATION

OPERATION

SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The PCM/TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which by design allow fluid to pass through in their relaxed or "off" state. This allows transaxle limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM/TCM during this test. It no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The PCM/TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the PCM/TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the PCM/TCM for the correct states (open or closed) in each gear as shown in the following chart:

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL
OP = OPEN			
CL = CLOSED			

A Diagnostic Trouble Code (DTC) will set if the PCM/TCM senses any switch open or closed at the wrong time in a given gear.

The PCM/TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 RPM, the PCM/TCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

5. Install the cable to the shifter (1, 2).
6. Install the knee blocker (2). Refer to **INSTALLATION** .

ADJUSTMENTS

ADJUSTMENTS

ADJUSTMENT

1. Park the vehicle on level ground and set the parking brake.
2. Place the gearshift lever in gated park (P) and remove ignition key.
3. Loosen the cable adjustment screw at the transaxle manual valve lever.
4. Pull the gearshift lever fully forward to the park detent position.
5. Release the park brake, then rock the vehicle to assure it is in park. Reset the park brake.
6. Tighten the cable adjustment screw to 8 N.m (70 in. lbs.). Gearshift cable should now be properly adjusted.
7. Verify adjustment by using the verification procedure.

VERIFICATION

1. Place gearshift lever in gated park (P).
2. Attempt to move vehicle by rocking back and forth on level ground. If vehicle does not move, attempt to start engine. If engine starts, the park position is correct.
3. Set parking brake.
4. Turn key to on/run and depress brake pedal. Place gearshift lever in neutral (N).
5. Attempt to start engine. If engine starts in both neutral (N) or park (P), gearshift cable is adjusted properly. No adjustment is required.
6. If engine does not start in either park (P) or neutral (N), perform adjustment procedure.

The 41TE differential is a conventional open design. It consists of a ring gear and a differential case. The differential case consists of pinion and side gears, and a pinion shaft. The differential case is supported in the transaxle by tapered roller bearings .

OPERATION

OPERATION

The differential assembly is driven by the transfer shaft by way of the differential ring gear. The ring gear drives the differential case, and the case drives the driveshafts through the differential gears. The differential pinion and side gears are supported in the case by thrust washers and a pinion shaft. Differential pinion and side gears make it possible for front tires to rotate at different speeds while cornering.

3. Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

4. Using Tool L-4436-A and an inch-pound torque wrench, check the turning torque of the differential . **The turning torque should be between 5 and 18 inch-pounds.**
5. If the turning torque is within specifications, remove tools. Setup is complete.
6. If turning torque is not within specifications, proceed with the following steps:
   a. Remove differential bearing retainer from the transaxle case.
   b. Remove the bearing cup from the differential bearing retainer using Tool 6062A.
   c. Remove the existing shim from under the cup.
   d. Measure the existing shim.
   e. If the turning torque was too high when measured, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is was too low, install a 0.05 mm (0.002 inch) thicker shim. Repeat until 5-18 inch-pounds turning torque is obtained.

      Oil Baffle is not required to be installed when making shim selection.

   f. Install the proper shim under the bearing cup. Make sure the oil baffle is installed properly in the bearing retainer, below the bearing shim and cup.
   g. Install the differential bearing retainer using Tool 5052 and C-4171. Seal the retainer to the housing with MOPAR® Silicone Rubber Adhesive Sealant and torque bolts to 28 N.m (250 in. lbs.).
7. Using Tool L-4436-A and an inch-pound torque wrench, recheck the turning torque of the differential. **The turning torque should be within 5-18 inch-pounds.**

Shim thickness need be determined only if any of the following parts are replaced:

- Transaxle case
- Differential carrier
- Differential bearing retainer
- Extension housing
- Differential bearing cups and cones

PRELOAD ADJUSTMENT W/O SHIM

1. Remove the bearing cup from the differential bearing retainer using Miller special Tool 6062A.
2. Remove existing shim from under bearing cup.
3. Reinstall the bearing cup into the retainer using Miller Special Tool 6061, and C-4171.

NOTE: Oil baffle is not required when making the shim calculation.

4. Install the bearing retainer into the case. Torque bolts to 28 N.m (250 in. lbs.).
5. Position the transaxle assembly vertically on the support stand and install Miller Special Tool L-4436-A into the bearing retainer.
6. Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.
7. Attach a dial indicator to the case and zero the dial. Place the tip on the end of Special Tool L-4436-A.
8. Place a large screwdriver to each side of the ring gear and lift. Check the dial indicator for the amount of end play.

CAUTION: Do not damage the transaxle case and/or differential retainer sealing surface.

9. Using the end play measurement that was determined, add 0.18mm (0.007 inch). This should give you between 5-18 inch pounds of bearing preload. Refer to **DIFFERENTIAL BEARING SHIM CHART** to determine which shim to use.
10. Remove the differential bearing retainer. Remove the bearing cup.
11. Install the oil baffle. Install the proper shim combination under the bearing cup.
12. Install the differential bearing retainer. Seal the retainer to the housing with Mopar® Silicone Rubber Adhesive Sealant. Torque bolts to 28 N.m (250 in. lbs.).
13. Using Miller Special Tool L-4436-A and an inch-pound torque wrench, check the turning torque of the differential . The turning torque should be between 5-18 inch-pounds.

NOTE: If turning torque is too high install a 0.05mm (0.002 inch) thicker shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thinner shim. Repeat until 5-18 inch-pounds of turning torque is obtained.

DRIVING CLUTCHES

DESCRIPTION

DESCRIPTION

1 - INPUT SHAFT
2 - UNDERDRIVE CLUTCH
3 - OVERDRIVE CLUTCH
4 - REVERSE CLUTCH
5 - OVERDRIVE SHAFT
6 - UNDERDRIVE SHAFT

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly . The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

OPERATION

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

NOTE: Refer to ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER for a collective view of which clutch elements are applied at each position of the selector lever.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

FLUID

STANDARD PROCEDURE

FLUID LEVEL AND CONDITION CHECK

FLUID LEVEL CHECK

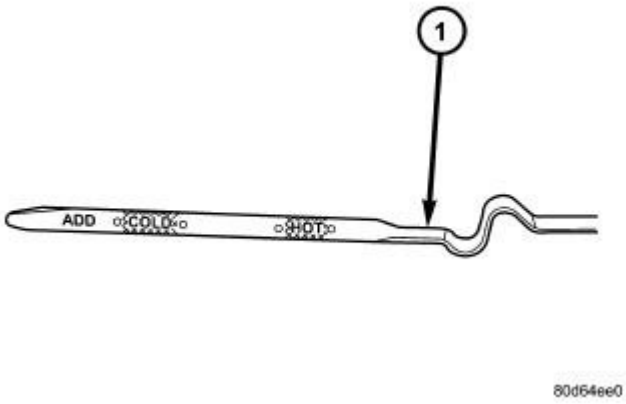

Fig. 351: Identifying Fluid Level Indicator
Courtesy of CHRYSLER LLC

1 - FLUID LEVEL INDICATOR

NOTE: Only transmission fluid of the type labeled Mopar ATF+4 (Automatic Transmission Fluid) should be used in this transaxle.

The transmission sump has a fluid level indicator (dipstick) to check oil similar to most automatic transmissions. It is located on the left side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P Park and N Neutral positions. Place the selector lever in P Park to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature 82° C (180° F), the fluid level is correct if it is in the HOT region on the oil level indicator (1) . The fluid level should be within the COLD region of the dipstick at 27° C (80° F) fluid temperature.

FLUID LEVEL CHECK USING DRB

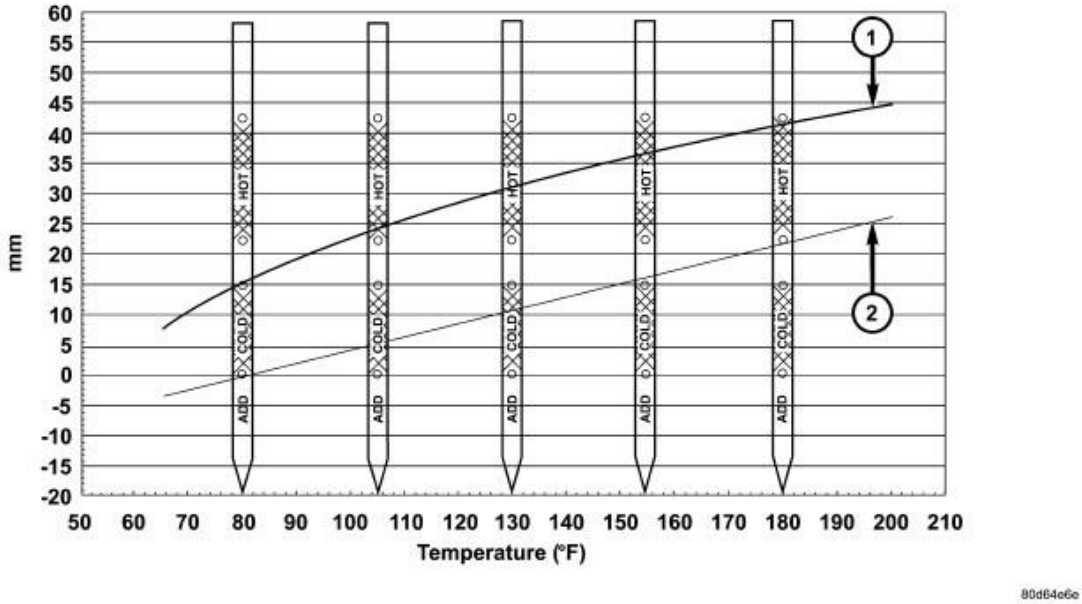

Fig. 352: Transmission Fluid Temperature Chart
Courtesy of CHRYSLER LLC

1 - MAX. LEVEL 2 - MIN. LEVEL

NOTE: Engine and Transaxle should be at normal operating temperature before performing this procedure.

1. Start engine and apply parking brake.
2. Hook up DRB scan tool and select transmission.
3. Select sensors.
4. Read the transmission temperature value.
5. Compare the fluid temperature value with the fluid temperature chart (1,2) .
6. Adjust transmission fluid level shown on the indicator according to **Fig. 352**.
7. Check transmission for leaks.

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transaxle has too much fluid, the gears churn up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with

normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transaxle vent where it may be mistaken for a leak.

FLUID CONDITION

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transaxle recondition is probably required. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

Mopar® ATF+4 (Automatic Transmission Fluid), when new, is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition or the need for a fluid change.**

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

FLUID AND FILTER SERVICE

FLUID/FILTER SERVICE (RECOMMENDED)

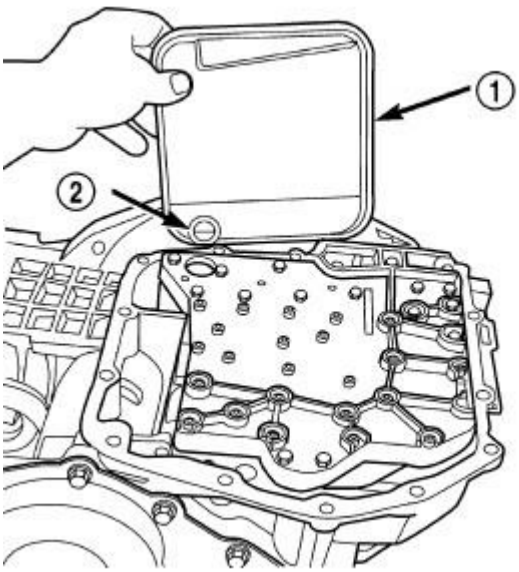

Fig. 353: Identifying Filter & O-Ring
Courtesy of CHRYSLER LLC

1 - OIL FILTER
2 - O-RING

NOTE: **Refer to MAINTENANCE SCHEDULES for the recommended maintenance (fluid/filter change) intervals for this transaxle.**

NOTE: Only fluids of the type labeled Mopar® ATF+4 should be used. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transaxle is disassembled for any reason, the fluid and filter should be changed.

1. Raise vehicle on a hoist. Refer to **HOISTING** for proper procedures. Place a drain container with a large opening, under transaxle oil pan.
2. Remove both engine mount-to-engine crossmember cradle nuts. Using suitable screw jack and wood block, raise engine and transmission slightly to facilitate transaxle oil pan removal and installation.
3. Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.
4. Install a new filter and o-ring on bottom of the valve body .

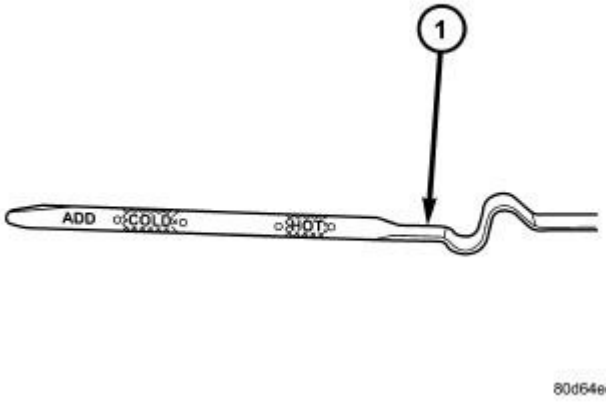

Fig. 354: Identifying Fluid Level Indicator
Courtesy of CHRYSLER LLC

1 - FLUID LEVEL INDICATOR

5. Clean the oil pan and magnet. Reinstall pan using new Mopar Silicone Adhesive sealant. Tighten oil pan bolts to 19 N.m (165 in. lbs.).
6. Pour four Quarts of Mopar® ATF+4 through the dipstick opening.
7. Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.
8. Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick .
9. Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.[82°C]). Refer to **FLUID LEVEL AND CONDITION CHECK** for the proper fluid fill procedure.
10. To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick

opening.

DIPSTICK TUBE FLUID SUCTION METHOD (ALTERNATIVE)

1. When performing the fluid suction method, make sure the transaxle is at full operating temperature.
2. To perform the dipstick tube fluid suction method, use a suitable fluid suction device (Vacula™ or equivalent).
3. Insert the fluid suction line into the dipstick tube.

NOTE: Verify that the suction line is inserted to the lowest point of the transaxle oil pan. This will ensure complete evacuation of the fluid in the pan.

4. Follow the manufacturers recommended procedure and evacuate the fluid from the transaxle.
5. Remove the suction line from the dipstick tube.
6. Pour four Quarts of Mopar® ATF+4 through the dipstick opening.
7. Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.
8. Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick .
9. Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.[82°C]). See **FLUID LEVEL CHECK**.
10. To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

The planetary geartrain is located between the input clutch assembly and the rear of the transaxle case. The planetary geartrain consists of two sun gears (1,5) , two planetary carriers, two annulus (ring) gears (4,6), and one output shaft.

OPERATION

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components (1,4) stationary while the input clutches drive others. The 2/4 (2) and Low/Reverse (3) clutches are considered holding clutches and are contained at the rear of the transaxle case.

OPERATION

OPERATION

NOTE: Refer to ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER for a collective view of which clutch elements are applied at each position of the selector lever.

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in Second and Fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transaxle case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in Park, Reverse, Neutral, and First gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transaxle case.

6 - REACTION SHAFT
7 - CRESCENT

The oil pump is located in the pump housing inside the bell housing of the transmission case. The oil pump assembly consists of an inner (3) and outer (2) gear, a housing (1), and a cover that also serves as the reaction shaft support (6).

OPERATION

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

STANDARD PROCEDURE

OIL PUMP VOLUME CHECK

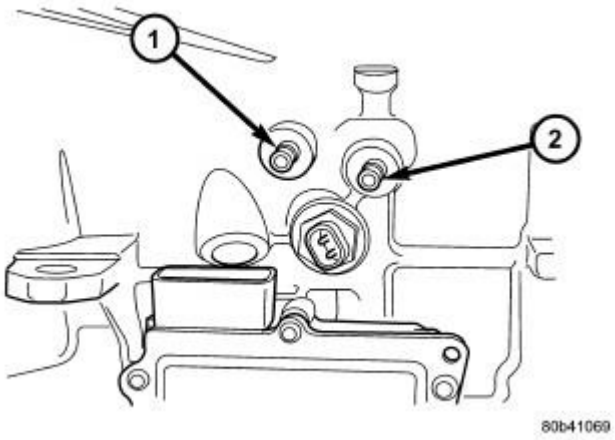

Fig. 360: Identifying Transmission Oil Cooler Ports
Courtesy of CHRYSLER LLC

1 - FROM COOLER 2 - TO COOLER

Measuring oil pump output volume will determine if sufficient flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that transmission fluid is at the proper level. If adding fluid is necessary, fill to the proper level with Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602). The following procedure is to check oil pump output volume:

1. Using hose cutters or a suitable blade, cut the "to cooler" line off flush with the cooler inlet fitting and place a collection container under the open line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

2. Start engine and run **at curb idle speed** , with the shift selector in neutral.
3. If one quart of ATF is collected in 20 seconds or less, flow is within acceptable limits. If fluid flow is intermittent or it takes more than 20 seconds to collect one quart of ATF, see **Transmission and Transfer Case/Automatic - 41TE - Diagnosis and Testing**.
4. Inspect the cooler hose for damage. Replace if necessary.
5. Re-connect the to cooler line to the transmission using a service splice kit. Refer to instructions included with the kit.
6. Refill the transaxle to proper level with Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602).

1 - TRANSMISSION CONTROL RELAY 2 - POWER DISTRIBUTION CENTER

The transmission control relay (1) is located in the Power Distribution Center (PDC) (2), which is located on the left side of the engine compartment between the battery and radiator upper support.

OPERATION

OPERATION

The Transmission Control Relay is supplied fused B+ voltage, energized by the PCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset (ignition key turned to the "run" position or after cranking engine), the PCM energizes the relay. Prior to this, the PCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the PCM monitors the terminals to verify that the voltage is greater than 3 volts.

The Input Speed Sensor (1) provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub (3) pass by the sensor coil, an AC voltage is generated and sent to the PCM/TCM. The PCM/TCM interprets this information as input shaft RPM.

The PCM/TCM compares the input speed signal with output speed signal to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The PCM/TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

1 - OUTPUT SPEED SENSOR
2 - REAR PLANET CARRIER/OUTPUT SHAFT ASSEMBLY
3 - TRANSAXLE CASE

The Output Speed Sensor (1) provides information on how fast the output shaft is rotating. As the rear planetary carrier park pawl lugs pass by the sensor coil, an AC voltage is generated and sent to the PCM/TCM. The PCM/TCM interprets this information as output shaft RPM.

The PCM/TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

VEHICLE SPEED SIGNAL

The vehicle speed signal is taken from the Output Speed Sensor. The PCM converts this signal into a pulse per mile signal and sends the vehicle speed message across the communication bus to the BCM. The BCM sends this signal to the Instrument Cluster to display vehicle speed to the driver. The vehicle speed signal pulse is roughly 8000 pulses per mile.

SENSOR, TRANSMISSION RANGE

DESCRIPTION

DESCRIPTION

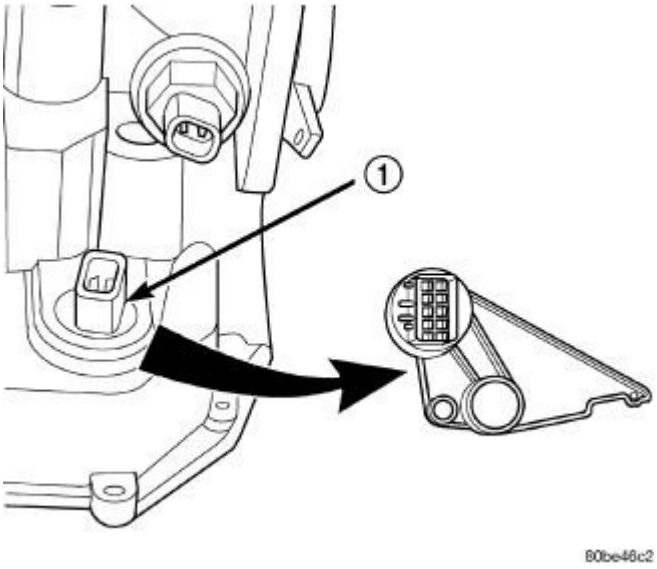

Fig. 386: Locating Transmission Range Sensor (TRS)
Courtesy of CHRYSLER LLC

1 - TRANSMISSION RANGE SENSOR

The Transmission Range Sensor (TRS) (1) is mounted to the top of the valve body inside the transaxle and can only be serviced by removing the valve body. The electrical connector extends through the transaxle case.

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the PCM/TCM.

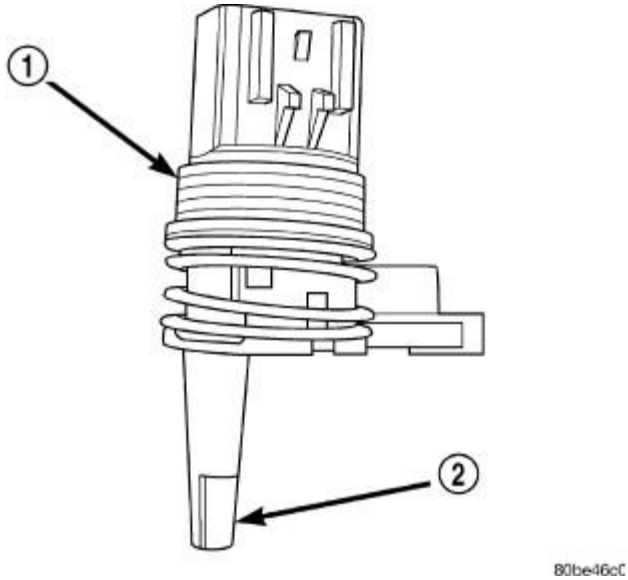

Fig. 387: Identifying Transmission Range Sensor With Integrated Temperature Sensor
Courtesy of CHRYSLER LLC

1 - TRANSMISSION RANGE SENSOR
2 - TEMPERATURE SENSOR

The TRS (1) also has an integrated temperature sensor (thermistor) (2) that communicates transaxle temperature to the TCM and PCM .

OPERATION

OPERATION

The Transmission Range Sensor (TRS) communicates Shift Lever Position (SLP) to the PCM/TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the PCM/TCM receives from four sense circuits. The PCM/TCM interprets this information and determines the appropriate transaxle gear position and shift schedule.

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as "between gear" codes. This results in six codes which should never occur. These are called "invalid" codes. An invalid code will result in a DTC, and the PCM/TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRS SWITCH STATES

SHIFT LEVER POSITION	T42	T41	T3	T1
P	CL	CL	CL	OP
R	CL	OP	OP	OP
N	CL	CL	OP	CL
OD	OP	OP	OP	CL
3	OP	OP	CL	OP
L	CL	OP	CL	CL

TRANSMISSION TEMPERATURE SENSOR

The TTS has an integrated thermistor that the PCM/TCM uses to monitor the transmission's sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the PCM/TCM requires this information to determine which shift schedule to operate in. The PCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission "overheat" condition exists. If the thermistor circuit fails, the PCM/TCM will revert to calculated oil temperature usage.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature

- Engine coolant temperature
- In-gear run time since start-up

SENSOR, VARIABLE LINE PRESSURE

The line pressure sensor (2) is mounted on the top of the valve body, next to the pressure control solenoid (1).

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump. The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure solenoid monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts and when the transmission is in the PARK and NEUTRAL positions. This is done to ensure consistent shift quality. During all other operation, the actual line

pressure is compared to the desired line pressure and adjustments are made to the pressure control solenoid duty cycle.

The pressure control solenoid (1) is mounted on the top of the valve body, next to the line pressure sensor (2).

The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

OPERATION

The pressure control solenoid (PCS) is a variable force (VFS) style solenoid. A VFS solenoid is an electro-hydraulic actuator, combining a solenoid and a regulating valve.

The transmission control module varies the current for the PCS, which varies the pressure in the line pressure hydraulic circuit. When the current (duty cycle) of the PCS is low, the pressure in the circuit is higher. At 0 current (0% duty cycle), the pressure is at the maximum value. Conversely, when the current is maximized (100% duty cycle), the pressure in the circuit is at the lowest possible value.

SWITCH, AUTOSTICK

DESCRIPTION

DESCRIPTION

Autostick is a driver-interactive transmission feature that offers manual gear shifting capability to provide you with more control. Autostick allows you to maximize engine braking, eliminate undersirable upshifts and downshifts, and improve overall vehicle performance. This system can also provide you with more control during passing, city driving, cold slippery conditions, mountain driving, trailer towing, and many other situations.

OPERATION

OPERATION

Autostick is a driver interactive transaxle feature that offers manual gear shifting capability. When the shifter is moved into the Autostick position, the transaxle remains in whatever gear it was using before Autostick was activated. Moving the shifter to the left (towards the driver) causes a downshift and moving to the right (towards the passenger) causes an upshift. The instrument cluster will illuminate the selected gear. The vehicle can be launched in 1st, 2nd, or 3rd gear while in the Autostick mode. The speed control is operable in 3rd and 4th gear Autostick mode. Speed control will be deactivated if the transaxle is shifted to 2nd gear. Shifting into OD position cancels the Autostick mode, and the transaxle resumes the OD shift schedule.

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a solenoid operated system that prevents the transmission gear shifter from being moved out of PARK without a driver in place.

OPERATION

OPERATION

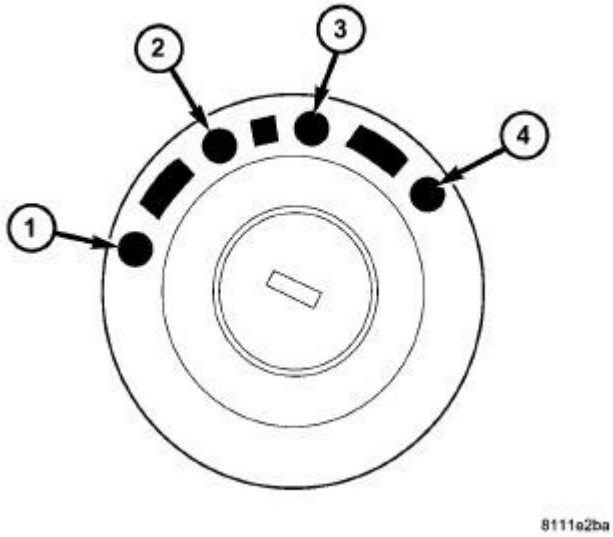

Fig. 419: Identifying Ignition Key/Switch Positions
Courtesy of CHRYSLER LLC

1 - LOCK 2 - ACC 3 - ON 4 - START

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK or ACC position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position.

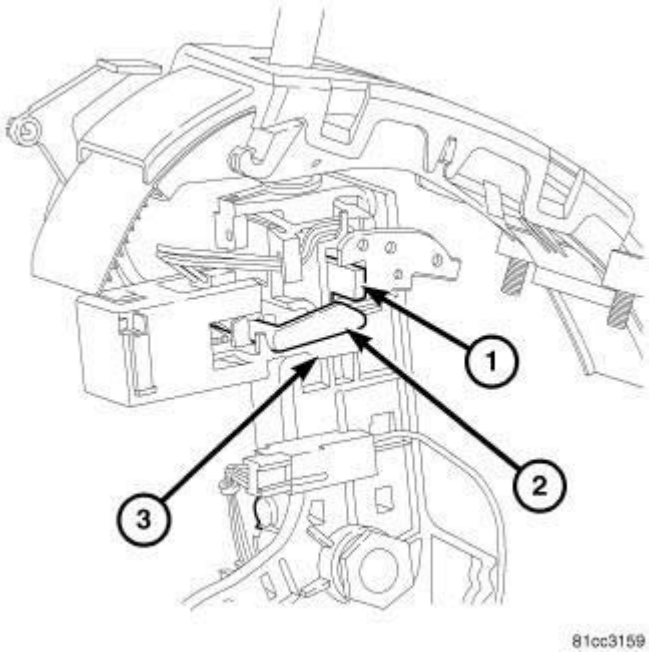

Fig. 420: Identifying Rotating Arm, Blocking Arm, & Shifter Gate Pin
Courtesy of CHRYSLER LLC

When service brake pedal is not depressed the solenoid rotating arm (2) is free to rotate. The shifter gate pin (1) hits the blocking arm (3) and is prevented from moving from park.

When service brake is applied the rotating arm (2) is prevented from rotating by magnetic force within the solenoid. The shifter gate pin (1) pushes the rotating arm (2) and blocker arm (3) allowing the shifter to move out of park.

DIAGNOSIS AND TESTING

SHIFT INTERLOCK SYSTEM

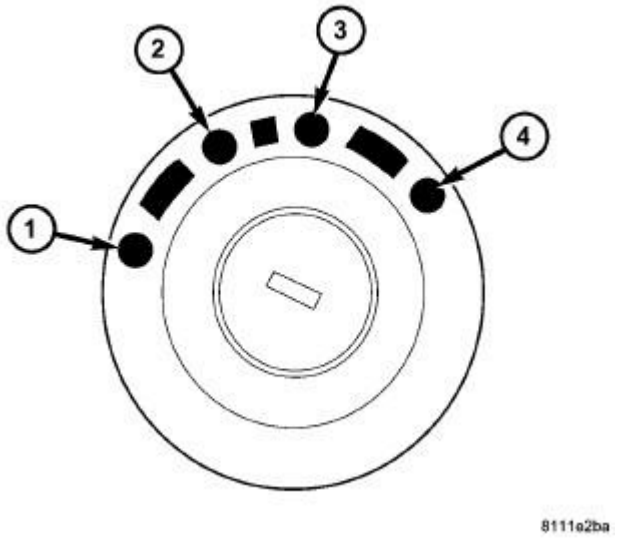

Fig. 421: Identifying Ignition Key/Switch Positions
Courtesy of CHRYSLER LLC

1 - LOCK
2 - ACC
3 - ON
4 - START

The Shifter Response Table describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair is necessary.

Refer to **SHIFTER RESPONSE** for expected shifter response, depending on ignition key/switch and brake pedal positions.

If the shifter cannot be moved out of the PARK position, refer to **SHIFTER LOCKED IN PLACE**. If the shift lever can be shifted out of PARK without the brake pedal depressed, the BTSI solenoid is faulty and the shifter must be replaced. If the shift lever still does not move from the park position, the problem is in the shift lever assembly. .

SHIFTER LOCKED IN PLACE

1. Gain access to the brake transmission shift interlock (BTSI) solenoid. The solenoid is part of the shifter assembly.
2. Disconnect the wire connector from the rear of the BTSI solenoid.
3. Insert the ignition key and turn it to the ON position.
4. With the brakes applied, try moving the shifter out of the PARK position.

   If the above test passes and the shifter can still be moved freely in and out of PARK without the brake pedal depressed, replace shifter assembly.

SHIFTER RESPONSE

ACTION	EXPECTED RESPONSE
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
Insert the key into the ignition cylinder and leave it at "LOCK." Try to move the transmission out of "Park".	Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system repair.

5 - CONVERTER CLUTCH DISC
6 - DRIVE PLATE

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1) , a stator (4), an over-running clutch, an impeller (2) and an electronically applied converter clutch (5). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub (3) drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION
3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller (3) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine (4,5), so is the impeller, because they are one and the same and are the driving member of the system.

The turbine (1) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft (3) is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

The stator assembly (1) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller (2) and turbine (4) within the torque converter case. The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

4 - STATOR
5 - TURBINE
6 - PISTON
7 - FRICTION DISC

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) was added to the turbine (5), and a friction material (7) was added to the inside of the front cover (1) to provide this mechanical lock-up.

OPERATION

OPERATION

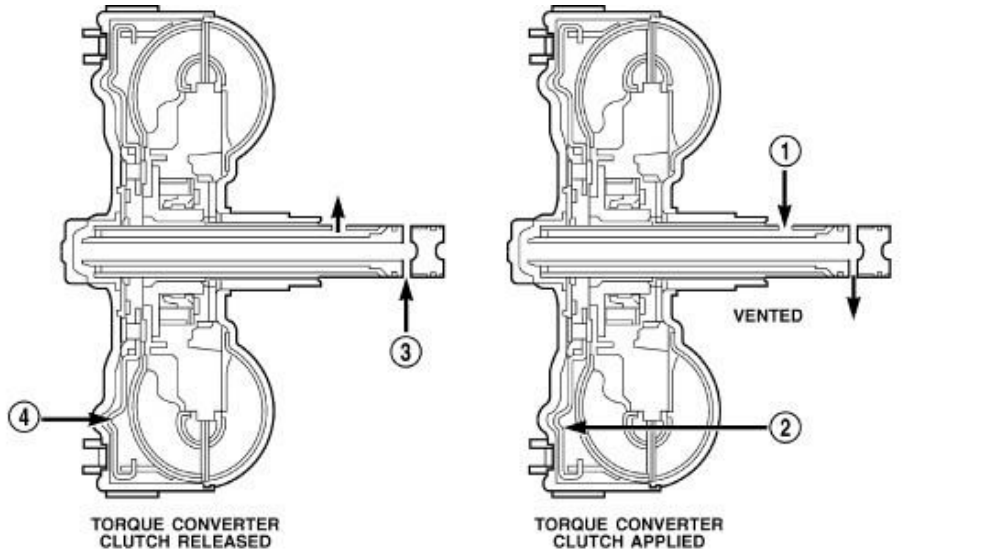

Fig. 427: Identifying Torque Converter Fluid Pressure Operation
Courtesy of CHRYSLER LLC

1 - APPLY PRESSURE	3 - RELEASE PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD	4 - THE PISTON MOVES SLIGHTLY REARWARD

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft .

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades, it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

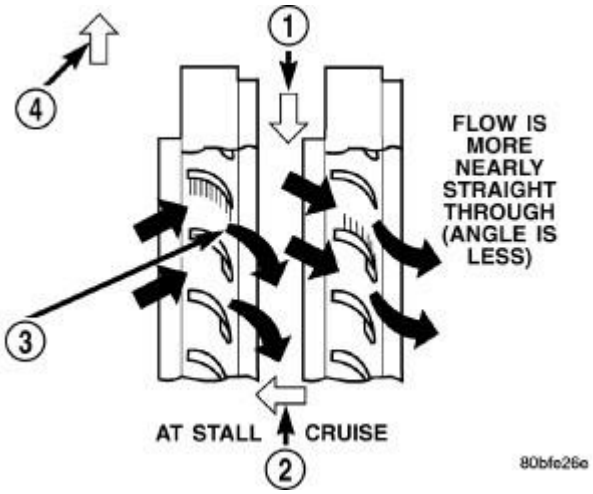

Fig. 428: Identifying Stator Operation
Courtesy of CHRYSLER LLC

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling .

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the front cover's friction material, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Powertrain Control Module (PCM). The engagement cannot be activated in the lower gears because it eliminates the torque multiplication effect of the torque converter necessary for acceleration. Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch will engage at approximately 56 km/h (35 mph) with light throttle, after the shift to third gear.

REMOVAL

REMOVAL

1. Remove transmission and torque converter from vehicle. See **Transmission and Transfer Case/Automatic - 41TE - Removal**.
2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition.

The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

1 - SCALE 2 - STRAIGHTEDGE

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches

with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate converter hub and oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle. See **Transmission and Transfer Case/Automatic - 41TE - Installation**.
9. Fill the transmission with the recommended fluid. See **FLUID AND FILTER SERVICE**.

2 - T/C REGULATOR VALVE	6 - CONVERTER CLUTCH SWITCH VALVE
3 - L/R SWITCH VALVE	7 - SOLENOID SWITCH VALVE
4 - CONVERTER CLUTCH CONTROL VALVE	8 - REGULATOR VALVE

The valve body assembly consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches. The valve body contains the following components :

- Regulator valve (8)
- Solenoid switch valve (7)
- Manual valve (5)
- Converter clutch switch valve (6)
- Converter clutch control valve (4)
- Torque converter regulator valve (2)
- Low/Reverse switch valve (3)

In addition, the valve body also contains the thermal valve, #2, #3 and #4 check balls, the #5 (overdrive) check valve and the 2/4 accumulator assembly. See **Transmission and Transfer Case/Automatic - 41TE/VALVE BODY - Disassembly**.

OPERATION

OPERATION

NOTE: Refer to Schematics and Diagrams for a visual aid in determining valve location, operation and design.

REGULATOR VALVE

The regulator valve controls hydraulic pressure in the transaxle. It receives unregulated pressure from the pump, which works against spring tension to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as "line pressure."

SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid. In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves.

MANUAL VALVE

The manual valve is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve is fed to the torque converter regulator valve, where it passes through the valve, and is slightly regulated. The pressure is then directed to the converter clutch switch valve and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve controls the back (on) side of the torque converter clutch. When the PCM/TCM energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under all operating conditions.

Getrag MPS6 - Service Information - Journey

OPERATION

OPERATION

The MPS6 is an electronically controlled and automatically shifted transaxle with a dual clutch torque conversion system. In the MPS6 dual clutch system, one clutch is splined to one half of a split input shaft, while the other clutch is splined to other half of the split input shaft. Only one of the dual clutches will be engaged at a time, depending on what gear ratio is selected. The MPS6 contains a set of constantly meshed helical gears, which are synchronized in all forward ranges, similar to the type of gears typically found in manual transmissions. The key difference between a typical manual transmission with a single clutch and the MPS6 dual clutch system is that the MPS6 dual clutch assembly allows engine torque to be constantly applied to the output shaft between shifts. When shifting a manual transmission, engine torque has to be completely removed from the transmission by disengaging the clutch.

The MPS6 is a considered a powershift transaxle, which means that when it is engaged in a forward or reverse gear, or when upshifting between gears, engine torque is constantly applied to the output shaft. All conventional automatic transmissions, or transmissions that transfer engine torque through the fluid coupling of a torque converter and achieve gear ratios by holding parts of a planetary gearset, or continuously variable transmissions (CVTs) fall into the category of powershift transmissions, as engine torque is constantly applied to the output shaft when the transmission is in a forward or reverse gear.

First Gear Operation

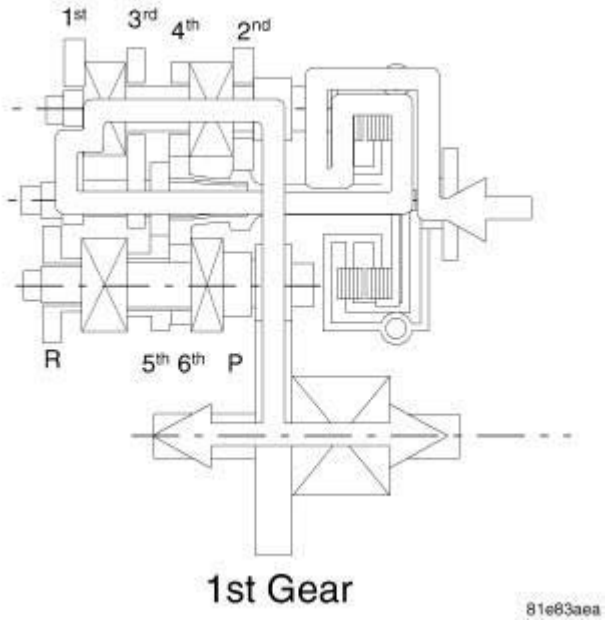

Fig. 1: FIRST GEAR PF
Courtesy of CHRYSLER LLC

In first gear, the first/third synchronizer locks the first gear to the 1st-4th output shaft. When the clutch pack connects the engine and the 1/3/5/R input shaft, power is transferred from the engine to the 1/3/5/R input shaft, to the first gear, to the 1st-4th output shaft, to the ring gear, and to the differential.

Under certain driving conditions, two gears on opposite input shafts are engaged. For example, if the transmission is in first gear while in Drive or AUTOSTICK™ Mode, the second/fourth synchronizer locks the second gear to the 1st-4th output shaft. Because the 2/4/6 input shaft is not engaged, the second gear and the 2/4/6 output shaft will freewheel with as the 1st-4th output shaft rotates. When the second gear is required, the transmission releases the 1/3/5/R input shaft clutch and engages the 2/4/6 input shaft clutch to complete the upshift.

Second Gear Operation

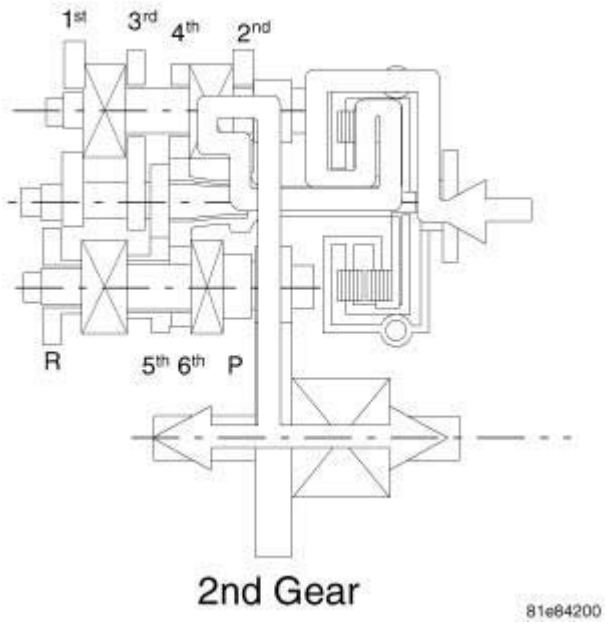

Fig. 2: 2ND GEAR PF
Courtesy of CHRYSLER LLC

To shift from first to second gear, the transmission disengages the wet clutch pack for the 1/3/5/R input shaft and engages the 2/4/6 input shaft. Because the second/fourth synchronizer has already locked the second gear to the 1st-4th output shaft, the transmission shifts to second gear. Engine power is transferred to the 2/4/6 input shaft, to the second gear, to the 1st-4th output shaft, and then to the ring gear.

When the transmission is operating in AUTOSTICK™ Mode, 3rd gear is preselected.

Third Gear Operation

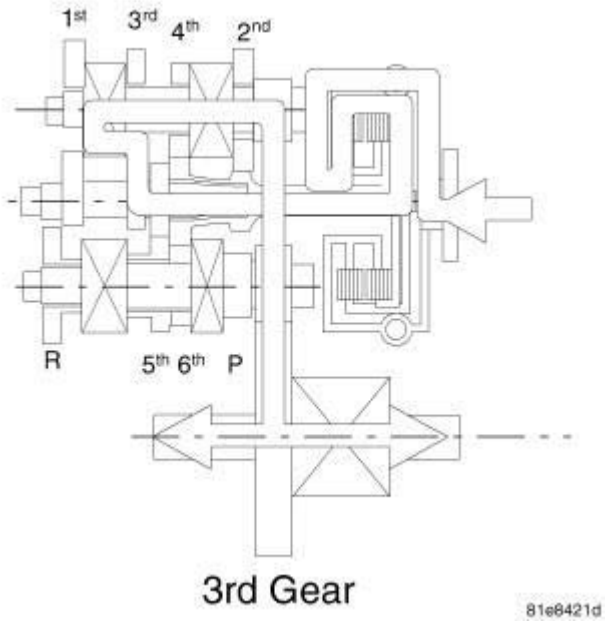

Fig. 3: 3RD GEAR PF
Courtesy of CHRYSLER LLC

When operating in the second in AUTOSTICK™ Mode the third gear is already engaged, shifting from the second to the third gear requires only that the wet clutch pack disengage the 2/4/6 input shaft from the engine and engage the 1/3/5/R input shaft. Power is then transferred from the 1/3/5/R input shaft, to the third gear, to the 1st-4th output shaft and then to the ring gear.

Fourth Gear Operation

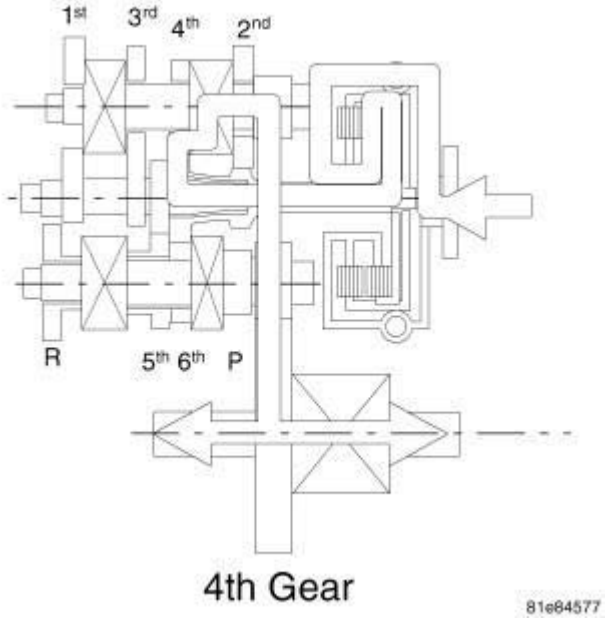

Fig. 4: 4TH GEAR PF
Courtesy of CHRYSLER LLC

When operating in the third gear, the fourth gear is not preselected. An upshift to the fourth gear requires that the shift fork move the second/fourth synchronizer to the fourth gear position. The wet clutch pack for the 1/3/5/R input is then disengaged from the engine and the 2/4/6 input shaft is engaged. Engine power is transferred to the 2/4/6 input shaft, to the fourth gear, to the 1st-4th output shaft, and then to the ring gear.

When operating in the fourth gear in AUTOSTICK™ Mode, the 3rd gear is preselected.

Fifth Gear Operation

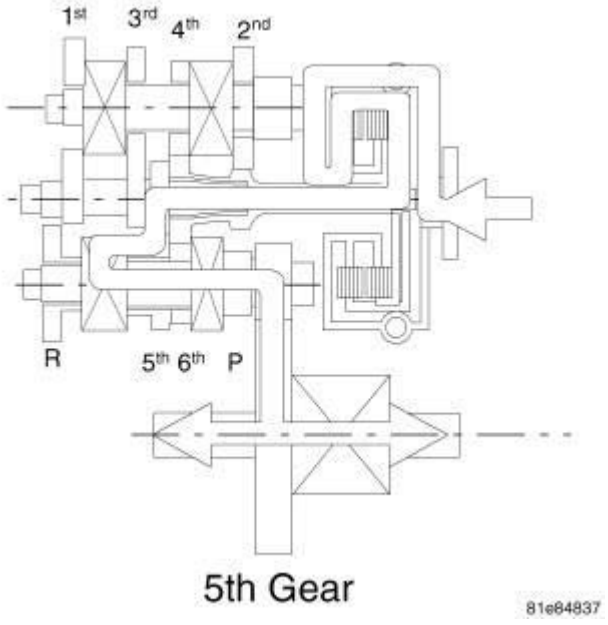

Fig. 5: 5TH GEAR PF
Courtesy of CHRYSLER LLC

To shift into fifth gear during an increase in speed, the fifth/reverse synchronizer locks the fifth gear to the output shaft, disengages the 2/4/6 input shaft and engages the 1/3/5/R input shaft. Engine power is transferred through the 1/3/5/R input shaft, to the fifth gear, to the 5th, 6th and Reverse output shaft and then to the ring gear.

When operating in the fifth gear in AUTOSTICK™ Mode, the 4th gear is preselected.

Sixth Gear Operation

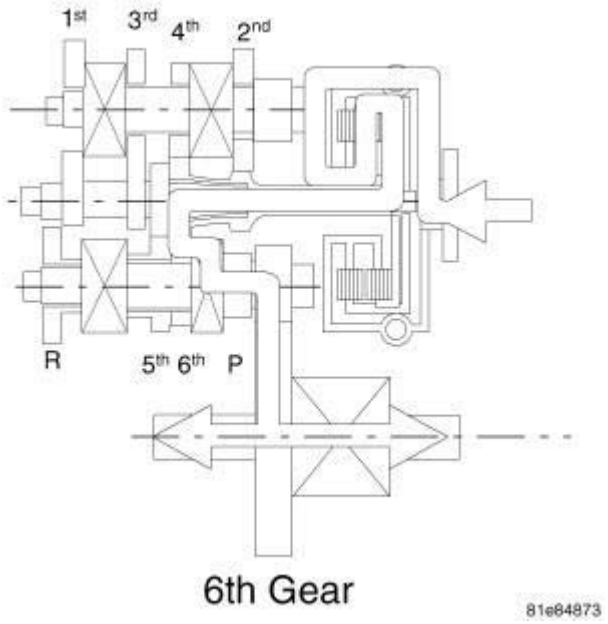

Fig. 6: 6TH GEAR PF
Courtesy of CHRYSLER LLC

To shift from the fifth gear to the sixth gear, the fifth/reverse synchronizer unlocks the fifth gear from the 5th, 6th, and Reverse output shaft, the sixth gear synchronizer locks the sixth gear to the 5th, 6th, and Reverse output shaft, the 1/3/5/R input shaft is disengaged from the engine, and the 2/4/6 input shaft is engaged. Engine power is transferred through the 2/4/6 input shaft, to the sixth gear, to the 5th, 6th and reverse output shaft and then to the ring gear.

Preselection is not used in sixth gear.

Shift Fork Preselection

Locking a second gear to the output shaft is called preselection. The SHIFT FORK PRESELECTION - VEHICLE MOVING table lists the driving conditions under which preselection occurs and which gear is preselected.

DIAGNOSIS AND TESTING

COMMON PROBLEM CAUSES

The majority of transaxle malfunctions are a result of:

- Insufficient lubrication
- Incorrect lubricant
- Mis-assembled or damaged internal components
- Improper operation

NOISY OPERATION

Transaxle noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings all cause noise.

Abnormal wear and damage to the internal components is frequently the end result of insufficient lubricant.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of leaks, or inaccurate fluid level check or refill method. **Vehicle must be level to accurately check fluid level.** Leakage is evident by the presence of oil around the leak point. If leakage is not evident, the condition is probably the result of an underfill.

If air-powered lubrication equipment is used to add fluid to the MPS6 transaxle, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an under fill condition. Refer to **Standard Procedure** in this service information.

REMOVAL

REMOVAL

NOTE: If transaxle assembly or Transaxle Control Module (TCM) is being overhauled or replaced, it is necessary to perform the TCM/PCM Quick Learn Procedure. Refer to Electrical/Electronic Control Modules/MODULE, Powertrain Control - Standard Procedure .

11. Lift the vehicle on a hoist.
12. If equipped, remove the engine belly pan.
13. Remove both front side splash shields.

NOTE: The MPS6 transmission has sealed differential side gears so oil won't come out after the half shaft removal. Hence there is no need to drain the oil for removing the transmission.

14. Remove the halfshafts. Refer to **Differential and Driveline/Half Shaft - Removal** .
15. Lower the hoist.

CLEANING

CLEANING

Clean the gears, bearings, shafts, synchronizers, thrust washers, oil feeder, shift mechanism, gear case, and bellhousing. Do not use solvent to clean sealed bearings. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

NOTE: All traces of original sealant must be cleaned from the top of the oil pump.

34. Apply a 4 mm bead of Mopar® ATF-RTV sealant (part number 05010884AA) to the top of the oil pump, where it meets the case half (4).

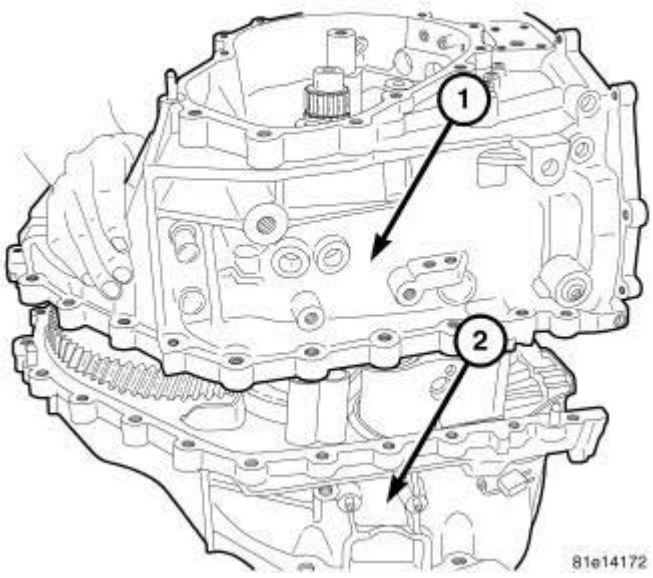

Fig. 104: SPLIT CASES
Courtesy of CHRYSLER LLC

NOTE: The case halves must be assembled within 15 minutes after the application of the anaerobic sealant. Do not allow transmission oil or any other lubricants to come in contact with the sealant for at least one hour after the case halves have been assembled.

35. Apply Mopar® Gasket Maker anaerobic sealant (part number 04318083) to the sealing surface of the case.
36. Verify that the transmission is in neutral, and that no synchronizers are engaging gears onto the shafts.
37. Verify that the blocker ring tabs are engaged with the slots in the synchronizers. Otherwise, a gear can be locked to a shaft, damaging the related synchronizer after the transmission is installed in the vehicle.

CAUTION: Verify the transmission manual lever is in neutral before assembling the case halves, and that all gears rotate freely on their respective shafts. Otherwise, damage to the synchronizers can occur after the transaxle is installed in the vehicle.

38. Install case half (1) onto the bellhousing half (2).

CAUTION: Do not force the case halves together with the case half bolts.

39. Install the case half bolts (1) and gradually draw the case halves together by tightening the bolts near the case half alignment dowels.
40. When the case halves are drawn together, tighten the case half bolts to 30 N.m (22 ft. lbs.).
41. Install the bellhousing side bolts (2) and tighten to 30 N.m (22 ft. lbs.).

46. Ensure that the thrust washers (1) are installed onto the two shafts (2).

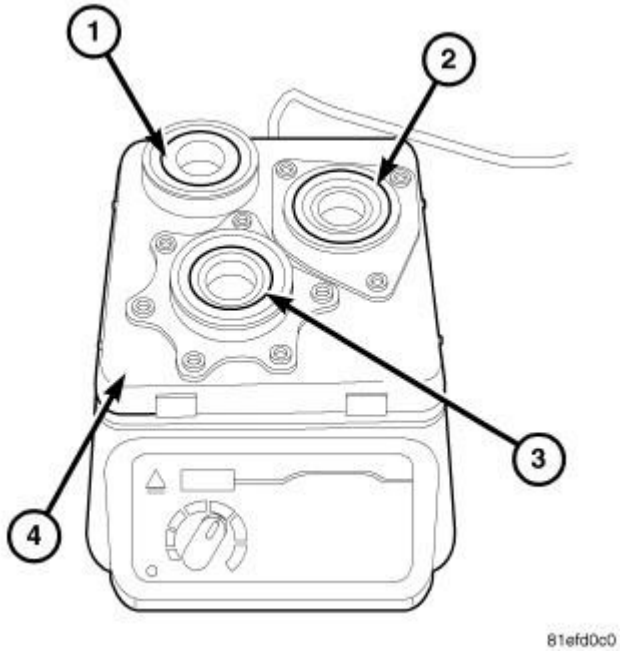

Fig. 110: HEAT BEARINGS
Courtesy of CHRYSLER LLC

WARNING: Use welding gloves or tongs when handling heated components.

Failure to follow these instructions will result in personal injury.

CAUTION: Use only a bearing heater/hot plate and follow manufacturer's instructions. Heat components to 100 - 177 Celsius (212° Min. - 350° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

47. Heat the 3 bearings with a bearing heater.

55. Apply Mopar® Gasket Maker anaerobic sealant (part number 04318083) to the sealing surface of the rear cover.
56. Install the rear cover (2).
57. Align rear cover retainers (1) with the holes in the cover and the case.
58. Verify the shim is centered.
59. Verify the shift forks are inserted into the hose in the cover.
60. Start the rear cover retainers by hand. Gradually tighten rear cover retainers to 30 N.m (22 ft. lbs.).

67. Move the manual lever to the Drive position.
68. Install new rubber seals on the four valve body towers.
69. Verify the speed sensor wire is positioned so that it will not get pinched between the valve body mounting surfaces during installation of the valve body.
70. Verify that the metal valve body gaskets are installed on the alignment posts.
71. Install a pin/drill bit into the TRS tone wheel.
72. Install the valve body (1).

NOTE: Maintain pin/drill bit position in the TRS hole and verify the manual lever stays in the Drive position during TRS installation.

74. Install the TRS into the case.
75. Install the screws (2) at the TRS and tighten to 6 N.m (53 in. lbs.).
76. Install the bolt (3) and a new O-ring at the TRS and tighten to 7 N.m (70 in. lbs.).
77. Remove the previously installed pin/drill bit from the TRS tone wheel.
78. Connect the speed sensor electrical connector (1) to the TRS.

NOTE: Do not reuse the original front cover.

NOTE: Apply BOT 41 transmission oil to the seals on the new front cover.

NOTE: Do not roll the clutch hub seal (1).

95. Install a new front cover. Verify the clutch hub seal in the front cover is not rolled over the clutch hub (2). If necessary, use a plastic trim tool to carefully walk the clutch hub seal (1) around the clutch hub.

NOTE: Do not reuse the original fasteners.

96. Install the retaining clips (1) that secure the front cover (2) and tighten the new fasteners to 10 N.m (88 in. lbs.).
97. Install the transaxle. See **Installation** .

INSTALLATION

INSTALLATION

NOTE: If transaxle assembly or Transaxle Control Module (TCM) is being overhauled or replaced, it is necessary to perform the TCM/PCM Quick Learn Procedure. Refer to Electrical/Electronic Control Modules/MODULE, Powertrain Control - Standard Procedure .

NOTE: If a new transaxle assembly is being installed due to warranty, be sure to keep all packing materials, plugs and retainers for returning the original transaxle. Be sure to install the shipping plugs in the axle openings and transaxle oil cooler fittings prior to shipment of the original transaxle.

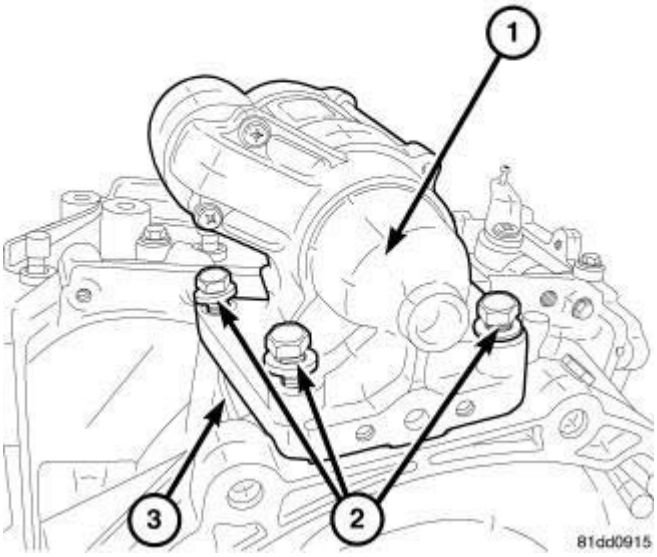

Fig. 134: STARTER

1. Install the starter (1) onto the transmission (3).

2. Install the starter bolts and tighten to 25 N.m (18 ft. lbs.).

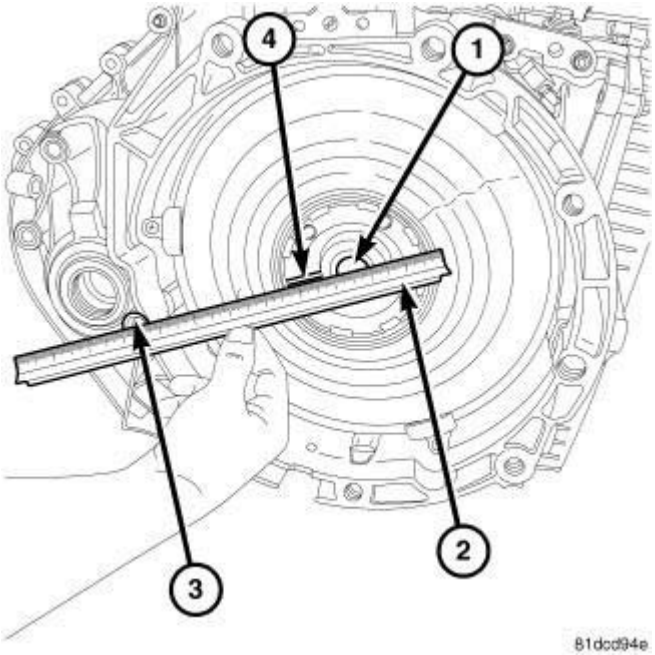

Fig. 135: Identifying Straight Edge, Hub, Spring Legs & Dowel Hole
Courtesy of CHRYSLER LLC

NOTE: Alignment of transaxle hub/coupler and engine crankshaft is critical for installation.

NOTE: Before aligning the clutch hub on a new transaxle, the shipping retainer must be removed from the bellhousing, and the locking pin must be loosened enough to allow the clutch to rotate freely.

CAUTION: Damage to the clutch assembly can occur if the clutch hub is not aligned correctly with the engine crankshaft.

3. Align the center of the hub (1), the center of both hub spring legs (4) and the center of the rear bellhousing stepped dowel hole (3) using a straight edge (2).

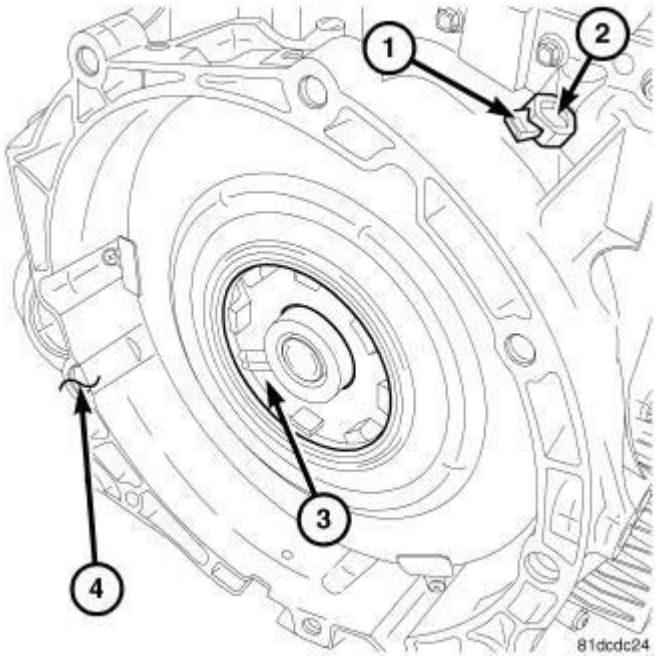

Fig. 136: Identifying Pull Out Tab & Locking Pin
Courtesy of CHRYSLER LLC

NOTE: If the original transaxle is being reinstalled, always use a NEW locking pin. A replacement (new) transaxle will have a new locking pin installed.

4. If the original transaxle is being reinstalled, install a **new** locking pin (2) into the transaxle bellhousing.
5. Tighten the locking pin (2) to 3 Nm (27 in. lb). Then tighten the locking pin until the pull-out tab (1) is oriented at approximately a 45° angle relative to the transaxle mounting surface.

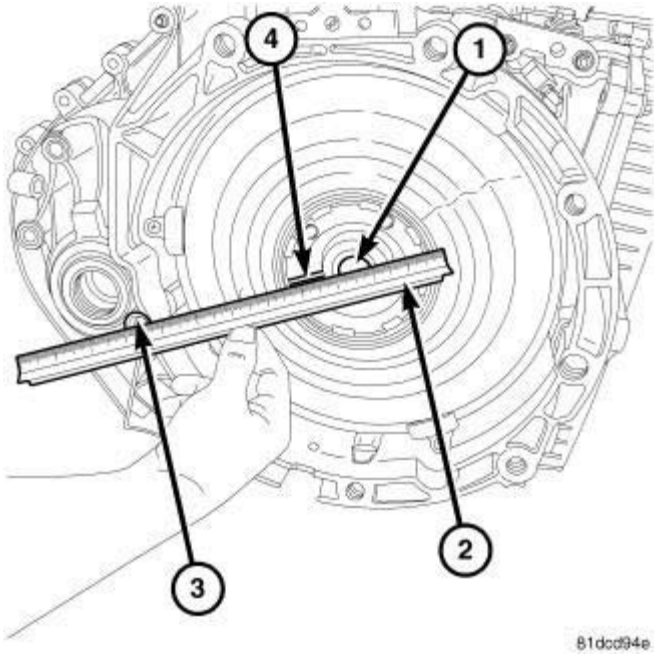

Fig. 137: Identifying Straight Edge, Hub, Spring Legs & Dowel Hole
Courtesy of CHRYSLER LLC

NOTE: Alignment of transaxle hub/coupler is critical for installation.

CAUTION: Damage to the clutch housing can occur if clutch hub alignment is not set correctly.

6. Use a straight edge (2) to verify that the center of the hub (1), the center of both hub spring legs (4) and the center of the bellhousing hole (3) are still aligned.

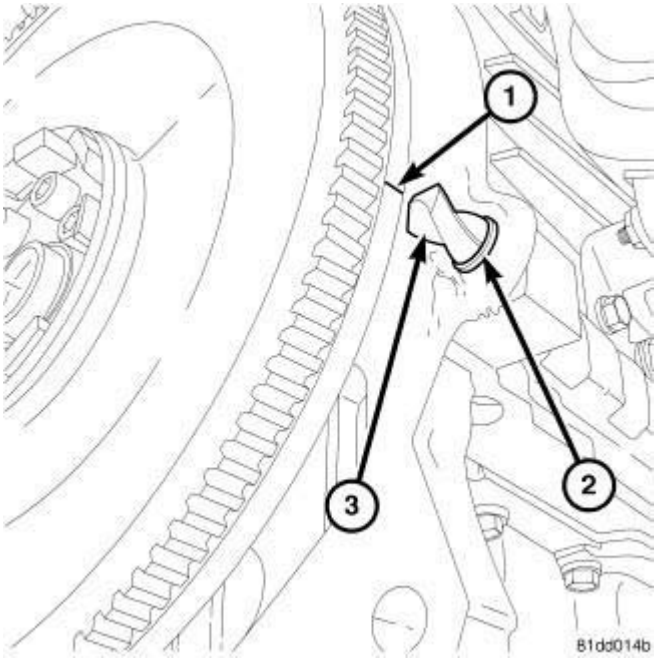

Fig. 138: Identifying Flywheel Alignment Mark, Drill Hole & Pin/Dowel Hole
Courtesy of CHRYSLER LLC

NOTE: Always use the largest drill bit (3) that will fit in the alignment pin/hole (2).

NOTE: Make sure that the couplers on both the transmission and engine are clean.

7. Apply grease to the couplers.
8. Install a drill bit (3) into the alignment pin/dowel hole (2).

NOTE: The alignment pin/dowel hole (2) at the rear (exhaust) side of the engine is shown in illustration.

9. Rotate the crankshaft by hand until the flywheel alignment mark (1) aligns with the tip of the drill bit (3)

in the alignment pin/dowel hole (2).

NOTE: Make sure that the bellhousing mounting surface remains parallel to the engine block mounting surface while raising transaxle into position.

10. Place transaxle on a transmission jack and lift it into place.

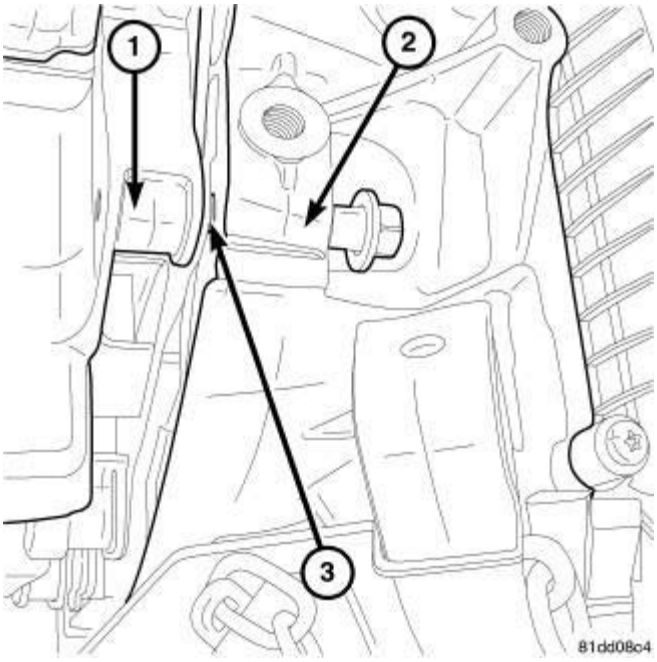

Fig. 139: Draw Transmission To Engine
Courtesy of CHRYSLER LLC

CAUTION: If the entire gap between the engine and transmission is more than 4 mm, then the clutch hub and engine crankshaft are not aligned correctly. If the gap between the engine and transaxle is more than 4 mm, do not use the bellhousing bolts to pull the transaxle and the engine block together.

NOTE: Verify transaxle mounting surface is square/aligned with engine block mounting surface.

11. When the entire gap between the engine and the transmission is at 4 mm (3), install bolts through the alignment dowels and draw the transmission to the engine.
12. While listening for any signs of misalignment of the clutch hub such as scraping noise inside the bellhousing, use the crankshaft damper to rotate the engine by hand.
13. Tighten the bellhousing bolts to 70 N.m (52 ft. lbs.).

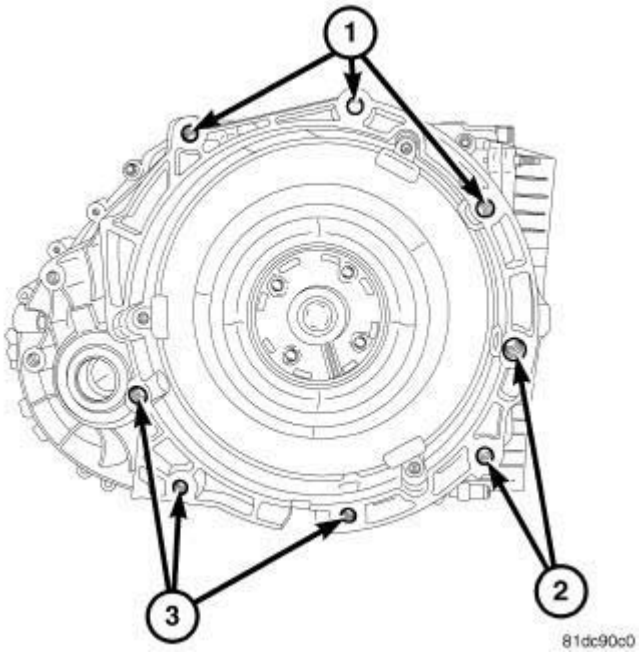

Fig. 140: BELLHOUSING BOLTS

NOTE: If bolts do not easily pull the transmission to the engine, STOP and check for correct alignment of the bellhousing.

14. Install the rest of the lower transmission bolts (2, 3) and tighten to 70 N.m (52 ft. lbs.).

ADJUSTMENTS

ADJUSTMENT

BEARING ADJUSTMENT PROCEDURE

NOTE: Use only new bearings on both output shafts and the differential to ensure correct turning torque. The bearings can loose as much as one half of its turning torque after break-in.

1. Use extreme care when removing and installing bearing cups and cones. Use only an arbor press for installation, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat give a false end-play reading while gauging for proper shims. Improperly seated bearing cups and cones are subject to low-mileage failure.
2. Bearing cups and cones should be replaced if they show signs of pitting or heat distress. If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.
3. Bearing preload and drag torque specifications must be maintained to avoid premature bearing failures. Used (original) bearings may lose up to 50% of the original drag torque after break-in.
4. Replace bearings as a pair: If one differential bearing is defective, replace both differential bearings, if one input shaft bearing is defective, replace both input shaft bearings.
5. Bearing cones must not be reused if removed unless a ground cone is used to find proper shim size.
6. Turning-torque readings should be obtained while smoothly rotating in either direction.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT

NOTE: True bearing turning-torque readings can be obtained only with the geartrain removed from the case.

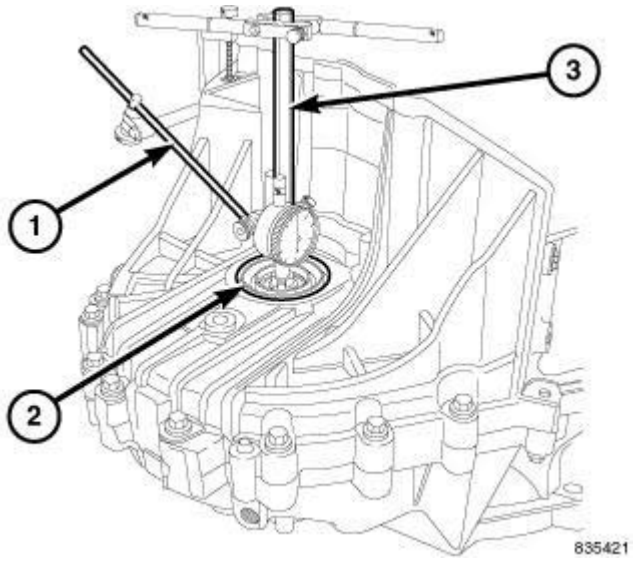

Fig. 155: TRANSAXLE GEAR CASE AND T-HANDLE
Courtesy of CHRYSLER LLC

1. Remove bearing cup and existing shim from clutch bellhousing case.
2. Use a cup that has been ground down on the outer edge for ease of measurement.
3. Oil differential bearings with transmission fluid. Install differential assembly (1) into transaxle gear case (2). Install clutch bellhousing over gear case. Install and tighten case bolts to 16 N.m (12 ft. lbs.).
4. Position transaxle with bellhousing facing down on workbench with C-clamps. Position Dial Indicator C-3339A (1) to measure differential endplay in the location shown in illustration (2).

NOTE: The dial indicator should be mounted parallel to the torque tool to obtain the most accurate reading.

5. Apply a medium load to differential with Torque Tool C-4995A and a T-handle (3), in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator. To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth. Record end play.

NOTE: If the original shim is missing or broken always start out with the middle shim size in the new parts package.

6. The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.19 mm (0.007 in.).** Never combine shims to obtain the required preload.
7. Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected, then press the bearing cup into clutch bellhousing.

8. Install Side Gear Locking Tool 10150 (1) to the side gears.

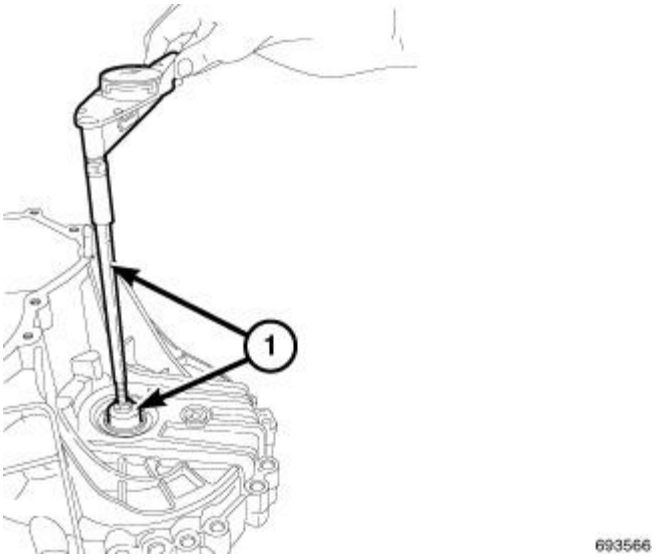

Fig. 157: TORQUE TOOL C-4995A
Courtesy of CHRYSLER LLC

9. Install clutch bellhousing case half. Install and tighten case bolts to 16 N.m (12 ft. lbs.).
10. Using Torque Tool C-4995A (1) and an inch-pound torque wrench, check turning torque of the differential assembly. **The turning torque should be 2 to 3 N.m (18 to 27 in. lbs.) If the turning torque is too high, install as close to 0.02 mm (0.0008 inch) thinner shim in shim pack. If the turning torque is too low, install as close to 0.02 mm (0.0008 inch) thicker shim in shim pack.**

11. Recheck turning torque (1). Repeat until the proper turning torque is obtained.
12. Install the correct shim.
13. Remove the cup used during measurement and install the **new** cup.

INPUT SHAFT BEARING ADJUSTMENT PROCEDURE

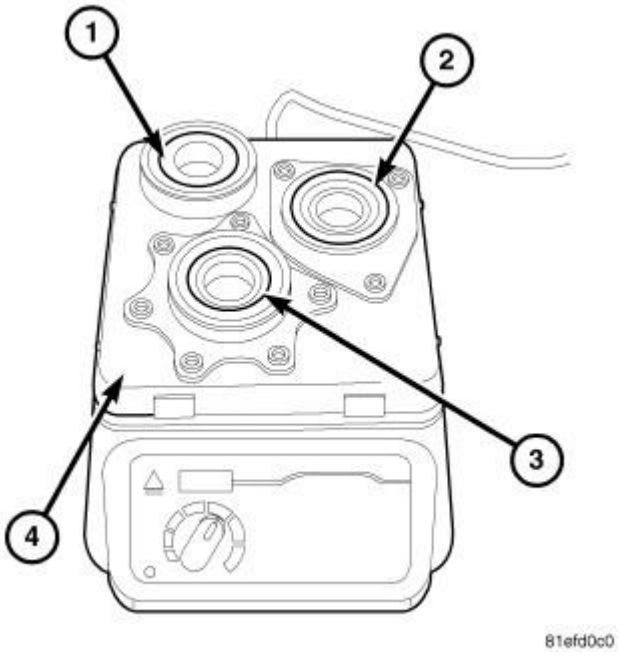

Fig. 158: HEAT BEARINGS
Courtesy of CHRYSLER LLC

WARNING: Use welding gloves or tongs when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Use only a bearing heater/hot plate and follow manufacturer's instructions. Heat components to 100 - 177 Celsius (212° Min. - 350° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

NOTE: After installation, allow the bearings to cool down to ambient temperature. The input shaft bearings must be at a temperature between 15° - 27° C (60° - 80° F) before checking total input shaft endplay.

1. Heat the front and rear bearings (1) with a bearing heater, install the front bearing on the front half of the input shaft and the rear bearing on the rear half of the input shaft.

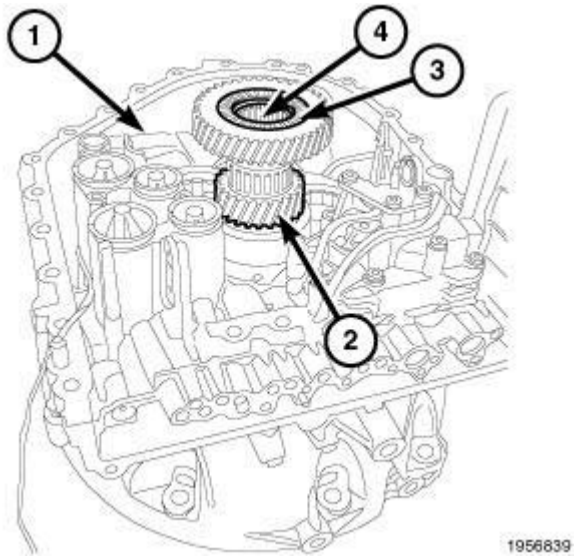

Fig. 159: CLUTCH HOUSING, INPUT SHAFT, THRUST BEARINGS AND LARGER ROLLER BEARINGS

2. Set the clutch housing case half (1) on a bench with the engine mounting surface facing down.
3. Install the front half of the input shaft (2) into the clutch housing case half (1).

NOTE: Oil the needle bearings prior to installation

4. Install the large roller bearing (4) and the needle thrust bearing (3) into the front half of the input shaft (2).

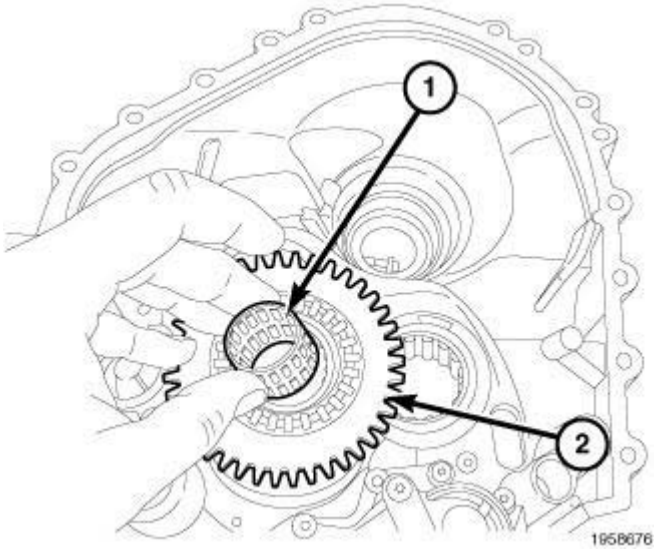

Fig. 160: SMALL NEEDLE BEARING AND INPUT SHAFT

NOTE: Oil the needle bearing prior to installation

5. Install the small needle bearing (1) into the front half of the input shaft (2). Verify all bearings are correctly seated.

6. Install the rear half of the input shaft (2) into the front half of the input shaft (1).

8. Install the bearing cover (2) without an input shaft shim. Install the bearing cover bolts (1) and tighten bolts to 16 N.m (12 ft. lbs.).
9. Set the case assembly so the clutch housing is facing up.
10. Verify the input shaft bearing is fully seated in the end cover.

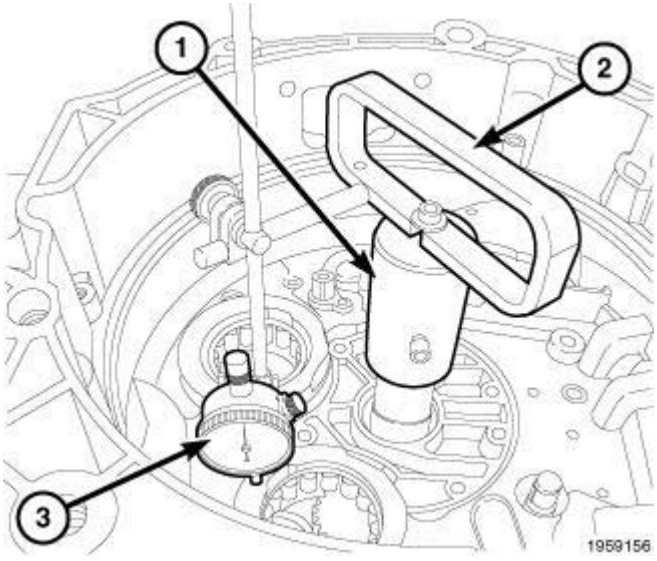

Fig. 164: TOOL 8266-21, HANDLE 8266-8 AND DIAL INDICATOR C-3339A
Courtesy of CHRYSLER LLC

11. Install the Input Shaft Endplay Tool 8266-21 (1), Handle 8266-8 (2) and set up a Dial Indicator C-3339A (3) as shown in illustration to measure endplay on the input shaft.

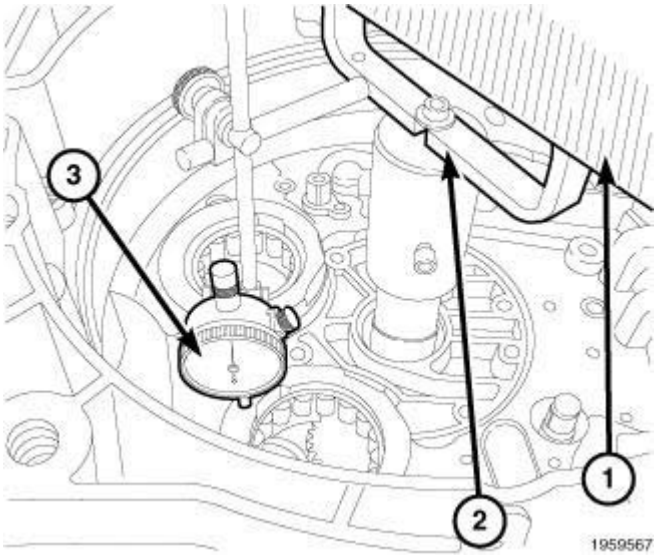

Fig. 165: INPUT SHAFT ENDPLAY TOOL
Courtesy of CHRYSLER LLC

12. Apply approximately 4.535 Kg. (10 lbs.) of force to the handle of the input shaft endplay tool (2) to load the bearings, then, while applying downward force, zero the dial indicator (3).
13. Pull upward on the input shaft endplay tool and record the measurement. Press down on the input shaft endplay tool and verify the tip of the dial indicator remains in one spot. Repeat this step several times and record each measurement. Average the measurements to get the input shaft endplay measurement.
14. Determine the required shim size by subtracting the preload value of 0.36 mm (0.006 in.) from the total input shaft endplay measurement found in step 13.
15. After the input shaft shim is installed, the final endplay of the input shaft should be 0.17 mm +/- 0.05 mm (0.006 in. +/- 0.002 in.).

FLUID

STANDARD PROCEDURE

FLUID LEVEL AND CONDITION CHECK

FLUID LEVEL CHECK

WARNING: There is a risk of accident from vehicle starting off by itself when engine is running. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.

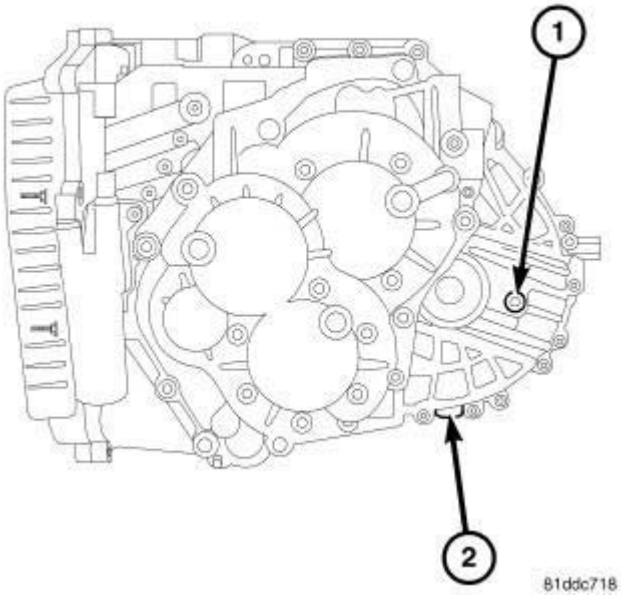

Fig. 248: DRAIN AND FILL PLUGS
Courtesy of CHRYSLER LLC

1. With the vehicle in neutral, position the vehicle on a hoist.
2. If equipped, remove the engine belly pan.
3. Start the vehicle and allow the engine to reach normal operating temperature. If the engine and transmission are cold, this may take up to 15 minutes.
4. Apply the brake and slowly cycle the gear shift through all ranges.
5. Shut off the engine, raise the vehicle and remove the transaxle fluid level check plug (1).
6. Verify the oil level is at the bottom of the transaxle check hole.
7. If the oil level is below the bottom of the fluid level check plug hole, add fluid. Refer to **Transmission and Transfer Case/Manual/FLUID - Standard Procedure** .

FLUID CONDITION CHECK

Along with fluid level, it is important to check the condition of the fluid. If the fluid is contaminated with metal or friction material particles, or has been burnt due to abuse or a mechanical problem, a complete transaxle recondition is probably required. If there is any question about the condition of the transmission fluid, drain out a sample to inspect for contamination. **Odor and color alone cannot be used to indicate the fluid condition or the need for a fluid change.**

DRAINING AND FILLING

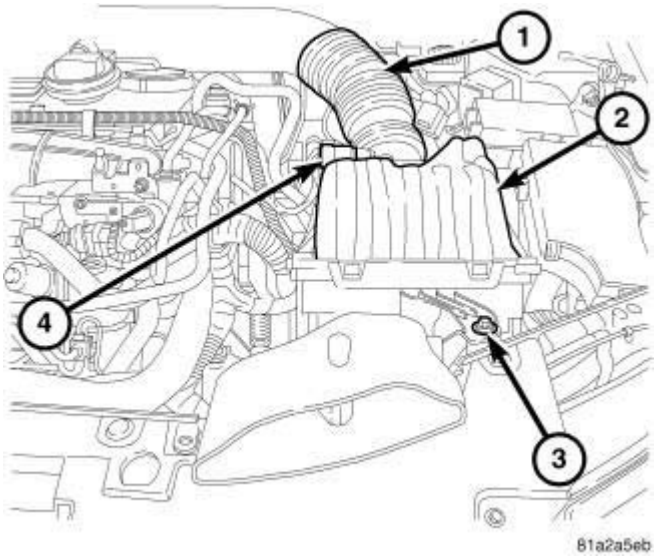

Fig. 249: AIR CLEANER HOUSING

1. Remove the hold down screw (3) from the air cleaner housing (2).
2. Pull air cleaner housing straight up and set aside to gain access to the transmission oil filling bore.
3. With the vehicle in neutral, hoist and support the vehicle.
4. If equipped, remove the engine belly pan.

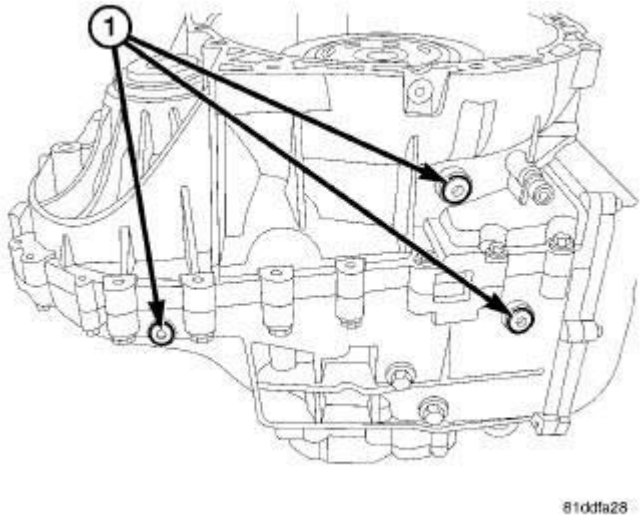

Fig. 250: DRAIN PLUGS
Courtesy of CHRYSLER LLC

5. The transaxle drain plugs (1) are located on the bottom of the transaxle differential housing. Remove all three drain plugs and allow the fluid to completely drain out of the transmission.
6. Install the drain plugs (1). Tighten drain plugs to 35 N.m (25 ft. lbs.).

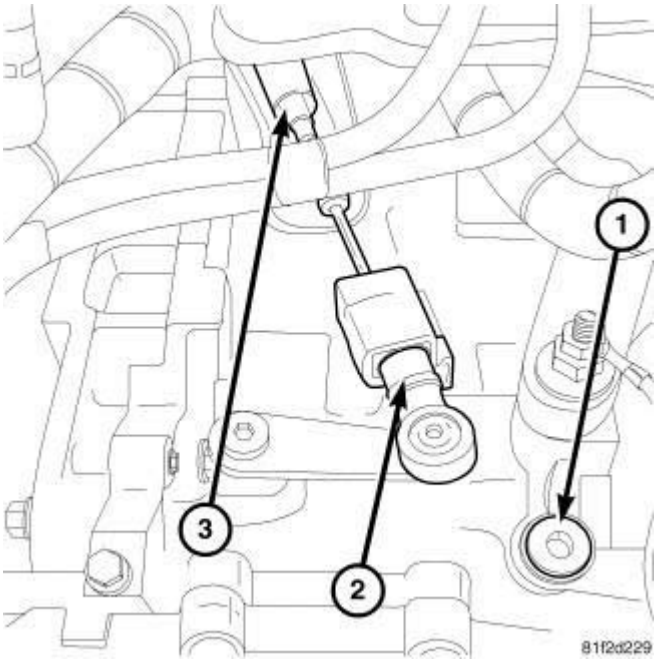

Fig. 251: FILL PLUG
Courtesy of CHRYSLER LLC

7. Lower the vehicle.
8. Remove the transaxle fill plug (1) located on the top of the transaxle.

NOTE: Use only BOT 341 fluid which is a full synthetic SAE 75W transmission fluid.

9. Add approximately 5.5 Liters of BOT 341 fluid and temporarily install the transaxle fill plug.
10. Start the vehicle and allow the engine to reach normal operating temperature. If the engine and transmission are cold, this may take up to 15 minutes.
11. Apply the brake, and slowly cycle the gear shift through all ranges.

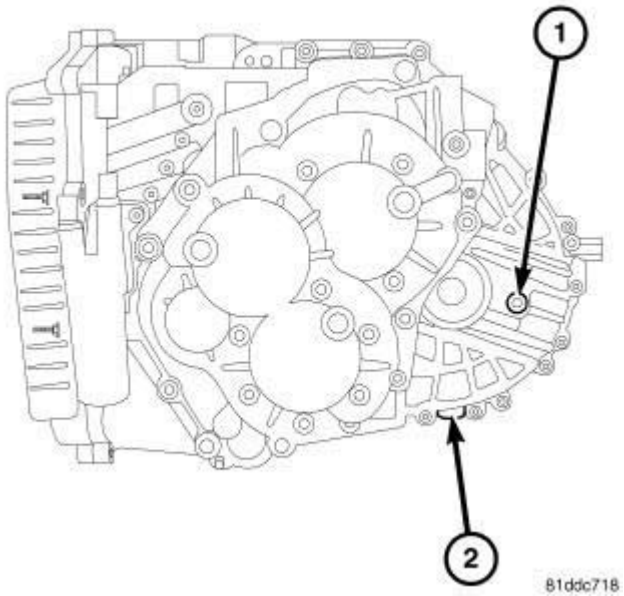

Fig. 252: DRAIN AND FILL PLUGS
Courtesy of CHRYSLER LLC

12. Shut off the engine, raise and support the vehicle and remove the transaxle fluid level check plug (1).
13. The fluid level should be at the top of the transaxle check hole (1) approximately 5.5 Liters. The vehicle must be level and the engine and transaxle must be warm when checking the level of the fluid. If the external transmission oil filter has been replaced, then an additional 0.1 Liter of BOT 341 fluid may be required. If the transaxle cooler and lines are empty, approximately 0.52 Liters of fluid may be required
14. When the fluid is at the correct level transmission oil will start to drain out through the oil level check bore (1), install the transaxle fluid level check plug. Tighten the check plug (1) to 35 N.m (25 ft. lbs.).
15. If equipped, install the engine belly pan.

4 - Clutch Shift Multiplex Solenoid-1 (CSMS1)	9 - Shift Cooling Multiplex Solenoid (SHCMS)
5 - Line Pressure Solenoid (LPS)	-

The valve body, which includes the transmission control module (TCM) and transmission range sensor (TRS), controls the delivery and pressure of transaxle fluid. The TCM and the TRS are integrated with the valve body. The TCM regulates the amount of hydraulic pressure used to engage the dual clutches, in addition to directing hydraulic pressure to actuate the shift forks. The TCM will actuate the valves and solenoids based on the position of the shifter/TRS, shift fork position sensors, transaxle fluid temperature, engine operating conditions, traction conditions, and driver demands. During a shift, the TCM will actuate the shift fork solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter/TRS, and vehicle speed as determined by the ECM based on input from the Vehicle Speed Sensor (VSS) and ABS module. Due to the complexity of the MPS6 transaxle control system and related mechanical and electrical components, always refer to the transaxle electrical/electronic diagnostics in this service information when attempting to diagnose transaxle problems.

19. Lower the vehicle.
20. Remove the transaxle fill plug (1) located on the top of the transaxle.

NOTE: Use only BOT 341 fluid which is a full synthetic SAE 75W transmission fluid.

21. Add approximately 5.5 Liters of BOT 341 fluid and temporarily install the transaxle fill plug.
22. Start the vehicle and allow the engine to reach normal operating temperature This may take up to 15 minutes if the engine and transmission are cold.
23. Apply the brake and slowly cycle the gear shift through all ranges.

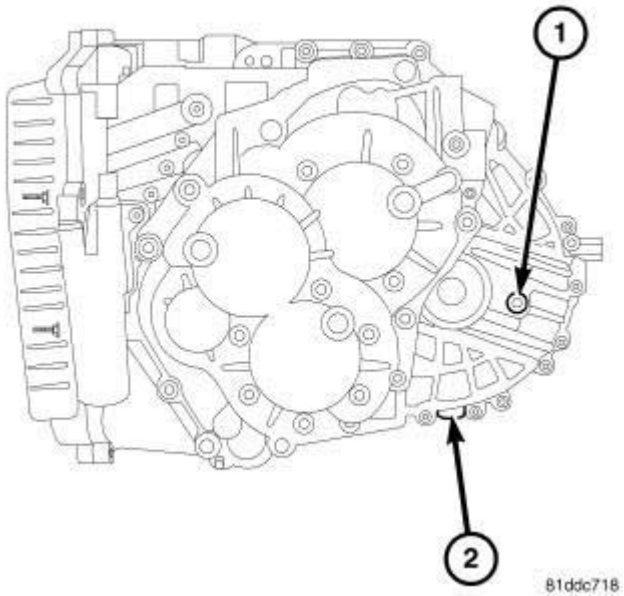

Fig. 364: DRAIN AND FILL PLUGS

24. Shut off the engine, raise and support the vehicle and remove the transaxle fluid level check plug.
25. The fluid level should be at the top of the transaxle check hole (1) approximately 5.5 Liters. The vehicle must be level and the engine and transaxle must be warm when checking the level of the fluid. If the external transmission oil filter has been replaced, then an additional 0.1 Liter of BOT 341 fluid may be required. If the transaxle cooler and lines are empty, approximately 0.52 Liters of fluid may be required
26. When the fluid is at the correct level, install the transaxle fluid level check plug. Tighten the check plug (1) to 35 N.m (25 ft. lbs.).
27. If equipped, install the engine belly pan.

DESCRIPTION

DESCRIPTION

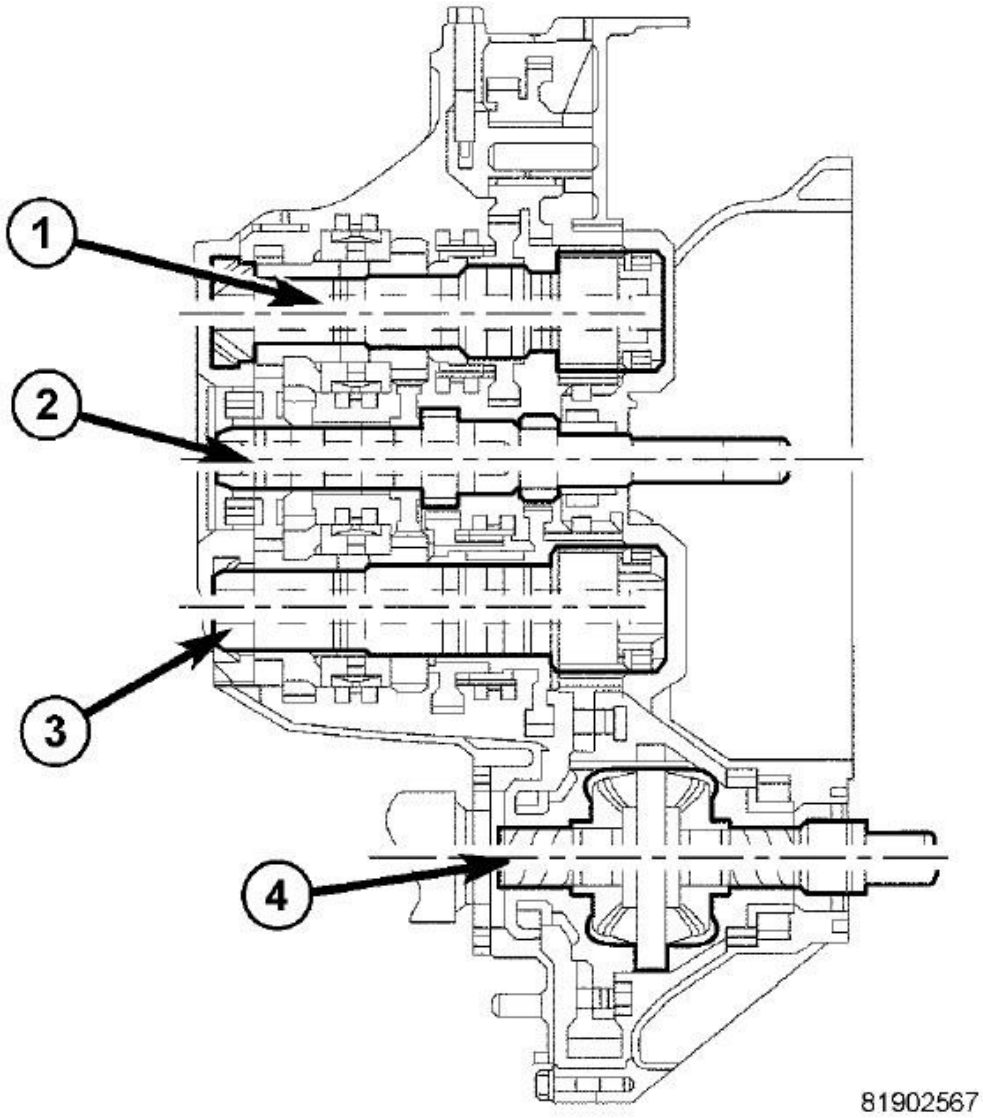

Fig. 1: BG6 Manual Transaxle

1 - OUTPUT SHAFT #2
2 - INPUT SHAFT
3 - OUTPUT SHAFT #1
4 - DIFFERENTIAL

The Aisin BG 6 6-speed transaxle is a constant-mesh transaxle that is synchronized in all gear ranges.

The BG 6 transaxle is a three-shaft design, as opposed to the more common two shaft configuration, to reduce overall length of the unit for easier packaging in the vehicle. The extra shaft is an output shaft. Ratios 1-4 are on one output shaft (2); ratios 5, 6 and Reverse are on the second shaft (1). Each output shaft has a different final drive ratio, which is also different from most transaxles. All ratios are synchronized.

Synchronizers are mounted on the output shafts (1, 3) to reduce the size of the transaxle. Triple-cone synchronizers on 1st through 3rd and dual-cone synchronizers 4th and 5th gears ensure that the rotating masses of gears, shafts and the clutch disc can accelerate quickly for fast, smooth shifting.

The four-plane shift mechanism is cable operated and incorporates a pull-up ring on the shift lever that must be lifted to engage Reverse. This prevents unintentional selection of Reverse when attempting to select 1st gear. Rubber isolation of the shift system at the transaxle minimizes noise carried along the cables to the car's interior.

GEAR RATIOS

GEAR	RATIO
1ST	3.54
2ND	2.05
3RD	1.37
4TH	0.97
5TH	0.90
6TH	0.79
REVERSE	3.83
Final Drive Ratio (FDR)	4.06 or 3.45*
Overall Top Gear	2.73
*Gears 1-4 use the 4.06 final drive; gears 5th, 6th and Reverse use the 3.45 ratio.	

DIAGNOSIS AND TESTING

COMMON PROBLEM CAUSES

The majority of transaxle malfunctions are a result of:

- Insufficient lubrication
- Incorrect lubricant
- Misassembled or damaged internal components
- Improper operation

HARD SHIFTING

Hard shifting may be caused by a misadjusted crossover cable. If hard shifting is accompanied by gear clash, synchronizer clutch and stop rings or gear teeth may be worn or damaged.

Misassembled synchronizer components also cause shifting problems. Incorrectly installed synchronizer sleeves, struts, or springs can cause shift problems.

Worn, damaged, misassembled or leaking hydraulic clutch release system/components can also cause difficult shifting or gear clash.

NOISY OPERATION

Transaxle noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings all cause noise.

Abnormal wear and damage to the internal components is frequently the end result of insufficient lubricant.

SLIPS OUT OF GEAR

Transaxle disengagement may be caused by misaligned or damaged shift components, or worn teeth on the drive gears or synchronizer components. Incorrect assembly also causes gear disengagement.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of leaks, or inaccurate fluid level check or refill method. **Vehicle must be level to accurately check fluid level.** Leakage is evident by the presence of oil around the leak point. If leakage is not evident, the condition is probably the result of an underfill.

If air-powered lubrication equipment is used to fill a transaxle, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an under fill condition.

CLUTCH PROBLEMS

Worn, damaged, or misaligned clutch components can cause difficult shifting, gear clash, and noise.

A worn or damaged clutch disc, pressure plate, or a faulty slave cylinder can cause hard shifting and gear clash.

REMOVAL

REMOVAL

NOTE: Never loosen the shift cable bracket bolts (2) for just removal. If the transmission is disassembled, see Adjustments.

CAUTION: Insure the shift levers are not deformed when removing cables.

7. Remove shift cables from shift levers (3) by tilting cable and prying from beneath with screwdriver tip.
8. Unplug connectors and move wiring harness at the top of the transmission out of the way.

CLEANING

CLEANING

Clean the gears, bearings, shafts, synchronizers, thrust washers, oil feeder, shift mechanism, gear case, and bellhousing. Do not use solvent to clean sealed bearings. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

INSPECTION

Inspect the gears, bearings and shafts. Replace the bearings and cups if the rollers are worn, chipped, cracked, flat spotted, brinnelled, or if the bearing cage is damaged or distorted. Replace the gears if the teeth are chipped, cracked or worn thin. Inspect the synchronizers. Replace the sleeve if worn or damaged in any way. Replace the stop rings if the friction material is burned, flaking off, or worn. Check the condition of the synchro keys and springs. Replace these parts if worn, cracked, or distorted.

ASSEMBLY

ASSEMBLY

BEARING ADJUSTMENT PROCEDURE

1. Use extreme care when removing and installing bearing cups and cones. Use only an arbor press for installation, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat gives a false end-play reading while gauging for proper shims. Improperly seated bearing cups and cones are subject to low mileage failures.
2. Bearing cups and cones should be replaced if they show signs of pitting or heat distress. If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.
3. Bearing preload and drag torque specifications must be maintained to avoid premature bearing failures. Used (original) bearings may lose up to 50% of the original drag torque after break-in. All bearing adjustments must be made with no other component interference or gear intermesh.
4. Replace bearings as a pair: If one differential bearing is defective, replace both differential bearings, if one input shaft bearing is defective, replace both input shaft bearings.
5. Bearing cones must not be reused if removed.
6. Turning torque readings should be obtained while smoothly rotating in either direction.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT

NOTE: True bearing turning torque readings can be obtained only with the geartrain removed from the case.

1. Remove bearing cup and existing shim from clutch bellhousing case.

2. Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).
3. Press in new bearing cup into gear case side.
4. Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and tighten case bolts to 29 N.m (257 in. lbs.).
5. Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator.

NOTE: The dial indicator should be parallel to T-Handle to obtain the most accurate reading.

6. Apply a medium load to differential with Torque Tool C-4995A (3) and a T-handle, in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator (2). To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth. Record end play.
7. The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18 mm (0.007 in.).** Never combine shims to obtain the required preload.
8. Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected, then press the bearing cup into clutch bellhousing.
9. Install clutch bellhousing. Install and tighten case bolts to 29 N.m (257 in. lbs.).
10. Using Torque Tool C-4995A (2) and an inch-pound torque wrench (1), check turning torque of the differential assembly. **The turning torque should be 1 to 3 N.m (9 to 22 in. lbs.) If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05 mm (0.002 inch) thicker shim.**
11. Recheck turning torque (1). Repeat until the proper turning torque is obtained.
12. Once proper turning torque has been established for the differential separate case halves, install output shaft # 2 assembly into case with the differential and recheck differential turning torque. **The turning torque should be 4 to 6 N.m (37 to 52 in. lbs.) If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05 mm (0.002 inch) thicker shim.**
13. Recheck total turning torque (1). Repeat until the proper turning torque is obtained.

    Once proper turning torque has been established, place gear case on the end plate. Draw a bead of MOPAR® Gasket Maker, Loctite® 518, or equivalent, on the flat surface of the case mating flange. Install clutch bellhousing onto gear case. Install and tighten case bolts to 29 N.m (257 in. lbs.).

14. Install axle seal (case side) on Seal Installer 9928 and Handle C-4171 and insert into axle shaft seal bore.
15. Tap seal into position until seated against transaxle case.

1. Remove the shifter. See **Removal** .
2. Raise hood.
3. Remove the resonator.
4. Remove engine cover.
5. Remove air cleaner assembly.
6. Disconnect negative battery cable.
7. Disconnect cables (1) from the shift levers at the transaxle.

CAUTION: Pry up with equal force on both sides of shifter cable isolator bushings to avoid damaging cable isolator bushings or damaging levers.

DESCRIPTION

DESCRIPTION

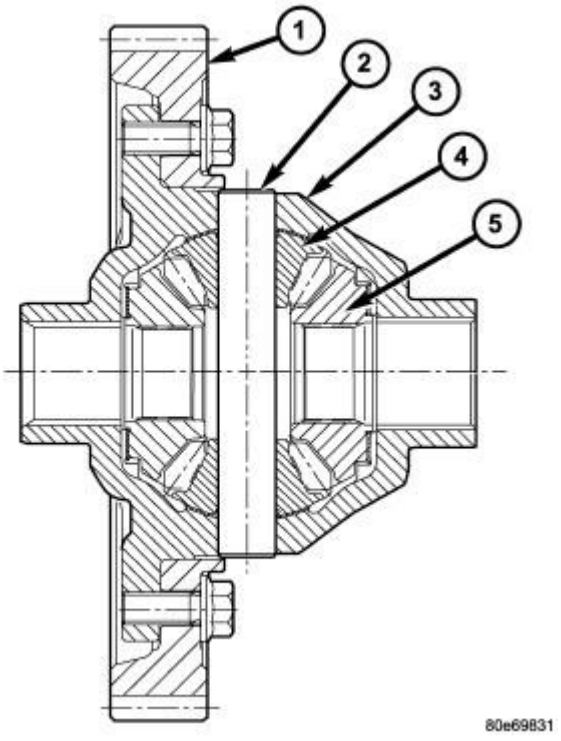

Fig. 166: Differential Assembly

1 - RING GEAR
2 - PINION SHAFT
3 - DIFFERENTIAL CASE
4 - PINION GEAR
5 - SIDE GEAR

The BG6 differential is a conventional open design, and is integral to the transaxle. It consists of a single-piece case (3), which houses pinion (4) and side gears (5). A pinion shaft (2) is retained by the differential ring gear (1) and roll pin, The differential case is supported in the transaxle by tapered roller bearings.

OPERATION

OPERATION

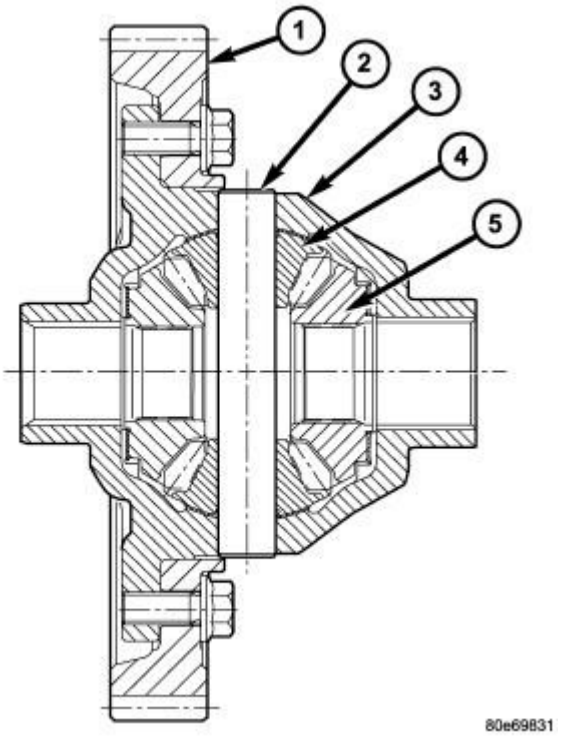

Fig. 167: Differential Assembly
Courtesy of CHRYSLER LLC

1 - RING GEAR
2 - PINION SHAFT
3 - DIFFERENTIAL CASE
4 - PINION GEAR
5 - SIDE GEAR

The differential assembly is driven by the intermediate shaft via the ring gear (1). The ring gear drives the differential case (3), and the case drives the halfshafts through the differential gears. The differential pinion (4) and side gears (5) are supported in the case by pinion shafts and thrust washers. Differential pinion (4) and side gears (5) make it possible for front wheels to rotate at different speeds while cornering.

REMOVAL

REMOVAL

1. The transaxle must be removed to gain access to and service the differential assembly. See **Removal**.
2. Disassemble transaxle and remove differential. See **Disassembly**.

INSTALLATION

INSTALLATION

1. Differential installation is part of the transaxle assembly process. Be sure to use the same differential shim that was removed upon disassembly. See **Assembly**.

ADJUSTMENTS

ADJUSTMENT

BEARING ADJUSTMENT PROCEDURE

1. Use extreme care when removing and installing bearing cups and cones. Use only an arbor press for installation, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat gives a false end-play reading while gauging for proper shims. Improperly seated bearing cups and cones are subject to low-mileage failure.
2. Bearing cups and cones should be replaced if they show signs of pitting or heat distress. If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.
3. Bearing preload and drag torque specifications must be maintained to avoid premature bearing failures. Used (original) bearings may lose up to 50% of the original drag torque after break-in. All bearing adjustments must be made with no other component interference or gear intermesh.

4. Replace bearings as a pair: If one differential bearing is defective, replace both differential bearings, if one input shaft bearing is defective, replace both input shaft bearings.
5. Bearing cones must not be reused if removed.
6. Turning-torque readings should be obtained while smoothly rotating in either direction.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT

NOTE: True bearing turning-torque readings can be obtained only with the geartrain removed from the case.

1. Remove bearing cup and existing shim from clutch bellhousing case.
2. Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).
3. Press in new bearing cup into gear case side.
4. Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and tighten case bolts to 29 N.m (257 in. lbs.).
5. Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator.

NOTE: The dial indicator should be parallel to T-Handle to obtain the most accurate reading.

6. Apply a medium load to differential with Torque Tool C-4995A (3) and a T-handle, in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator (2). To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth. Record end play.
7. The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18 mm (0.007 in.).** Never combine shims to obtain the required preload.
8. Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected, then press the bearing cup into clutch bellhousing.
9. Install clutch bellhousing. Install and tighten case bolts to 29 N.m (257 in. lbs.).
10. Using Torque Tool C-4995A (2) and an inch-pound torque wrench (1), check turning torque of the differential assembly. **The turning torque should be 9 to 22 in. lbs. If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05 mm (0.002 inch) thicker shim.**
11. Recheck turning torque (1). Repeat until the proper turning torque is obtained.
12. Once proper turning torque has been established for the differential separate case halves, install counter shaft assembly into case with the differential and recheck differential turning torque. **The turning torque should be 37 to 52 in. lbs. If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05 mm (0.002 inch) thicker shim.**
13. Recheck total turning torque (1). Repeat until the proper turning torque is obtained.

Once proper turning torque has been established, place gear case on the end plate. Draw a bead of MOPAR® Gasket Maker, Loctite® 518, or equivalent, on the flat surface of the case mating flange. Install clutch

bellhousing onto gear case. Install and tighten case bolts to 29 N.m (257 in. lbs.).

FLUID

STANDARD PROCEDURE

FLUID LEVEL CHECKING

The fluid required for this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid). Use of improper or substitute fluids can cause shift problems and/or transaxle failure.

1. Insure the vehicle is level, remove the fill plug and add fluid until the fluid just starts to trickle out.

FLUID DRAIN AND FILL

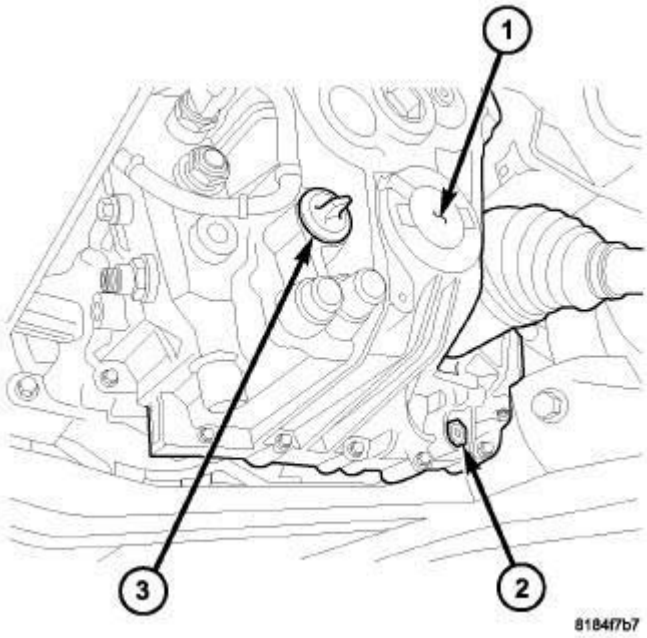

Fig. 174: Drain Plug
Courtesy of CHRYSLER LLC

NOTE: The fluid required for this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid). Use of improper or substitute fluids can cause shift problems and/or transaxle failure.

1. Raise vehicle on hoist.
2. Obtain suitable fluid collection container and place under transaxle.
3. Remove transaxle drain plug (2). Allow fluid to drain into container until empty.
4. Install the drain plug (2) with a **new** gasket and tighten to 39 N.m (29 ft. lbs.).

5. Remove transaxle rubber fill plug (3).
6. Add the appropriate amount of transaxle fluid to the transaxle. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** .
7. Install the transaxle rubber fill plug (3).

SYNCHRONIZER

DISASSEMBLY

DISASSEMBLY

Place synchronizer in a clean shop towel and wrap. Press on inner hub. Carefully open up shop towel and remove springs, balls, keys, hub, and sleeve.

CLEANING

CLEANING

Do not attempt to clean the blocking rings in solvent. The friction material will become contaminated. Place synchronizer components in a suitable holder and clean and air dry.

INSPECTION

INSPECTION

Proper inspection of components involve:

- Teeth, for wear, scuffed, nicked, burred, or broken teeth
- Keys, for wear or distortion
- Balls and springs, for distortion, cracks, or wear

If any of these conditions exist in these components, replace as necessary.

2009 MANUAL TRANSMISSION

T355 - Service Information - Journey

DESCRIPTION

DESCRIPTION

This five speed is a constant-mesh manual transaxle. All gear ranges, except reverse, are synchronized. The reverse gear utilizes a reverse brake for shifting ease. The reverse idler gear is supported on a sliding spindle idler shaft. The transaxle case is aluminum with a steel end-plate bearing cover. It is housed in a die-cast aluminum case featuring a two-piece, middle split design.

The T355 transaxle internal components can be serviced only by separating the gear case from the bellhousing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.

TRANSAXLE IDENTIFICATION

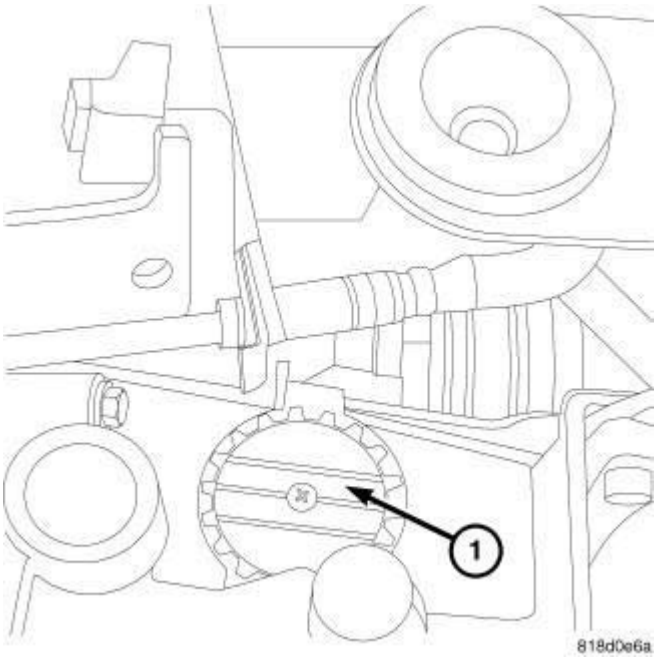

Fig. 1: Locating Transaxle ID Tag
Courtesy of CHRYSLER LLC

The transaxle model, assembly number, and build date are on a metal I.D. tag (1) that is attached to the top of the transaxle.

GEAR RATIOS

GEAR	Ratio
1st	3.77
2nd	2.16
3rd	1.41
4th	1.026
5th	0.81
REVERSE	3.4
FINAL DRIVE RATIO	4.12
REVERSE BRAKE	YES
CLUTCH RELEASE SYSTEM	HYDRAULIC

CAUTION: All gears and shafts must not be interchanged with other transaxles; they will not function correctly.

The differential is a conventional arrangement of gears that is supported by tapered roller bearings. The final output gear turns the ring gear and differential assembly, thereby turning the drive axle shafts.

GEARSHIFT PATTERN

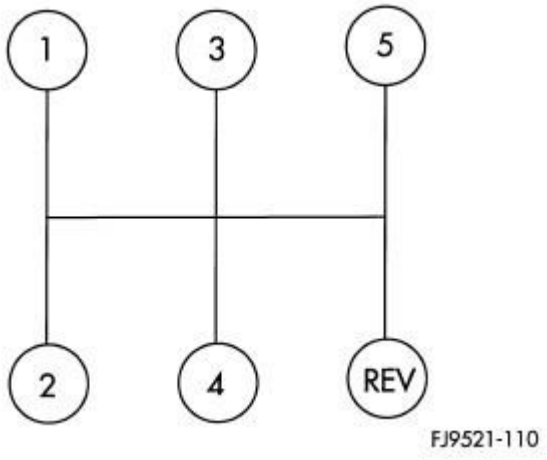

Fig. 2: T355 Transaxle Shift Pattern
Courtesy of CHRYSLER LLC

The T355 transaxle shift pattern is a modified H-pattern. Overdrive fifth and reverse gears are in-line and outboard of the first through fourth gear positions.

DIAGNOSIS AND TESTING

COMMON PROBLEM CAUSES

The majority of transaxle malfunctions are a result of:

- Insufficient lubrication
- Incorrect lubricant
- Misassembled or damaged internal components
- Improper operation

NOISY OPERATION

Transaxle noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth, and brindled, spalled bearings all cause noise.

Abnormal wear and damage to the internal components is frequently the end result of insufficient lubricant.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of leaks, or inaccurate fluid level check or refill method. **Vehicle must be level to accurately check fluid level.** Leakage is evident by the presence of oil around the leak point. If leakage is not evident, the condition is probably the result of an underfill.

If air-powered lubrication equipment is used to add fluid to the MPS6 transaxle, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an under fill condition. Refer to**Standard Procedure** for Draining and Filling in this service information .

30. Remove input (2) and output shaft (1) assemblies from Bench Fixture 6785.

CAUTION: The output shaft assembly is serviced as an assembly. Do not try to repair any component on the output shaft. If the 1-2 synchronizer or gear fails, it is necessary to replace the complete output shaft assembly.

CLEANING

CLEANING

Clean the gears, bearings, shafts, synchronizers, thrust washers, oil feeder, shift mechanism, gear case, and bellhousing. Do not use solvent to clean sealed bearings. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

INSPECTION

Inspect the gears, bearings and shafts. Replace the bearings and cups if the rollers are worn, chipped, cracked, flat spotted, brindled, or if the bearing cage is damaged or distorted. Replace the gears if the teeth are chipped, cracked or worn thin. Inspect the synchronizers. Replace the sleeve if worn or damaged in any way. Replace the stop rings if the friction material is burned, flaking off, or worn. Check the condition of the synchro keys and springs. Replace these parts if worn, cracked, or distorted.

ASSEMBLY

ASSEMBLY

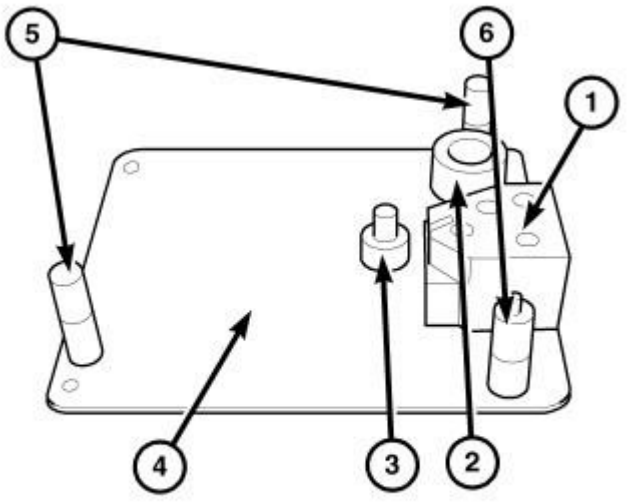

Fig. 42: Bench Fixture 6785 & Adaptors

The T355 transaxle internal components can be serviced only by separating the gear case from the bellhousing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.

The sealant used to seal the transaxle case halves is MOPAR® Gasket Maker, Loctite® 518, or equivalent. The sealant used for the bearing end plate cover is MOPAR® RTV.

NOTE: Some of the assembly adaptors are different part numbers form the disassembly adaptors.

1. Load bench fixture (4) with adaptors 9761-1 (1), 9761-2 (3), 9761-3 (2), 9761-4 (5) and 9761-5 (6).

2. Install the output (1) and input (2) shafts onto bench fixture 6785.
3. Install shift blocker assemblies, fork assemblies and detent assemblies all as one.

NOTE: Adaptor 9761-1 will slide shift blocker assembly and all the shift fork into the input and output shafts.

4. Align all shift forks and slide into place.

NOTE: One detent assembly bolt may need to be installed to align assembly.

NOTE: Insure that the select link is installed properly also insure that the blocker assembly catches the crossover ball stud (this can be checked by using a mirror).

7. Install gear case half (1) over bench fixture (2). Line up shift finger over 3-4 lug.
8. Line up reverse brake friction cone lugs to the slots in the gear case. Verify reverse brake shim is in position.

BEARING ADJUSTMENT PROCEDURE

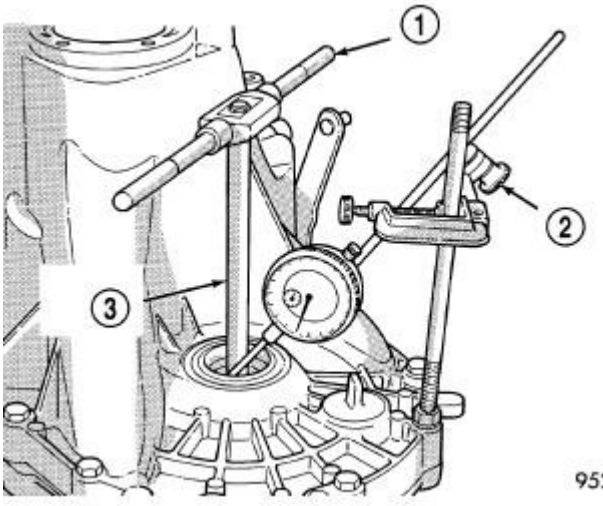

Fig. 57: Checking Differential Bearing End Play To Determine Shim Thickness
Courtesy of CHRYSLER LLC

1 - T-HANDLE
2 - DIAL INDICATOR SET
3 - TORQUE TOOL C-4995A

1. Use extreme care when removing and installing bearing cups and cones. Use only an arbor press for installation, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat gives a false end-play reading while gauging for proper shims. Improperly seated bearing cups and cones are subject to low mileage failures.
2. Bearing cups and cones should be replaced if they show signs of pitting or heat distress. If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.
3. Bearing preload and drag torque specifications must be maintained to avoid premature bearing failures. Used (original) bearings may lose up to 50% of the original drag torque after break-in. All bearing adjustments must be made with no other component interference or gear intermesh.
4. Replace bearings as a pair: If one differential bearing is defective, replace both differential bearings, if one input shaft bearing is defective, replace both input shaft bearings.
5. Bearing cones must not be reused if removed.
6. Turning torque readings should be obtained while smoothly rotating in either direction.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT

NOTE: True bearing turning torque readings can be obtained only with the geartrain

removed from the case.

1. Remove bearing cup and existing shim from clutch bellhousing case.
2. Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).
3. Press in new bearing cup into gear case side.
4. Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and tighten case bolts to 25 N.m (225 in. lbs.).
5. Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator.

NOTE: Position of dial indicator is for illustrative purposes only. The dial indicator should be parallel to T-Handle to obtain the most accurate reading.

6. Apply a medium load to differential with Torque Tool C-4995A (3) and a T-handle (1) , in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator (2). To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth. Record end play.

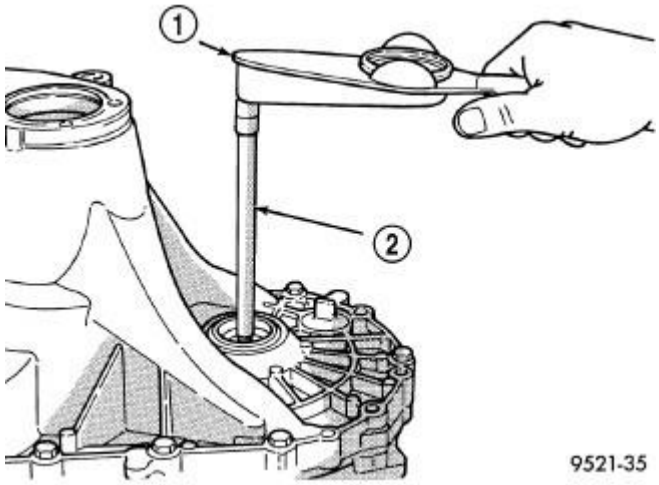

Fig. 58: Checking Differential Bearing Turning Torque
Courtesy of CHRYSLER LLC

1 - INCH-POUND TORQUE WRENCH
2 - TORQUE TOOL C-4995A

7. The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18**

mm (0.007 in.). Never combine shims to obtain the required preload.

8. Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected. Then press the bearing cup into clutch bellhousing.
9. Install clutch bellhousing. Install and tighten case bolts to 25 N.m (225 in. lbs.).

   Using Torque Tool C-4995A (2) and an inch-pound torque wrench (1), check turning torque of the differential assembly. **The turning torque should be 6 to 12 in. lbs. If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05 mm (0.002 inch) thicker shim.**

10. Recheck turning torque (1). Repeat until the proper turning torque is obtained.

    Once proper turning torque has been established, place gear case on the end plate. Draw a bead of MOPAR® Gasket Maker, Loctite® 518, or equivalent, on the flat surface of the case mating flange. Install clutch bellhousing onto gear case. Install and tighten case bolts to 25 N.m (225 in. lbs.).

11. Install the backup lamp switch (2), tighten switch to 23 N.m (17 ft. lbs.).

1. Install cable assembly through floor pan opening.
2. Route transaxle end of cable assembly into engine compartment and over transaxle assembly.

NOTE: The Cable with the white colored clip installs to the inboard side of the bracket

3. Install the Cables (2) to the Transaxle Bracket (4).
4. Connect the Cable Ends (1) to the Shift Levers (3) on the Transaxle.

NOTE: Cable (1) installs with the barbed side facing up on the left side of the shifter

5. Install the Shifter Cables (1) and (2) into the Shifter Base (3).
6. Install ORC. Refer to **Restraints/MODULE, Occupant Restraint Controller - Installation** .
7. Install the Electronic Stability Control (ESC) Dynamics Sensor. Refer to **Brakes/Electrical/SENSOR, Dynamics - Installation** .
8. Install shifter. See **Installation** .
9. Install the air cleaner assembly.
10. Connect battery cable.

Measure and Adjust Side Gear End-Play

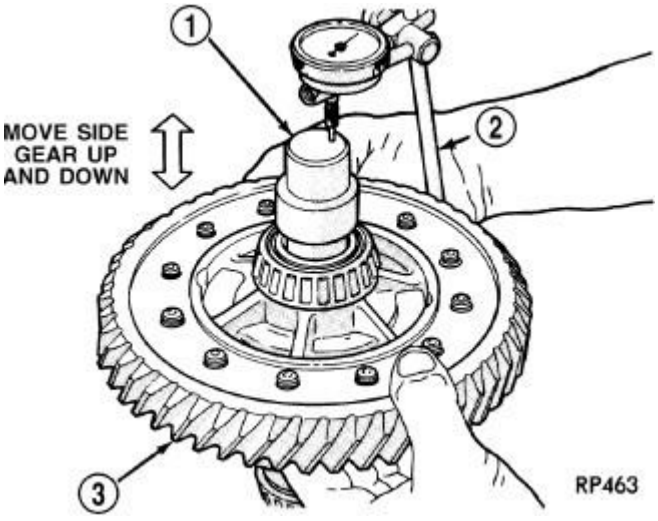

Fig. 136: Checking Side Gear End Play - Typical
Courtesy of CHRYSLER LLC

1. Rotate the assembly two full revolutions both clockwise and counterclockwise. Set up dial indicator and record end play.
2. Rotate side gear 90 degrees and take another measurement (2) . Again, rotate side gear 90 degrees and record a final measurement.
3. Using the smallest end play recorded, shim that side gear to within 0.001 to 0.013 inch. The other side gear should be checked using the same procedure.

CAUTION: Side gear end play must be within 0.001 to 0.013 inch.

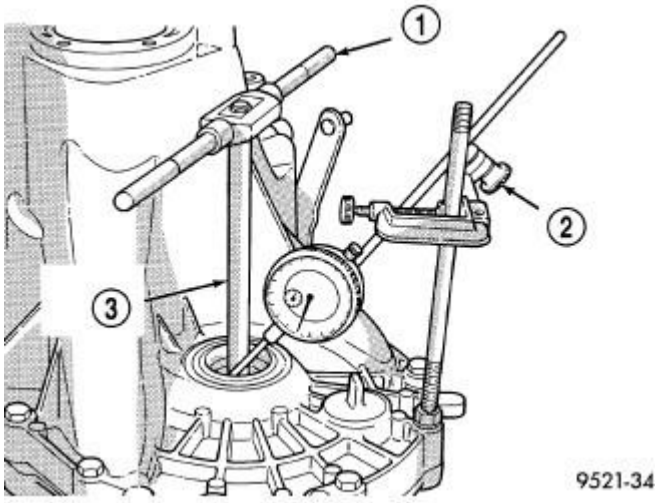

Fig. 137: Checking Differential Bearing End Play to Determine Shim Thickness
Courtesy of CHRYSLER LLC

1 - T-HANDLE
2 - DIAL INDICATOR SET
3 - TORQUE TOOL C-4995A

Measure and adjust differential side bearing preload during any transaxle service, especially when the following components are replaced:

- Transaxle gear case
- Clutch bellhousing case
- Differential case
- Differential bearings

NOTE: True bearing turning torque readings can be obtained only with the geartrain removed from the case.

1. Remove bearing cup and existing shim from clutch bellhousing case.
2. Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).
3. Press in new bearing cup into gear case side.
4. Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and torque case bolts to 25 N.m (225 in. lbs.).
5. Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator (2) .

NOTE: Indicator is set up as shown for illustrative purposes only. Indicator must be parallel to T-Handle to obtain the most accurate reading.

6. Apply a medium load to differential with Torque Tool C-4995A (3) and a T-handle (1), in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator (2). To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth. Record end play.

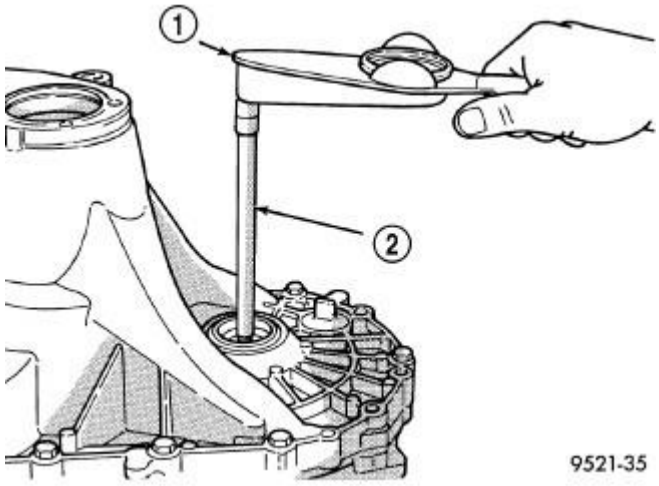

Fig. 138: Checking Differential Bearing Turning Torque

1 - INCH-POUND TORQUE WRENCH
2 - TORQUE TOOL C-4995A

7. The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18 mm (0.007 in.).** Never combine shims to obtain the required preload.
8. Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected in 7. Then press the bearing cup into clutch bellhousing.
9. Install clutch bellhousing. Install and tighten case bolts to 25 N.m (225 in. lbs.).
10. Using Torque Tool C-4995A (2) and an inch-pound torque wrenched (1) check turning torque of the differential assembly. **The turning torque should be 6 to 12 in. lbs. If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05 mm (0.002 inch) thicker shim.**
11. Recheck turning torque. Repeat 10 until the proper turning torque is obtained.

FLUID

STANDARD PROCEDURE

FLUID DRAIN AND FILL

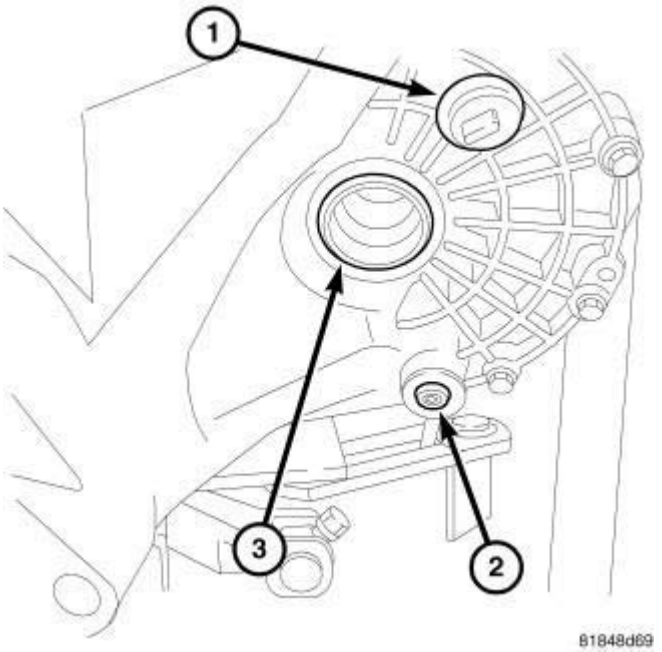

Fig. 139: Removing/Installing Transaxle Oil Drain Plug
Courtesy of CHRYSLER LLC

NOTE: All T355 Manual Transaxles require the use of ATF+4 (Automatic Transmission Fluid).

The transaxle fill plug (1) is located on the left side of the transaxle differential area. The fluid level should be within 3/16 inch from the bottom of the transaxle fill hole (vehicle must be level when checking).

The transaxle drain plug (2) is located on the lower right side of the transaxle differential housing. Tighten drain plug to 14 N.m (120 in. lbs.).

4 - 5TH SPEED GEAR
5 - STOP RING
6 - SLEEVE
7 - 4TH SPEED GEAR
8 - STOP RING
9 - 3RD SPEED GEAR

NOTE: Ring gaps must be measured with synchronizer ring biased towards gear clutching teeth on gear cone as much as possible while measuring gaps.

Before disassembly of the input shaft (1) , it is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings (2, 5, and 8) and the speed gears. The correct gaps are listed below:

- 3rd - 0.73-1.53 mm (0.029-0.060 in)
- 4th - 0.77-1.57 mm (0.030-0.062 in).
- 5th - 0.73-1.53 mm (0.029-0.060 in)
- Reverse Brake - 0.505-1.74 mm (0.020-0.068 in.)

The reverse brake measurement is taken between the stop ring and case.

If a stop ring gap does not fall within the specifications, it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.

The input shaft incorporates the 3rd, 4th, and 5th speed gears and synchronizers on the assembly.

REMOVAL

REMOVAL

It is not necessary to remove the shift shafts from the transaxle to service the shift shaft seals.

1. Using a pick tool, pry up on the shift shaft seal, and remove seal from bore.

INSTALLATION

INSTALLATION

1. Position new shift shaft seal into bore.
2. Install shift shaft seal into bore using an appropriate size deep-well socket.

SENSOR, VEHICLE SPEED

DESCRIPTION

DESCRIPTION

The Vehicle Speed Sensor (VSS) is a hall effect sensor mounted above the transaxle differential. The sensor is triggered by the ring gear teeth passing below it. The VSS pulse signal to the speedometer/odometer is monitored by the PCM speed control circuitry to determine vehicle speed and to maintain speed control set speed.

REMOVAL

REMOVAL

1. Open hood.
2. Remove the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal** .
3. Disconnect the speed sensor connector.

CAUTION: Clean area around speed sensor before removing to prevent dirt from entering the transaxle during speed sensor removal.

4. Remove speed sensor retaining bolt.
5. Remove speed sensor from transaxle.

INSTALLATION

INSTALLATION

1. Using a NEW O-ring, install the speed sensor to the transaxle.
2. Install the bolt and tighten to 7 N.m (60 in. lbs.).
3. Connect speed sensor connector.
4. Install the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation** .

CAUTION: The output shaft is serviced as an assembly. Do not try to repair any component on the output shaft. If the 1-2 synchronizer or gear fails, it is necessary to replace the output shaft assembly.

NOTE: Ring gaps must be measured with synchronizer ring biased towards gear clutching teeth on gear cone as much as possible while measuring gaps.

It is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings and the speed gears . The correct gaps are listed below:

- 1st - 0.522-2.208 mm (0.021-0.087 in)
- 2nd - 0.522-2.208 mm (0.021-0.087 in)

If a stop ring gap does not fall within the specifications it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.

The output shaft incorporates the 1st and 2nd gears and synchronizers on the assembly.

SYNCHRONIZER

DISASSEMBLY

DISASSEMBLY

Place synchronizer in a clean shop towel and wrap. Press on inner hub. Carefully open up shop towel and remove springs, balls, keys, hub, and sleeve.

CLEANING

CLEAN

Do not attempt to clean the blocking rings in solvent. The friction material will become contaminated. Place synchronizer components in a suitable holder and clean and air dry.

INSPECTION

INSPECT

Proper inspection of components involve:

- Teeth, for wear, scuffed, nicked, burred, or broken teeth
- Keys, for wear or distortion
- Balls and springs, for distortion, cracks, or wear

If any of these conditions exist in these components, replace as necessary.

1 - OIL FEED TROUGH

The bearing oil feed trough (1) is retained in the case by a pin that is molded into the case and clips that are part of the trough.

1. Using light plier pressure, squeeze the clips together at the rear of the trough.
2. Slide the trough over the retaining pin that locates the trough in the case.

Base - Service Information - Journey

DESCRIPTION

DESCRIPTION

The base brake system consists of the following components:

- Brake pedal
- Power brake booster
- Master cylinder
- Brake tubes and hoses
- Disc brakes (four-wheel)
- Brake lamp switch
- Brake fluid level switch
- Parking brakes

Antilock brakes with traction control and Electronic Stability Program (ESP) are standard equipment on this vehicle. ABS and ESP components are described in detail in ABS SERVICE INFORMATION.

For information on the brake lamp switch. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Description**

WARNING

WARNING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION

CAUTION

CAUTION: During service procedures, grease or any other foreign material must be

kept off brake shoes and braking surfaces of brake rotor or drum, and external surfaces of hub and bearing assembly.

CAUTION: Brake rotor and caliper handling must be done in such a way as to avoid damage to the rotor, especially the machined surfaces, and scratching or nicking of the brake linings.

CAUTION: Only the recommended jacking or hoisting procedures for this vehicle are to be used whenever it is necessary to lift a vehicle. Failure to raise a vehicle utilizing the recommended lift points can result in damage to the vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure .

DIAGNOSIS AND TESTING

BASE BRAKE SYSTEM

NOTE: There are three diagnosis charts following that cover the RED BRAKE WARNING INDICATOR LAMP, BRAKE NOISE and OTHER BRAKE CONDITIONS.

RED BRAKE WARNING INDICATOR LAMP

CONDITION	POSSIBLE CAUSES	CORRECTION
RED BRAKE WARNING LAMP ON	1. Parking brake lever not fully released.	1. Release parking brake lever.
	2. Parking brake warning lamp switch on parking brake lever.	2. Inspect and replace switch as necessary.
	3. Brake fluid level low in reservoir.	3. Fill reservoir. Check entire system for leaks. Repair or replace as required.
	4. Brake fluid level switch.	4. Disconnect switch wiring connector. If lamp goes out, replace switch.
	5. Mechanical instrument cluster (MIC) problem.	5. Refer to appropriate Diagnostic information.
	6. Amber ABS Warning Indicator Lamp also illuminated.	6. Refer to appropriate Diagnostic information.

BRAKE NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLICK OR SQUAWK ON PEDAL APPLICATION	1. Brake lamp switch.	1. Replace switch.
	2. Brake Transmission Shift Interlock Linkage.	2. Lubricate BTSI linkage.
	3. Pedal pivot bushings	3. Lubricate pivot bushings. Replace

		if necessary.
DISC BRAKE CHIRP	1. Excessive brake rotor runout. 2. Lack of lubricant on brake caliper slides. 3. Caliper/shoes not fully seated.	1. Follow brake rotor diagnosis and testing. Correct as necessary. 2. Lubricate brake caliper slides. 3. Reseat caliper/shoes.
DISC BRAKE RATTLE OR CLUNK	1. Broken or missing anti-rattle spring clips. 2. Caliper guide pins/bolts loose.	1. Replace anti-rattle spring clips. 2. Tighten guide pins/bolts.
DISC BRAKE SQUEAK AT LOW SPEED (WHILE APPLYING LIGHT BRAKE PEDAL EFFORT)	1. Brake shoe linings.	1. Replace brake shoes.
SCRAPING (METAL-TO-METAL).	1. Foreign object interference with brakes. 2. Brake shoes worn out.	1. Inspect brakes and remove foreign object. 2. Replace brake shoes. Inspect rotors. Reface or replace as necessary.

OTHER BRAKE CONDITIONS

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKES CHATTER	1. Disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake rotors as necessary.
BRAKES DRAG (FRONT OR ALL)	1. Contaminated brake fluid. 2. Binding caliper pins or bushings. 3. Binding master cylinder. 4. Binding brake pedal. 5. Brake lamp switch not adjusted properly and mounting bracket is bent.	1. Check for swollen seals. Replace all system components containing rubber. 2. Replace pins and bushings. 3. Replace master cylinder. 4. Replace brake pedal. 5. Straighten mounting bracket and replace brake lamp switch.
BRAKES DRAG (REAR ONLY)	1. Parking brake cables binding or froze up. 2. Parking brake cable return spring not returning shoes. 3. Rear disc brake parking brake not properly adjusted.	1. Check cable routing. Replace cables as necessary. 2. Replace cables as necessary. 3. Adjust parking brake shoes.
BRAKES GRAB	1. Contaminated brake shoe linings.	1. Inspect and clean, or replace shoes. Repair source of contamination.

	2. Improper power brake booster assist.	2. Refer to **BOOSTER, Power Brake**.
EXCESSIVE PEDAL EFFORT	1. Obstruction of brake pedal. 2. Low power brake booster assist (vacuum leak). 3. Glazed brake linings. 4. Brake shoe lining transfer to brake rotor.	1. Inspect, remove or move obstruction. 2. Refer to **BOOSTER, Power Brake**. 3. Reface or replace brake rotors as necessary. Replace brake shoes. 4. Reface or replace brake rotors as necessary. Replace brake shoes.
EXCESSIVE PEDAL TRAVEL (VEHICLE STOPS OK)	1. Air in brake lines.	1. Bleed brakes.
EXCESSIVE PEDAL TRAVEL (ONE FRONT WHEEL LOCKS UP DURING HARD BRAKING)	1. One of the two hydraulic circuits to the front brakes is malfunctioning.	1. Inspect system for leaks. Check master cylinder for internal malfunction.
PEDAL PULSATES/SURGES DURING BRAKING	1. Disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake rotors as necessary.
PEDAL IS SPONGY	1. Air in brake lines. 2. Power brake booster runout (vacuum assist).	1. Bleed brakes. 2. Check booster vacuum hose and engine tune for adequate vacuum supply. Refer to **BOOSTER, Power Brake**.
PREMATURE WHEEL LOCKUP	1. Contaminated brake shoe linings. 2. Antilock brake system function issue.	1. Inspect and clean, or replace shoes. Repair source of contamination. 2. Refer to appropriate antilock brake diagnostic information.
STOP/BRAKE LAMPS STAY ON	1. Brake lamp switch out of adjustment. 2. Brake pedal binding. 3. Obstruction in pedal linkage. 4. Power Brake Booster not allowing pedal to return completely.	1. Replace brake lamp switch. 2. Inspect and replace as necessary. 3. Remove obstruction. 4. Replace power brake booster.
VEHICLE PULLS TO RIGHT OR LEFT ON BRAKING	1. Frozen brake caliper piston. 2. Contaminated brake shoe lining. 3. Pinched brake lines.	1. Replace frozen piston or caliper. Bleed brakes. 2. Inspect and clean, or replace shoes. Repair source of contamination. 3. Replace pinched line.

	4. Leaking piston seal. 5. Suspension problem.	4. Replace piston seal or brake caliper. 5. Refer to **FRONT SUSPENSION** or **REAR SUSPENSION** .
PARKING BRAKE - EXCESSIVE LEVER TRAVEL	1. Broke cable. 2. Binding cable. 3. Damaged lever at rear brake caliper. 4. Binding/frozen rear brake caliper piston.	1. Replace broken cable. 2. Replace binding cable. 3. Replace rear brake caliper. 4. Replace rear brake caliper.

STANDARD PROCEDURE

BASE BRAKE BLEEDING

NOTE: This bleeding procedure is only for the vehicle's base brakes hydraulic system. For bleeding the antilock brakes hydraulic system. See Brakes - Standard Procedure

CAUTION: Before removing the master cylinder reservoir cap, thoroughly clean the cap and master cylinder fluid reservoir to prevent dirt and other foreign matter from dropping into the master cylinder fluid reservoir.

NOTE: The following wheel sequence should be used when bleeding the brake hydraulic system. The use of this wheel sequence will ensure adequate removal of all trapped air from the brake hydraulic system.

- Left Rear Wheel
- Right Front Wheel
- Right Rear Wheel
- Left Front Wheel

NOTE: When bleeding the brake system, some air may be trapped in the brake lines far upstream, as much as ten feet from the bleeder screw. Therefore, it is essential to have a fast flow of a large volume of brake fluid when bleeding the brakes to ensure all the air gets out.

Pressure bleeding the brakes is recommended, although the brakes may be manually bled or pressure bled. Refer to the appropriate following procedure.

PRESSURE BLEEDING PROCEDURE

Follow the pressure bleeder manufacturer's instructions for use of the pressure bleeding equipment.

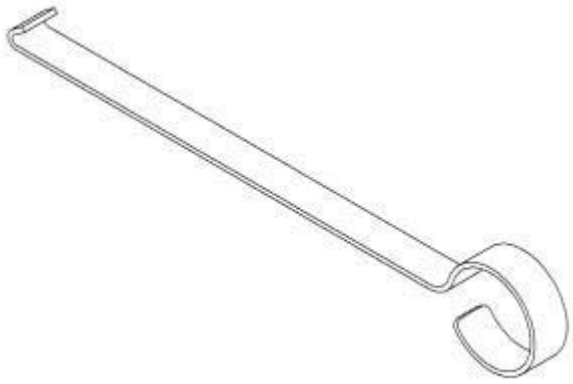

Fig. 1: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

1. Install Master Cylinder Pressure Bleed Cap, Special Tool 6921, or equivalent on the master cylinder fluid reservoir. Attach the fluid hose from the pressure bleeder to the fitting on Special Tool 6921.
2. Attach a clear plastic hose (1) to the bleeder screw and feed the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
3. Open the bleeder screw at least one full turn or more to obtain a steady stream of brake fluid.
4. After approximately 120-240 ml (4-8 ounces) of fluid have been bled through the brake circuit and an air-free flow is maintained in the clear plastic hose and jar, close the bleeder screw.
5. Repeat this procedure at all the remaining bleeder screws.
6. Check and adjust brake fluid level to the FULL mark on the reservoir.
7. Check brake pedal travel and feel. If pedal travel is excessive or if the pedal feels excessively spongy, some air may still be trapped in the system. Re-bleed the brakes as necessary including the IPB Caliper Brake Bleeding Procedure on the rear calipers as listed below.
8. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

MANUAL BLEEDING PROCEDURE

NOTE: To bleed the brakes manually, the aid of a helper will be required.

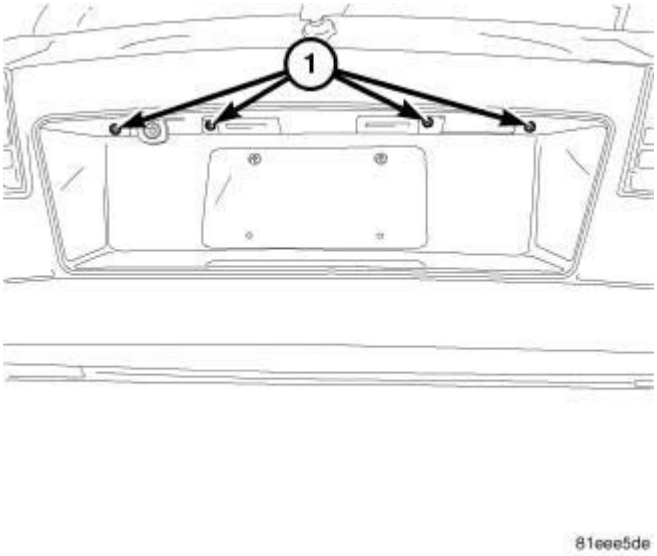

Fig. 2: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

1. Attach a clear plastic hose (1) to the bleeder screw and feed the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
2. Have a helper pump the brake pedal three or four times and hold it in the down position.
3. With the pedal in the down position, open the bleeder screw at least one full turn.
4. Once the brake pedal has dropped, close the bleeder screw. After the bleeder screw is closed, release the brake pedal.
5. Repeat the above steps until all trapped air is removed from that wheel circuit (usually four or five times).
6. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake system. Monitor the fluid level in the master cylinder reservoir to make sure it does not go dry.
7. Check and adjust brake fluid level to the FULL mark.
8. Check brake pedal travel and feel. If pedal travel is excessive or if the pedal feels excessively spongy, some air may still be trapped in the system. Re-bleed the brakes as necessary including the IPB Caliper Brake Bleeding Procedure on the rear calipers as listed below.
9. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

IPB CALIPER BRAKE BLEEDING PROCEDURE

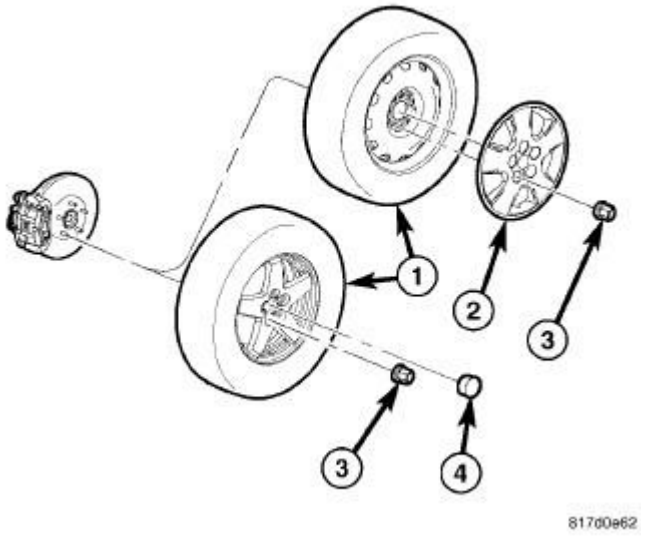

Fig. 3: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

NOTE: The following procedure is normally only necessary if a rear brake caliper has been removed and installed, or replaced.

Perform the following procedure on each rear brake caliper as necessary.

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**
2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).

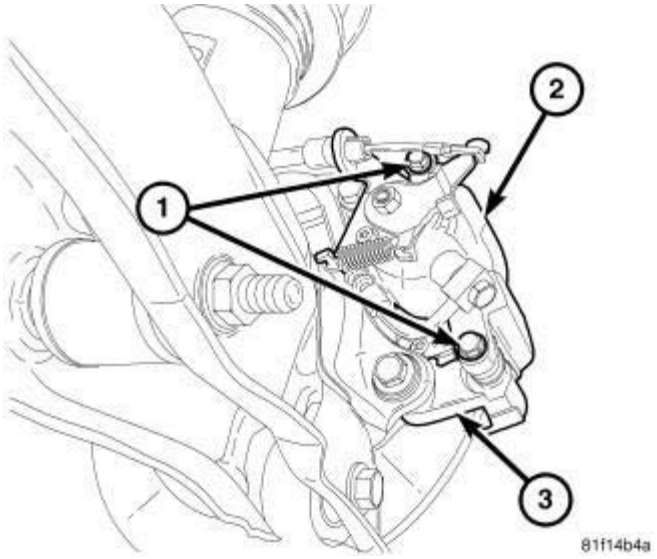

Fig. 4: REAR CALIPER MOUNTING
Courtesy of CHRYSLER LLC

3. Remove the brake caliper lower guide pin bolt (1).
4. Swing the caliper assembly upward, pivoting off the upper guide pin, until clear of the adapter bracket.

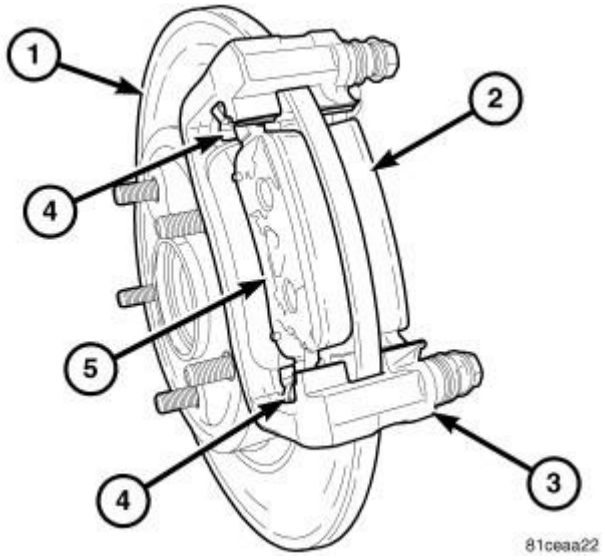

Fig. 5: REAR BRAKE PADS
Courtesy of CHRYSLER LLC

5. Remove the outboard pad (5) from the adapter bracket.
6. Return the caliper back down over the adapter bracket into mounted position and install the lower guide pin bolt finger tight.
7. Slowly pump the brake pedal until the caliper fingers touch the outboard surface of the brake rotor. Release the pedal.
8. Remove the brake caliper lower guide pin bolt.
9. Swing the caliper assembly upward, pivoting off the upper guide pin, until clear of the adapter bracket.
10. Reinstall the outboard pad in the adapter bracket.
11. Open the caliper bleeder screw at least one full turn.

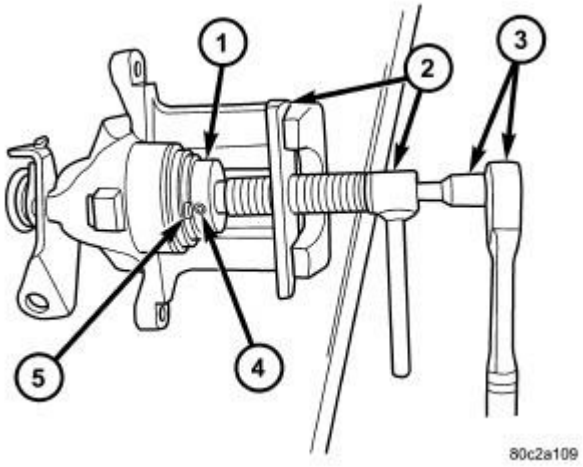

Fig. 6: SEATING PISTON WITH SPECIAL TOOL
Courtesy of CHRYSLER LLC

12. Seat (bottom) the caliper piston in the bore as follows:
    a. Assemble a 3/8 in. drive ratchet handle and an extension (3).
    b. Insert the extension through Special Tool 8807-1 (2).
    c. Place Special Tool 8807-2 (1) on the end of the extension.
    d. Insert lugs on Special Tool 8807-2 into notches in face of caliper piston (5).
    e. Thread the screw drive on 8807-1 down until it contacts the top of 8807-2 which is against the caliper piston. **Do not over tighten the screw-drive. Damage to the piston can occur.**
    f. Turn 8807-2 with the ratchet, rotating the piston in a **clockwise** direction until fully seated (bottomed) in the bore. **It may be necessary to turn 8807-1 with 8807-2 to start the process of piston retraction.**
13. Close the bleeder screw.
14. Return the caliper back down over the adapter bracket into mounted position and install the lower guide pin bolt finger tight.
15. Have a helper pump the brake pedal three or four times and hold it in the down position.
16. With the pedal in the down position, open the bleeder screw at least one full turn and let out fluid and air, if any.
17. Once the brake pedal has dropped, close the bleeder screw. Once the bleeder screw is closed, release the brake pedal.
18. Repeat the previous three steps until all trapped air is removed.
19. Tighten the guide pin bolt to 35 N.m (26 ft. lbs.).
20. Repeat the above procedure on the opposite rear brake caliper as necessary.
21. Check brake pedal travel and feel. If pedal travel is still excessive or if the pedal feels excessively spongy, repeat the entire procedure as necessary.
22. Install the tire and wheel assembly. Refer to **Tires and Wheels - Installation** . Install and tighten wheel mounting nuts to 135 N.m (100 ft. lbs.).
23. Lower the vehicle

24. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

HYDRAULIC/MECHANICAL

DESCRIPTION

DESCRIPTION

Four-wheel disc brakes are standard on this vehicle. Each disc brake assembly consists of the following major components:

- Caliper
- Caliper adapter bracket
- Pads (Shoe and lining assemblies)
- Rotor

FRONT DISC BRAKES

Each front disc brake features a single 2.6 in. (66 mm) piston floating caliper acting on a 11.9 x 1.1 in. (302 x 28 mm) vented rotor. The brake caliper is a low-drag type. The vented rotor utilizes an inverted hat construction (vent openings are on the outboard side of the rotor versus inboard side) to improve cooling and minimize high-temperature deformation for long-term smooth operation. The front brake caliper piston and seals are serviceable.

REAR DISC BRAKES

Each rear disc brake features a single 1.7 in. (43 mm) piston floating caliper acting on a 12.0 x.47 in. (305 x 12 mm) solid rotor. The brake caliper used features an Integral Parking Brake (IPB) mechanism which combines a mechanical parking brake function with a conventional rear caliper. Refer to **Parking Brake** for additional information on this feature. The rear brake caliper with integrated parking brake is not serviceable.

All brake calipers are coated in zinc nickel and dipped after machining with clear coat for excellent corrosion protection and a neat appearance. They use adapter bracket mounted guide pins for caliper slide functions.

All rotors are made from high-carbon, damped iron for quiet operation. They are fully coated with zinc dust water-soluble, environmental friendly corrosion preventive. Both the friction surfaces and the vents are coated. During initial brake applications, the brake pads scrub the coating off the friction surfaces, ensuring that the remainder will be rust free. Coating the vents also maintains their heat capacity over time.

Front disc brakes are equipped with an audible wear indicator on the left side inboard brake pad only. The right side pads do not include an audible wear indicator.

Rear disc brakes are equipped with audible wear indicators on both left side and right side inboard brake pads.

When the brake pads are replaced, only brake pads meeting the Original Equipment Manufacturer (OEM) formulation (such as Mopar® replacement parts) should be used.

BOOSTER, POWER BRAKE

Description

DESCRIPTION

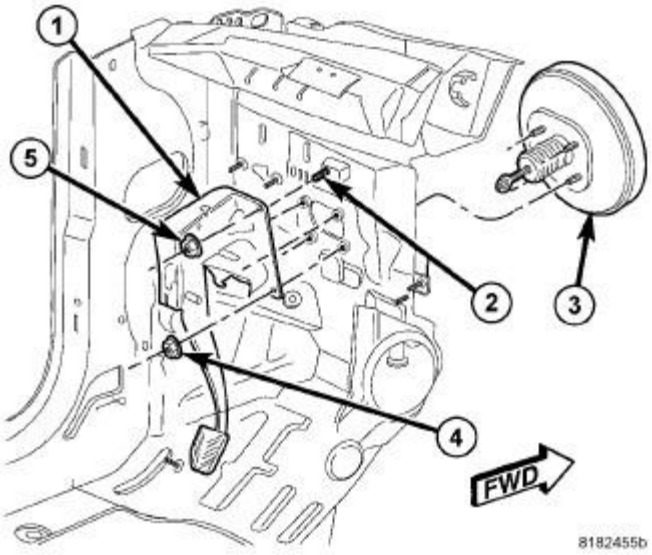

Fig. 17: PEDAL AND BOOSTER MOUNTING - LHD
Courtesy of CHRYSLER LLC

The power brake booster (3) is mounted to the engine side of the dash panel. The master cylinder is bolted to the front of the booster. A vacuum check valve is also mounted on the front of the booster. A vacuum line connects the check valve to engine source vacuum. The booster input rod extends through the dash panel and connects to the brake pedal.

This vehicle uses a tandem diaphragm, single rate vacuum power brake booster with 203 and 229 mm (8 and 9 in.) diaphragms. Power brake boosters are internally tuned differently depending on whether the vehicle is equipped with ABS or without ABS. If the power brake booster requires replacement, be sure it is replaced with the correct part.

The power brake booster can be identified by the tag attached to the body of the booster. This tag contains the following information:

- The production part number
- The date it was built, and
- The booster manufacturer.

Diagnosis and Testing

POWER BRAKE BOOSTER

BASIC TEST

1. With engine off, depress and release the brake pedal several times to purge all vacuum from the power brake booster.

2. Depress and hold the pedal with light effort (15 to 25 lbs. (6.8 to 11.3 kg) pressure), then start the engine.

   The pedal should fall slightly, then hold. Less effort should be needed to apply the pedal at this time. If the pedal fell as indicated, perform the **VACUUM LEAK TEST** listed after the **BASIC TEST**. If the pedal did not fall, continue on with this BASIC TEST.

3. Disconnect the vacuum hose at the vacuum check and tee-in a vacuum gauge.
4. Start the engine.
5. When the engine is at warm operating temperature, allow it to idle and check the vacuum at the gauge.

   If the vacuum supply is 12 inches Hg (40.5 kPa) or more, the power brake booster is defective and must be replaced. If the vacuum supply is below 12 inches Hg, continue on with this BASIC TEST.

6. Shut off the engine.
7. Connect the vacuum gauge to the vacuum reference port on the engine intake manifold.
8. Start the engine and observe the vacuum gauge.

If the vacuum is still low, check the engine tune and repair as necessary. If the vacuum is above 12 inches, the hose or check to the booster has a restriction or leak.

Once an adequate vacuum supply is obtained, repeat the BASIC TEST.

VACUUM LEAK TEST

1. Disconnect the vacuum hose at the vacuum check and tee-in a vacuum gauge.
2. Start the engine.
3. Allow the engine to warm up to normal operating temperature and engine idle.
4. Using vacuum line pliers, close off the vacuum supply hose near the booster and observe the vacuum gauge.

   If the vacuum drop exceeds 1.0 inch Hg (3.3 kPa) in one minute, repeat the above steps to confirm the reading. The vacuum loss should be less than 1.0 inch Hg in one minute time span. If the loss is more than 1.0 inch Hg, replace the power brake booster. If it is not, continue on with this test.

5. Remove the pliers from the hose temporarily.
6. Apply light effort (approximately 15 lbs. (6.8 kg) of force) to the brake pedal and hold the pedal steady. Do not move the pedal once the pressure is applied or the test results may vary.
7. Have an assistant reattach the pliers to the vacuum supply hose.
8. Allow 5 seconds for stabilization, then observe the vacuum gauge.

If the vacuum drop exceeds 3.0 inches Hg (10 kPa) in 15 seconds, repeat the above steps to confirm the reading. The vacuum loss should be less than 3.0 inches Hg in 15 seconds time span. If the loss is more than 3.0 inches Hg, replace the power brake booster. If it is not, the booster is not defective.

Removal

LEFT-HAND-DRIVE

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

CAUTION: The vacuum in the power brake booster must be pumped down before removing the master cylinder to prevent the booster from sucking in any contamination. This can be done by pumping the brake pedal while the engine is not running until a firm brake pedal is achieved.

1. With the engine not running, pump the brake pedal 4-5 strokes until the pedal feel is firm.
2. Disconnect the negative (ground) cable from the battery and isolate the cable.

13. Remove the retaining clip (2) securing the power brake booster push rod (1) to the brake pedal. To do so, position a small screwdriver under the center tang of the retaining clip, then rotate the screwdriver enough to allow the retaining clip tang to pass over the end of the brake pedal pin (3). Remove and discard the

clip. **Do not reuse the clip.**

14. Slide the booster push rod (1) off the brake pedal pin (3).

CAUTION: Do not reuse the original stop lamp switch on vehicles built prior to July 21, 2008. Anytime a switch has been removed or its position compromised, a new switch must be installed and adjusted. Do not attempt to readjust the switch. The original brake lamp switch can be reused and adjusted on vehicles built on or after July 21, 2008.

6. Install and adjust a NEW stop lamp switch (2) in the brake pedal bracket (1) on vehicle built prior to July 21, 2008. The original brake lamp switch can be reused on vehicles built on or after July 21, 2008. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Installation**
7. If equipped, install the silencer pad below the instrument panel.

REMOVAL

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

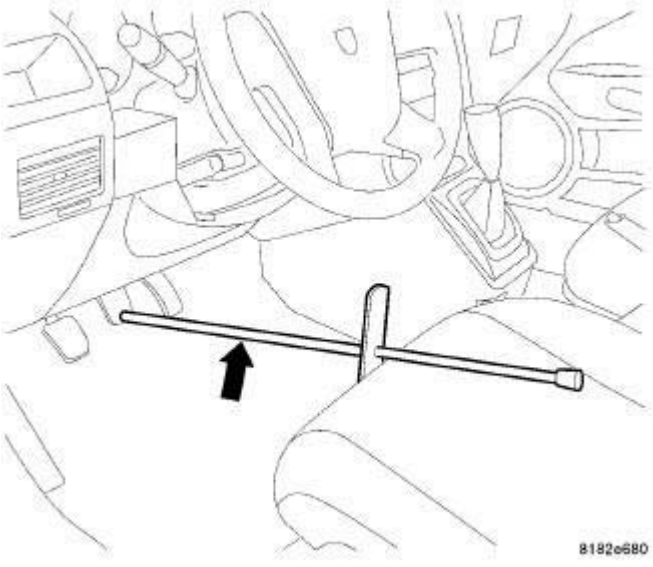

Fig. 56: BRAKE PEDAL HOLDING TOOL
Courtesy of CHRYSLER LLC

1. Using a brake pedal holding tool as shown, depress the brake pedal past its first one inch (25 mm) of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir when the lines are opened.
2. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

CAUTION: When removing or installing a caliper guide pin bolt, it is necessary to hold the guide pin stationary while turning the bolt. Hold the guide pin stationary using a wrench placed upon the pin's hex-shaped head.

5. Remove the two brake caliper guide pin bolts (2, 3).
6. Slide the disc brake caliper (4) from the disc brake adapter bracket (1) and brake pads and remove.

Disassembly

DISASSEMBLY

NOTE: Before disassembling the brake caliper, remove it from the vehicle. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Removal

NOTE: Before disassembling the brake caliper, clean and inspect it. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Cleaning. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Inspection

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Mount the caliper in a vise equipped with protective jaws.

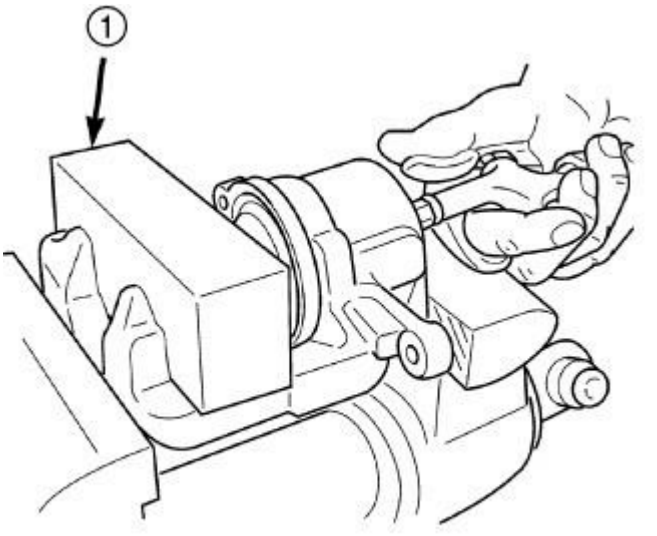

Fig. 60: Piston Removal

1 - WOOD BLOCK

WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

2. Place a wooden block (1) in the caliper as shown.
3. If necessary, apply low pressure compressed air to the caliper fluid inlet in short spurts to force the piston out.
4. Remove the piston from the caliper.
5. Remove the dust boot from the piston and discard it.

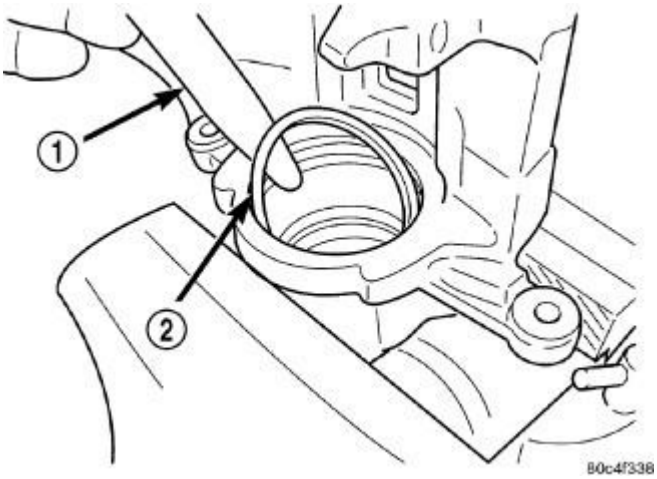

Fig. 61: Piston Seal Removal
Courtesy of CHRYSLER LLC

1 - TRIM STICK
2 - SEAL

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

6. Using a soft tool such as a plastic trim stick (1), work the piston seal (2) out of its groove in caliper piston bore. Discard the used seal.
7. Clean the piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
8. Inspect both the piston and bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth.

Cleaning

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing

mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

Inspection

INSPECTION

Inspect the disc brake caliper for the following:

- Brake fluid leaks in and around piston boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.

Assembly

ASSEMBLY

NOTE: Always have clean hands when assembling a brake caliper.

NOTE: Always use fresh, clean brake fluid when assembling a brake caliper.

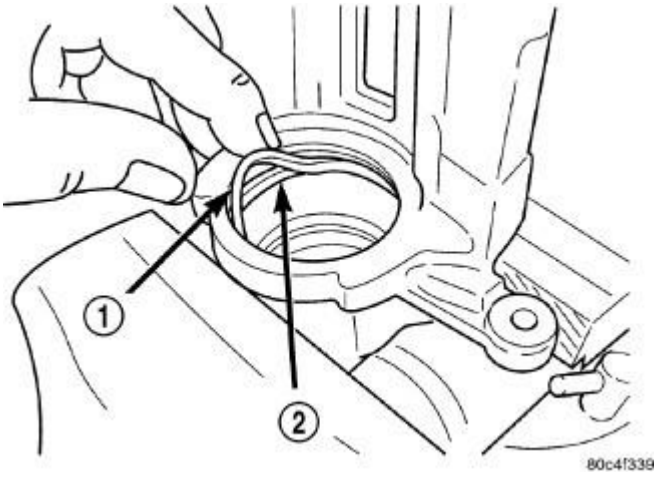

Fig. 62: New Piston Seal Installation

1 - SEAL
2 - GROOVE

NOTE: Never use an old piston seal.

1. Dip the NEW piston seal in clean brake fluid and install it in the groove (2) of the caliper bore. The seal (1) should be started at one area of the groove and gently worked around into the groove using only your clean fingers to seat it.

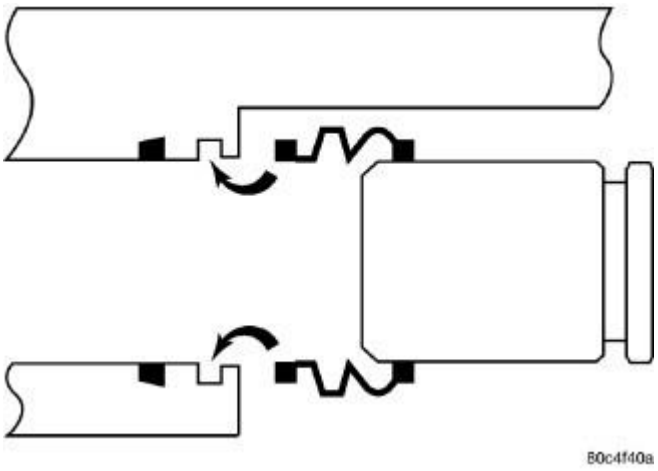

Fig. 63: Boot Installation

2. Coat the NEW piston with clean brake fluid.
3. Coat the NEW piston boot with clean brake fluid leaving a generous amount inside the boot.
4. Position the dust boot over the lower section of the piston.
5. Extend the dust boot below the bottom of the piston and guide the lip seal into the groove in the caliper piston bore.

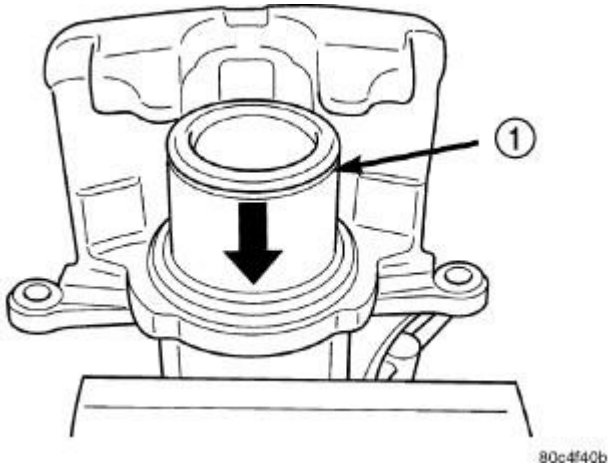

Fig. 64: Piston Installation

1 - PISTON GROOVE

CAUTION: Force applied to the piston (1) to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

6. Install the piston (1) into the bore, carefully pushing it past the piston seal using **hand pressure** . Push the piston in until it bottoms in the caliper bore and the dust boot lip seal falls into the groove near the top of the piston.
7. Install the caliper on the vehicle and bleed the brakes as necessary. See **Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Installation**

Installation

INSTALLATION

1. Completely retract the caliper piston back into the bore of the caliper. Use a C-clamp to retract the piston. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.

CAUTION: Use care when installing the caliper (4) onto the adapter bracket (1) to avoid damaging the guide pin boots.

2. Install the disc brake caliper over the brake pads on the brake caliper adapter bracket.

CAUTION: When removing or installing a caliper guide pin bolt, it is necessary to hold the guide pin stationary while turning the bolt. Hold the guide pin stationary using a wrench placed upon the pin's hex-shaped head.

3. Align the caliper guide pin bolt holes with the adapter bracket. Install the upper (2) and lower (3) caliper guide pin bolts. Tighten the guide pin bolts to 35 N.m (26 ft. lbs.).

CAUTION: Use care when installing the caliper (2) onto the adapter bracket to avoid damaging the guide pin boots.

2. Install the disc brake caliper (2) over the inboard brake pad on the brake caliper adapter bracket and the brake rotor.

CAUTION: When removing or installing a caliper guide pin bolt, it is necessary to hold the guide pin stationary while turning the bolt. Hold the guide pin stationary using a wrench placed upon the pin's hex-shaped head.

3. Align the caliper guide pin bolt holes with the adapter bracket. Install the upper and lower caliper guide pin bolts (1). Lightly tighten the guide pin bolts at this time.

10. Seat (bottom) the caliper piston in the bore as follows:
    a. Assemble a 3/8 in. drive ratchet handle and an extension (3).
    b. Insert the extension through Special Tool 8807-1 (2).
    c. Place Special Tool 8807-2 (1) on the end of the extension.
    d. Insert lugs on Special Tool 8807-2 into notches in face of caliper piston (5).
    e. Thread the screw drive on 8807-1 down until it contacts the top of 8807-2 which is against the caliper piston. **Do not over tighten the screw-drive. Damage to the piston can occur.**
    f. Turn 8807-2 with the ratchet, rotating the piston in a **clockwise** direction until fully seated (bottomed) in the bore. **It may be necessary to turn 8807-1 with 8807-2 to start the process of piston retraction.**
11. Close the bleeder screw.

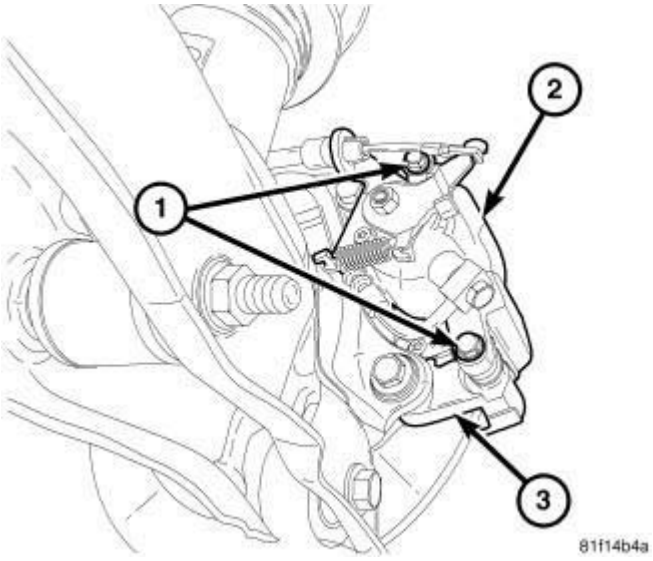

Fig. 83: REAR CALIPER MOUNTING

CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boots.

CAUTION: When removing or installing a caliper guide pin bolt, it is necessary to hold the guide pin stationary while turning the bolt. Hold the guide pin stationary using a wrench placed upon the pin's hex-shaped head.

12. Return the brake caliper back down over the adapter bracket into mounted position and install the guide pin bolts (1). Tighten both guide pin bolts to 35 N.m (26 ft. lbs.).

NOTE: While bleeding air from the brake caliper in the following steps, be sure to monitor the fluid level in the master cylinder reservoir making sure it does not go dry.

13. Have a helper pump the brake pedal three or four times and hold it in the down position.
14. With the pedal in the down position, open the bleeder screw at least one full turn and let out fluid and air, if any.
15. Once the brake pedal has dropped, close the bleeder screw. Once the bleeder screw is closed, release the brake pedal.
16. Repeat the previous three steps as necessary until all trapped air is removed.
17. If necessary, bleed remaining wheel circuits as necessary using normal bleeding procedure. See **Brakes - Standard Procedure**

20. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
21. Reconnect the parking brake cable equalizer and reset the cable tension. See **Brakes/Parking Brake - Standard Procedure**
22. Lower vehicle.
23. Connect battery negative (-) cable to battery post.
24. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads.

FLUID

Diagnosis and Testing

BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts. Swelling indicates the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If the fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If the brake fluid is contaminated, drain and thoroughly flush the brake system. Replace all the rubber parts or components containing rubber coming into contact with the brake fluid including: the master cylinder and reservoir; proportioning valves (non-ABS); caliper seals; wheel cylinder seals; ABS hydraulic control unit; and all hydraulic fluid hoses.

Standard Procedure

BRAKE FLUID LEVEL CHECKING

NOTE: Brake fluid level should be checked a minimum of twice a year.

Master cylinder reservoirs are marked, FULL and ADD, indicating the allowable brake fluid level range in the master cylinder fluid reservoir.

CAUTION: Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container. Do not use petroleum-based fluid because seal damage in the brake system will result. See Brakes/Hydraulic/Mechanical/FLUID - Specifications

NOTE: Although there is a range, the preferred level is FULL.

1. Remove the cap.
2. Adjust the brake fluid level to the FULL mark listed on the side of the master cylinder fluid reservoir as necessary. Do not overfill the system.
3. Install the cap.

Specifications

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

MASTER CYLINDER, BRAKE

Description

DESCRIPTION

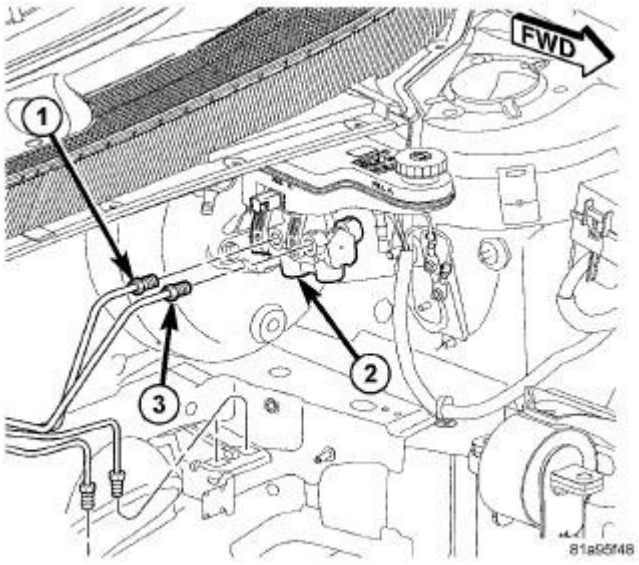

Fig. 87: PRIMARY AND SECONDARY BRAKE TUBES
Courtesy of CHRYSLER LLC

All master cylinders (2) are a two-outlet design and the brake tubes from these primary and secondary outlet ports lead directly to the Integrated Control Unit (ICU) before going to each wheel brake.

All master cylinders mount to the power brake booster in the same manner.

The master cylinder body is an anodized aluminum casting. It has a machined bore to accept the master cylinder pistons and also has threaded ports with seats for hydraulic brake tube connections.

The master cylinder has the brake fluid reservoir mounted on top of it which gravity feeds brake fluid to the master cylinder when it is required. On manual transmission model vehicles the brake fluid reservoir also feeds the clutch hydraulic circuit. The reservoir is made of see-through plastic and it houses the brake fluid level switch. A removable brake fluid level switch is mounted in the right side.

Operation

OPERATION

When the brake pedal is pressed, the master cylinder primary and secondary pistons apply brake pressure through the chassis brake tubes to each brake assembly. The brake fluid reservoir supplies the brake hydraulic system with the necessary fluid to operate properly.

The master cylinder's outlet ports supply hydraulic pressure to the Integrated Control Unit (ICU) where it is distributed to the individual wheel brakes.

The master cylinder reservoir cap diaphragm is slit to allow atmospheric pressure to equalize on both sides of the diaphragm.

Standard Procedure

MASTER CYLINDER BLEEDING

1. Clamp the master cylinder in a vise with soft-jaw caps.

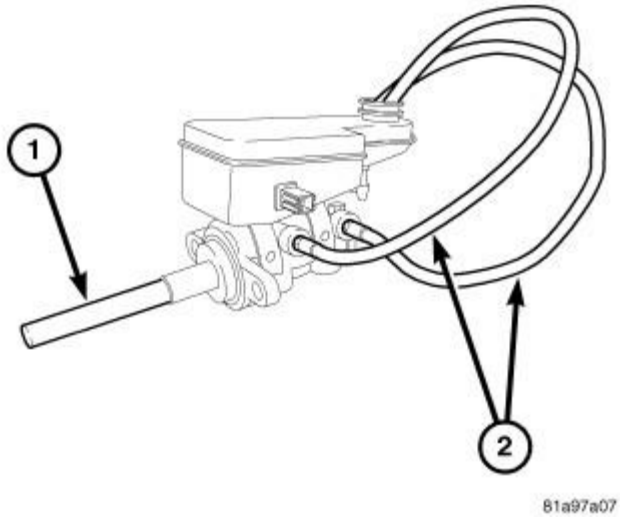

Fig. 88: BLEEDING MASTER CYLINDER WITH ABS
Courtesy of CHRYSLER LLC

2. Thread a Bleeder Tube (2), Special Tool 8358-1, into the primary and secondary ports. Tighten bleeder tube nuts to 17 N.m (150 in. lbs.).
3. Flex each Bleeder Tube and place the open ends into the neck of the master cylinder reservoir. Position the open ends of the tubes into the reservoir so their outlets are below the surface of the brake fluid in the reservoir when filled.

NOTE: Make sure the ends of the Bleeder Tubes stay below the surface of the brake fluid in the reservoir at all times during the bleeding procedure.

4. Fill the brake fluid reservoir with fresh Mopar® Brake Fluid DOT 3 Motor Vehicle, or equivalent. See **Brakes/Hydraulic/Mechanical/FLUID - Specifications**

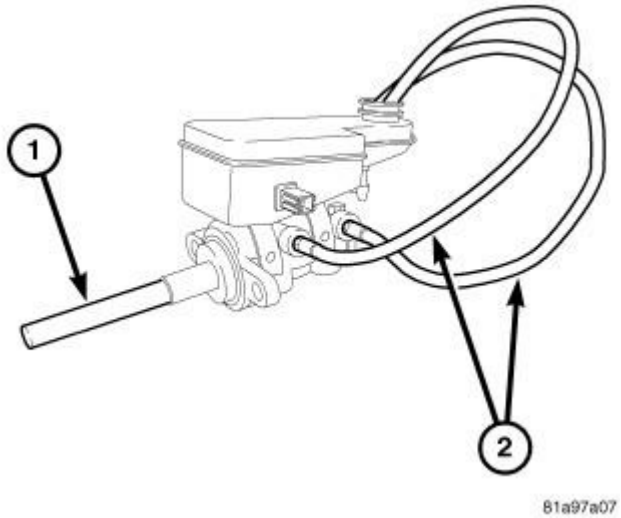

Fig. 89: BLEEDING MASTER CYLINDER WITH ABS
Courtesy of CHRYSLER LLC

5. Using an appropriately sized wooden dowel as a pushrod (1), slowly press the pistons inward discharging brake fluid through the Bleeder Tubes (2), then release the pressure, allowing the pistons to return to the released position. Repeat this several times until all air bubbles are expelled from the master cylinder bore and Bleeder Tubes.
6. Remove the Bleeder Tubes from the master cylinder and plug the master cylinder outlet ports.
7. Install the fill cap on the reservoir.
8. Remove the master cylinder from the vise.
9. Install the master cylinder on the vehicle. See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Installation**

Removal

LEFT-HAND-DRIVE

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

CAUTION: The vacuum in the power brake booster must be depleted before removing the master cylinder to avoid damaging the master cylinder and to prevent inhalation of the o-ring or any other contamination into the booster. The preferred method is to pump the brake pedal while the engine is not running until the brake pedal becomes firm. An alternative method is to remove and immediately reinstall the check valve located on the booster. If the check valve is removed, special care should be taken to ensure that the grommet is not damaged and remains seated, the check valve is dry and free of debris, and that contaminates cannot be ingested during removal.

1. With the engine not running, pump the brake pedal 4-5 strokes until the pedal feel is firm.
2. Disconnect the negative (ground) cable from the battery and isolate the cable.

3. Disconnect the wiring harness connector (1) from the brake fluid level switch (2) in the master cylinder brake fluid reservoir.

4. Disconnect the primary (1) and secondary (3) brake tubes at the master cylinder (2) outlet ports. Install

plugs at all of the open brake tube outlets on the master cylinder.

6. Clean the area around where the master cylinder (2) attaches to the power brake booster (1) using a suitable brake cleaner such as Mopar® Brake Parts Cleaner or an equivalent.
7. Remove the two nuts (3) attaching the master cylinder (2) to the power brake booster (1).

8. Slide the master cylinder straight out of the power brake booster.

RIGHT-HAND-DRIVE

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

CAUTION: The vacuum in the power brake booster must be depleted before removing the master cylinder to avoid damaging the master cylinder and to prevent inhalation of the o-ring or any other contamination into the booster. The preferred method is to pump the brake pedal while the engine is not running until the brake pedal becomes firm. An alternative method is to remove and immediately reinstall the check valve located on the booster. If the check valve is removed, special care should be taken to ensure that the grommet is not damaged and remains seated, the check valve is dry and free of debris, and that contaminates cannot be ingested during removal.

1. With the engine not running, pump the brake pedal 4-5 strokes until the pedal feel is firm.
2. Disconnect the negative (ground) cable from the battery and isolate the cable.
3. Remove the engine appearance cover.

Disassembly

DISASSEMBLY

NOTE: If the reservoir is being replaced, the new reservoir will come with a brake fluid level switch installed. The old fluid switch does not need to be transferred from the old reservoir to the new reservoir.

1. Clean the master cylinder housing and brake fluid reservoir. Use only Mopar® Brake Parts Cleaner or equivalent.
2. Remove the brake fluid reservoir cap. Using a syringe or equivalent type tool, empty as much brake fluid as possible from the reservoir.

3. Remove the four reservoir retaining tabs from the mounting posts on the master cylinder housing.
4. Pull the reservoir straight up and remove it from the grommet seals in master cylinder housing.

5. Remove the vacuum O-ring seal (2) from the master cylinder mounting flange (1).

Assembly

ASSEMBLY

NOTE: If the reservoir is being replaced, the new reservoir will come with a brake fluid level switch installed. The old fluid switch does not need to be transferred from the old reservoir to the new reservoir.

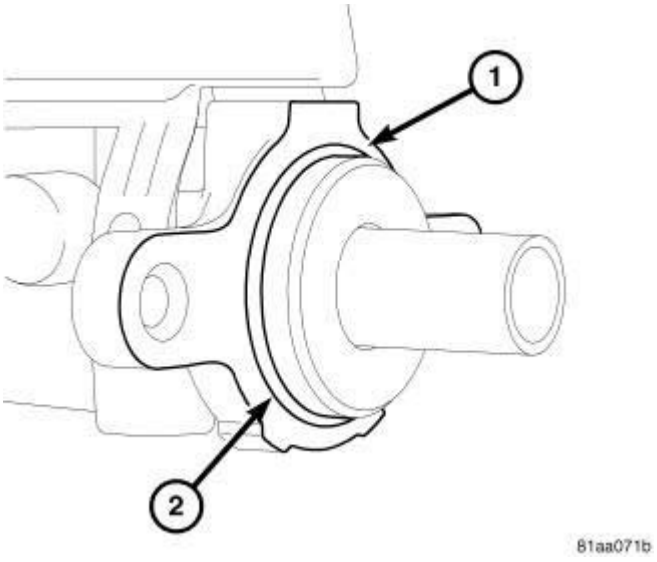

Fig. 102: SEAL ON REAR OF MASTER CYLINDER

2. Lubricate the reservoir mounting area with fresh clean brake fluid. With the grommet seals (2) on the fluid reservoir spigots, place the reservoir in position over the master cylinder. Install the fluid reservoir by firmly pressing down on the fluid reservoir. Once installed, make sure the fluid reservoir is touching

the top of both grommet seals.

3. Push the reservoir retaining tabs over the mounting posts on the master cylinder housing. Make sure the retaining tabs are securely engaged.
4. Fill and thoroughly bleed the master cylinder before installing it. See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Standard Procedure**
5. Install the master cylinder. See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Installation**

Installation

LEFT-HAND-DRIVE

NOTE: The master cylinder must be bled before installing it on the vehicle.

1. Bench bleed the master cylinder. See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Standard Procedure**
2. Wipe the face of the power brake booster clean where the vacuum seal on the rear of the master cylinder comes in contact when it's installed. Do not get any cleaner or debris inside the booster.

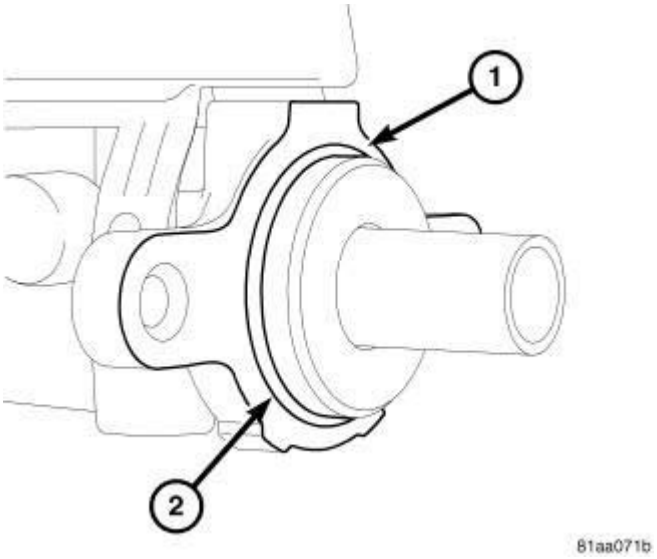

Fig. 104: SEAL ON REAR OF MASTER CYLINDER

CAUTION: When installing a master cylinder on the vehicle, a NEW vacuum O-ring seal (2) MUST be installed on the master cylinder mounting flange (1).

3. If the master cylinder does not have a new vacuum O-ring seal (2) on the mounting flange (1), remove it. Install a NEW vacuum O-ring seal on the master cylinder mounting flange making sure the O-ring fits evenly against the mounting flange.

CAUTION: If resistance is met during master cylinder insertion into power brake booster, the master cylinder push rod may not be lined up with the booster push rod. Remove the master cylinder, realign and insert it again.

4. Line the master cylinder mounting holes up with the mounting studs on the power brake booster. Ensure the master cylinder piston push rod lines up with the booster push rod, then carefully slide the master cylinder into the power brake booster until it contacts the face of the booster.

CAUTION: When removing or installing a caliper guide pin bolt, it is necessary to hold the guide pin stationary while turning the bolt. Hold the guide pin stationary using a wrench placed upon the pin's hex-shaped head.

3. Remove the two brake caliper guide pin bolts (2, 3).
4. Remove the disc brake caliper (4) from the disc brake adapter bracket (1) and hang it out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.

5. Remove the brake pads (4, 5) from the caliper adapter bracket (2).

Cleaning

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

Inspection

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

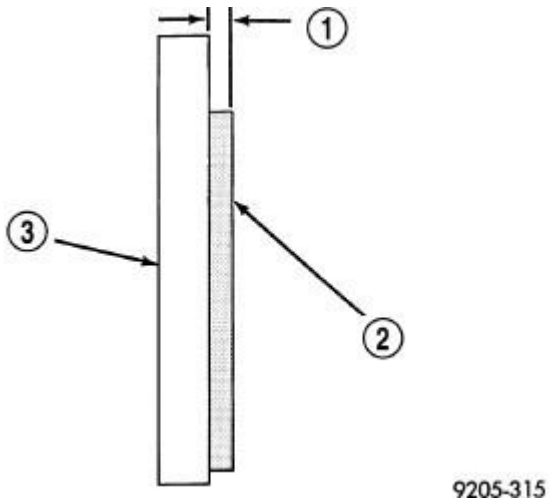

Fig. 120: Brake pad Friction Material Thickness Measurement
Courtesy of CHRYSLER LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT.
2 - BRAKE Shoe ASSEMBLY FRICTION MATERIAL

3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a brake pad lining (2) measured at its **thinnest point** measures one millimeter (0.04 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: It is important to inspect both front and rear brake pads during the same inspection.

Installation

INSTALLATION

NOTE: Perform 1 through 5 on each side of the vehicle to complete pad set installation, then proceed to 6.

NOTE: Make sure that the audible wear indicator (if equipped) is placed toward the top when the inboard brake pad is installed on each side of the vehicle.

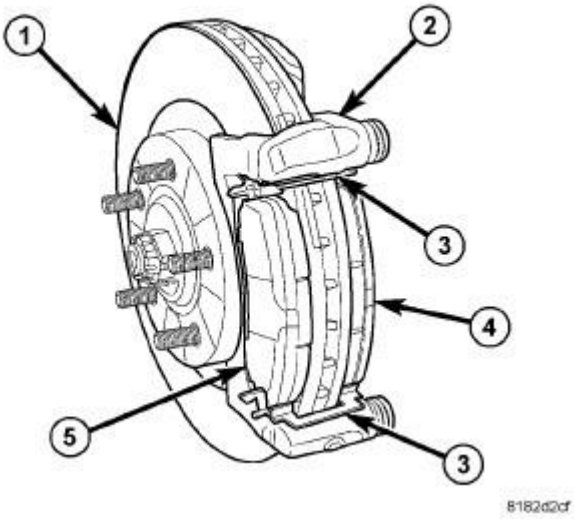

Fig. 121: FRONT BRAKE PADS
Courtesy of CHRYSLER LLC

NOTE: If the brake pads have a protective paper on the rear face of the brake pad plate,

it must be removed before pad installation.

1. Place the brake pads (4, 5) in the abutment shims (3) clipped into the disc brake caliper adapter bracket (2) as shown. Place the pad with the wear indicator (if equipped) attached on the inboard side (2).
2. Completely retract the caliper piston back into the bore of the caliper.

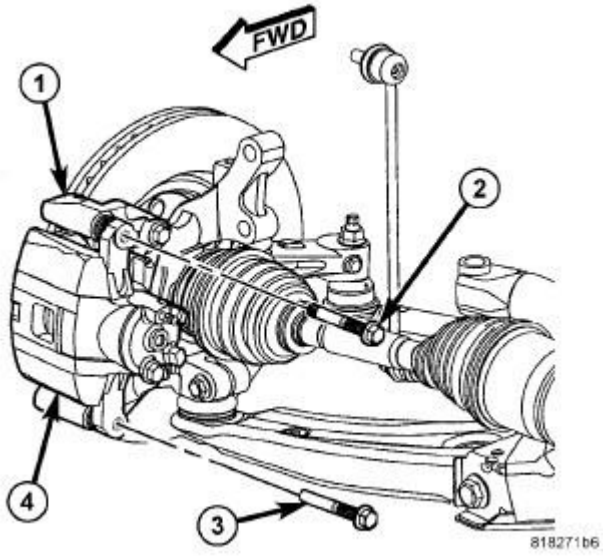

Fig. 122: CALIPER GUIDE PIN BOLTS

CAUTION: Use care when installing the caliper (4) onto the adapter bracket (1) to avoid damaging the boots.

3. Install the disc brake caliper over the brake pads on the brake caliper adapter bracket.

CAUTION: When removing or installing a caliper guide pin bolt, it is necessary to hold the guide pin stationary while turning the bolt. Hold the guide pin stationary using a wrench placed upon the pin's hex-shaped head.

4. Align the caliper guide pin bolt holes with the adapter bracket. Install the upper (2) and lower (3) caliper guide pin bolts. Tighten the guide pin bolts to 35 N.m (26 ft. lbs.).

5. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
6. Lower the vehicle.
7. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
8. Check and adjust the brake fluid level in the reservoir as necessary.
9. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

Installation

INSTALLATION

NOTE: Perform 1 through 6 on each side of vehicle to complete pad set installation, then proceed to 7.

CAUTION: Anytime the brake rotor or brake pads are being replaced, the rear caliper piston must be seated (bottomed) to compensate for the new brake rotor or lining. Because the parking brake self-adjuster mechanism is attached to the piston, a special seating method is required. The only acceptable

method is by rotating the piston back into the bore using Retractor, Special Tool 8807, as described below. Any other seating method will damage the self-adjuster mechanism.

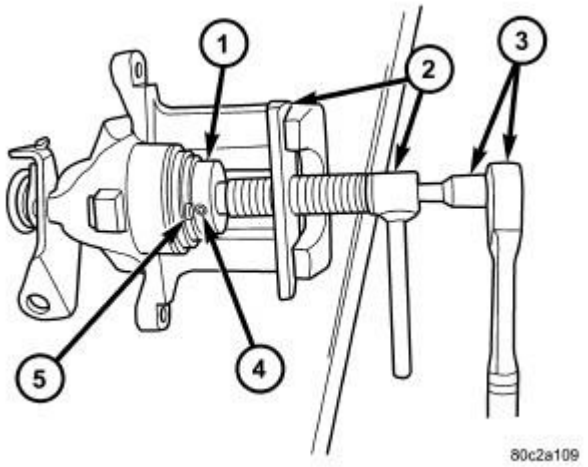

Fig. 128: SEATING PISTON WITH SPECIAL TOOL
Courtesy of CHRYSLER LLC

1. If necessary, seat (bottom) the caliper piston in the bore as follows:
   a. Assemble a 3/8 in. drive ratchet handle and an extension (3).
   b. Insert the extension through Special Tool 8807-1 (2).
   c. Place Special Tool 8807-2 (1) on the end of the extension.
   d. Insert lugs on Special Tool 8807-2 into notches in face of caliper piston (5).
   e. Thread the screw drive on 8807-1 down until it contacts the top of 8807-2 which is against the caliper piston. **Do not over tighten the screw-drive. Damage to the piston can occur.**
   f. Turn 8807-2 with the ratchet, rotating the piston in a **clockwise** direction until fully seated (bottomed) in the bore. **It may be necessary to turn 8807-1 with 8807-2 to start the process of piston retraction.**

2. Make sure abutment shims (4) are in place on both upper and lower slide abutments of caliper adapter (3).

NOTE: If the brake pads have a protective paper on the rear face of the brake pad plate, it must be removed before pad installation.

3. Place the brake pads (2, 5) in the abutment shims (3) clipped into the disc brake caliper adapter bracket (3) as shown.

CAUTION: Use care when installing the caliper (2) onto the adapter bracket to

avoid damaging the guide pin boots.

4. Install the disc brake caliper (2) over the brake pads on the brake caliper adapter bracket (3).

CAUTION: When removing or installing a caliper guide pin bolt, it is necessary to hold the guide pin stationary while turning the bolt. Hold the guide pin stationary using a wrench placed upon the pin's hex-shaped head.

5. Align the caliper guide pin bolt holes with the adapter bracket. Install the upper and lower caliper guide pin bolts (1). Tighten the guide pin bolts to 35 N.m (26 ft. lbs.).

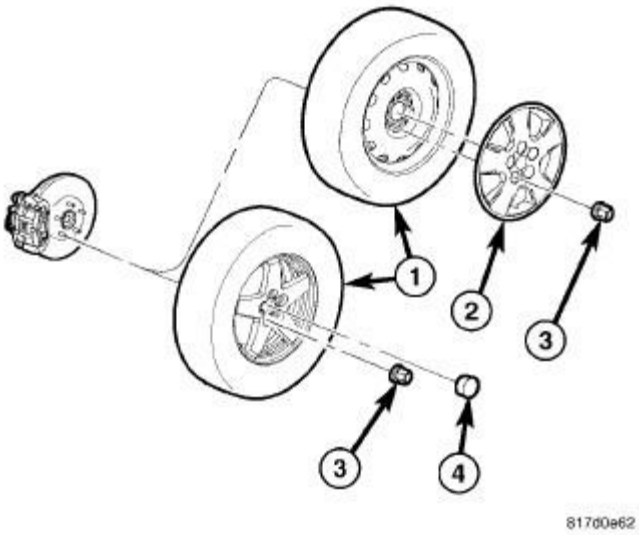

Fig. 131: TIRE AND WHEEL MOUNTING

6. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
7. Lower vehicle.
8. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
9. Check and adjust brake fluid level as necessary.
10. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake pads.

RESERVOIR, BRAKE MASTER CYLINDER

Removal

REMOVAL

CAUTION: If at any time the master cylinder is loosened or removed, you must perform the master cylinder installation procedure to ensure that the seal (o-ring) is still on the hub of the master cylinder. See Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Installation.

NOTE: The brake fluid level switch is mounted through the center of the fluid reservoir. The switch can be serviced separately from the master cylinder fluid reservoir. See Brakes/Electrical/SWITCH, Brake Fluid Level - Removal

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

1. Lubricate the reservoir mounting area with fresh clean brake fluid. With the grommet seals (2) on the fluid reservoir spigots, place the reservoir in position over the master cylinder. Install the fluid reservoir by firmly pressing down on the fluid reservoir. Once installed, make sure the fluid reservoir is touching the top of both grommet seals.
2. Push the reservoir retaining tabs over the mounting posts on the master cylinder housing. Make sure the retaining tabs are securely engaged.
3. Fill the brake fluid reservoir with fresh Mopar® Brake Fluid DOT 3 Motor Vehicle, or equivalent. See **Brakes/Hydraulic/Mechanical/FLUID - Specifications**
4. Install the front wiper motor module. Refer to **Electrical - Wipers/Washers/Wipers/Washers/LINKAGE, Wiper Arm - Installation**
5. Install the inner and outer cowl covers. Refer to **Body/Exterior/COVER, Cowl Panel - Installation**

ROTOR, BRAKE

Diagnosis and Testing

BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Standard Procedure**.

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

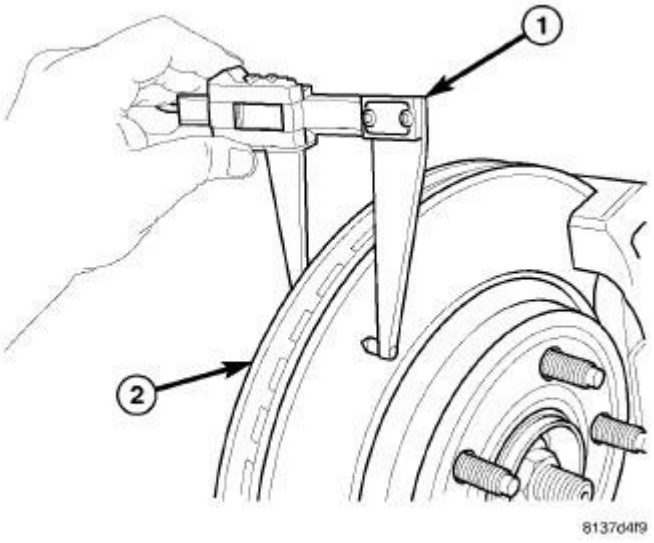

Fig. 153: MEASURING ROTOR THICKNESS
Courtesy of CHRYSLER LLC

Measure rotor thickness (1) at the center of the brake pad contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

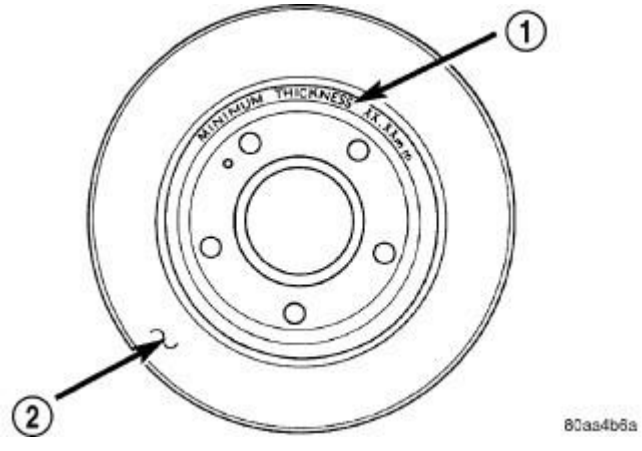

Fig. 154: Minimum
Courtesy of CHRYSLER LLC

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

Minimum thickness specifications are cast on the rotor's unmachined surface (1). Limits can also be found in **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**

ROTOR THICKNESS VARIATION

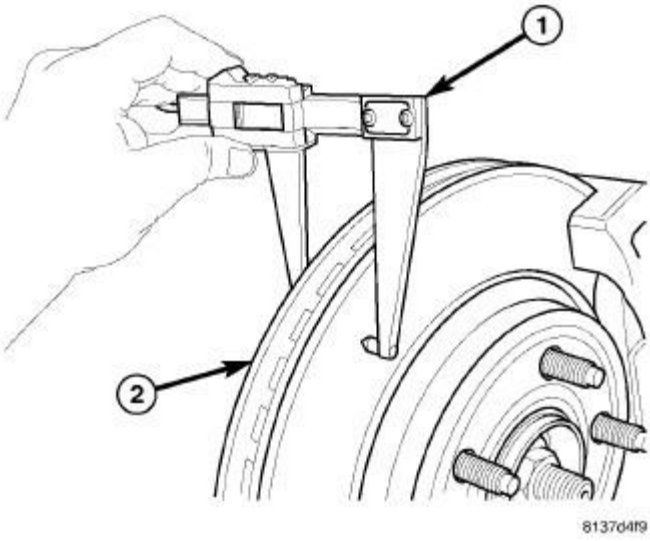

Fig. 155: MEASURING ROTOR THICKNESS
Courtesy of CHRYSLER LLC

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor (2) at 12 equal points around the rotor braking surface with a micrometer (1) at a radius approximately 25 mm (1 inch) from edge of rotor. If thickness measurements vary beyond the specification listed in the specification table. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**, the rotor should be refaced or replaced. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Standard Procedure**.

ROTOR RUNOUT

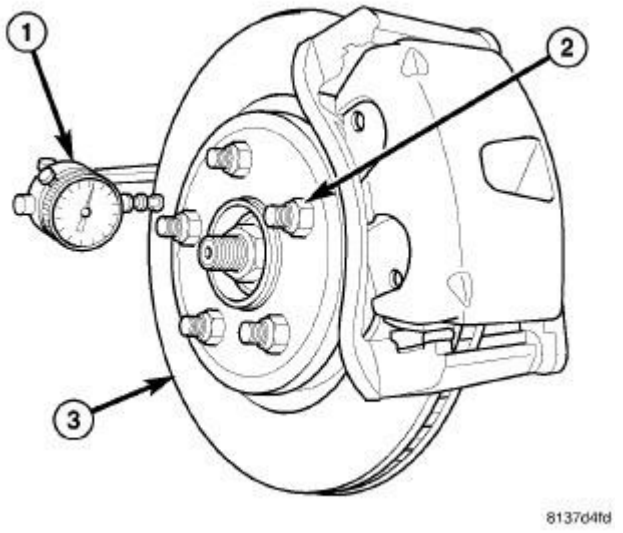

Fig. 156: MEASURING ROTOR RUNOUT
Courtesy of CHRYSLER LLC

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the brake rotor (hub runout can be measured separately). To measure rotor runout on the vehicle:

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**
2. Remove the tire and wheel assembly. Refer to **Tires and Wheels - Removal**
3. Install standard wheel mounting nuts, flat side to rotor, on all the wheel studs (2). Progressively tighten the nuts in a crisscross (star) pattern to 135 N.m (100 ft. lbs.).

NOTE: Dial Indicator, Special Tool 9524, can be used in conjunction with C-3339A to measure in millimeters instead of inches. Dial indicator 9524 includes a finer scale to measure lower, tighter tolerances.

4. Mount Dial Indicator (1), Special Tool C-3339A, with Wheel, Special Tool 25w, or equivalent, to the knuckle. Position the dial indicator wheel to contact the rotor braking surface approximately 10 millimeters from the outer edge of the rotor (3).
5. Slowly rotate the brake rotor checking lateral runout, marking the low and high spots. Record these measurements.
6. Check and record the runout on the opposite side of the rotor in the same fashion, marking the low and high spots.
7. Compare runout measurement to specifications. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**

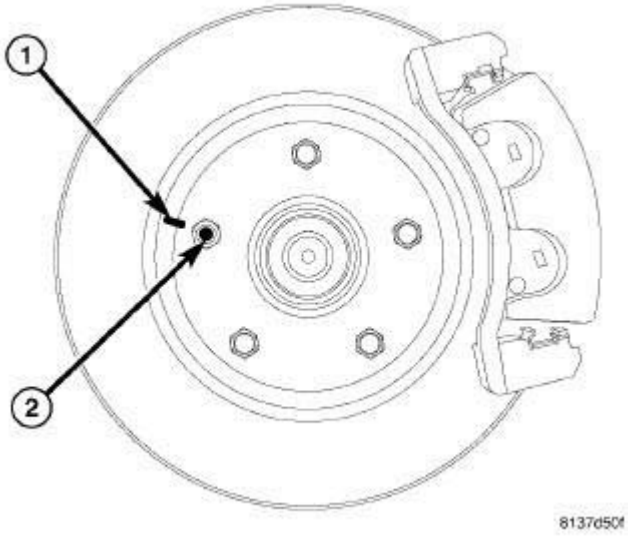

Fig. 157: WHEEL STUD AND ROTOR INDEX MARKED
Courtesy of CHRYSLER LLC

If runout is in excess of specifications, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor (1) and the one wheel stud (2) closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed.

8. Remove the rotor from the hub. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Removal**

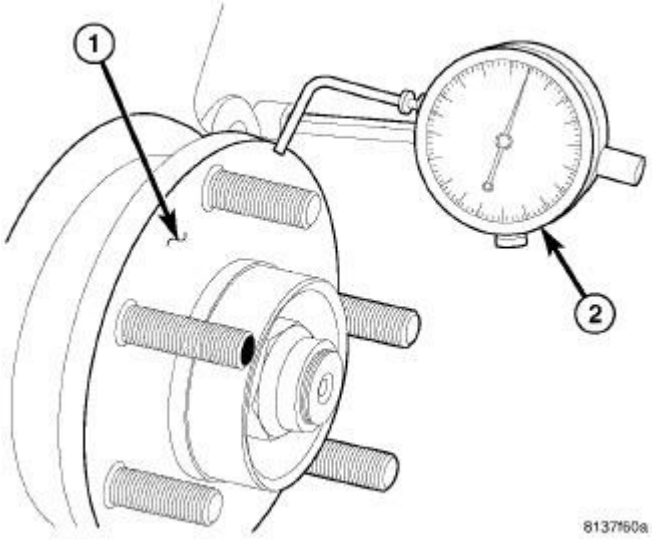

Fig. 158: MEASURING HUB RUNOUT
Courtesy of CHRYSLER LLC

NOTE: Before measuring hub runout, clean the hub face surface with an appropriate cleaner. This provides a clean surface to get an accurate indicator reading.

NOTE: Dial Indicator, Special Tool 9524, can be used in conjunction with C-3339A to measure in millimeters instead of inches. Dial indicator 9524 includes a finer scale to measure lower, tighter tolerances.

9. Mount Dial Indicator (2), Special Tool C-3339A, to the knuckle. Position the dial indicator stem so it contacts the hub face (1) near the outer diameter. Care must be taken to position the stem outside of the stud circle, but inside of the chamfer on the hub rim.
10. Slowly rotate the hub measuring runout. Hub runout should not exceed 0.01 mm (0.0004 inch). If runout exceeds this specification, the hub must be replaced. Refer to **Front Suspension/Front/KNUCKLE, Steering - Removal** . Refer to **Rear Suspension/HUB AND BEARING - Removal**

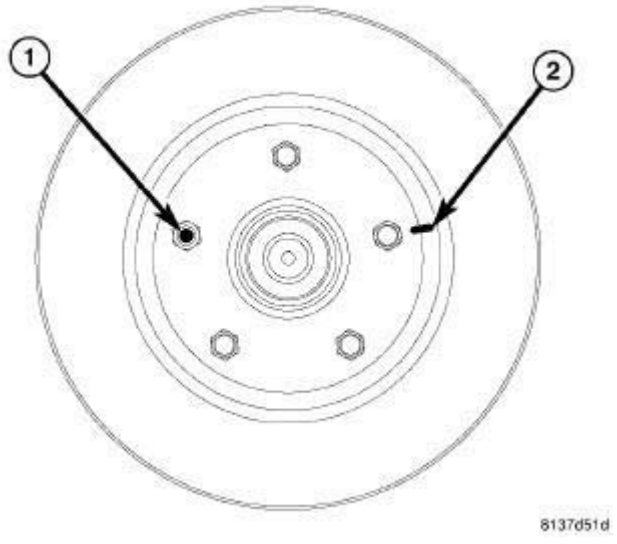

Fig. 159: ROTOR REINDEXED ON WHEEL STUDS
Courtesy of CHRYSLER LLC

11. If hub runout does not exceed this specification, install the original rotor back on the hub, aligning the chalk mark on the rotor (2) with a wheel mounting stud, two studs apart from the original stud (1).

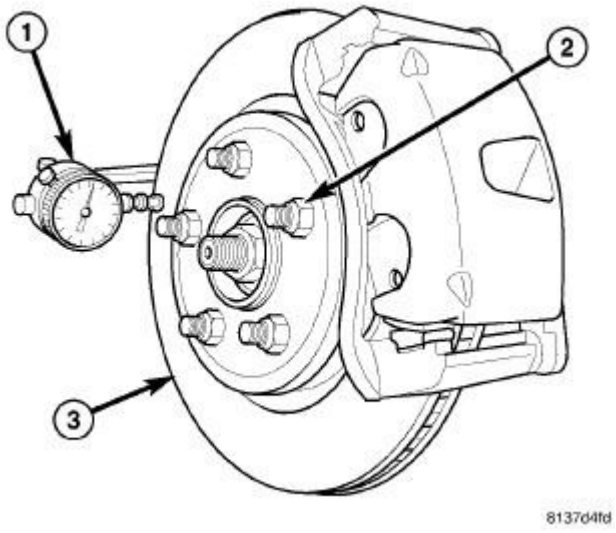

Fig. 160: MEASURING ROTOR RUNOUT
Courtesy of CHRYSLER LLC

12. Install standard wheel mounting nuts, flat side to rotor, on all the wheel studs (2). Progressively tighten the nuts in a crisscross (star) pattern to 135 N.m (100 ft. lbs.).
13. Mount the Dial Indicator (1), Special Tool C-3339A, and remeasure runout on both sides of the brake rotor as explained in earlier steps to see if runout is now within specifications. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**
14. If runout is still not within specifications, reface or replace brake rotor. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Standard Procedure**

Standard Procedure

BRAKE ROTOR MACHINING

NOTE: Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

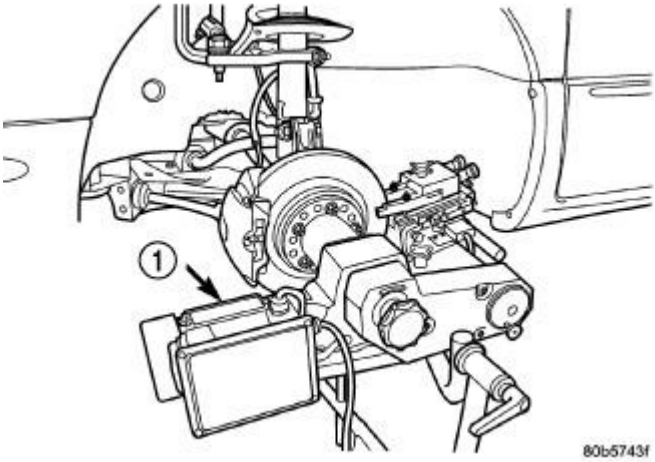

Fig. 161: On-Car Brake Lathe
Courtesy of CHRYSLER LLC

1 - ON-CAR BRAKE LATHE

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (1), or replaced.

The use of a hub-mounted on-car brake lathe (1) is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

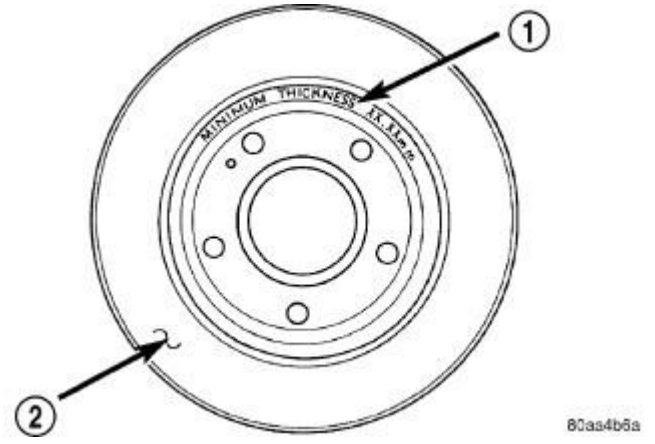

Fig. 162: Minimum Brake Rotor Thickness (Typical)
Courtesy of CHRYSLER LLC

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

NOTE: All brake rotors (2) have markings for minimum allowable thickness cast on an unmachined surface of the rotor (1) or stamped into the hat section. Minimum thickness specifications can also be found in

Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Before lathe installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning equipment is required. Specifications for brake rotor machining can be found in **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**

Removal

FRONT

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

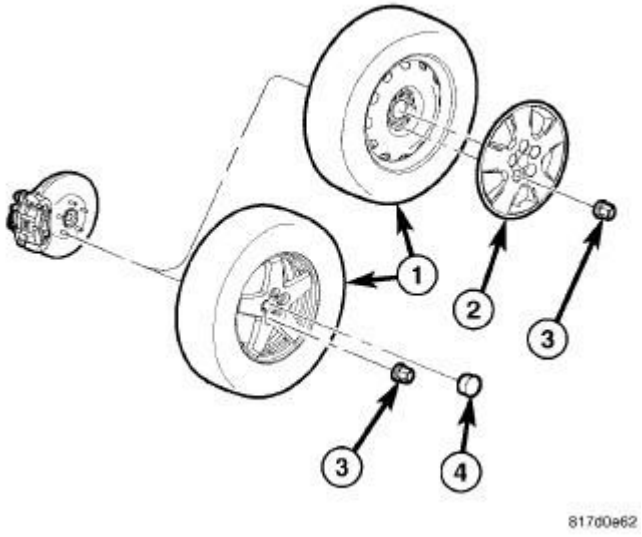

Fig. 163: TIRE AND WHEEL MOUNTING

Courtesy of CHRYSLER LLC

2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).

NOTE: In some cases, it may be necessary to retract the caliper piston in its bore a small amount in order to provide sufficient clearance between the pads and the rotor to easily remove the caliper from the knuckle. This can usually be accomplished before removal by grasping the inboard side of the caliper and pulling outward working with the guide pins, thus retracting the piston. Never push on the piston directly as it may get damaged.

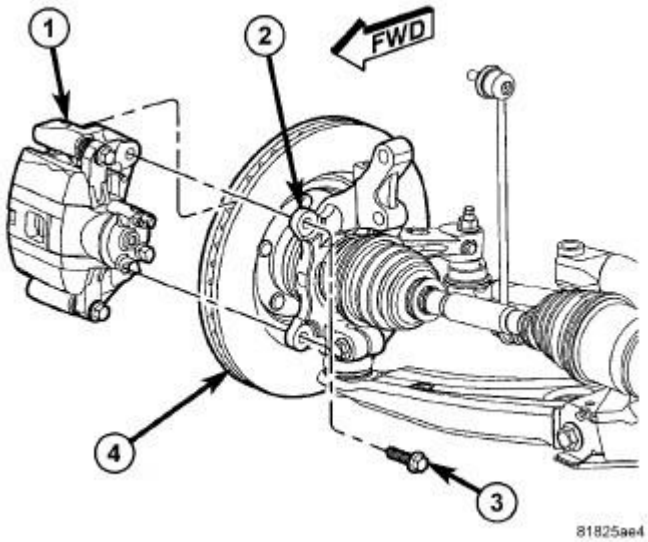

Fig. 164: CALIPER/ADAPTER MOUNTING

3. Remove the two bolts (3) securing disc brake caliper and adapter bracket (1) to the steering knuckle (2).
4. Remove the disc brake caliper and adapter bracket (1) from the knuckle (2) and rotor (4) as an assembly. Hang the assembly out of the way using wire or a bungee cord. **Use care not to overextend the brake hose when doing this.**

5. Remove any clips retaining the brake rotor to the wheel mounting studs.
6. Slide the brake rotor (2) off the hub and bearing (1).

REAR

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).

NOTE: In some cases, it may be necessary to retract the caliper piston in its bore a small amount in order to provide sufficient clearance between the pads and the rotor to easily remove the caliper from the knuckle. This can usually be accomplished before removal by grasping the inboard side of the caliper and pulling outward working with the guide pins, thus retracting the piston. Never push on the piston directly as it may get damaged.

1. Clean the hub face (1) to remove any dirt or corrosion where the rotor mounts.
2. Install the brake rotor (2) over the studs on the hub and bearing.

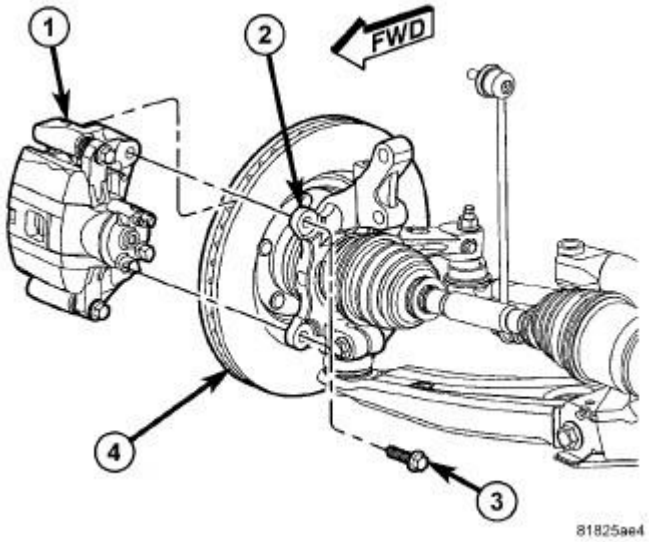

Fig. 170: CALIPER/ADAPTER MOUNTING
Courtesy of CHRYSLER LLC

3. Install the disc brake caliper and adapter bracket assembly (1) over the brake rotor (4) and knuckle (2).
4. Install the mounting bolts (3) securing the caliper adapter bracket to the knuckle (2). Tighten the bolts to 169 N.m (125 ft. lbs.).

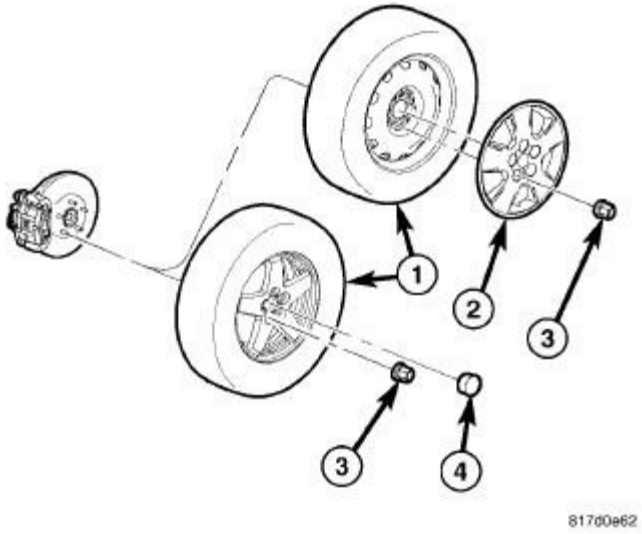

Fig. 171: TIRE AND WHEEL MOUNTING

5. Install the tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Tighten the wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
6. Lower the vehicle.
7. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
8. Check and adjust the brake fluid level in the reservoir as necessary.
9. Road test the vehicle and make several stops to seat the brake pads to the rotor.

REAR

NOTE: Inspect disc brake pads before installation. Replace as necessary.

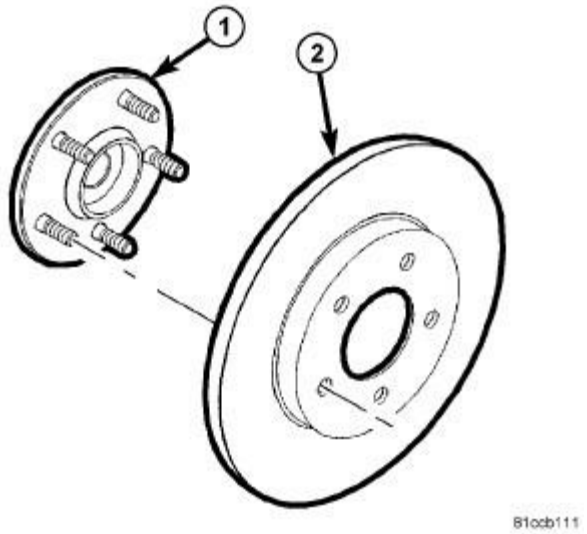

Fig. 172: SOLID BRAKE ROTOR MOUNTING

1. Clean the rotor mounting face of the hub and bearing (1) to remove any dirt or corrosion.
2. Install the brake rotor (2) over the hub and bearing (1).

CAUTION: If the brake rotor or brake pads are being replaced, the rear caliper piston must be seated (bottomed) to compensate for the new brake rotor or lining. Because the parking brake self-adjuster mechanism is attached to the piston, a special seating method is required. The only acceptable method is by rotating the piston back into the bore using Retractor, Special Tool 8807, as described below. Any other seating method will damage the self-adjuster mechanism.

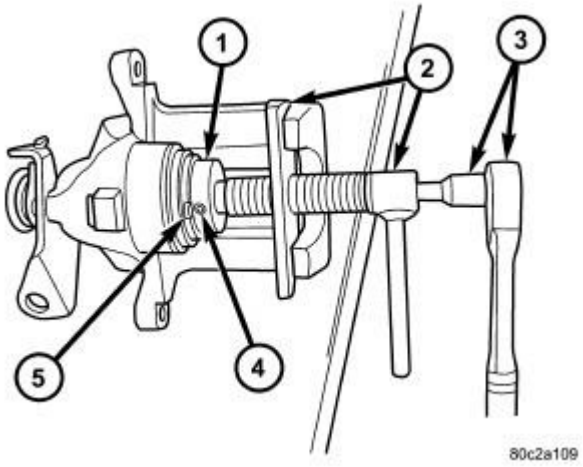

Fig. 173: SEATING PISTON WITH SPECIAL TOOL
Courtesy of CHRYSLER LLC

3. If necessary, seat (bottom) the caliper piston in the bore as follows:
   a. Assemble a 3/8 in. drive ratchet handle and an extension (3).
   b. Insert the extension through Special Tool 8807-1 (2).
   c. Place Special Tool 8807-2 (1) on the end of the extension.
   d. Insert lugs on Special Tool 8807-2 into notches in face of caliper piston (5).
   e. Thread the screw drive on 8807-1 down until it contacts the top of 8807-2 which is against the caliper piston. **Do not over tighten the screw-drive. Damage to the piston can occur.**
   f. Turn 8807-2 with the ratchet, rotating the piston in a **clockwise** direction until fully seated (bottomed) in the bore. **It may be necessary to turn 8807-1 with 8807-2 to start the process of piston retraction.**

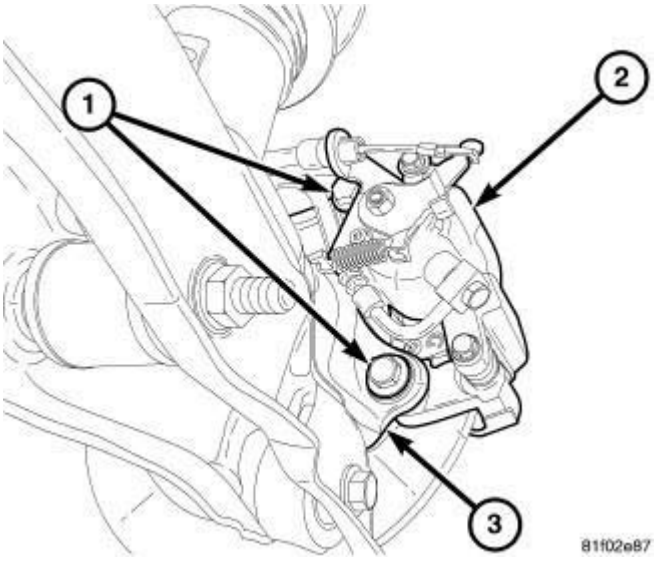

Fig. 174: REAR CALIPER ADAPTER MOUNTING

4. Install the disc brake caliper and adapter bracket (2) over the knuckle and rotor as an assembly.
5. Install the two bolts (1) securing the disc brake caliper and adapter bracket (2) to the knuckle. Tighten the mounting bolts to 100 N.m (74 ft. lbs.).

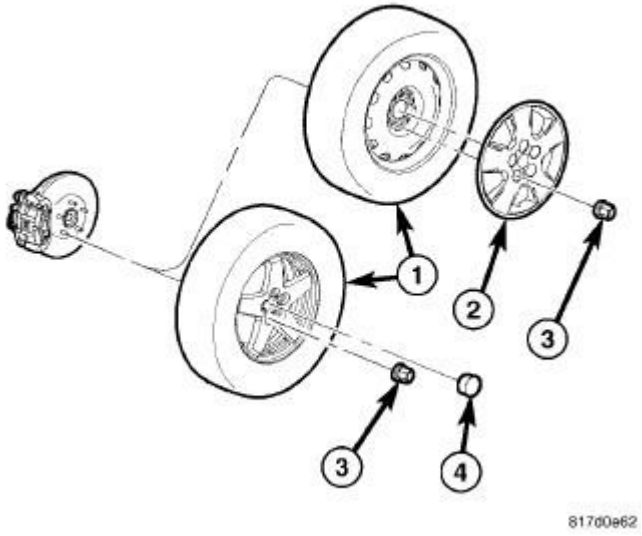

Fig. 175: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

6. Install the tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten the wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
7. Lower the vehicle.
8. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving vehicle.
9. Check and adjust the brake fluid level as necessary.
10. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

TUBES AND HOSES, BRAKE

Description

DESCRIPTION

The brake tubes are steel with a corrosion-resistant nylon coating applied to the external surfaces.

The flex hoses used at each wheel brake are made of reinforced rubber with fittings at each end. The fitting at each brake caliper is the banjo-type and requires a special banjo bolt and copper washers.

Operation

OPERATION

The purpose of the chassis brake tubes and flex hoses is to transfer the pressurized brake fluid developed by the master cylinder to the wheel brakes of the vehicle. The flex hoses are made of rubber to allow for the movement of the vehicle's suspension.

Inspection

INSPECTION

Brake tubing should be inspected periodically for evidence of physical damage or contact with moving or hot components.

Flexible rubber hose is used at both the front and rear wheel brakes. Inspection of the flexible brake hoses should be performed whenever the brake system is serviced and every 12,000 km (7,500 miles) or 12 months, whichever comes first. Inspect hydraulic brake hoses for surface cracking, scuffing, or worn spots. If the fabric casing of the hose becomes exposed due to cracks or abrasions in the hose cover, the hose should be replaced immediately. Eventual deterioration of the hose can take place with possible burst failure. Faulty installation can cause twisting, resulting in wheel, tire, or chassis interference.

NOTE: This vehicle is equipped with more than one size (diameter) brake tube depending on location on the vehicle. If a brake tube must be replaced, always use the same size brake tubing as that being replaced. Never use under-size brake tubing.

PARKING BRAKE

DESCRIPTION

DESCRIPTION

The parking brake consists of the following components:

- Foot-operated parking brake lever *
- Cables (front, left rear, right rear)
- Cable equalizer
- Caliper with Integral Parking Brake (IPB)

* Right-Hand-Drive Export models feature a hand-operated parking brake lever.

The parking brake lever is an automatic-adjusting type that continuously applies minimal tension to the parking brake cables to keep them in adjustment at all times.

The front cable extends from the lever to the parking brake cable equalizer. The equalizer joins the front cable to the left and right rear cables that extend to the individual rear calipers with Integral Parking Brake (IPB). The parking brake cables are made of flexible steel cable.

The brake caliper used for the foundation brakes features an Integral Parking Brake (IPB) which combines a mechanical parking brake function with a conventional rear caliper.

This caliper features a lever attached to a shaft on the outside of the caliper. The lever uses a ball-ramp mechanism to mechanically apply piston clamp force to the rear rotor when the parking brake lever is applied. As the lever and shaft rotate, the ball-ramp interface causes the shaft to lift and the piston to travel toward the rotor.

The IPB includes an automatic adjuster mechanism that keeps the mechanical park brake mechanism in contact with the piston as the pads wear. The auto-adjuster is linked to the piston through a friction clutch that is used to detect pad wear.

STANDARD PROCEDURE

PARKING BRAKE CABLE TENSION RELEASE - FOOT LEVER

Use the following procedure to release the tension from the parking brake cables and the automatic adjuster in the parking brake lever (pedal) mechanism when required.

1. Release the parking brake.
2. Raise the vehicle to a comfortable working position and support. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

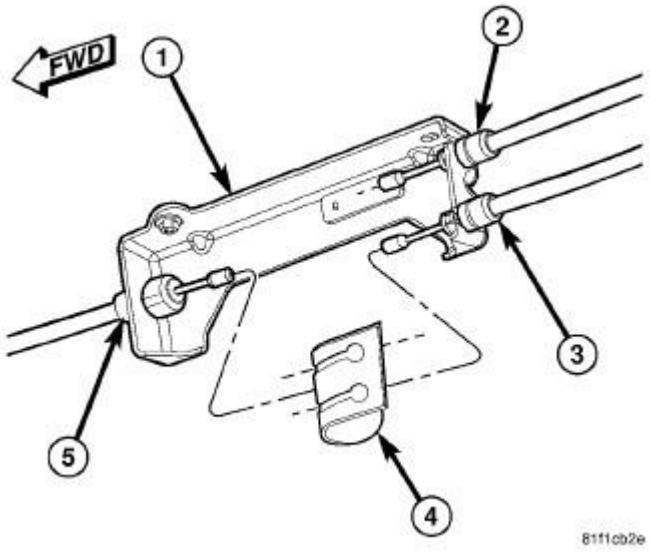

Fig. 176: PARKING BRAKE CABLE EQUALIZER
Courtesy of CHRYSLER LLC

3. Wipe the parking brake cable strands (front and both rear) clean where visible at the intermediate bracket.

CAUTION: Do not use any type of sharp instrument to hold the cable strand in place. Damage to the cable strand or coating can occur.

4. Pull rearward on the equalizer (4) until the front cable stops, then grasp the front cable (5) strand and hold it in this position. Disconnect the equalizer from the front cable strand.
5. Release the front cable strand allowing the lever automatic self-adjusting mechanism to pull the front cable strand forward. This action allows the adjuster mechanism to rotate around to its stop, removing tension from the adjuster and front parking brake cable.

PARKING BRAKE CABLE TENSION RELEASE - HAND LEVER

1. Release the parking brake.
2. Block the tire and wheel assemblies so the vehicle does not move once the parking brake lever is released.
3. Release the parking brake.

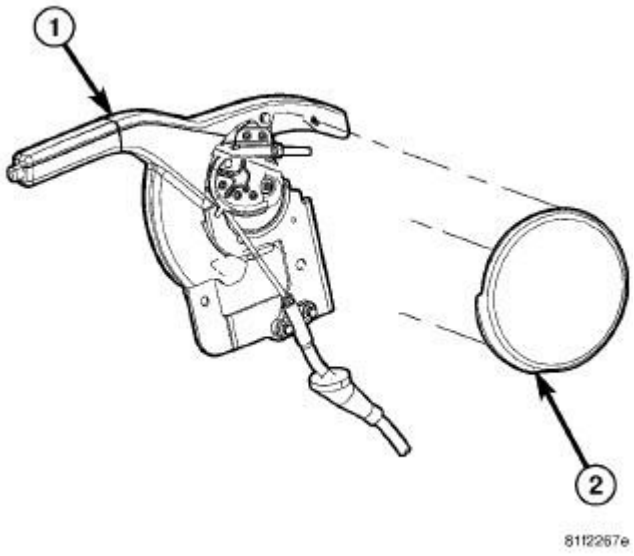

Fig. 177: HAND LEVER COVER MOUNTING
Courtesy of CHRYSLER LLC

4. Remove the cover from the side of the parking brake lever. To remove the cover, unclip it at the top and rotate it counterclockwise.

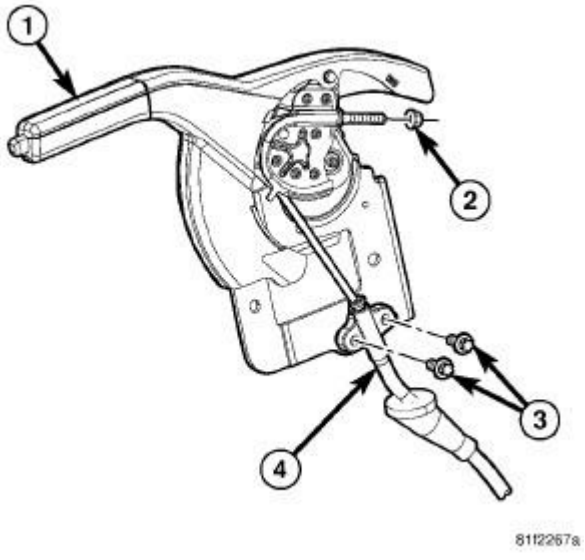

Fig. 178: CABLE MOUNTING TO HAND LEVER
Courtesy of CHRYSLER LLC

5. Place the parking brake lever (1) in the fully released (down) position.
6. Loosen the adjusting nut (2) on the end of the front parking brake cable. Back it off to the end of the cable.

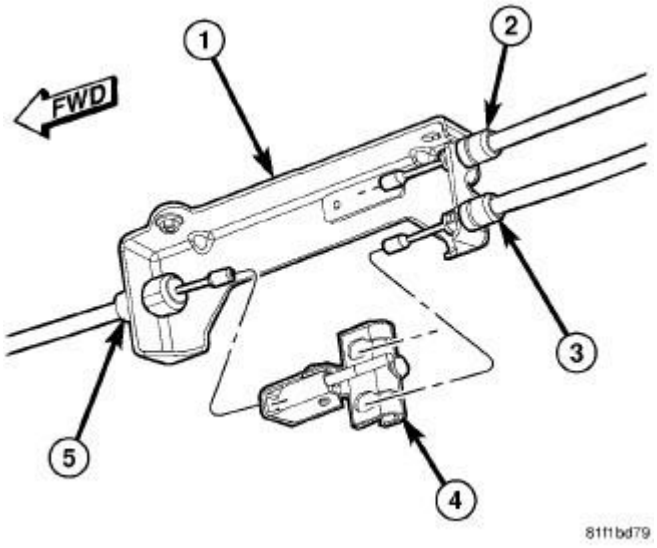

Fig. 179: CABLE EQUALIZER/TENSIONER
Courtesy of CHRYSLER LLC

7. If the cable equalizer/bent nail tensioner needs to be removed, perform the following:
   a. Raise the vehicle to a comfortable working position and support. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**
   b. Remove the parking brake cable equalizer/bent nail tensioner (4) from the three parking brake cables (2, 3, 5).

PARKING BRAKE CABLE TENSION RESET - FOOT LEVER

1. Raise the vehicle to a comfortable working position and support. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

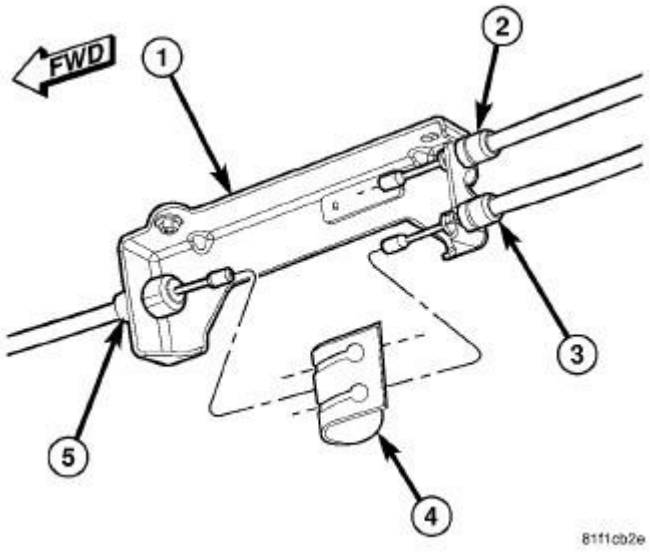

Fig. 180: PARKING BRAKE CABLE EQUALIZER
Courtesy of CHRYSLER LLC

2. Wipe the front parking brake cable strand clean at the intermediate bracket (1) area.

CAUTION: Do use any type of sharp instrument directly on the cable strand to hold it in place. Damage to the cable strand or coating can occur.

3. Clamp an appropriate pair of pliers on the front parking brake cable **button (2) only** and pull the cable stand rearward until it stops, then grasp the front cable strand and hold it in this position. Remove the pliers from the button.

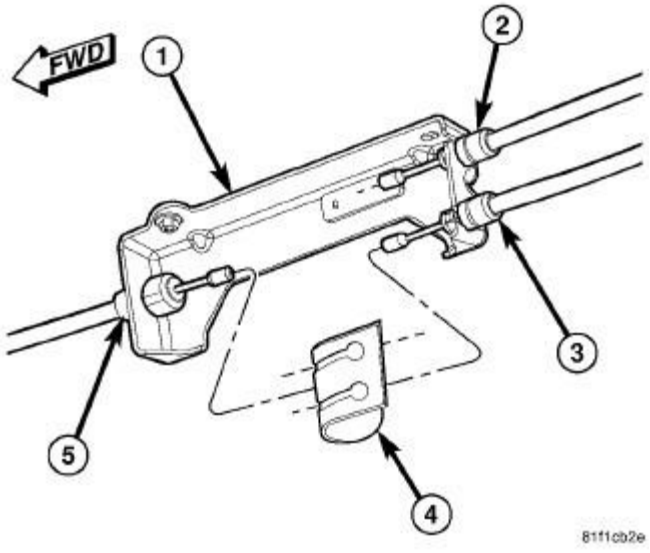

Fig. 181: PARKING BRAKE CABLE EQUALIZER

Courtesy of CHRYSLER LLC

4. While holding the front cable in this position, install the equalizer (2) (attached to both rear cables) on the front parking brake cable.
5. Release the grasp on the front parking brake cable.
6. Lower the vehicle.
7. Apply and release the parking brake lever one time. This will seat the parking brake cables and allow the auto adjuster in the parking brake lever mechanism to correctly tension the parking brake cables.

PARKING BRAKE CABLE TENSION RESET - HAND LEVER

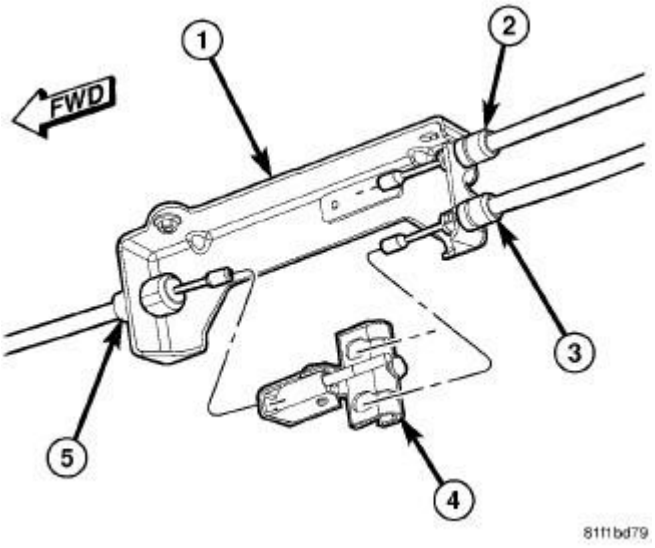

Fig. 182: CABLE EQUALIZER/TENSIONER
Courtesy of CHRYSLER LLC

1. If the cable equalizer/bent nail tensioner needs to be installed on the cables, perform the following:
   a. Raise the vehicle to a comfortable working position and support. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**
   b. Connect the parking brake cable equalizer/bent nail tensioner (4) to the three parking brake cables (2, 3, 5).
   c. Remove any slack from the parking brake cables by pushing the front cable strand forward into the housing until slack is removed.
   d. Lower the vehicle.
2. If not installed during Step (1), make sure the parking brake cable equalizer/bent nail tensioner is attached to all three parking brake cables
3. Make sure that the front parking brake cable is properly aligned and installed on the cable track of the parking brake lever.

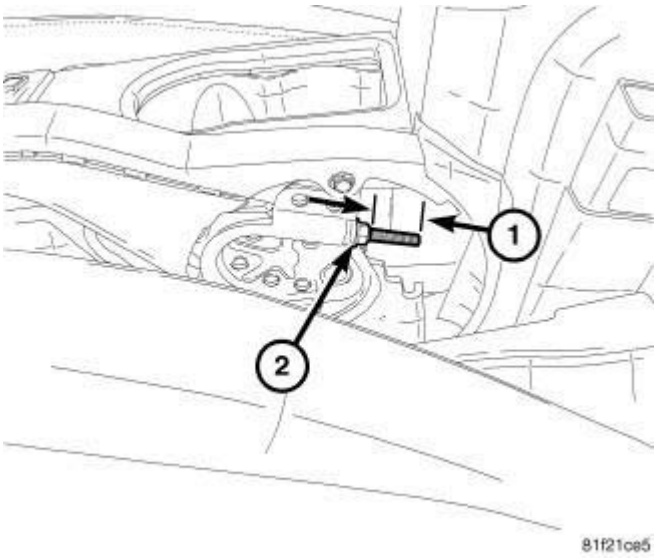

Fig. 183: CABLE STUD-TO-NUT DIMENSION
Courtesy of CHRYSLER LLC

NOTE: Actuating the parking brake lever to its fully applied position one time after tightening the adjustment nut will yield (stretch) the bent nail portion of the equalizer approximately 1/4 inch (6 mm). This process will correctly set the parking brake cable tension.

4. Adjust parking brake cable tension using the following steps:
   a. Make sure the parking brake lever in the fully released (down) position.
   b. While maintaining tension on the cable, tighten the adjusting nut (2) on the front parking brake cable until 34 millimeters (1.34 in.) of thread (1) is out past the end of the adjustment nut.
   c. Actuate the parking brake lever to its fully applied position one time, then reposition it to its fully released (down) position.
5. Raise the vehicle to a point where the rear wheels just clear the floor.
6. Check the rear wheels of the vehicle; they should rotate freely without dragging.
7. Apply the parking brake. Check the rear wheels of the vehicle. They should not rotate.
8. Return the parking brake lever to its fully released (down) position and check the rear wheels. They should rotate freely without dragging.
9. Apply the parking brake.
10. Lower the vehicle.

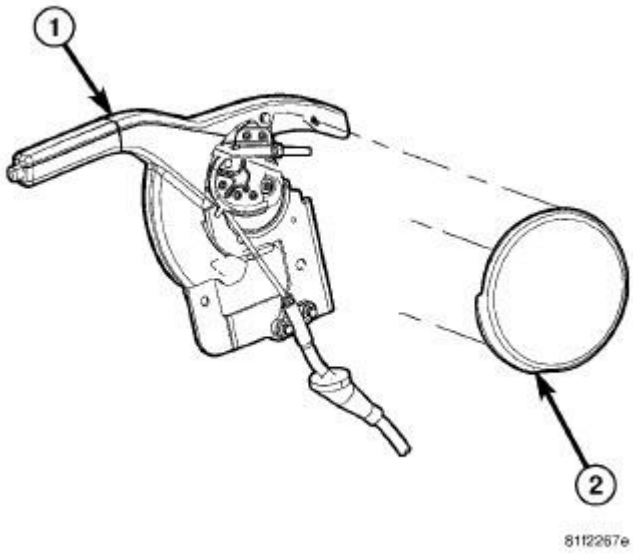

Fig. 184: HAND LEVER COVER MOUNTING

11. Install the cover on the side of the parking brake lever.

CABLE END CLEANING AND LUBRICATION

Periodic cleaning and lubrication can be done to ensure proper operation of the parking brake cables. This procedure applies to the trailing end of all parking brake cables.

CAUTION: If a liquid cleaner is necessary, use a cleaner such as Mopar® Non-Chlorinated Brake Parts Cleaner or equivalent.

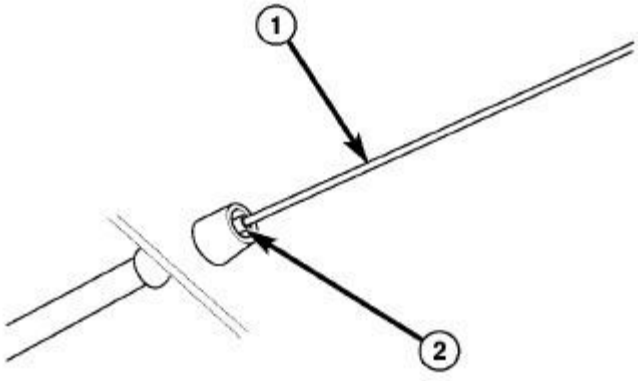

Fig. 185: Areas To Be Cleaned And Lubricated
Courtesy of CHRYSLER LLC

1 - STRAND AREA 2 - SEAL AREA

1. Using an appropriate bristle brush, clean the cable strand (1) in the area that retracts into the cable housing when the parking brake lever is applied.
2. Clean the cable seal area (2) at the end of the cable housing.
3. Lubricate the cleaned area with a general purpose grease lubricant.

9. Remove the mounting screws (3) fastening the front cable (4) to the side of the parking brake lever (1).
10. Remove the adjusting nut (2) from the end of the front parking brake cable.
11. Remove the cable strand from the lever.
12. Pull the cable seal loose from the floor pan and remove the front parking brake cable from the vehicle through the access hole in the floor pan.

Installation

WITH FOOT LEVER

1. Pass most of the front parking brake cable down through the access hole in the floor pan from inside the vehicle.

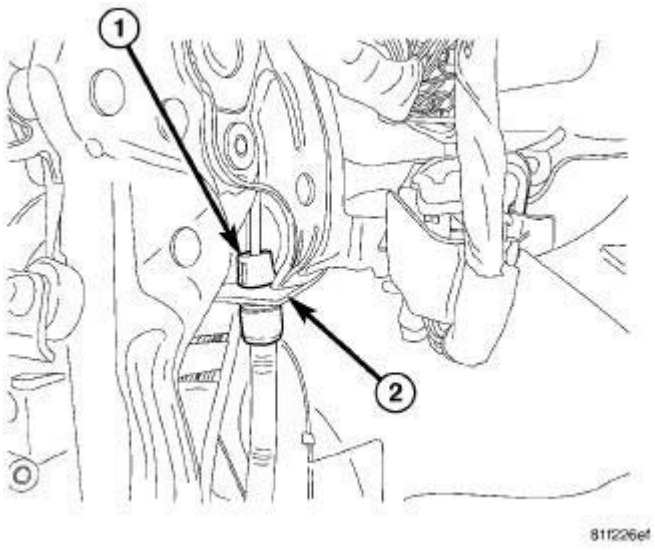

Fig. 195: CABLE HOUSING RETAINED IN LEVER

3. Pull the button on the end of cable strand out of housing and route the strand around the cable guide, then rotate the cable strand up and align the cable with the slot in lever mechanism (1). Slide the cable button (2) into the slot and rotate the cable down into mounted position with the cable inserted into the guide on

the mechanism.

4. Slide any extra cable back into the cable housing. This can be easily done by pulling on the trailing end of the front cable strand that is now under the vehicle.
5. Install the front parking brake cable floor pan seal into the access hole in the floor pan.
6. Reposition the carpeting back down on the floor.

15. Reconnect the parking brake cable equalizer (4) and reset the cable tension. See **Brakes/Parking Brake - Standard Procedure**
16. Lower the vehicle.
17. Apply and release the parking brake lever (pedal) one time. This will seat the parking brake cables.
18. Check operation of parking brakes.

WITH HAND LEVER

1. Pass most of the front parking brake cable down through the access hole in the floor pan from inside the vehicle.
2. Install the front parking brake cable floor pan seal into the access hole in the floor pan.

3. Install the mounting screws (3) fastening the front cable (4) to the side of the parking brake lever (1). Tighten the mounting screws to 28 N.m (21 ft. lbs.).
4. Route the cable strand around the lever cable guide and start the adjusting nut (2) on the end of the cable stud. **Do not install the nut any further than having the threads flush with the top of the nut.** Otherwise, cable equalizer/bent nail tensioner installation later in this procedure could be difficult.
5. Slide any extra cable back into the cable housing.
6. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

ABS - Service Information - Journey

DESCRIPTION

ANTILOCK BRAKE SYSTEM WITH ELECTRONIC STABILITY PROGRAM

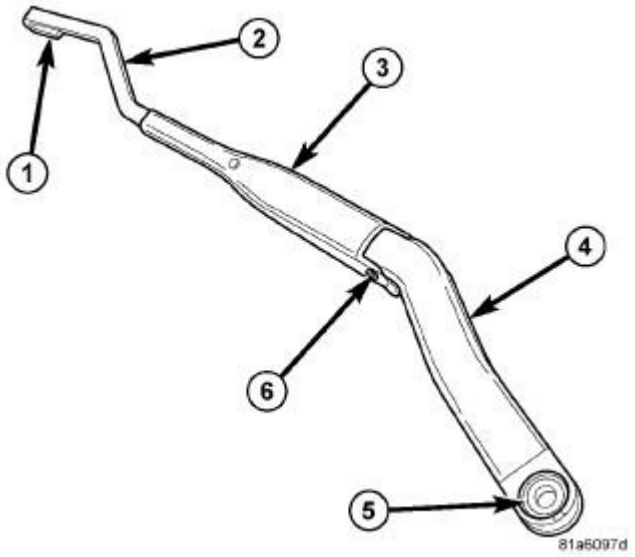

Fig. 1: Integrated Control Unit
Courtesy of CHRYSLER LLC

This vehicle uses the Continental Mk25e electronic brake control system. The system includes ABS (Anti-lock Brake System), EVBP (Electronic Variable Brake Proportioning), TCS (Traction Control System), BAS (Brake Assist System), Electronic Roll Mitigation (ERM) and ESP (Electronic Stability Program). These systems work together to enhance vehicle stability and control in various driving conditions and are commonly referred to as ESP. ESP is standard on this vehicle.

This electronic brake control system uses the following components to operate:

- Integrated Control Unit (ICU) - Hydraulic Control Unit (HCU) (2) and Antilock Brake Module (ABM) (1)
- Wheel Speed Sensors (WSS) - Four sensors (one sensor at each wheel)
- Dynamics Sensor - The Dynamics Sensor includes the Yaw Rate Sensor and the lateral Acceleration Sensor.
- Steering Angle Sensor (SAS) - The steering angle sensor is located in the Steering Column Control Module (SCCM) mounted on the steering column.
- Brake Pressure Sensor - The brake pressure sensor is located in the HCU and is not serviceable separate from the HCU.

ABS

The purpose of the Antilock Brake System (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

All vehicles equipped with ABS use Electronic Variable Brake Proportioning (EVBP) to balance front-to-rear braking when the brakes are applied in the partial braking range.

ALL-SPEED TRACTION CONTROL

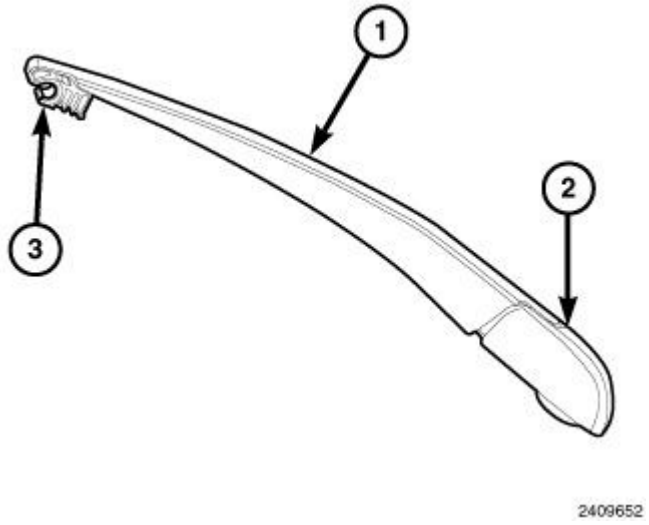

Fig. 2: Accessory Switch Bank Module
Courtesy of CHRYSLER LLC

The traction control system (TCS) is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

All-Speed Traction Control is effective up to 85 mph (137 km/h).

The traction control system may be turned off or on by depressing the ESP Off switch button (2) located in the instrument panel switch pod located in center of the instrument panel.

ELECTRONIC STABILITY PROGRAM

The Electronic Stability Program (ESP) enhances control and stability of the vehicle under various driving conditions. ESP corrects for over/under steering of the vehicle by applying the brake of the appropriate wheel to assist in counteracting the over/under steer condition. Engine power may also be reduced to help the vehicle maintain the desired path. ESP uses sensors in the vehicle to determine the vehicle path intended by the driver and compares it to the actual path of the vehicle. When the actual path does not match the intended path, ESP

applies the brake of the appropriate wheel to assist in counteracting the oversteer or understeer condition.

- Oversteer - When the vehicle is turning more that appropriate for the steering wheel position.
- Understeer - When the vehicle is turning less than appropriate for the steering wheel position.

The "ESP/TCS" indicator light located in the instrument cluster starts to flash as soon as the tires lose traction and the ESP system becomes active. The "ESP/TCS" indicator light also flashes when the TCS is active.

The ESP® default mode is Full-On with every key-on. Pressing the ESP Off button once activates what is referred to as Partial mode. In Partial mode, Traction Control is deactivated and ESP® operates at a higher threshold, therefore, it will not come on as aggressively as in the Full-On mode. The system can be returned to "normal" Full-On mode by pressing and releasing the ESP Off switch. The ESP function lamp is illuminated in the cluster whenever the ESP system is turned off.

ELECTRONIC ROLL MITIGATION

Electronic Roll Mitigation (ERM) is a software feature in addition to ESP control that focuses on preventing wheel lift in NHTSA Fish Hook maneuvers. These very extreme situations are well out of normal everyday driving, but if by chance an extreme dynamic maneuver occurs, ERM can help reestablish vehicle stability and return control to the driver. ERM determines when a vehicle is in a potential roll over condition and applies the appropriate braking force to reduce the likelihood that such an event will occur. ERM will not aid vehicle stability in "trip" situations, such as when a vehicle slides sideways into a curb, etc. which could still cause the wheels opposite the curb to lift and the vehicle to roll.

HILL START ASSIST

The Hill Start Assist (HSA) system is designed to assist the driver when starting a vehicle from a stop on a hill. HSA will maintain the level of brake pressure the driver applied for a short period of time after the driver takes his foot off of the brake pedal.

TRAILER SWAY CONTROL

Trailer Sway Control (TSC) is safety feature made possible by ESP. TSC does not require driver input; it activates once the yaw sensor recognizes the unique vehicle motion associated with trailer sway and no steering input. It becomes clear that this motion has to be from a trailer and thus activates the brakes to eliminate the trailer sway.

BRAKE ASSIST SYSTEM

The Brake Assist System (BAS) is designed to optimize the vehicle's braking capability during emergency braking maneuvers. The system detects an emergency braking situation by sensing the rate and amount of brake application and then applies optimum pressure to the brakes. This can help reduce braking distances. The BAS complements the antilock brake system (ABS). Applying the brakes very quickly results in the best BAS assistance.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Electronic Variable Brake Proportioning (EVBP) is used to balance front-to-rear braking in place of a traditional rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

EVBP activation is nearly invisible to the customer since there is no pump motor noise and minimal brake pedal feedback.

OPERATION

ANTILOCK BRAKE SYSTEM WITH ELECTRONIC STABILITY PROGRAM

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 3-5 mph (5-8 km/h) If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the Integrated Control Unit (ICU) regulates hydraulic pressure at all four of the vehicle's wheels.

The hydraulic pressure at each wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes.

The system can build and release pressure at each wheel, depending on signals generated by the Wheel Speed Sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3-4 mph (5-6 km/h).

There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph (5 km/h) or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25-30 percent. This means that the wheel rolling velocity is 25-30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12-25 mph (20-40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no faults are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel speed sensor mounting bosses; damaged teeth on the sensor tone wheel; and loose wheel speed sensor mounting screws.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed

under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing "all-speed" traction control.

The traction control system is enabled at each ignition cycle. It may be turned off by depressing the ESP OFF switch button. The ESP/TCS function indicator lamp illuminates immediately upon depressing the button. Pressing this button again or turning off and restarting the vehicle will enable the traction control system.

ELECTRONIC STABILITY PROGRAM

To determine whether the car is responding properly to cornering commands, ESP® uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESP® operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESP® system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

ELECTRONIC ROLL MITIGATION

Typically when a vehicle makes a sudden turn, the outside tires provide the majority of cornering force. In order for the vehicle to make a turn, a significant amount of grip must exist at the tire contact patch. The body tilt that occurs during this event increases the weight on the outside tires. These conditions, plus the lateral acceleration of the vehicle, combined with the center of gravity position in the vehicle can cause the two inside wheels to lift in the turn and the vehicle rolls over the outside tires. ERM uses the principle that a slipping tire creates less cornering force than one that has full grip by applying enough brake pressure to intentionally make the outside tires slip close to the point of lockup. This reduces the cornering force of the outside tires and increases the turning radius. This straighter path reduces the amount of lateral acceleration and transfers some of the weight back to the inside tires, thus preventing a rollover.

HILL START ASSIST

Hill Start Assist (HSA) will maintain the level of brake pressure the driver applied for a short period of time after the driver takes his foot off of the brake pedal. If the driver does not apply the throttle during this short

period of time the system will release brake pressure and the vehicle may roll down the hill. The system will release brake pressure in proportion to the amount of throttle applied as the vehicle starts to move in the intended direction of travel.

TRAILER SWAY CONTROL

Programmed into the ESP, Trailer Sway Control will be activated once critical amplitude and frequency of oscillation of the vehicle-trailer system is reached. TSC builds up pressure to decelerate the vehicle-trailer system to below the critical speed. Depending on the oscillation conditions, TSC software can build up an additional asymmetric pressure to counter the trailer oscillation. The ESP function lamp will flash when TSC is activated.

HYDRAULIC BRAKE ASSIST

Brake Assist is programmed into the ESP® system. During a panic stop, a pressure sensor determines when the driver is doing so by measuring the brake pedal pressure application rate. A high rate of pedal pressure application causes the ESP® system to apply maximum available pressure to the brakes and the vehicle stops as quickly as available traction will allow.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the hydraulic control unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the Electronic Shuttle Valve.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

CAUTION

CAUTION

The antilock brake system uses an electronic control module known as the Antilock Brake Module (ABM). This module is designed to withstand normal current draws associated with vehicle operation. Care must be taken to avoid overloading the circuits.

CAUTION: In testing for open or short circuits, do not ground or apply voltage to any of the circuits unless instructed to do so for a diagnostic procedure.

CAUTION: These circuits should only be tested using a high impedance multi-meter or the designated scan tool as described in this service information . Power should never be removed or applied to any control module with the

ignition in the ON position. Before removing or connecting battery cables, fuses, or connectors, always turn the ignition to the OFF position.

CAUTION: The ABM 47-way connector should never be connected or disconnected with the ignition switch in the ON position.

CAUTION: This vehicle utilizes active wheel speed sensors. Do not apply voltage to wheel speed sensors at any time.

CAUTION: Use only factory wiring harnesses. Do not cut or splice wiring to the brake circuits. The addition of aftermarket electrical equipment (car phone, radar detector, citizen band radio, trailer lighting, trailer brakes, etc.) on a vehicle equipped with antilock brakes may affect the function of the antilock brake system.

CAUTION: When performing any service procedure on a vehicle equipped with ABS, do not apply a 12-volt power source to the ground circuit of the pump motor in the HCU. Doing this will damage the pump motor and will require replacement of the entire HCU.

CAUTION: An attempt to remove or disconnect certain system components may result in improper system operation. Only those components with approved removal and installation procedures in this service information should be serviced.

CAUTION: If welding work is to be performed on the vehicle using an electric arc welder, the ABM connector should be disconnected during the welding operation.

CAUTION: Many components of the ABS are not serviceable and must be replaced as an assembly. Do not disassemble any component which is not designed to be serviced.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surface, wash off with water immediately.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle.

DIAGNOSIS AND TESTING

INSPECTION AND ROAD TEST

1. Visually inspect the ABS for damaged or disconnected components and connectors.
2. Verify the brake lamps are operational. If they are not, repair them prior to continuing.

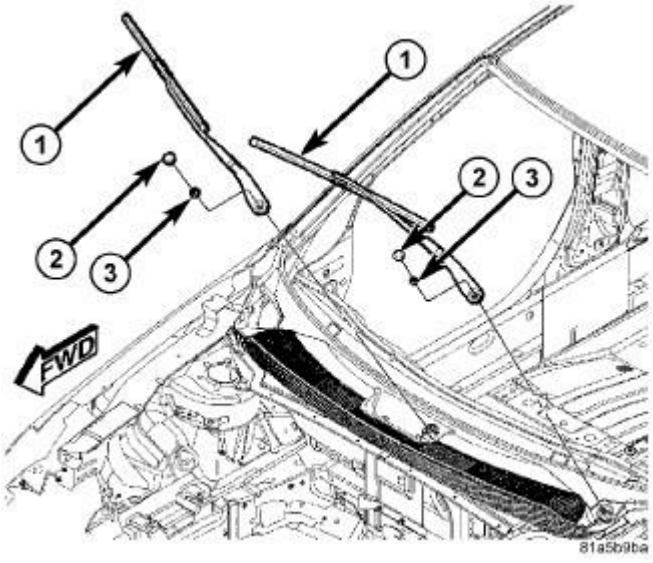

Fig. 3: Locating Data Link Connector
Courtesy of CHRYSLER LLC

3. Connect a scan tool to the Data Link Connector located under the instrument panel to the left of the steering column (1). If the scan tool does not power-up, check the power and ground supplies to the connector.
4. Turn the ignition key to the ON position.
5. Using the scan tool, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate diagnostic service information.

   If no problems are observed, it will be necessary to road test the vehicle.

   Many ABS conditions judged to be a problem by the driver may be normal operating conditions. To become familiarized with the normal operating characteristics of this antilock brake system. See **Operation** .

   Before road testing a brake complaint vehicle, note whether the red BRAKE warning indicator lamp, amber ABS warning indicator lamp, or both are turned on. If it is the red BRAKE warning indicator, there is a brake hydraulic problem that must be corrected before driving the vehicle. See **Diagnosis and Testing** .

   If the amber ABS warning indicator is on, road test the vehicle as described below. While only the amber ABS warning indicator is on, the ABS is not functional. The ability to stop the car using the base brake system should not be affected.

6. Turn the key to the OFF position and then back to the ON position. Note whether the amber ABS warning

indicator lamp continues to stay on.

7. If the amber ABS warning indicator lamp stays on, shift into gear and drive the car to a speed of approximately 25 km/h (15 mph) to complete the ABS Start-Up and Drive-Off Cycles. See **Operation** . If at this time the amber ABS warning indicator lamp stays on, refer to the appropriate diagnostic service information.
8. If the amber ABS warning indicator lamp goes out at any time, drive the vehicle a short distance. Accelerate the vehicle to a speed of at least 64 km/h (40 mph). Bring the vehicle to a complete stop, braking hard enough to cause the ABS to cycle. Repeat this action several times. Using the scan tool, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate diagnostic service information.

STANDARD PROCEDURE

ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS must always be bled anytime it is suspected that the HCU has ingested air.

Brake systems with ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.

NOTE: During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add Mopar® DOT 3 brake fluid as required.

BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

1. Make sure all hydraulic fluid lines are installed and properly torqued.
2. Connect the scan tool to the diagnostics connector. The diagnostic connector is located under the lower steering column cover to the left of the steering column.
3. Using the scan tool, check to make sure the ABM does not have any fault codes stored. If it does, clear them.

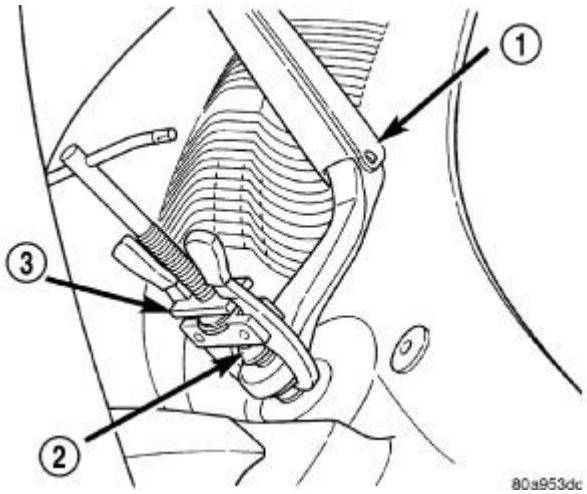

Fig. 4: Bleed Hose Set Up
Courtesy of CHRYSLER LLC

WARNING: When bleeding the brake system wear safety glasses. A clear bleed tube (1) must be attached to the bleeder screws and submerged in a clear container filled part way with clean brake fluid (2). Direct the flow of brake fluid away from yourself and the painted surfaces of the vehicle. Brake fluid at high pressure may come out of the bleeder screws when opened.

NOTE: Pressure bleeding is recommended to bleed the base brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

4. Bleed the base brake system. See **Standard Procedure**
5. Using the scan tool, select ECU VIEW, followed by ABS MISCELLANEOUS FUNCTIONS to access bleeding. Follow the instructions displayed. When finished, disconnect the scan tool and proceed.
6. Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.
7. Fill the master cylinder fluid reservoir to the FULL level.
8. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor (1). The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

The Dynamics Sensor (1) is located on the floor tunnel just forward of the center floor console (2), below the instrument panel.

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor must be replaced when necessary.

Removal

REMOVAL

1. Disconnect and isolate the battery negative cable from the battery post.

SENSOR, WHEEL SPEED, FRONT

Description

DESCRIPTION

The antilock brake system uses two-wire wheel speed sensors, known as active wheel speed sensors. The sensors use an electronic principle known as magnetoresistive to help increase performance and durability. The sensors convert wheel speed into a small digital signal. A Wheel Speed Sensor (WSS) is used at each wheel. A magnetic pole encoder serves as the trigger mechanism for each sensor. At each wheel of the vehicle there is one wheel speed sensor and one encoder.

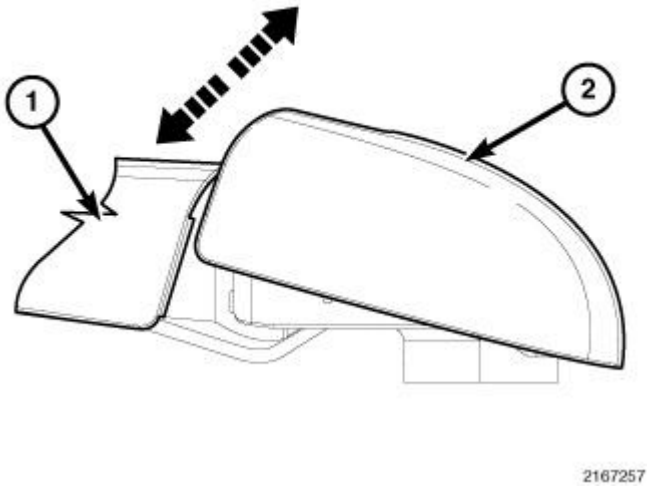

Fig. 11: Front Wheel Speed Sensor
Courtesy of CHRYSLER LLC

A front wheel speed sensor (2) is attached to a mounting boss on each front knuckle (3). The encoder is an integral part of the hub and bearing.

WSS air gaps are not adjustable.

Operation

OPERATION

The ABM sends 12 volts to power an Integrated Circuit (IC) in the sensor. The IC supplies a constant 7 mA power supply to the ABM. The relationship of the magnetic pole encoder to the permanent magnet in the sensor, signals the IC to enable a second 7 mA power supply. The output of the sensor, sent to the ABM, is a DC voltage signal with changing voltage and current levels. The ground for the IC and the current sense circuit is provided by the ABM.

When a pole is properly aligned with the sensor, the voltage signal is approximately 0.8 volts and a constant 7 mA current is sent to the ABM. As the magnetic pole encoder rotates, the encoder shifts the magnetic field and the IC enables a second 7 mA current source. The ABM senses a voltage signal of approximately 1.6 volts and 14 mA. The ABM measures the amperage of the digital signal for each wheel. The resulting signal is interpreted by the ABM as the wheel speed.

SWITCH, ELECTRONIC STABILITY PROGRAM (ESP)

Description

DESCRIPTION

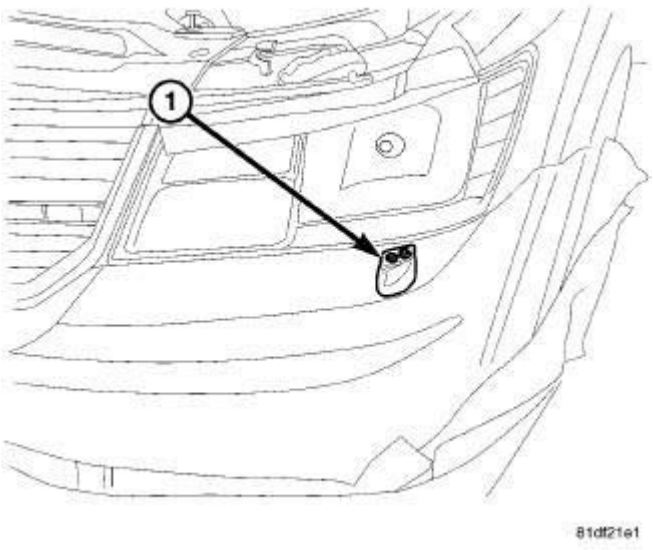

Fig. 32: Accessory Switch Bank Module
Courtesy of CHRYSLER LLC

The ESP Off Switch (2) is part of the accessory switch bank module located in the center bezel (2) on the instrument panel above the radio. The ESP Off switch turns the Electronic Stability Program off whenever the switch is depressed. Depressing the switch a second time turns the ESP® back on. The switch resets itself each time the ignition is cycled.

When the ESP Off switch is depressed and released, turning ESP® off, it does not completely turn the system off. The ESP® system reduces torque management to a lesser amount, but ESP® function can still occur if the system perceives the need.

The ESP Off switch is serviced as part of the accessory switch bank. There are different accessory switch banks available based on the option content of the vehicle. Ensure the accessory switch bank being installed matches the vehicle options.

Removal

REMOVAL

NOTE: The ESP Off switch is integral to the accessory switch bank and cannot be serviced separately.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel from the instrument panel and place it on a work bench. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal** .
3. Remove the screws that secure the accessory switch bank to the back of the center bezel and remove the accessory switch bank.

Installation

INSTALLATION

NOTE: The ESP Off switch is serviced as part of the accessory switch bank.

NOTE: There are different instrument panel accessory switch banks available based on the option content of the vehicle. Ensure the accessory switch bank being installed matches the vehicle options.

1. Position the accessory switch bank onto the back of the instrument panel center bezel.
2. Install the screws that secure the accessory switch bank to the center bezel. Tighten the screws to 2 N.m (17 in. lbs.).
3. Install the center bezel onto the instrument panel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** .
4. Reconnect the negative battery cable.
5. Perform the ABS Verification Test and make sure the ESP Off switch operates properly. See **Standard Procedure**
6. Verify proper operation of all components controlled by the switch bank.

HYDRAULIC CONTROL UNIT (HCU)

Description

DESCRIPTION

The Hydraulic Control Unit (HCU) is mounted to the Antilock Brake Module (ABM) as part of the Integrated Control Unit (ICU). The HCU controls the flow of brake fluid to the brakes using a series of valves and accumulators. A pump/motor is mounted on the HCU to supply build pressure to the brakes during TCS and ESP events and to empty the low pressure accumulators during ABS events.

NOTE: The HCU is not serviceable from the ICU for vehicles equipped with Hill Start Assist (HSA).

On Right-Hand-Drive vehicles, the ICU (1) is located in the engine compartment, mounted to the left side body frame rail and strut tower.

The ABS with ESP® and All-Speed Traction Control ICU consists of the following components: the ABM, 8

(build/decay) solenoid valves, two traction control solenoid valves, two electronic shuttle valves, valve block, fluid accumulators, a pump, and an electric pump/motor.

NOTE: The HCU and the ABM are not serviceable separately from the ICU for vehicles equipped with Hill Start Assist (HSA).

The replaceable components of the ICU are the HCU and the ABM. No attempt should be made to service any components of the HCU or ABM. The ABM can be serviced without removing the entire assembly from the vehicle.

For additional information on the ABM. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Anti-Lock Brake System - Description** . For additional information on the HCU. See **Description**).

Assembly

ASSEMBLY

1. Clean any debris off the mating surfaces of the HCU and ABM.

CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.

DIAGNOSIS AND TESTING

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

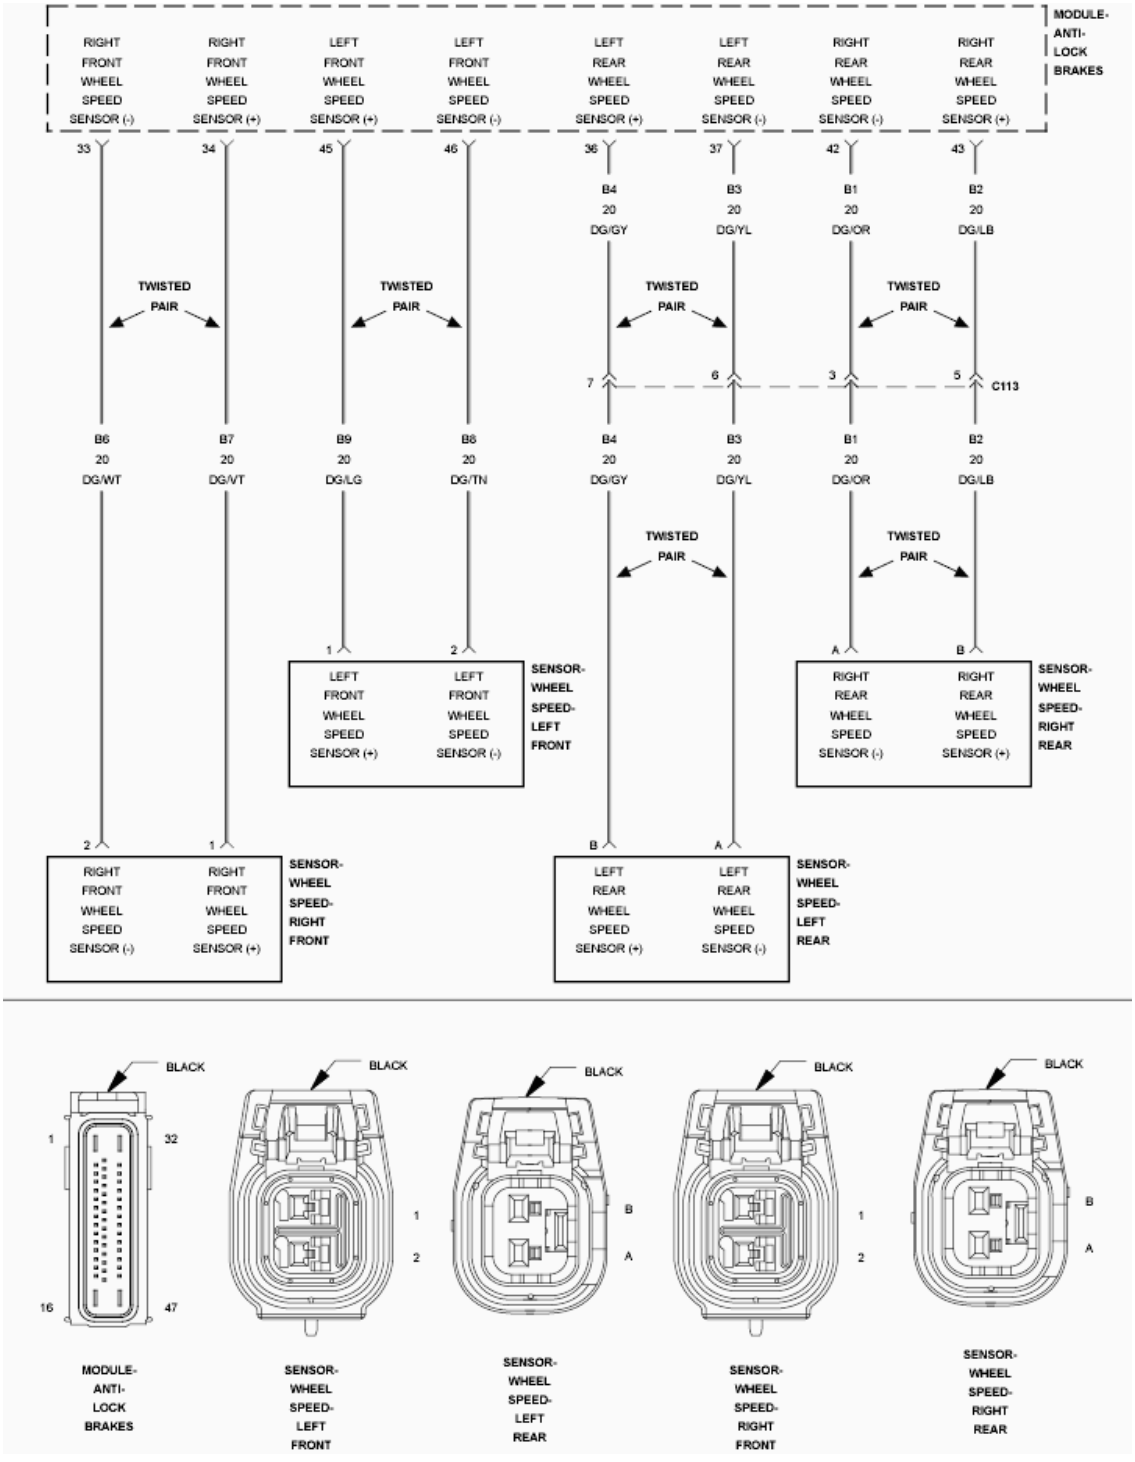

Fig. 1: Left Front Wheel Speed Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

With the ignition on.

- **Set Condition:**

  When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND OR OPEN
(B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C100A LEFT FRONT WHEEL SPEED SENSOR CIRCUIT**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

      Does the scan tool display: C100A LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?

      Yes

      - Go to step 2

      No

      - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
      - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off.

2. Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

   Is the Left Front WSS or any of the connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 3

3. **CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT VOLTAGE**

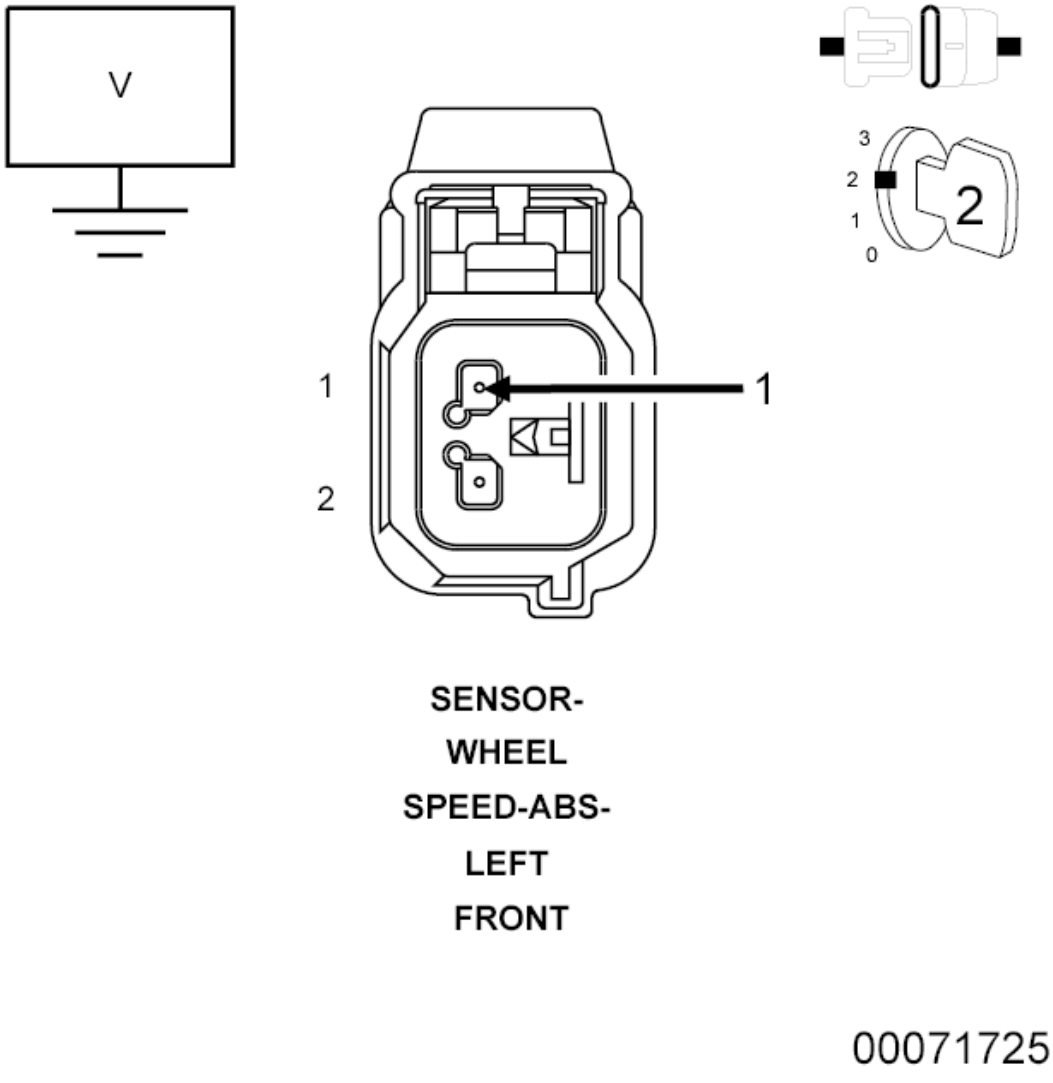

Fig. 2: Checking Left Front Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER LLC

1. Disconnect the Left Front WSS harness connector.
2. Turn the ignition on.
3. Measure the voltage between the (B9) Left Front WSS Supply circuit and ground.

   Is the voltage above 10 volts?

   Yes

   - Go to step 6

   No

- Go to step 4

4. **CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND**

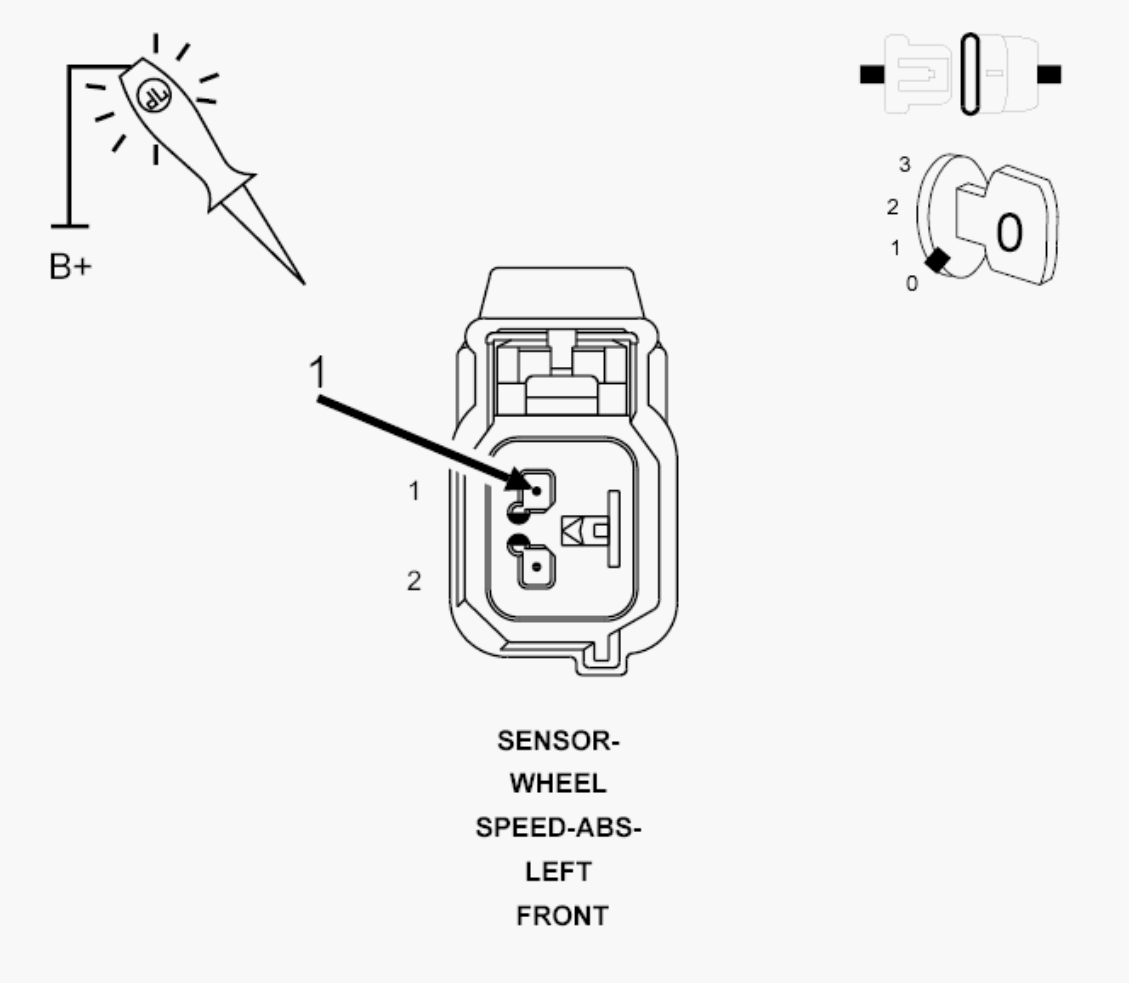

Fig. 3: Checking Left Front Wheel Speed Sensor Supply Circuit Short To Ground
Courtesy of CHRYSLER LLC

1. Disconnect the Anti-Lock Brake Module harness connector.
2. Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

   Does the test light illuminate brightly?

   Yes

   - Repair the (B9) Left Front WSS Supply circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

- Go to step 5

5. **CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT OPEN**

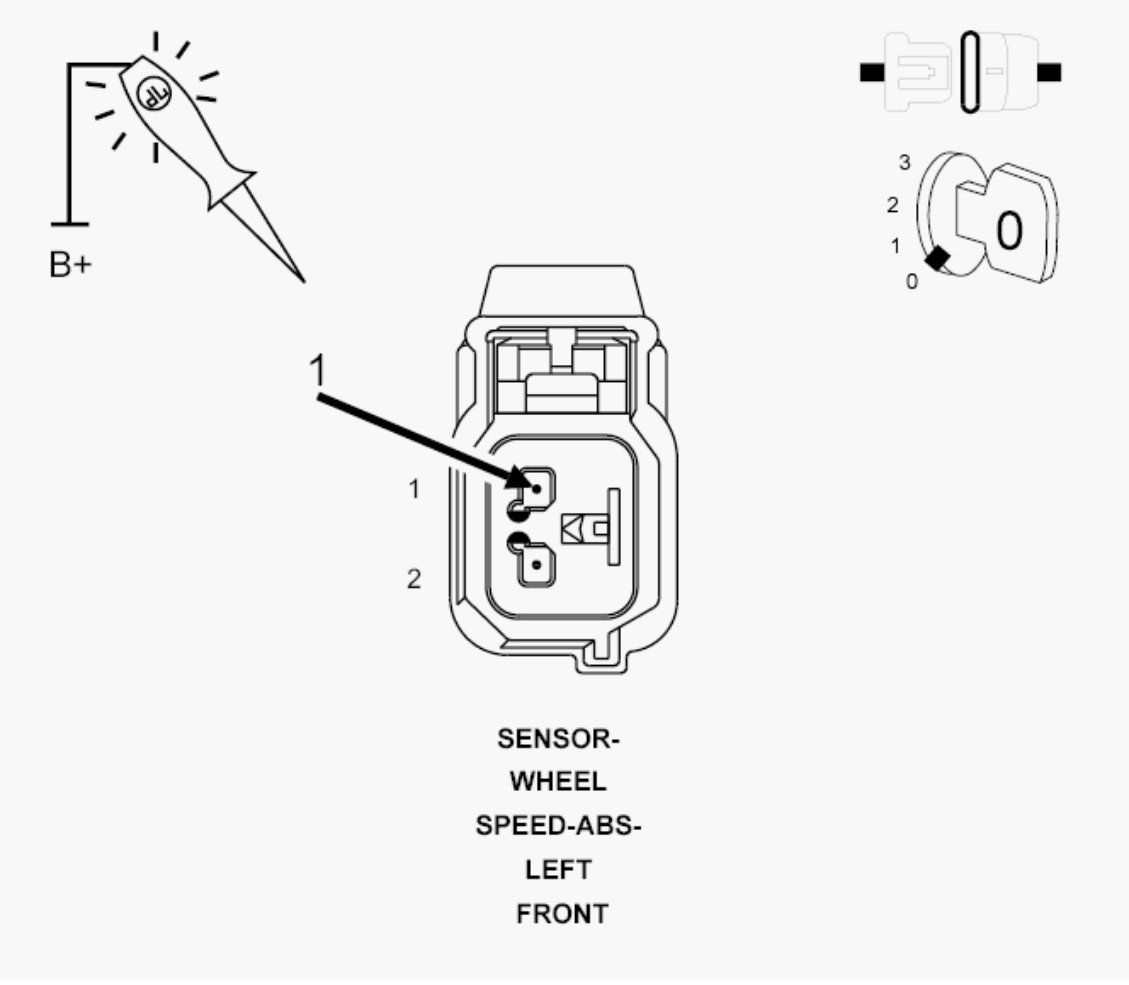

Fig. 4: Checking Left Front Wheel Speed Sensor Supply Circuit Short To Ground
Courtesy of CHRYSLER LLC

1. Connect a jumper wire between ground and the (B9) Left Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.
2. Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

   Does the test light illuminate brightly

   Yes

   - Go to step 6

   No

   - Repair the (B9) Left Front WSS Supply circuit for an open

- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

6. **CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE**

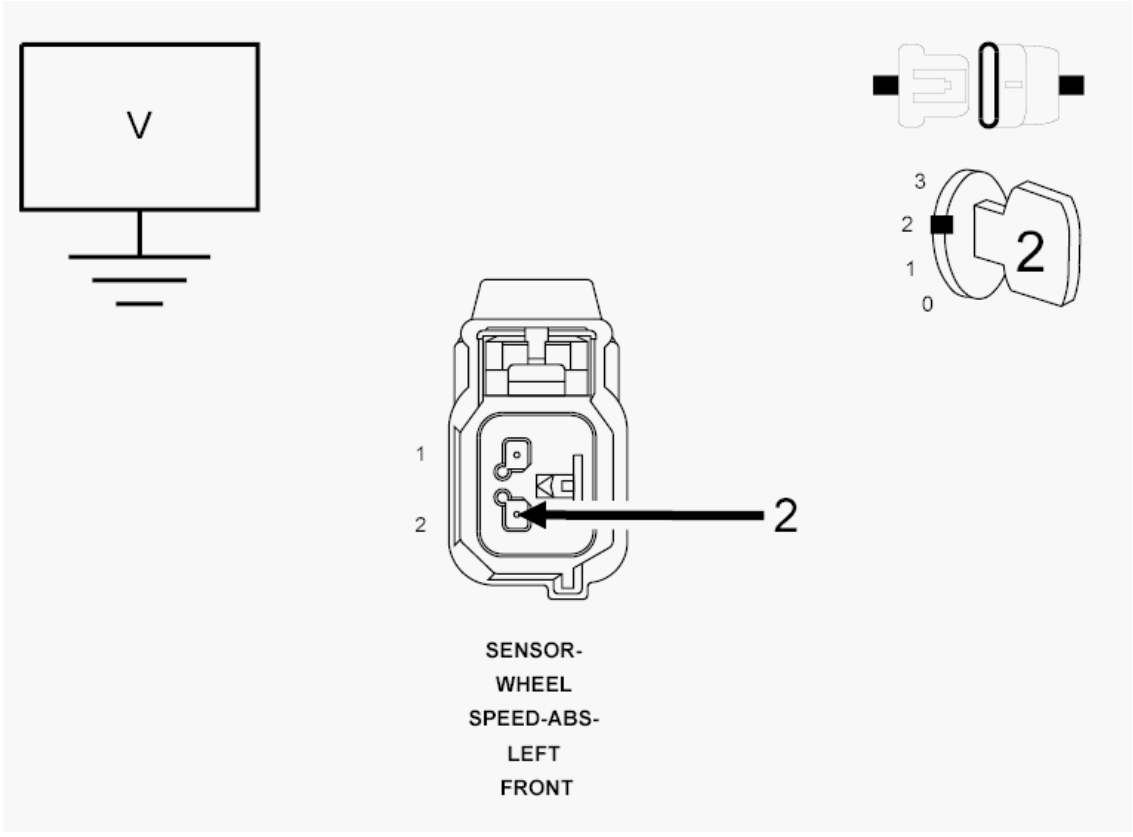

Fig. 5: Checking Left Front Wheel Speed Sensor Signal Circuit Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.
2. Measure the voltage between the (B8) Left Front WSS Signal circuit and ground.

   Is the voltage above 1 volt?

   Yes

   - Repair the (B8) Left Front WSS Signal circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND**

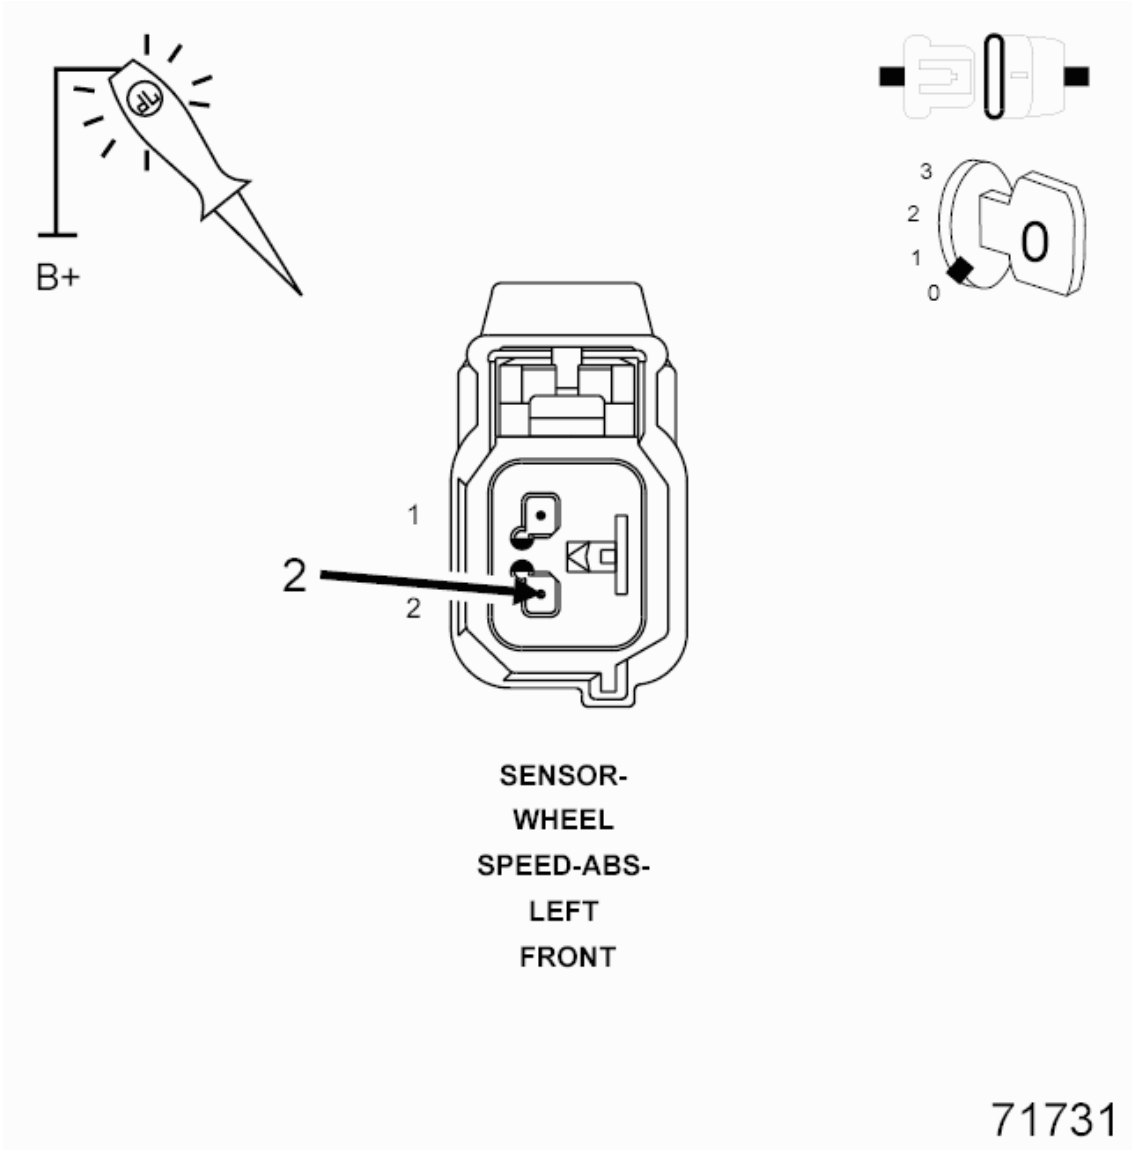

Fig. 6: Checking Left Front Wheel Speed Sensor Signal Circuit Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. If not done previously, disconnect the Anti-Lock Brake Module harness connector.
3. Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

   Does the test light illuminate brightly?

   Yes

   - Repair the (B8) Left Front WSS Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 8

8. **CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN**

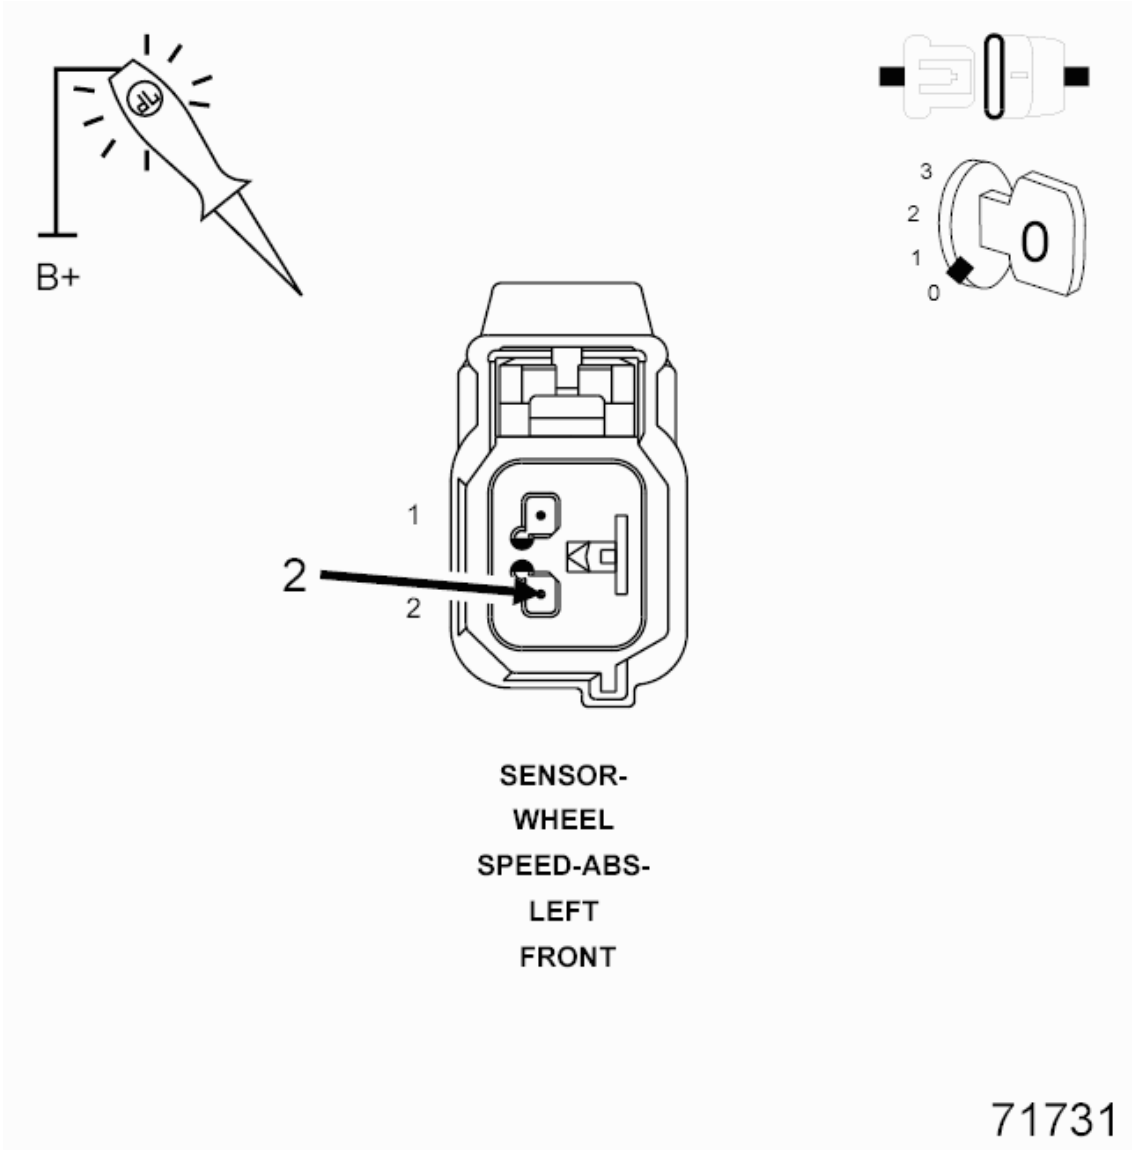

Fig. 7: Checking Left Front Wheel Speed Sensor Signal Circuit Short To Ground
Courtesy of CHRYSLER LLC

1. Connect a jumper wire between ground and the (B8) Left Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.
2. Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

   Does the test light illuminate brightly?

Yes

- Go to step 9

No

- Repair the (B8) Left Front WSS Signal circuit for an open.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

9. **CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TOGETHER**

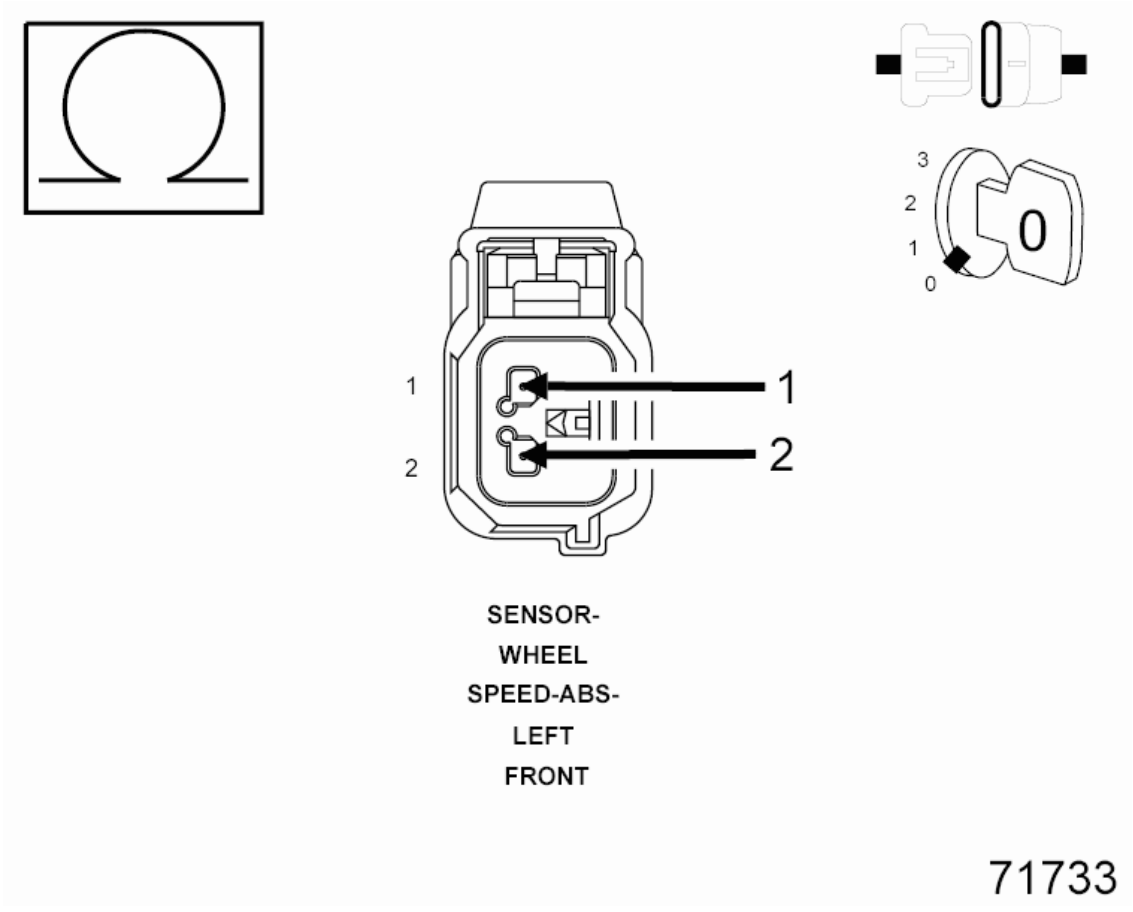

Fig. 8: Checking Left Front Wheel Speed Sensor Signal Circuit & Left Front Wheel Speed Sensor Supply Circuit Short Together
Courtesy of CHRYSLER LLC

1. Remove all jumper wires.
2. Measure the resistance between the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit.

   Is the resistance above 5.0 Ohms?

Yes

- Go to step 10

No

- Repair the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit for a short together.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

10. **LEFT FRONT WHEEL SPEED SENSOR**
    1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
    2. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Did DTC C100A LEFT FRONT WHEEL SPEED SENSOR CIRCUIT reset?

       Yes

       - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
       - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       No

       - Test Complete.

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Left Front Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
LEFT FRONT WSS LOOSE - B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT FRONT TONE WHEEL DAMAGE
LEFT FRONT WHEEL/ BEARING DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   NOTE: If DTC C100A Left Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.
   5. Start the engine.

      CAUTION: Ensure brake capability is available before road testing.

   6. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   7. With the scan tool, read DTCs.

      Does the scan tool display: C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

- Go to step 3

No

- Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

      NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

      Yes

      - Go to step 3

      No

      - Refer to the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

      Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

      No

- Go to step 4

4. **CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

1. Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector
2. Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.
3. Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 5

5. **CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Left Front Wheel Speed Sensor
   2. Inspect the Left Front Wheel Speed Sensor face for damage.

Is the Left Front Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 6

6. **CHECK LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE**
   1. Inspect the Left Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel/Bearing damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 7

7. **CHECK LEFT FRONT WHEEL BEARING FOR DAMAGE**
   1. Inspect the Left Front wheel bearing for excessive runout or clearance. Refer to **Front Suspension/Front/HUB AND BEARING - Diagnosis and Testing**

      Is the Left Front Wheel Bearing Damaged?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 8
8. **LEFT FRONT WHEEL SPEED SENSOR**
   1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Did DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock**

Brake (ABS) - Standard Procedure.

No

- Test Complete.

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Left Front Wheel Speed Sensor (WSS) Signal reading is different from the readings received from the other WSS's at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
LEFT FRONT WSS LOOSE - B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT TONE WHEEL/BEARING DAMAGE
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

4. With the scan tool, read DTCs.

   Does the scan tool display: C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE active?

   Yes

   - Go to step 3

   No

   - Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

      NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

      Yes

      - Go to step 3

      No

      - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
      - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

      Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 4

4. **CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

1. Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.
2. Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.
3. Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 5

5. **CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE**

1. Remove the Left Front Wheel Speed Sensor
2. Inspect the Left Front Wheel Speed Sensor face for damage.

Is the Left Front Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 6

6. **CHECK LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE**
   1. Inspect the Left Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

      NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

      Is the Left Front Tone Wheel/Bearing damaged?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 7

7. **LEFT FRONT WHEEL SPEED SENSOR**
   1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
   2. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Did DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

      Yes

      - Replace the Anti-Lock Brake Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Test Complete.

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

With the ignition on.

- **Set Condition:**

  If the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT
RIGHT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **CHECK FOR DTC C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

      Does the scan tool display: C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?

      Yes

      - Go to step 2

      No

      - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
      - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off.
2. Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.

   Is the Right Front WSS or any of the connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 3

3. **CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE**

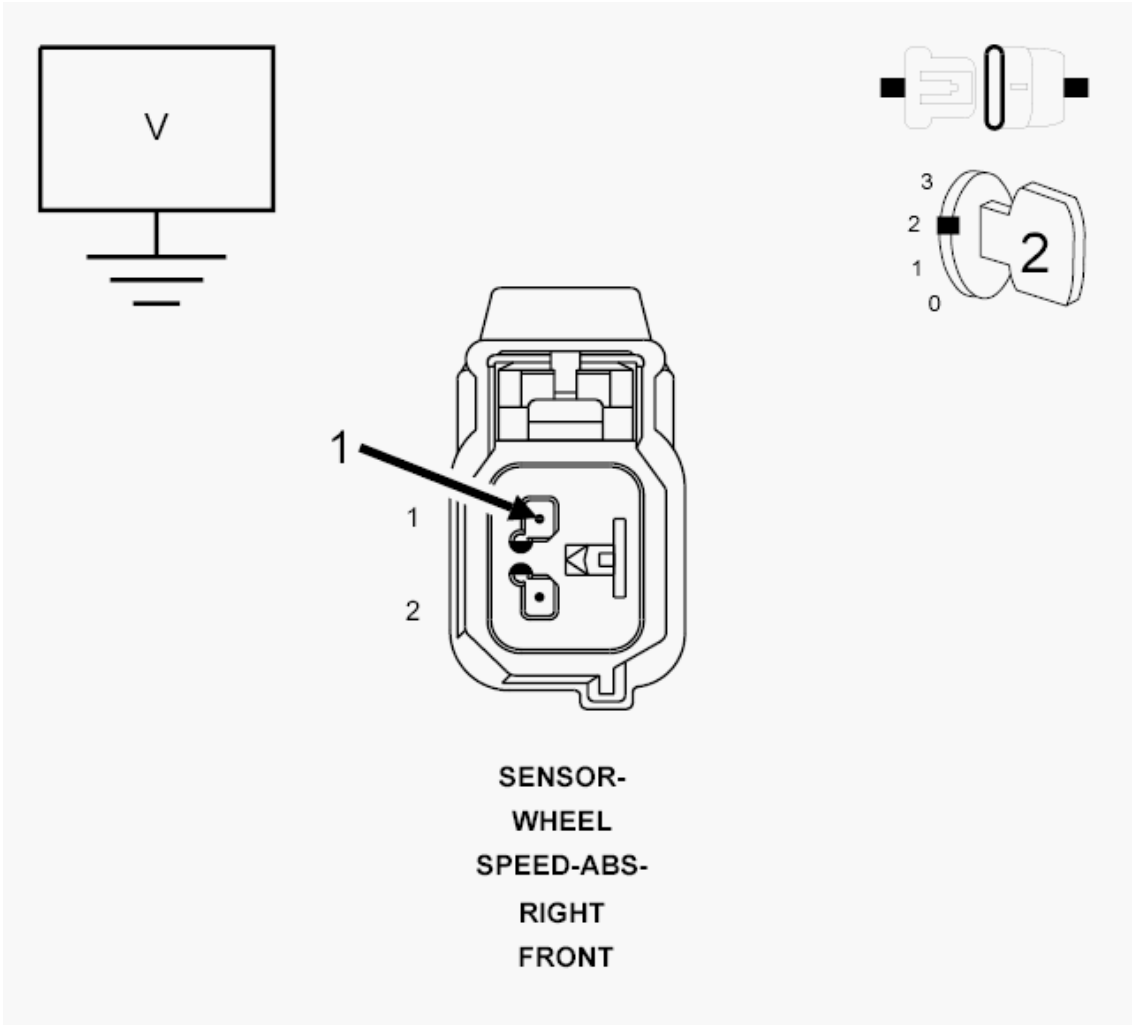

Fig. 10: Checking Right Front Wheel Speed Sensor 12 Volt Supply Circuit Voltage
Courtesy of CHRYSLER LLC

1. Disconnect the Right Front WSS harness connector.
2. Turn the ignition on.
3. Measure the voltage of the (B7) Right Front WSS 12 Volt Supply circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Go to step 6

   No

   - Go to step 4
4. **CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

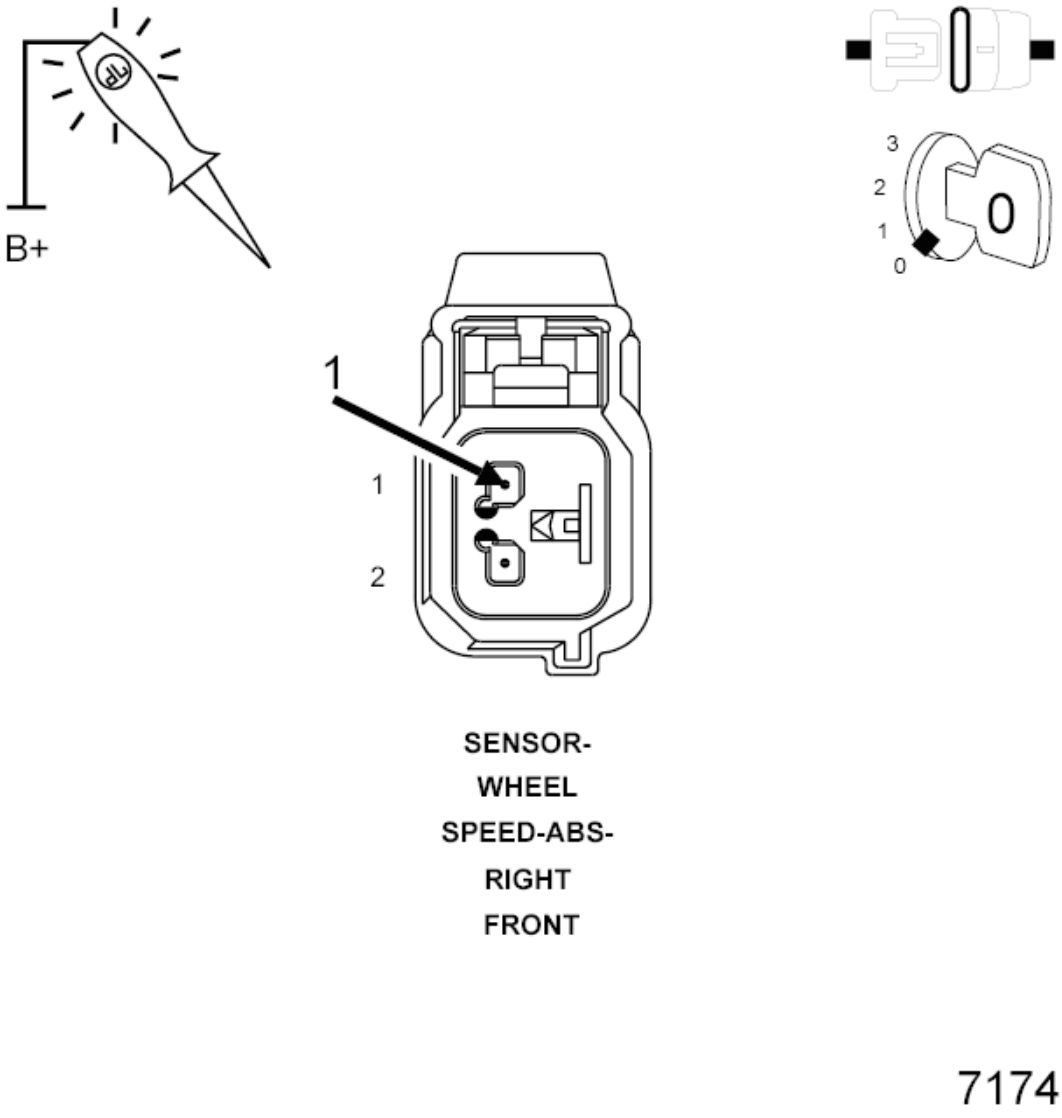

Fig. 11: Checking Right Front Wheel Speed Sensor 12 Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Right Front WSS harness connector.
3. Disconnect the Anti-Lock Brake Module harness connector.
4. Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

   Does the test light illuminate brightly?

   Yes

   - Repair the (B7) Right Front WSS Supply circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE,**

Antilock Brake (ABS) - Standard Procedure.

No

- Go to step 5

5. **CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN**

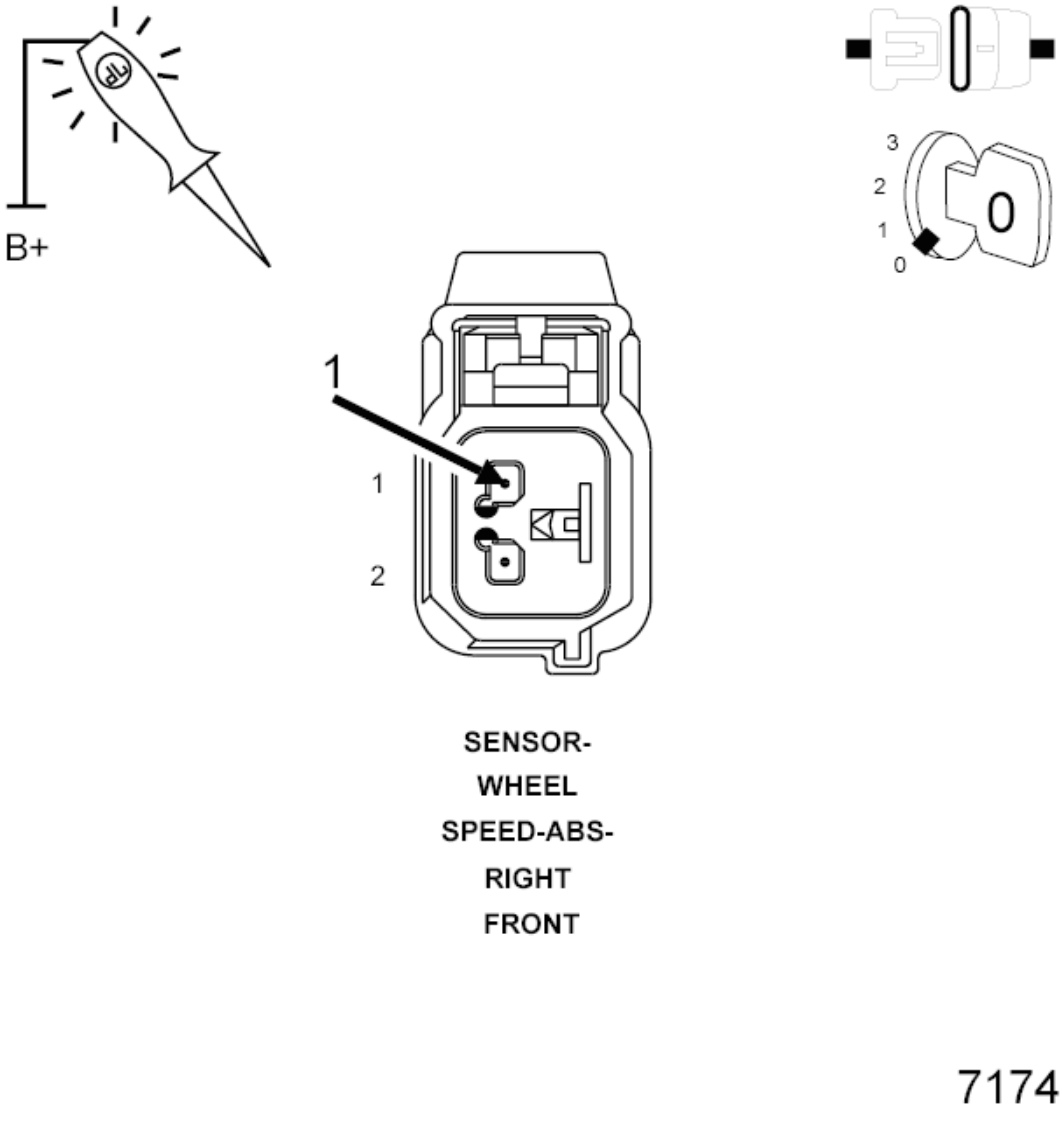

Fig. 12: Checking Right Front Wheel Speed Sensor 12 Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Connect a jumper wire between ground and the (B7) Right Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.
2. Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

   Does the test light illuminate brightly?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Repair the (B7) Right Front WSS Supply circuit for an open.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

6. **CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND**

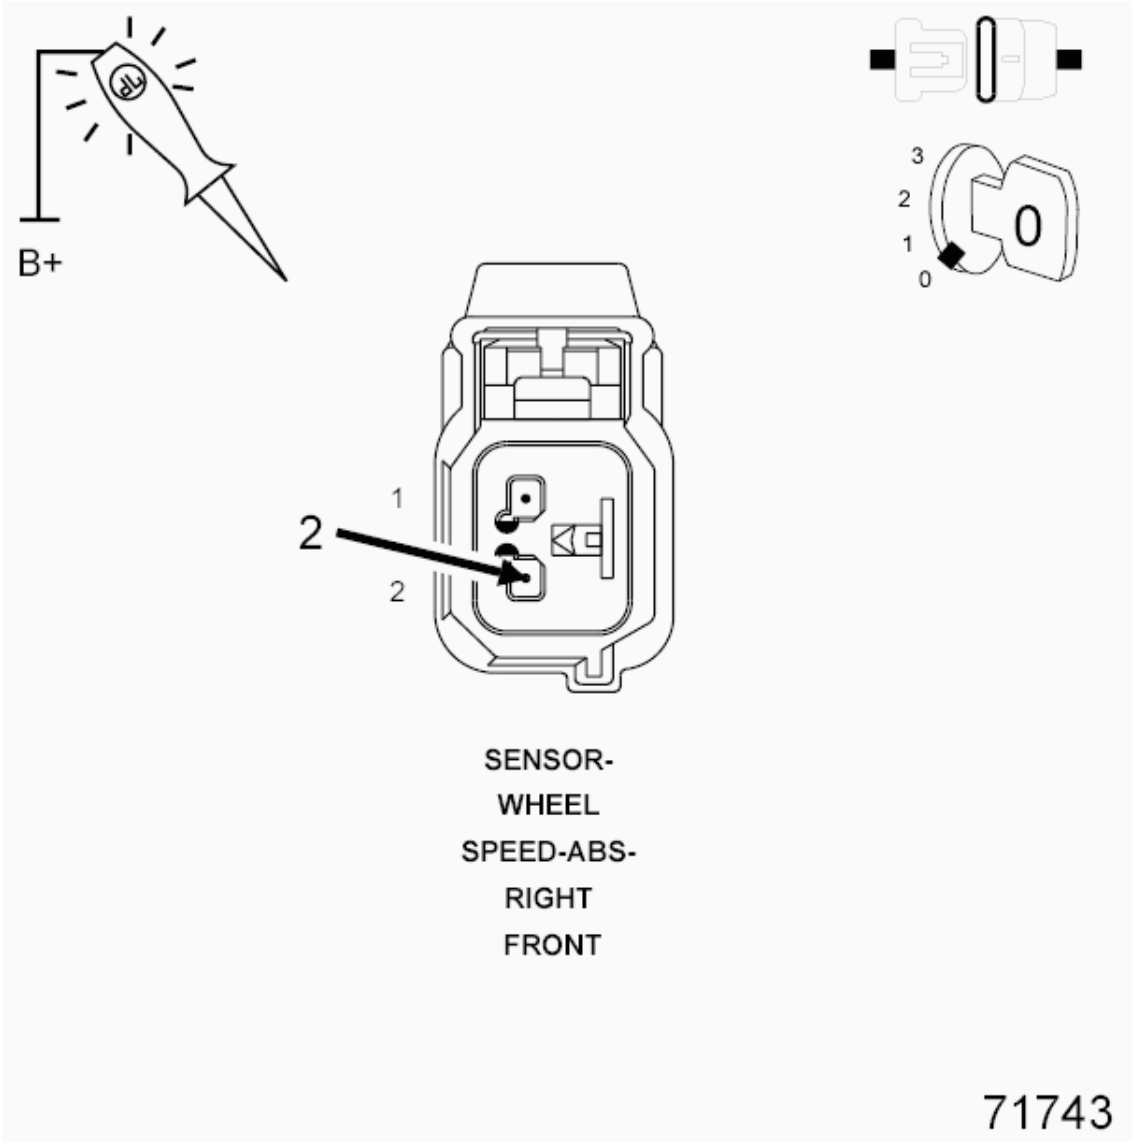

Fig. 13: Checking Right Front Wheel Speed Sensor Signal Circuit Short To Ground

Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. If not done previously, disconnect the Anti-Lock Brake Module harness connector.
3. Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.

   Does the test light illuminate brightly?

   Yes

   - Repair the (B6) Right Front WSS Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN**

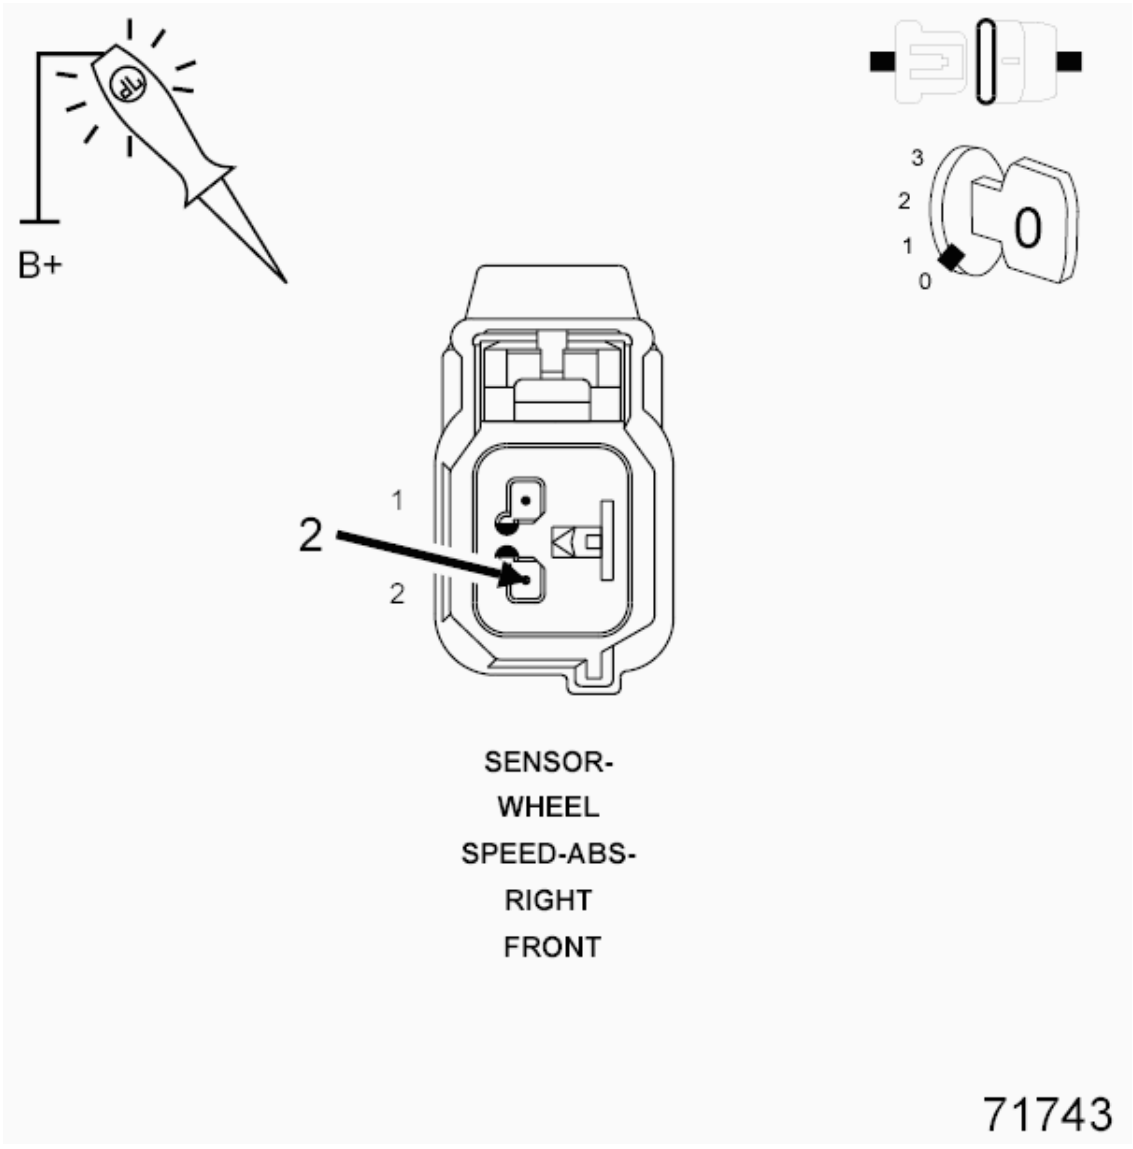

Fig. 14: Checking Right Front Wheel Speed Sensor Signal Circuit Short To Ground
Courtesy of CHRYSLER LLC

1. Connect a jumper wire between ground and the (B6) Right Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.
2. Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.

   Does the test light illuminate brightly?

   Yes

   - Go to step 8

   No

- Repair the (B6) Right Front WSS Signal circuit for an open.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

8. **CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR AN SHORT TO VOLTAGE**

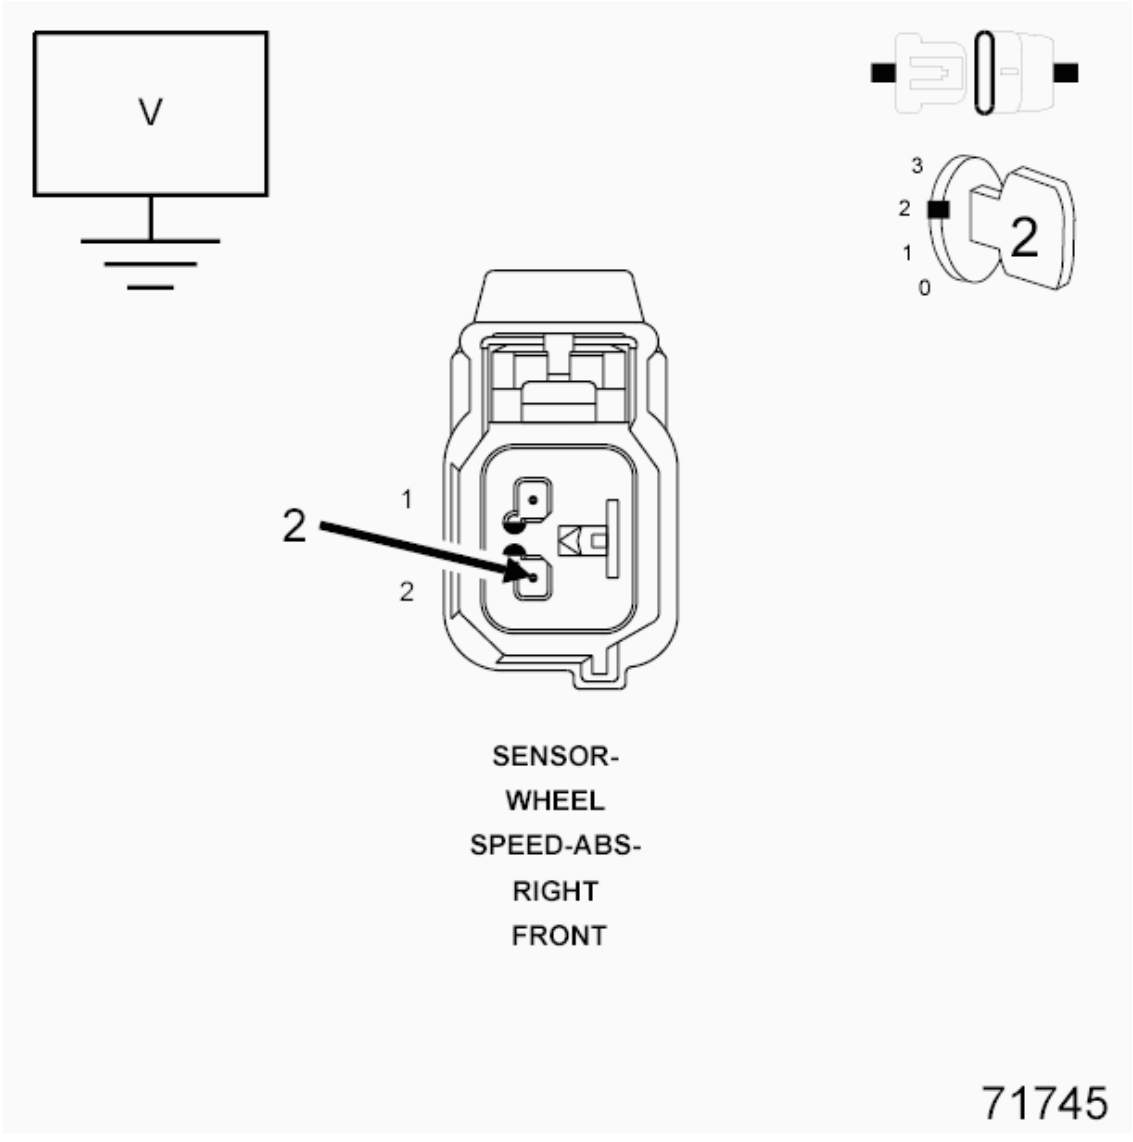

Fig. 15: Checking Right Front Wheel Speed Sensor Signal Circuit For An Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.
2. Remove all jumper wires.
3. Measure the voltage between the (B6) Right Front WSS Signal circuit and ground.

   Is the voltage above 1 volt?

Yes

- Repair the (B6) Right Front WSS Signal circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 9

9. **CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TOGETHER**

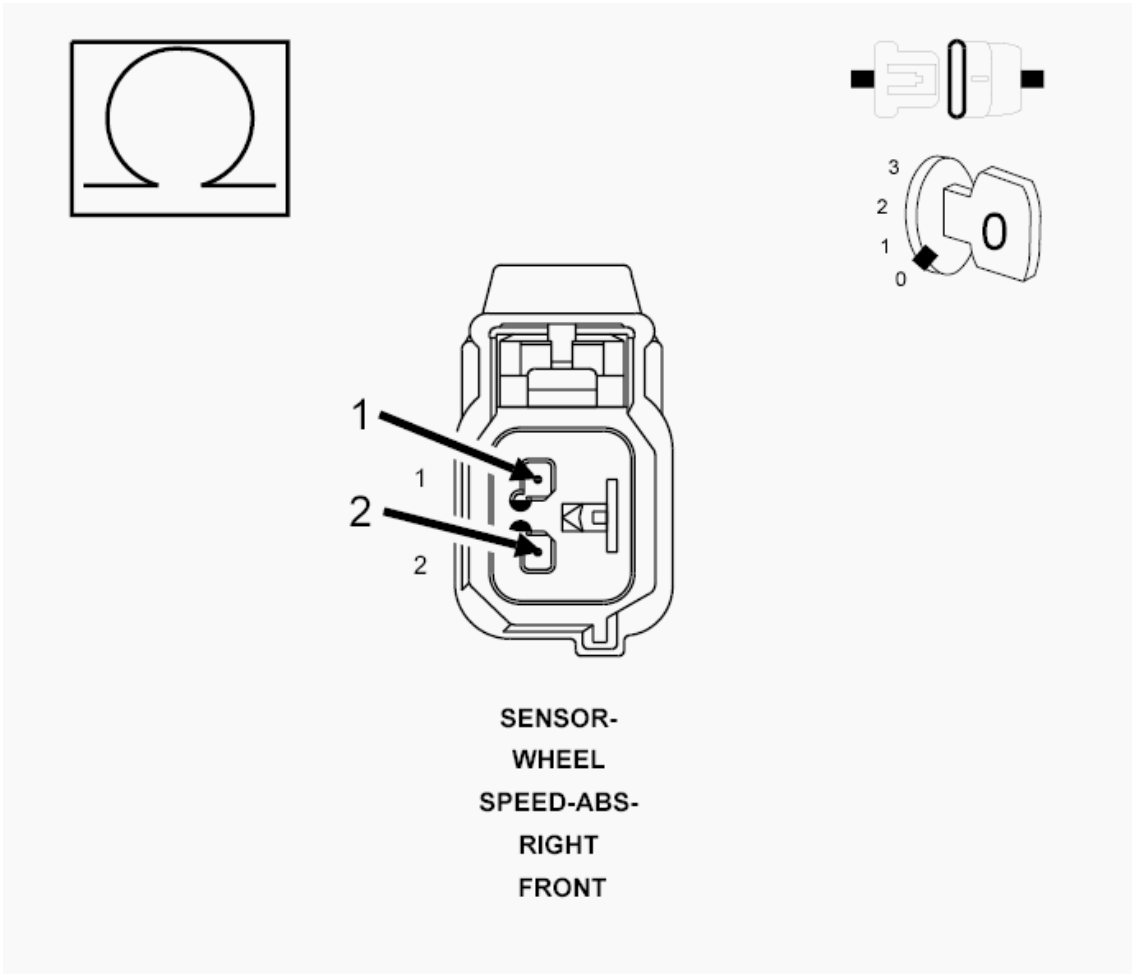

Fig. 16: Checking Right Front Wheel Speed Sensor Signal Circuit & Right Front Wheel Speed Sensor 12 Volt Supply Circuit Shorted Together
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance between the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit.

Is the resistance above 5.0 Ohms?

Yes

- Go to step 10

No

- Repair the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit for a short together.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

10. **RIGHT FRONT WHEEL SPEED SENSOR**
    1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
    2. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Did DTC C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT reset?

       Yes

       - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
       - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       No

       - Test Complete.

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

With the ignition on.

- **Set Condition:**

  When the Right Front Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
RIGHT FRONT WSS LOOSE - B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT FRONT TONE WHEEL DAMAGE
RIGHT FRONT WHEEL/BEARING DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   NOTE: If DTC C1015-Right Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read DTCs.

      Does the scan tool display: C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

      Yes

- Go to step 3

No

- Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

      NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Right Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

      Yes

      - Go to step 3

      No

      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

      Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 4

4. **CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR**

DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

1. Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector
2. Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.
3. Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

   Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Right Front Wheel Speed Sensor
   2. Inspect the Right Front Wheel Speed Sensor face for damage.

      Is the Right Front Wheel Speed Sensor damaged?

      Yes

      - Replace sensor and hub assembly.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 6

6. **CHECK RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE**
   1. Inspect the Right Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

      NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

      Is the Right Front Tone Wheel/Bearing damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 7

7. **CHECK RIGHT FRONT WHEEL BEARING FOR DAMAGE**
   1. Inspect the Right Front wheel bearing for excessive runout or clearance.

      NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications. Refer to Front Suspension/Front/HUB AND BEARING - Diagnosis and Testing .

      Is the Right Front Wheel Bearing Damaged?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 8

8. **RIGHT FRONT WHEEL SPEED SENSOR**
   1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Did DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information.

- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Test Complete.

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Right Front Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
RIGHT FRONT WSS LOOSE B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT TONE WHEEL/BEARING DAMAGE
RIGHT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

4. With the scan tool, read DTCs.

   Does the scan tool display: C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE active?

   Yes

   - Go to step 3

   No

   - Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

      NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Right Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

      Yes

      - Go to step 3

      No

      - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
      - Refer to the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

      Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 4

4. **CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

1. Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.
2. Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.
3. Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 5

5. **CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE**

1. Remove the Right Front Wheel Speed Sensor
2. Inspect the Right Front Wheel Speed Sensor face for damage.

Is the Right Front Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 6

6. **CHECK RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE**
   1. Inspect the Right Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

      NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

      Is the Right Front Tone Wheel/Bearing damaged?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 7

7. **RIGHT FRONT WHEEL SPEED SENSOR**
   1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Did DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Test Complete.

C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT

Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

With the ignition on.

- **Set Condition:**

  If the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT
LEFT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **CHECK FOR DTC C1020 LEFT REAR WHEEL SPEED SENSOR CIRCUIT**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

      Does the scan tool display: C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT?

      Yes

      - Go to step 2

      No

      - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
      - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off.
2. Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

   Is the Left Rear WSS or any of the connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 3

3. **CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE**

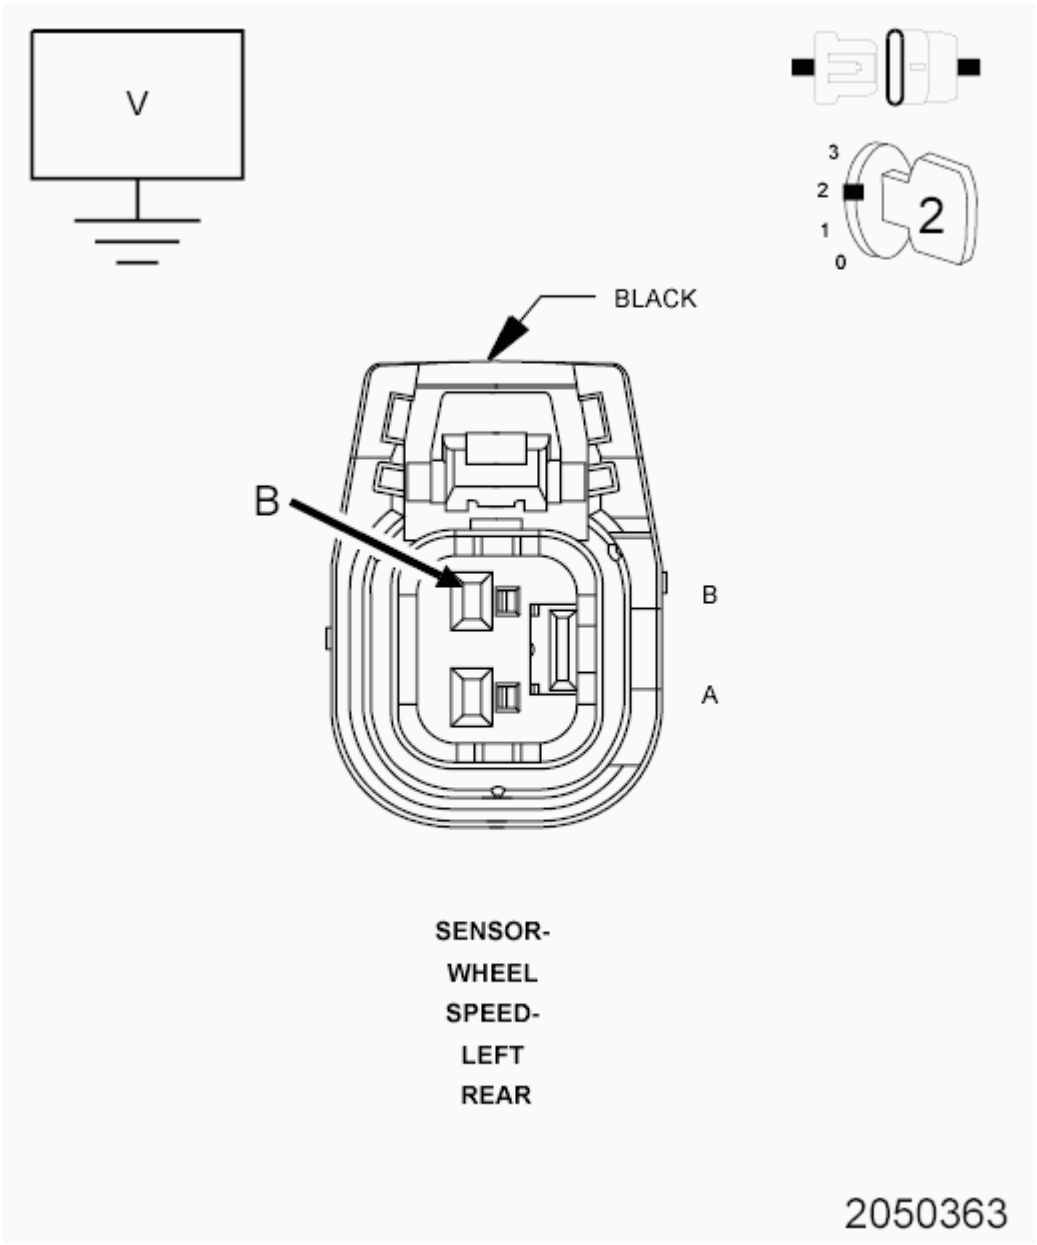

Fig. 18: Checking Left Rear Wheel Speed Sensor 12 Volt Supply Circuit Voltage
Courtesy of CHRYSLER LLC

1. Disconnect the Left Rear WSS harness connector.
2. Turn the ignition on.
3. Measure the voltage of the (B4) Left Rear WSS 12 Volt Supply circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Go to step 6

No

- Go to step 4

4. **CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

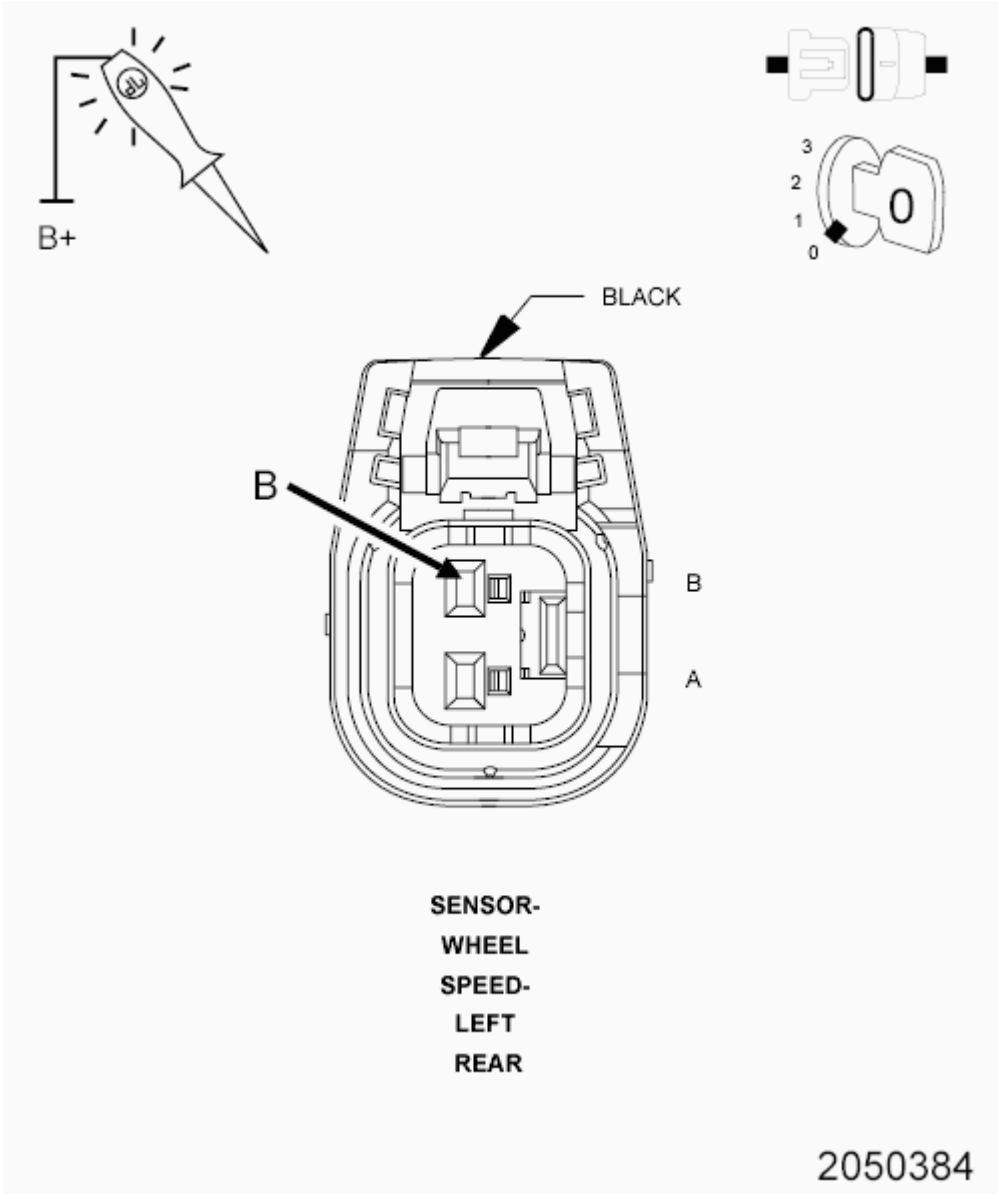

Fig. 19: Checking Left Rear Wheel Speed Sensor 12 Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Left Rear WSS harness connector.
3. Disconnect the Anti-Lock Brake Module harness connector.
4. Using a 12-volt test light connected to 12 volts, probe the (B4) Left Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes

- Repair the (B4) Left Rear WSS Supply circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 5

5. **CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN**

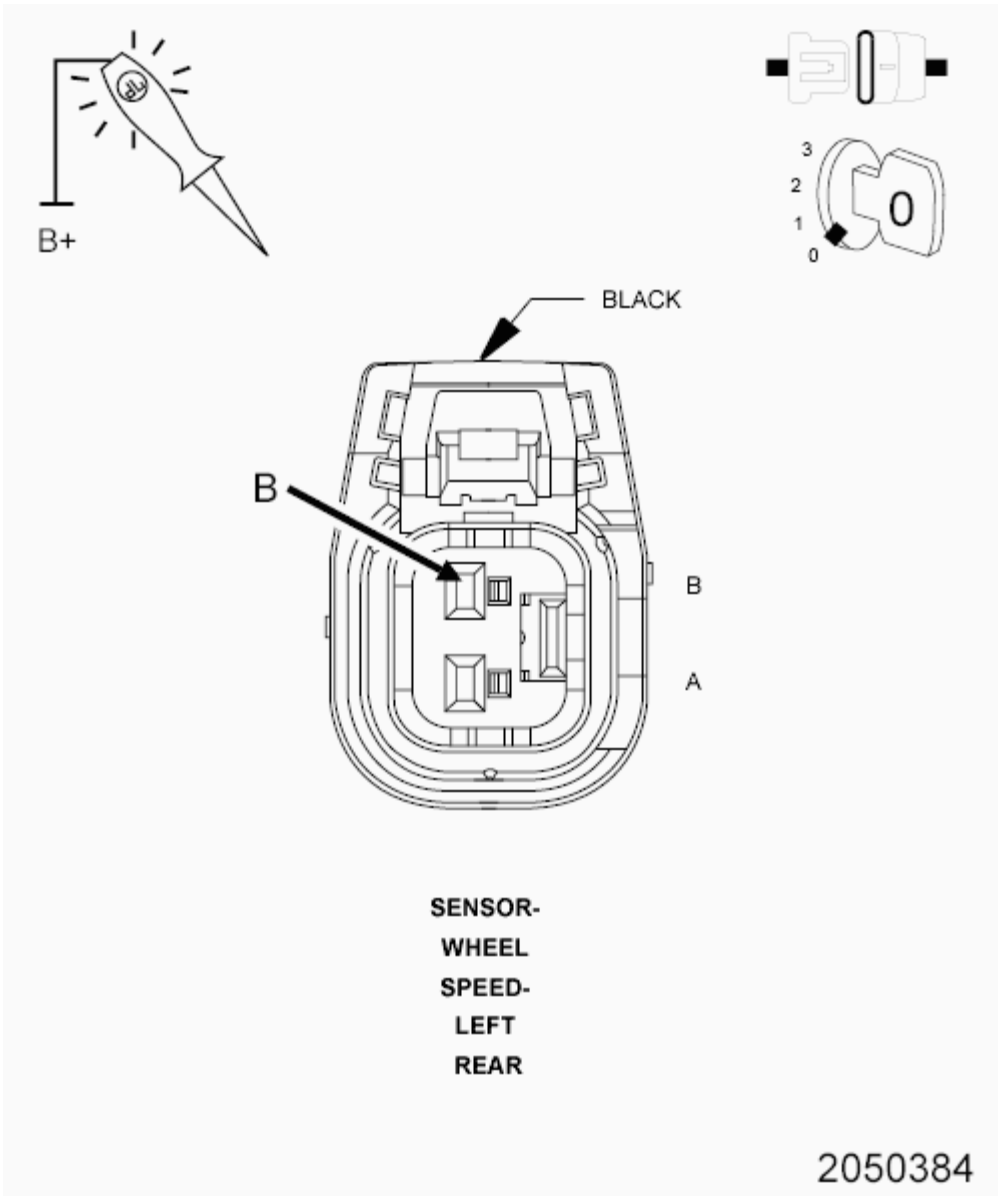

Fig. 20: Checking Left Rear Wheel Speed Sensor 12 Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Connect a jumper wire between ground and the (B4) Left Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.
2. Using a 12-volt test light connected to 12 volts, probe the (B4) Left Rear WSS Supply circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair the (B4) Left Rear WSS Supply circuit for an open.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

6. **CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

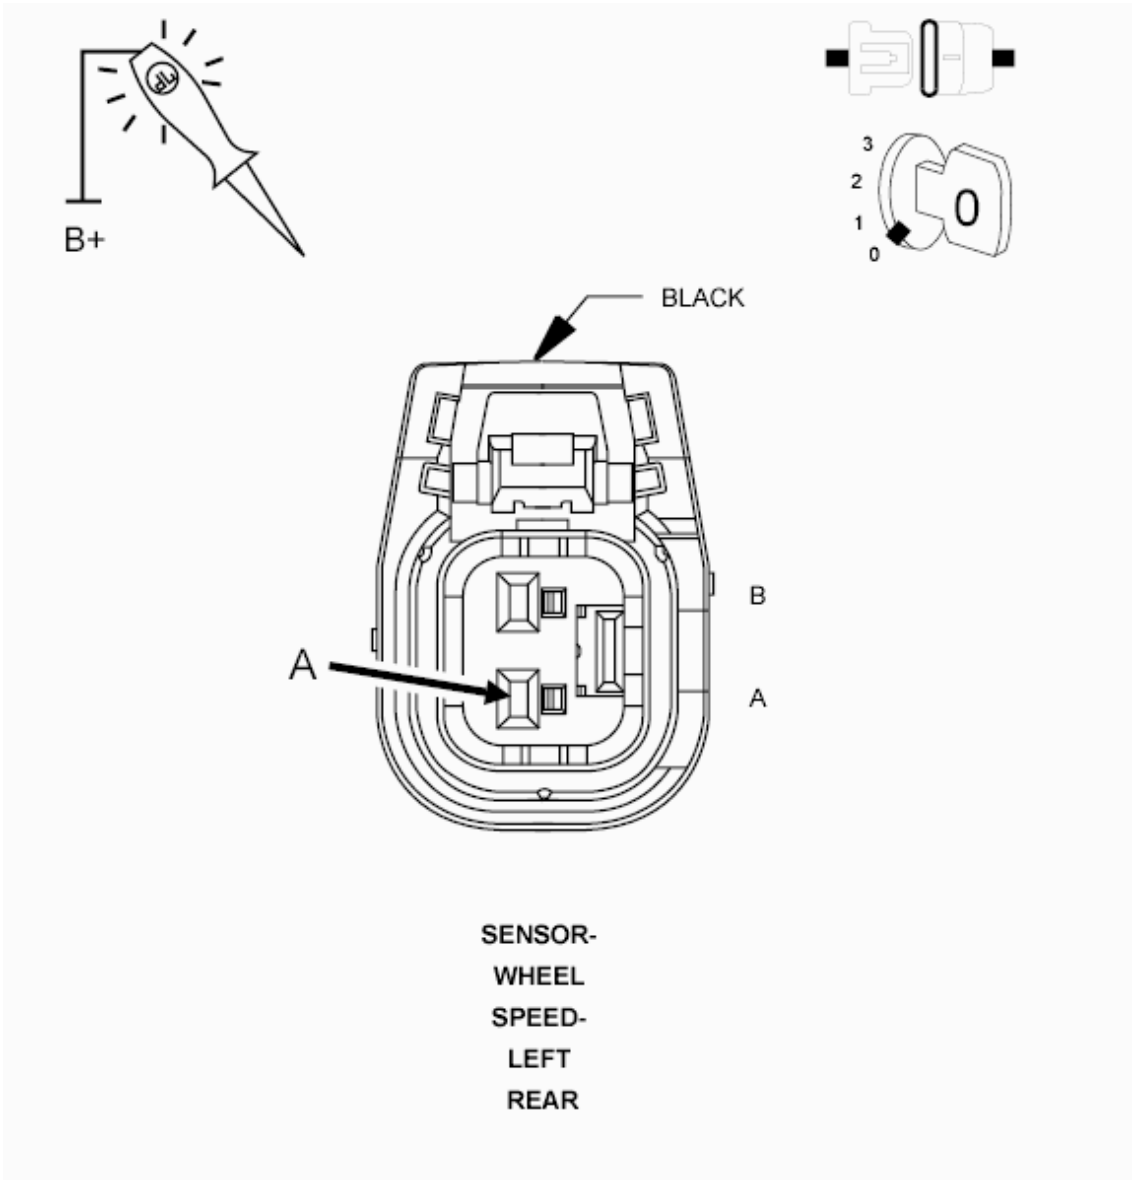

Fig. 21: Checking Left Rear Wheel Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. If not done previously, disconnect the Anti-Lock Brake Module harness connector.
3. Using a 12-volt test light connected to 12 volts, probe the (B3) Left Rear WSS Signal circuit.

   Does the test light illuminate brightly?

   Yes

   - Repair the (B3) Left Rear WSS Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE,**

Antilock Brake (ABS) - Standard Procedure.

No

- Go to step 7

7. **CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR AN OPEN**

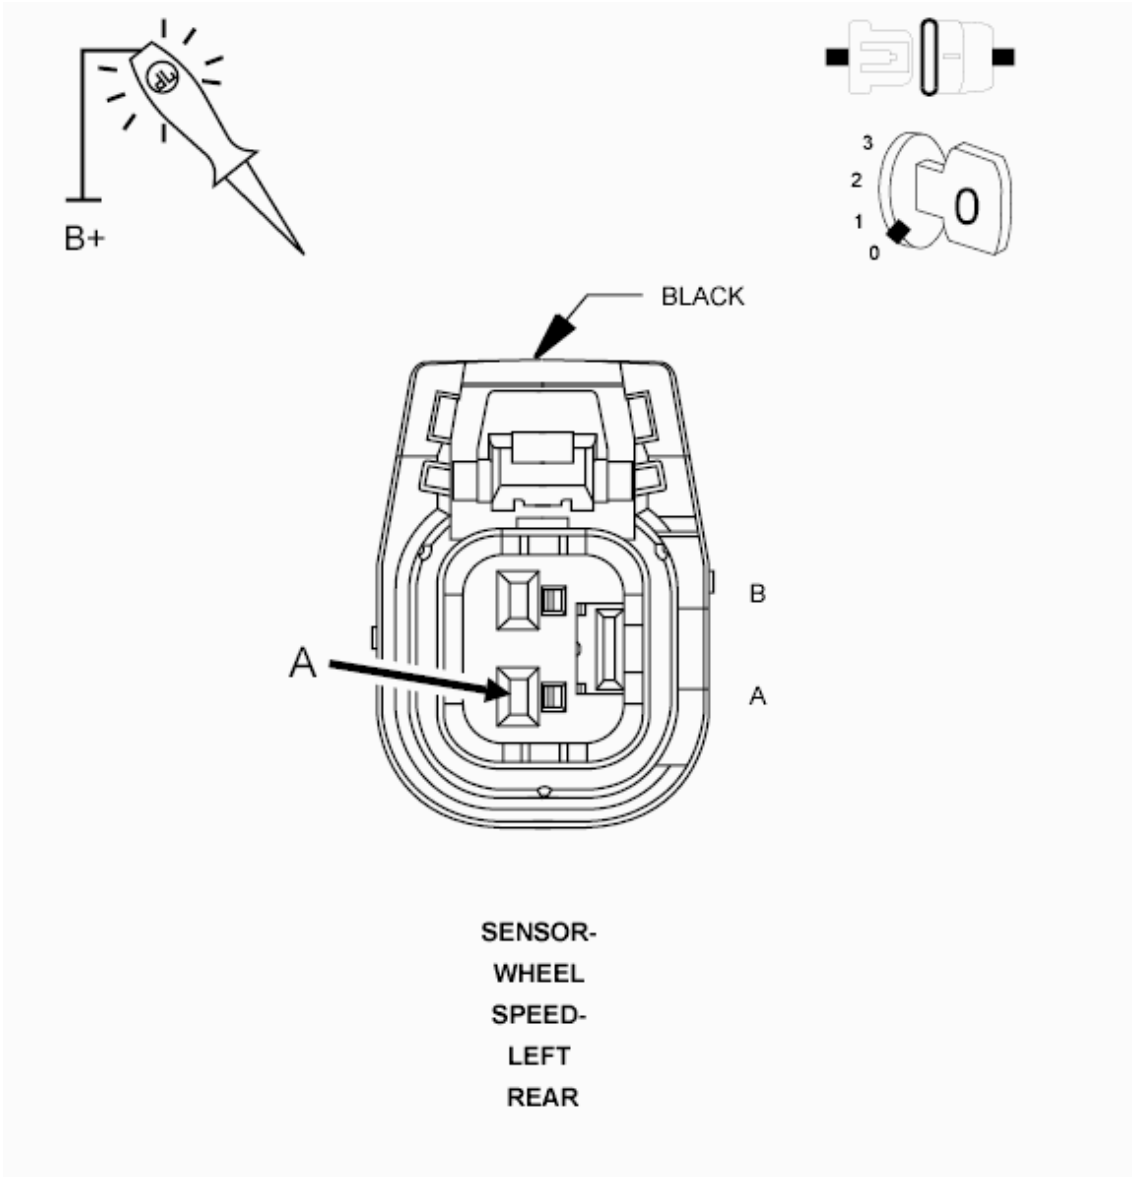

Fig. 22: Checking Left Rear Wheel Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Connect a jumper wire between ground and the (B3) Left Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.
2. Using a 12-volt test light connected to 12 volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

- Go to step 8

No

- Repair the (B3) Left Rear WSS Signal circuit for an open.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

8. **CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE**

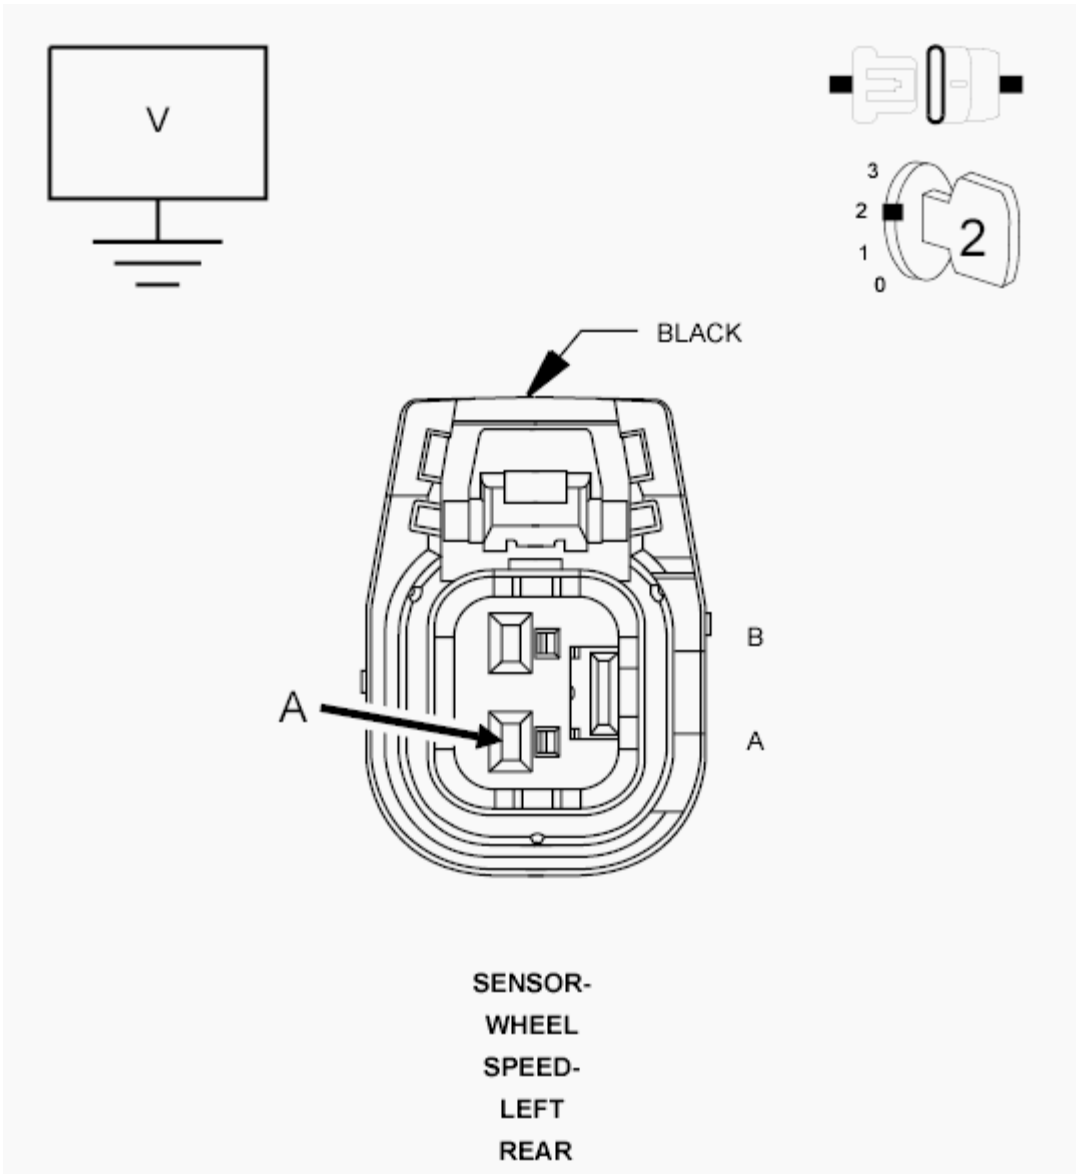

Fig. 23: Checking Left Rear Wheel Speed Sensor Signal Circuit Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.
2. Remove all jumper wires.
3. Measure the voltage between the (B3) Left Rear WSS Signal circuit and ground.

   Is the voltage above 1 volt?

   Yes

   - Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 9

9. **CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TOGETHER**

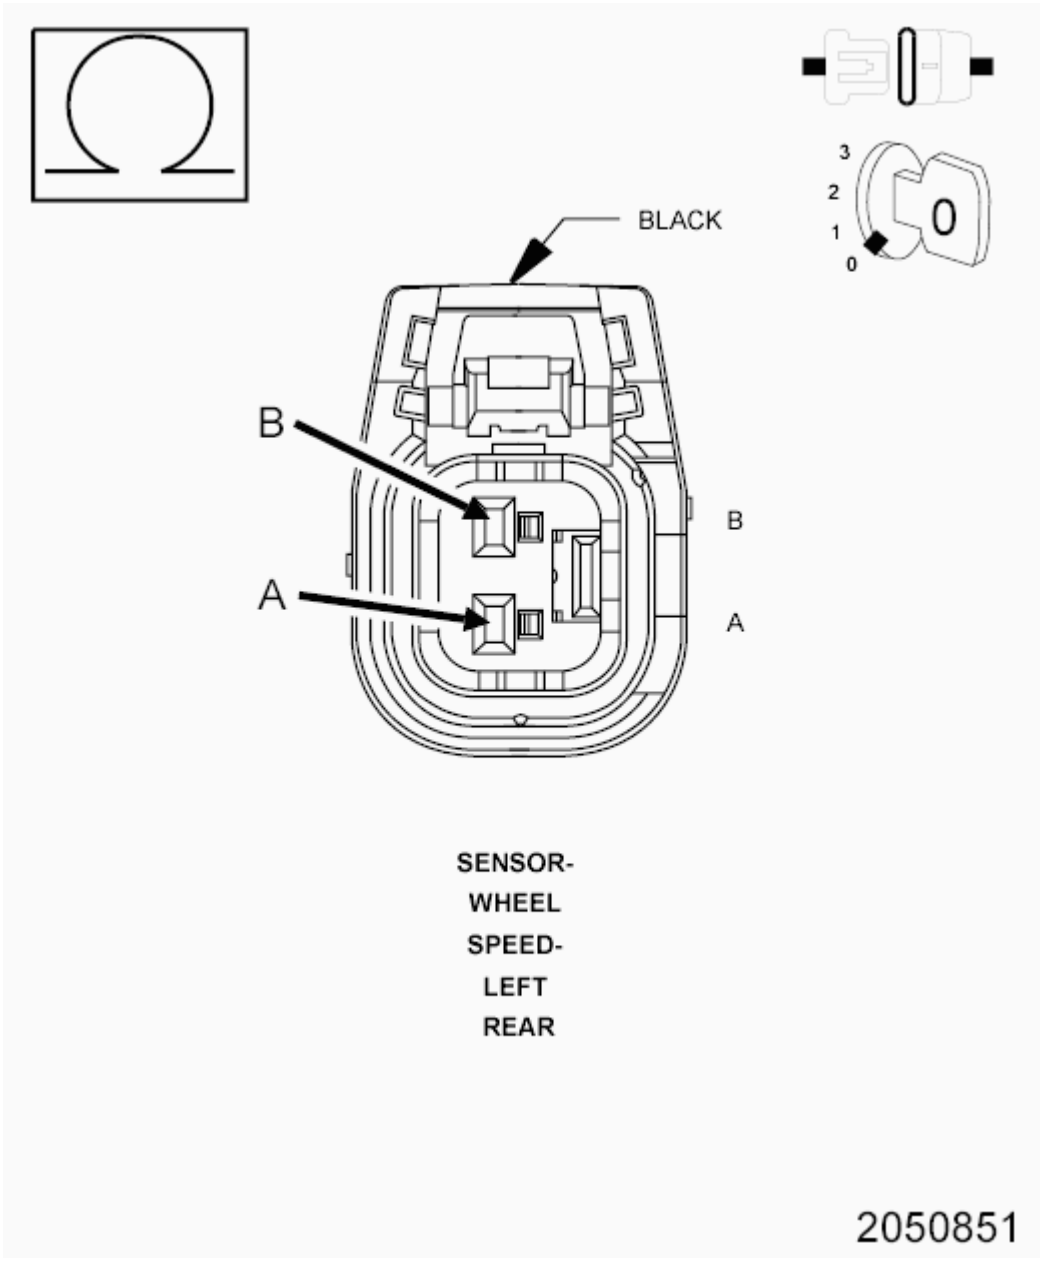

Fig. 24: Checking Left Rear Wheel Speed Sensor Signal Circuit & Left Rear Wheel Speed Sensor 12 Volt Supply Circuit Shorted Together
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance between the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit.

   Is the resistance above 5.0 Ohms?

   Yes

- Go to step 10

No

- Repair the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit for a short together.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

10. **LEFT REAR WHEEL SPEED SENSOR**
    1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
    2. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Did DTC C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT reset?

       Yes

       - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
       - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       No

       - Test Complete.

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

When the Left Rear Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
LEFT REAR WSS LOOSE - B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT REAR TONE WHEEL DAMAGE
LEFT REAR WHEEL BEARING DAMAGE
AXLE SHAFT FASTENER HARDWARE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read DTCs.

      Does the scan tool display: C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

      Yes

      - Go to step 3

      No

      - Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**

1. Turn the ignition on.
2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

   Yes

   - Go to step 3

   No

   - Refer to the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Rear Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

      Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 4

4. **CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**
   1. Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

      Was the Axle Shaft fastener loose?

      Yes

- Repair as necessary.

No

- Go to step 5

5. **CHECK LEFT REAR WSS LOOSENESS, INSPECT B3, B4 CIRCUITS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

1. Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector
2. Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.
3. Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 6

6. **CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE**

1. Remove the Left Rear Wheel Speed Sensor
2. Inspect the Left Rear Wheel Speed Sensor face for damage.

Is the Left Rear Wheel Speed Sensor damaged?

Yes

- Replace sensor and hub assembly.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 7

7. **CHECK LEFT REAR TONE WHEEL FOR DAMAGE**

1. Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Rear Tone Wheel damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 8

8. **CHECK LEFT REAR WHEEL BEARING FOR DAMAGE**
   1. Inspect the Left Rear wheel bearing for excessive runout or clearance.

      NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications. Refer to Front Suspension/Front/HUB AND BEARING - Diagnosis and Testing

      Is the Left Rear Wheel Bearing Damaged?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 9

9. **LEFT REAR WHEEL SPEED SENSOR**
   1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Did DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Test Complete.

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Left Rear Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
LEFT REAR WSS LOOSE - B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR TONE WHEEL DAMAGE
AXLE SHAFT FASTENER HARDWARE
LEFT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

   CAUTION: Ensure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

4. With the scan tool, read DTCs.

Does the scan tool display: C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE active?

Yes

- Go to step 3

No

- Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go to step 3

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Rear Tire pressure.

3. Check and adjust all other tire pressures.
4. Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 4

4. **CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**
   1. Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

   Was the Axle Shaft fastener loose?

   Yes

   - Repair as necessary.

   No

   - Go to step 5
5. **CHECK LEFT REAR WSS LOOSENESS, INSPECT B3, B4 CIRCUITS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

1. Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.
2. Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.
3. Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock**

Brake (ABS) - Standard Procedure.

No

- Go to step 6

6. **CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Left Rear Wheel Speed Sensor
   2. Inspect the Left Rear Wheel Speed Sensor face for damage.

   Is the Left Rear Wheel Speed Sensor damaged?

   Yes

   - Replace sensor and hub assembly.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 7
7. **CHECK LEFT REAR TONE WHEEL FOR DAMAGE**
   1. Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness.

   NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

   Is the Left Rear Tone Wheel damaged?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 8
8. **LEFT REAR WHEEL SPEED SENSOR**
   1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   3. Road test the vehicle over 40 km/h (25 mph).

   NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to

be met.

4. With the scan tool, read ABS DTCs.

   Did DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

   Yes

   - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Test Complete.

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

With the ignition on.

- **Set Condition:**

  If the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT
RIGHT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **CHECK FOR DTC C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

   Does the scan tool display: C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?

   Yes

   - Go to step 2

   No

   - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
   - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off.
2. Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

   Is the Right Rear WSS or any of the connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 3

3. **CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE**

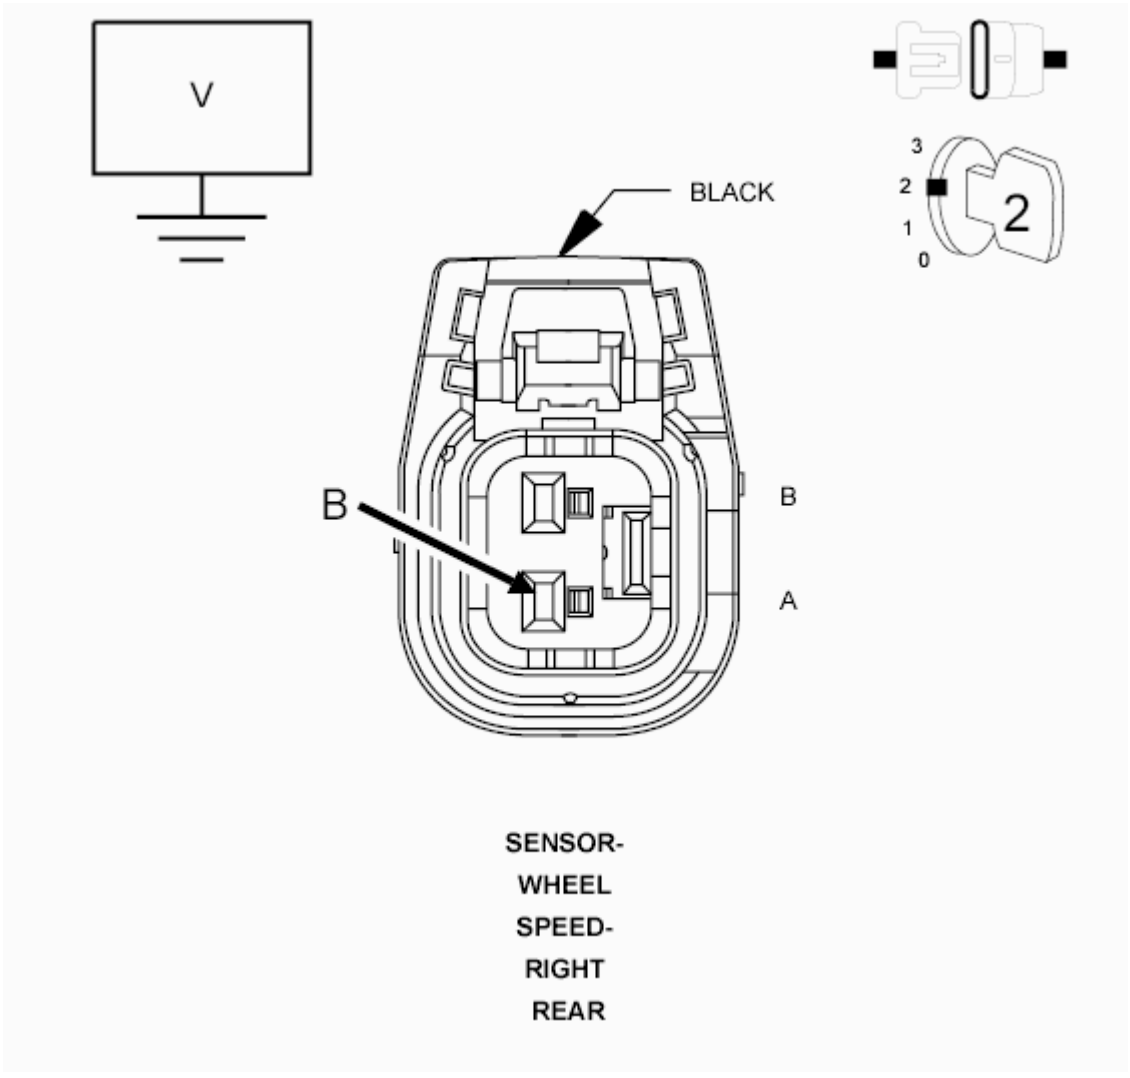

Fig. 26: Checking Right Rear Wheel Speed Sensor 12 Volt Supply Circuit Voltage
Courtesy of CHRYSLER LLC

1. Disconnect the Right Rear WSS harness connector.
2. Turn the ignition on.
3. Measure the voltage of the (B2) Right Rear WSS 12 Volt Supply circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Go to step 6

   No

   - Go to step 4

4. **CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

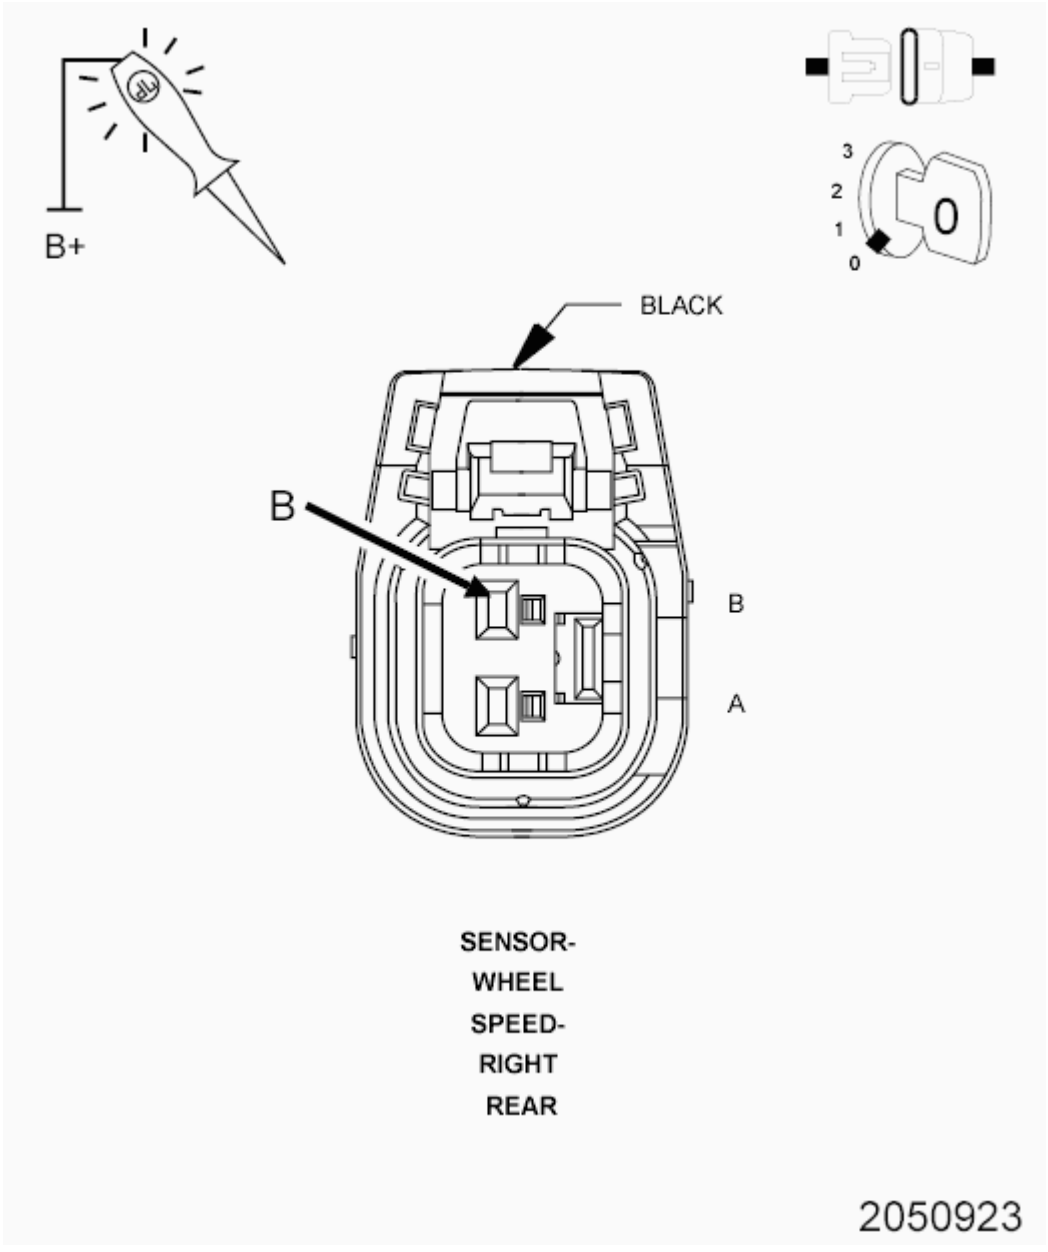

Fig. 27: Checking Right Rear Wheel Speed Sensor 12 Volt Supply Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Right Rear WSS harness connector.
3. Disconnect the Anti-Lock Brake Module harness connector.
4. Using a 12-volt test light connected to 12 volts, probe the (B2) Right Rear WSS Supply circuit.

   Does the test light illuminate brightly?

Yes

- Repair the (B2) Right Rear WSS Supply circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 5

5. **CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN**

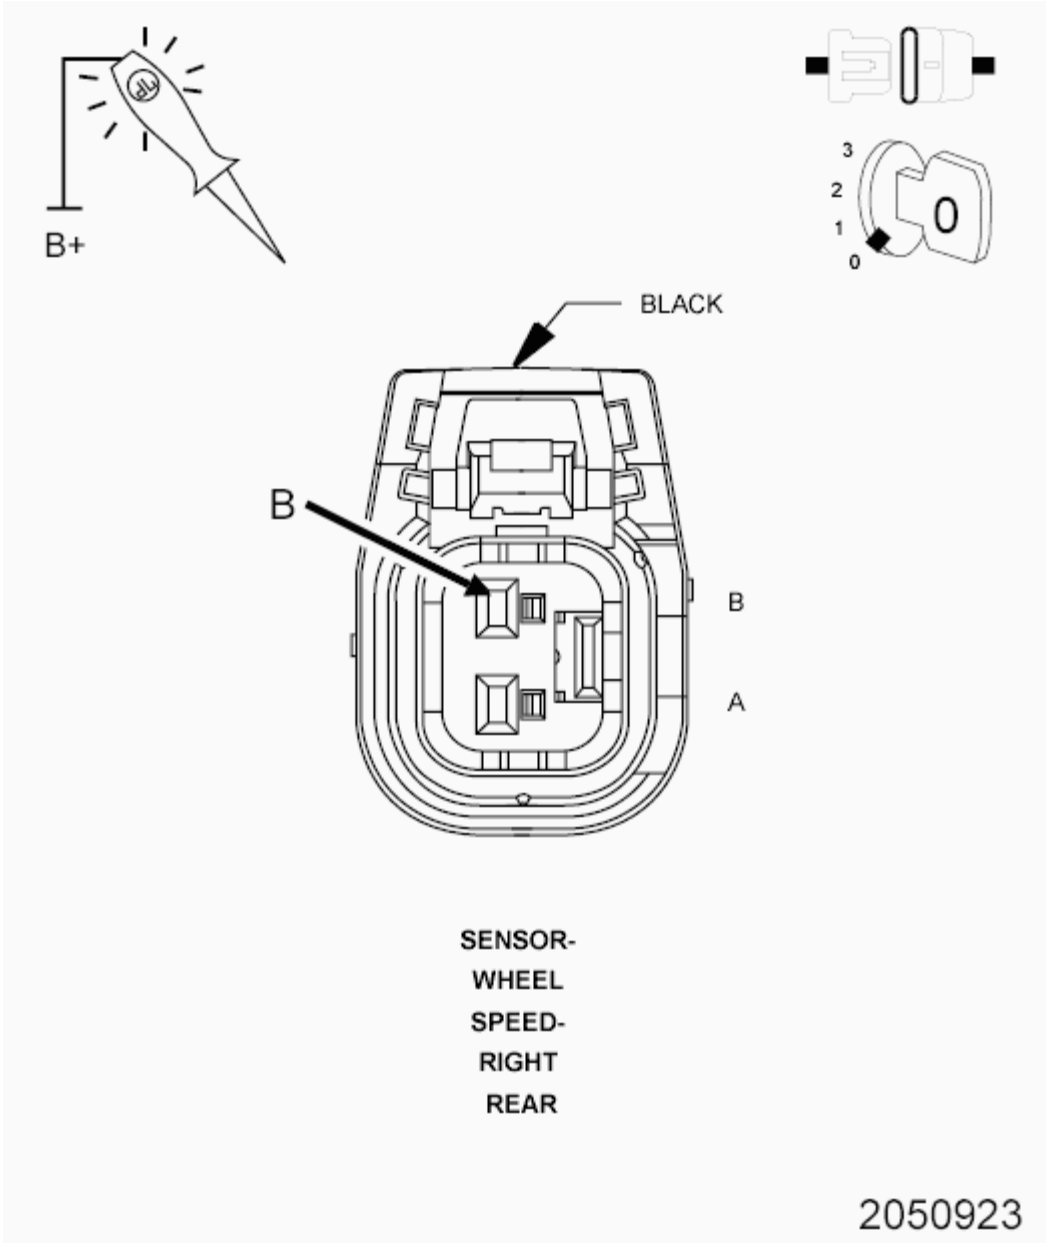

Fig. 28: Checking Right Rear Wheel Speed Sensor 12 Volt Supply Circuit For A Short To Ground

Courtesy of CHRYSLER LLC

1. Connect a jumper wire between ground and the (B2) Right Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.
2. Using a 12-volt test light connected to 12 volts, probe the (B2) Right Rear WSS Supply circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair the (B2) Right Rear WSS Supply circuit for an open.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

6. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

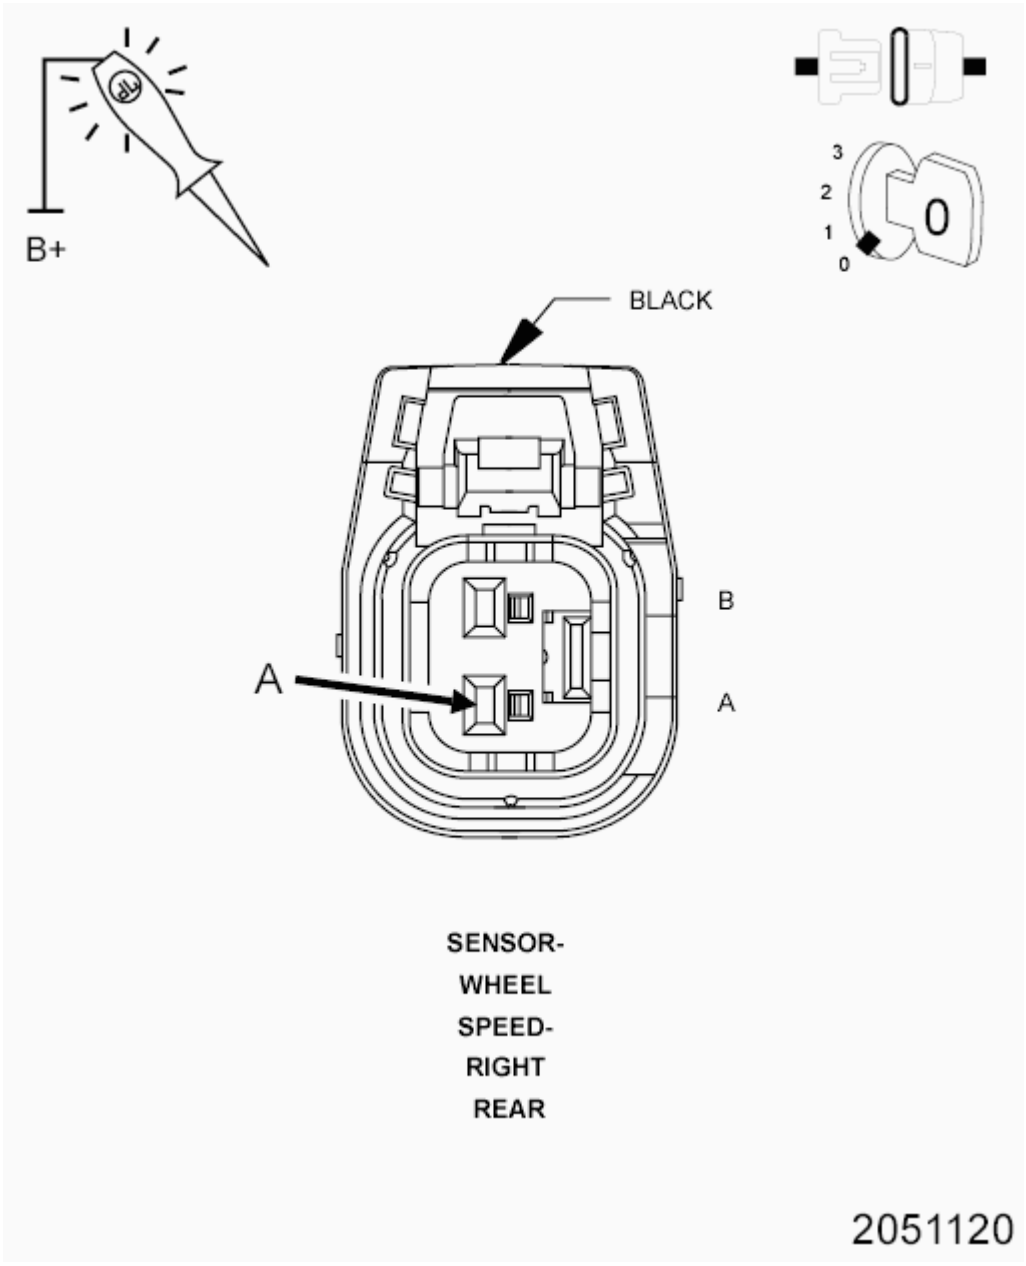

Fig. 29: Checking Right Rear Wheel Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. If not done previously, disconnect the Anti-Lock Brake Module harness connector.
3. Using a 12-volt test light connected to 12 volts, probe the (B1) Right Rear WSS Signal circuit.

   Does the test light illuminate brightly?

   Yes

- Repair the (B1) Right Rear WSS Signal circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 7

7. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR AN OPEN**

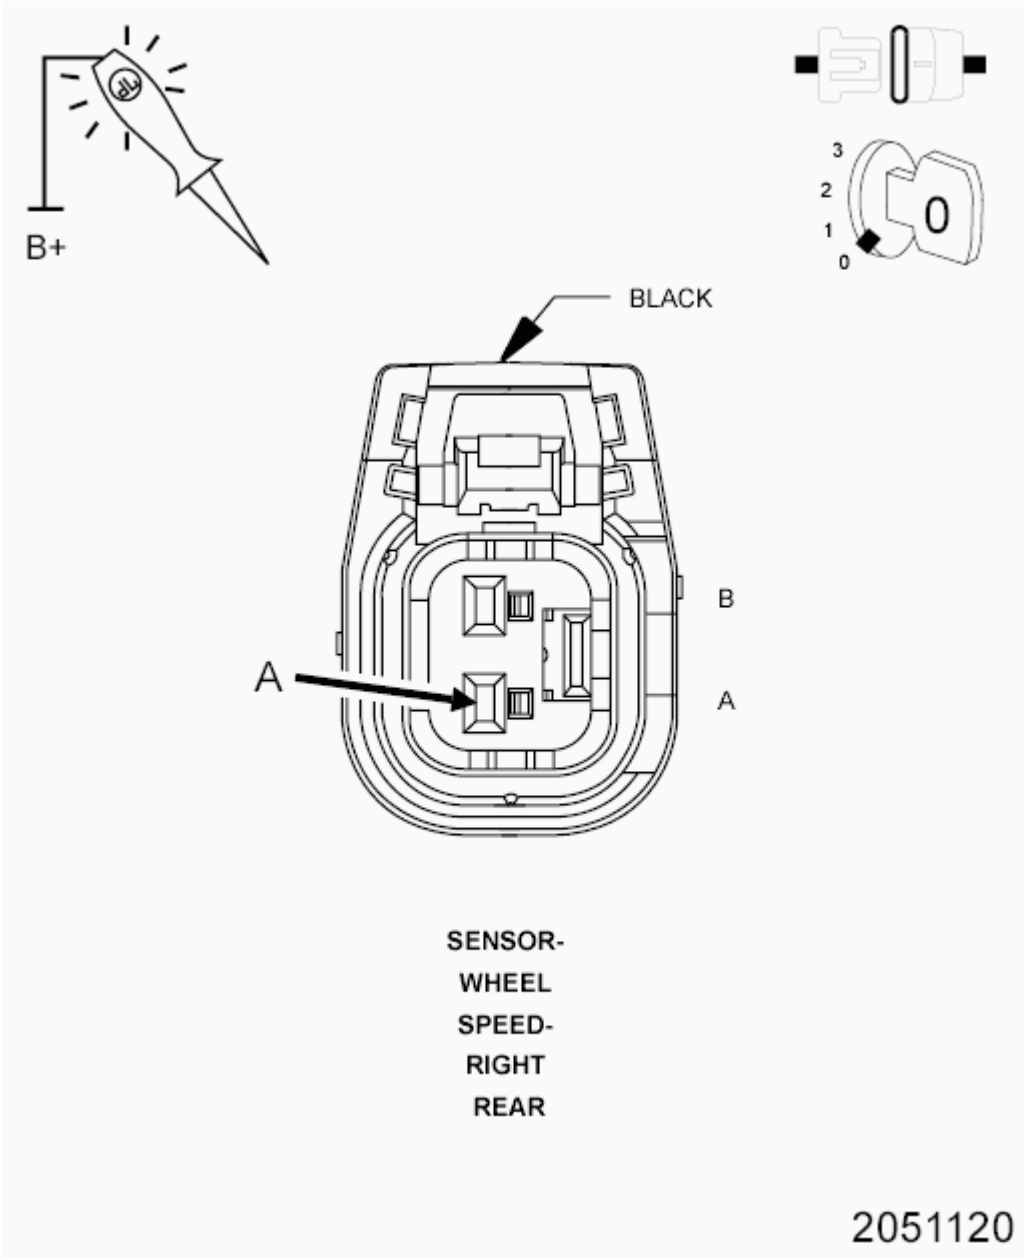

Fig. 30: Checking Right Rear Wheel Speed Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Connect a jumper wire between ground and the (B1) Right Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.
2. Using a 12-volt test light connected to 12 volts, probe the (B1) Right Rear WSS Signal circuit.

   Does the test light illuminate brightly?

   Yes

   - Go to step 8

   No

   - Repair the (B1) Right Rear WSS Signal circuit for an open.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

8. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE**

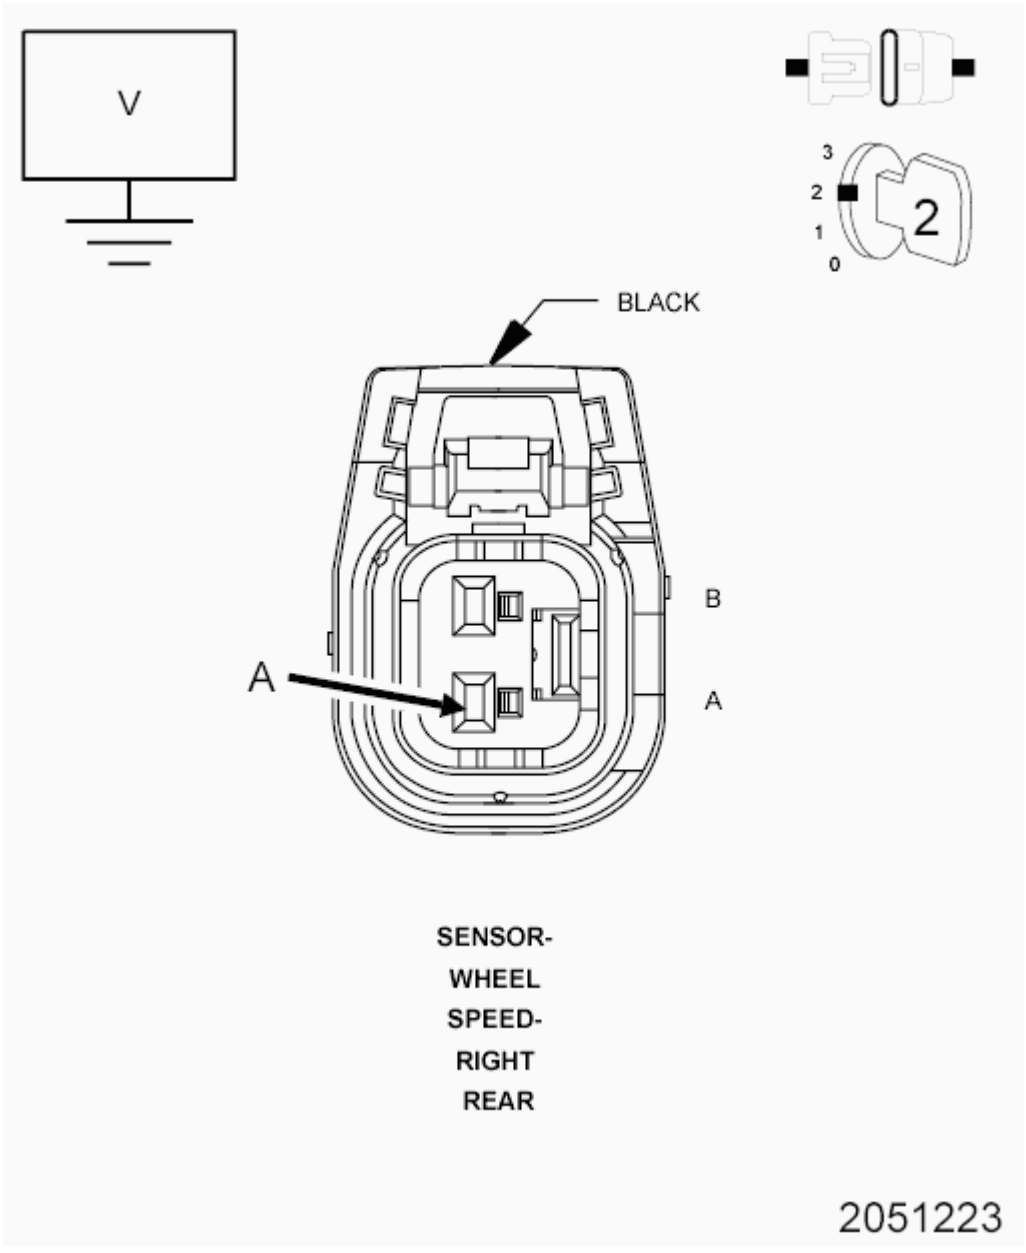

Fig. 31: Checking Right Rear Wheel Speed Sensor Signal Circuit Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.
2. Remove all jumper wires.
3. Measure the voltage between the (B1) Right Rear WSS Signal circuit and ground.

   Is the voltage above 1 volt?

   Yes

   - Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.

- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 9

9. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT**

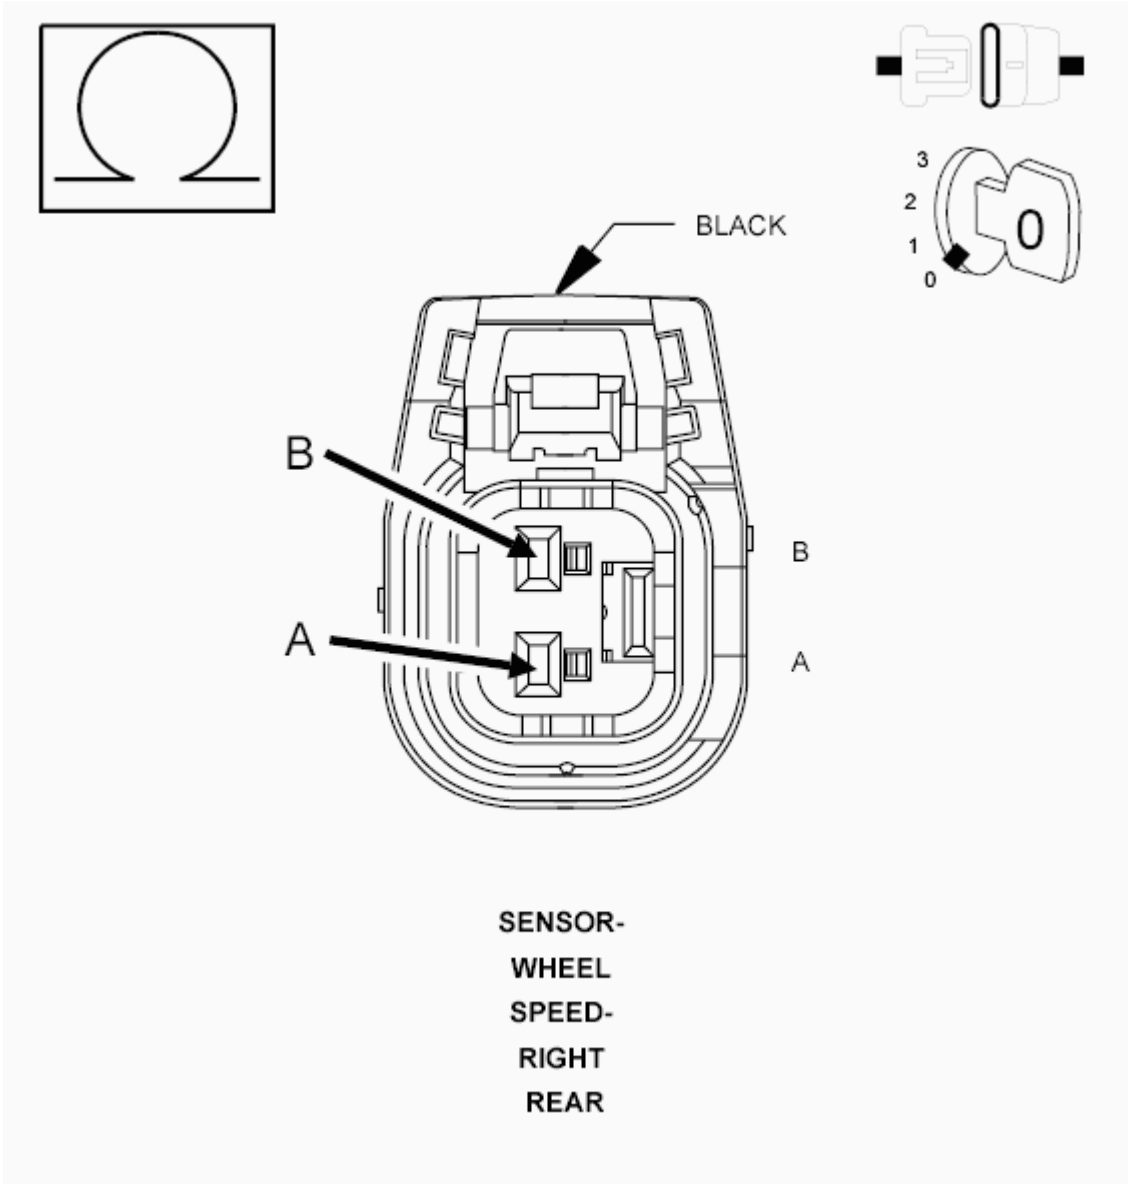

Fig. 32: Checking Right Rear Wheel Speed Sensor Signal Circuit For A Short To Right Rear Wheel Speed Sensor 12 Volt Supply Circuit
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance between the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Go to step 10

   No

   - Repair the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit for a short together.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

10. **RIGHT REAR WHEEL SPEED SENSOR**
    1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
    2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Did DTC C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT reset?

       Yes

       - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
       - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       No

       - Test Complete.

Diagnostic Test

1. **CHECK FOR DTC C102C-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

   Does the scan tool display: C102C-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT PERFORMANCE?

   Yes

   - Go to step 2

   No

   - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
   - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off.
2. Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

   Is the Right Rear WSS or any of the connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 3

3. **CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE**

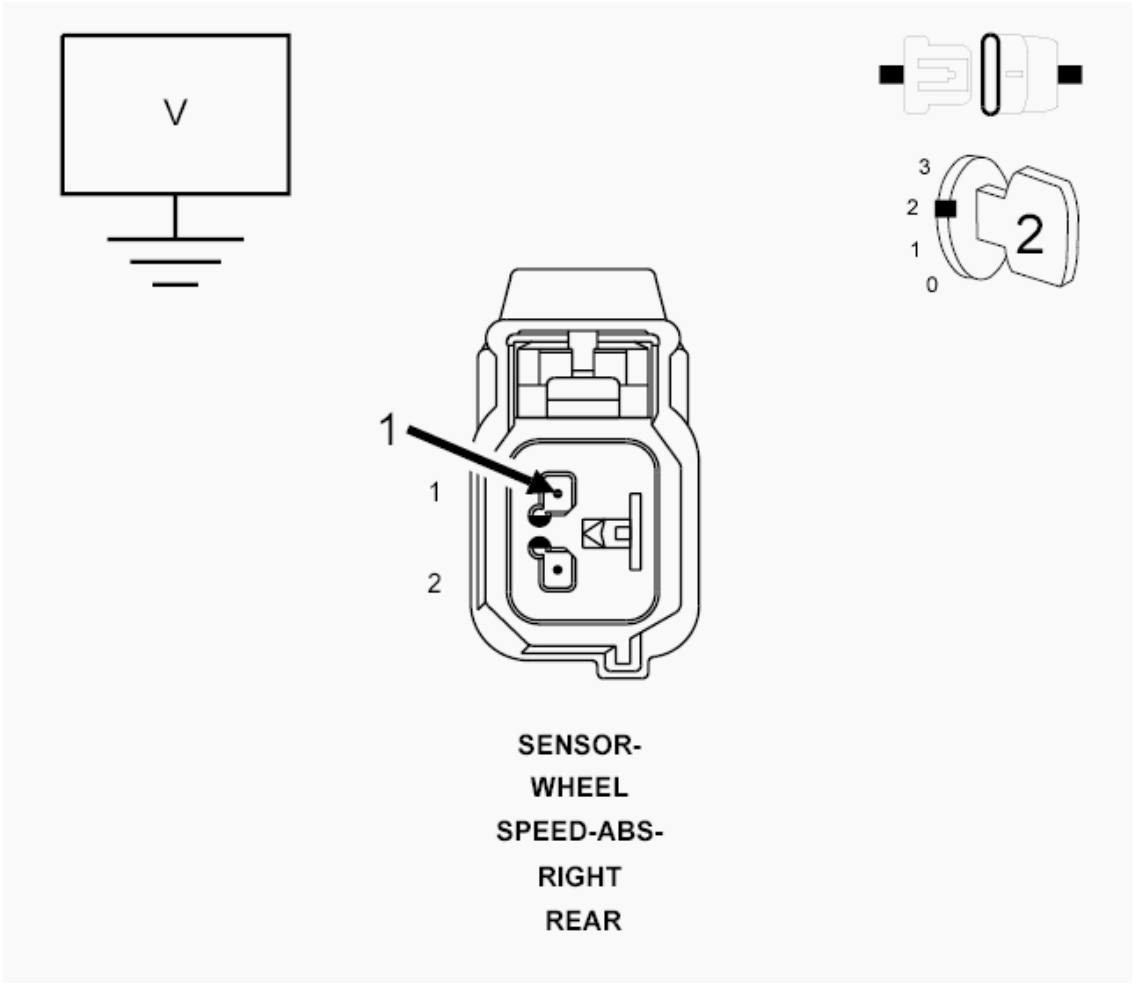

Fig. 34: Checking Right Rear Wheel Speed Sensor 12 Volt Supply Circuit Voltage

Courtesy of CHRYSLER LLC

1. Disconnect the Right Rear WSS harness connector.
2. Turn the ignition on.
3. Measure the voltage of the (B2) Right Rear WSS 12 Volt Supply circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Go to step 6

   No

   - Go to step 4
4. **CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.
2. Disconnect the Right Rear WSS harness connector.
3. Disconnect the Anti-Lock Brake Module harness connector.
4. Using a 12-volt test light connected to 12 volts, probe the (B2) Right Rear WSS Supply circuit.

   Does the test light illuminate brightly?

   Yes

   - Repair the (B2) Right Rear WSS Supply circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN**

1. Connect a jumper wire between ground and the (B2) Right Rear WSS Supply circuit in the Anti-Lock Brake Module harness connector.
2. Using a 12-volt test light connected to 12 volts, probe the (B2) Right Rear WSS Supply circuit.

   Does the test light illuminate brightly?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair the (B2) Right Rear WSS Supply circuit for an open.

- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

6. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

1. Connect a jumper wire between ground and the (B1) Right Rear WSS Signal circuit in the Anti-Lock Brake Module harness connector.
2. Using a 12-volt test light connected to 12 volts, probe the (B1) Right Rear WSS Signal circuit.

   Does the test light illuminate brightly?

Yes

- Go to step 8

No

- Repair the (B1) Right Rear WSS Signal circuit for an open.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

8. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE**

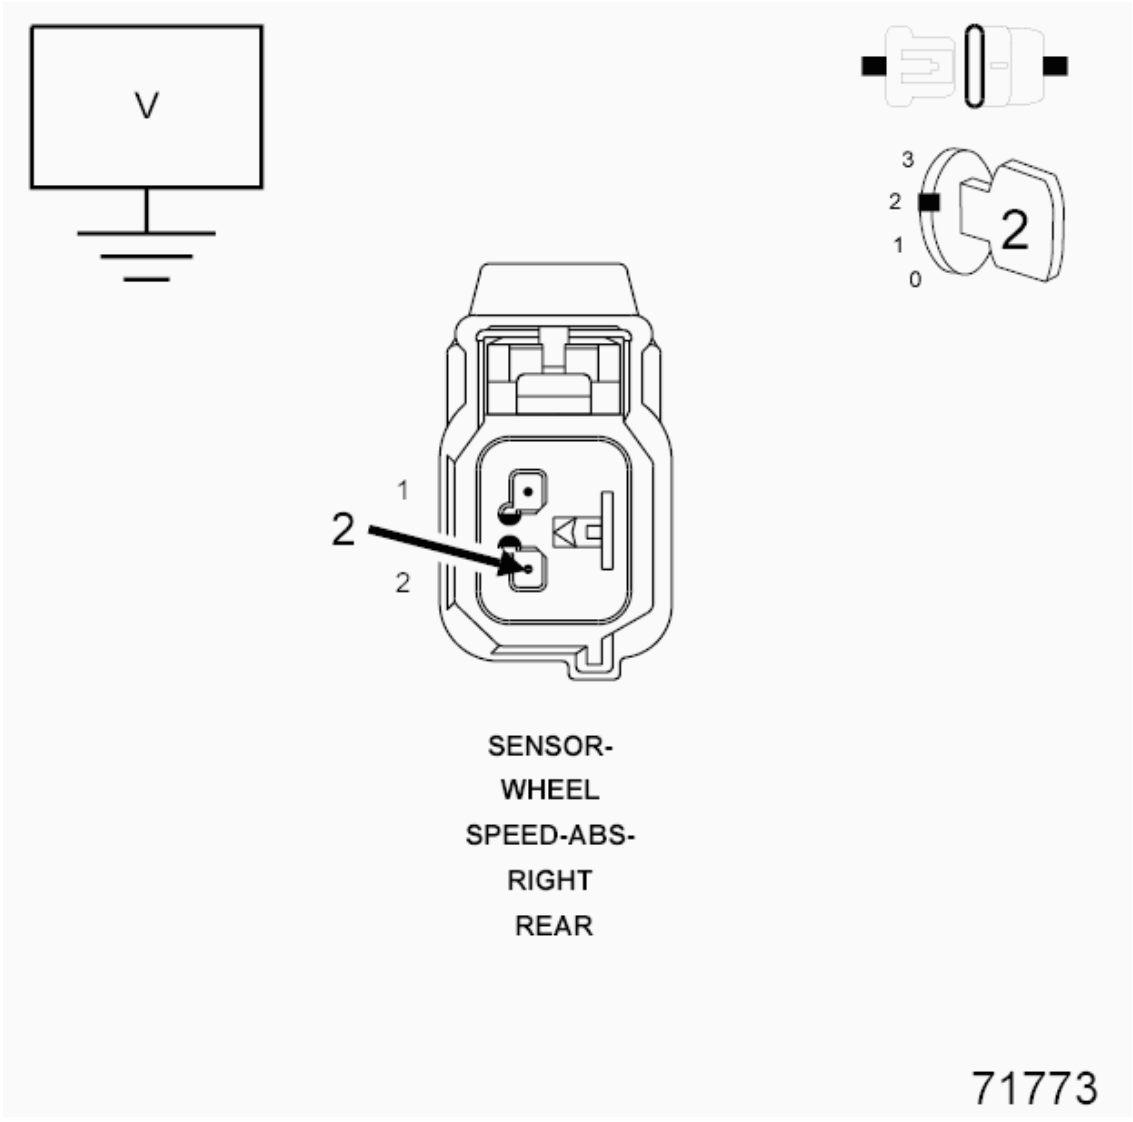

Fig. 39: Checking Right Rear Wheel Speed Sensor Signal Circuit Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.

2. Remove all jumper wires.
3. Measure the voltage between the (B1) Right Rear WSS Signal circuit and ground.

   Is the voltage above one volt?

   Yes

   - Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 9

9. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT**

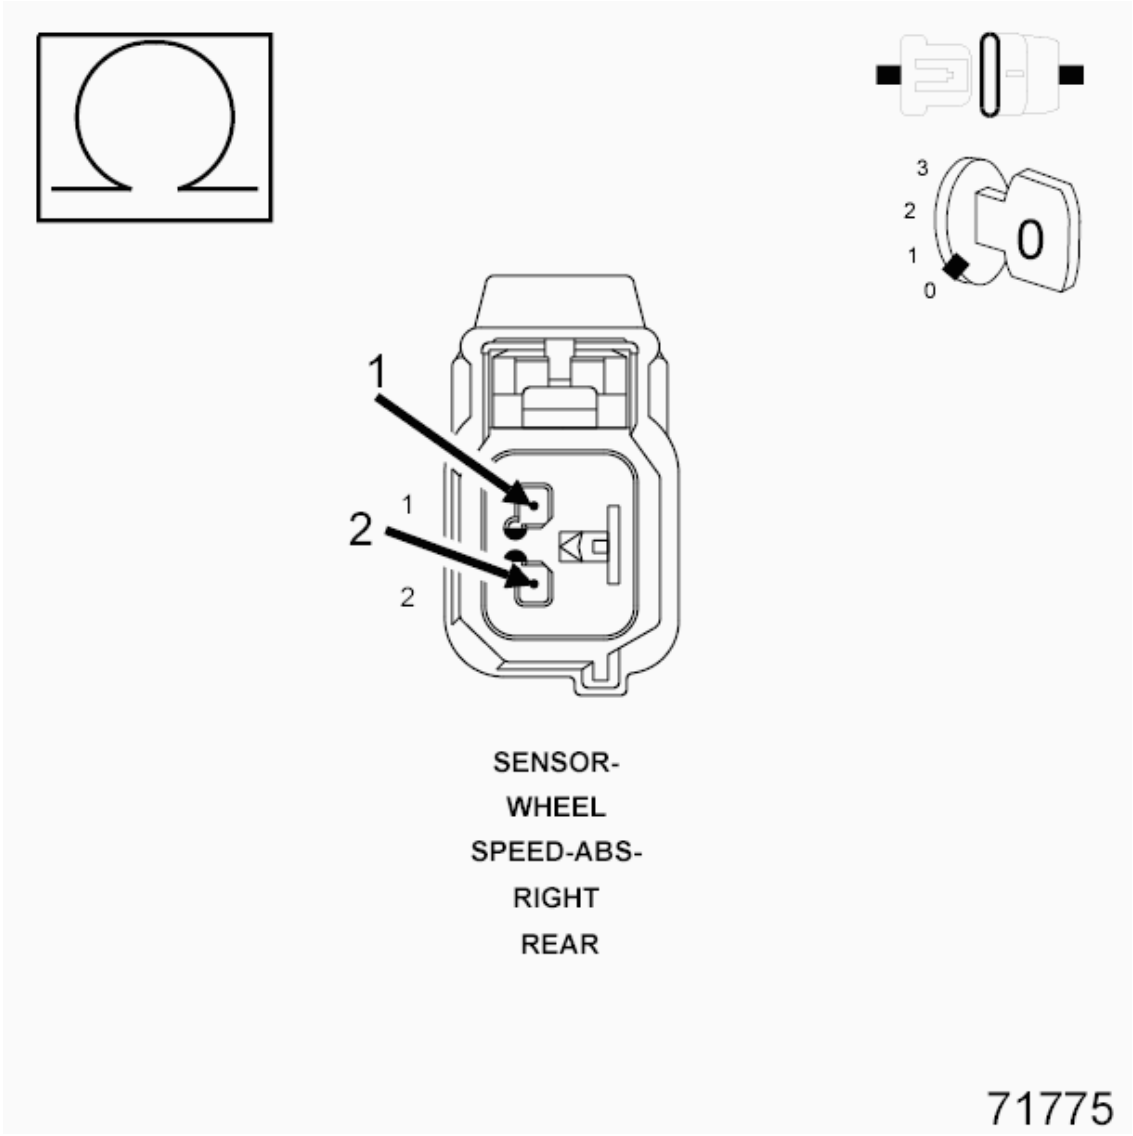

Fig. 40: Checking Right Rear Wheel Speed Sensor Signal Circuit For A Short To Right Rear Wheel Speed Sensor 12 Volt Supply Circuit
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance between the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit.

   Is the resistance above 5.0 ohms?

   Yes

   - Go to step 10

   No

- Repair the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit for a short together.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

10. **RIGHT REAR WHEEL SPEED SENSOR**
    1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
    2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       CAUTION: Ensure brake capability is available before road testing.

    3. Road test the vehicle over 25 mph (40 km/h).

       NOTE: Vehicle must be driven above 25 mph (40 km/h) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Did DTC C102C-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT PERFORMANCE reset?

       Yes

       - Replace the Anti-Lock Brake Module in accordance with the Service Information.
       - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       No

       - Test complete.

ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read DTCs.

      Does the scan tool display: C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

      Yes

      - Go to step 3

      No

      - Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

   Yes

   - Go to step 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Rear Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

      Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 4

4. **CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**
   1. Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

      Was the Axle Shaft fastener loose?

      Yes

      - Repair as necessary.

      No

- Go to step 5

5. **CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.
   2. Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.
   3. Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

   Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 6

6. **CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Right Rear Wheel Speed Sensor.
   2. Inspect the Right Rear Wheel Speed Sensor face for damage.

   Is the Right Rear Wheel Speed Sensor damaged?

   Yes

   - Replace sensor and hub assembly.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK RIGHT REAR TONE WHEEL FOR DAMAGE**
   1. Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness.

   NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Rear Tone Wheel damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 8

8. **CHECK RIGHT REAR WHEEL BEARING FOR DAMAGE**
   1. Inspect the Right Rear wheel bearing for excessive runout or clearance.

      NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications. Refer to Front Suspension/Front/HUB AND BEARING - Diagnosis and Testing

      Is the Right Rear Wheel Bearing Damaged?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 9

9. **RIGHT REAR WHEEL SPEED SENSOR**
   1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
   2. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Did DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

      Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Test Complete.

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Right Rear Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
RIGHT REAR WSS LOOSE - B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
RIGHT REAR TONE WHEEL/BEARING DAMAGE
AXLE SHAFT FASTENER HARDWARE
RIGHT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

4. With the scan tool, read DTCs.

   Does the scan tool display: C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE active?

   Yes

   - Go to step 3

   No

   - Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

      NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

      Yes

      - Go to step 3

      No

      - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
      - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
3. **CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Rear Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 4

4. **CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**
   1. Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

      Was the Axle Shaft fastener loose?

      Yes

      - Repair as necessary.

      No

      - Go to step 5
5. **CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

   1. Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector
   2. Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.
   3. Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

      Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

- Go to step 6

6. **CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Right Rear Wheel Speed Sensor.
   2. Inspect the Right Rear Wheel Speed Sensor face for damage.

   Is the Right Rear Wheel Speed Sensor damaged?

   Yes

   - Replace sensor and hub assembly.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK RIGHT REAR TONE WHEEL/BEARING FOR DAMAGE**
   1. Inspect the Right Rear Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

   NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

   Is the Right Rear Tone Wheel/Bearing damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 8

8. **RIGHT REAR WHEEL SPEED SENSOR**
   1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
   2. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   3. Road test the vehicle over 40 km/h (25 mph).

   NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

Did DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Test Complete.

C1041-LEFT FRONT TONE WHEEL PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT FRONT TONE WHEEL/ BEARING DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
DIRTY TONE WHEEL/SENSOR

Diagnostic Test

1. **CHECK FOR A DTC C1041-LEFT FRONT TONE WHEEL PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid. If DTC C100A Left Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.
   5. Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

6. Test drive the vehicle in a straight line to 40 km/h (25 mph).

   NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

7. With the scan tool, read DTCs.

   Does the scan tool display: C1041-LEFT FRONT TONE WHEEL PERFORMANCE?

   Yes

   - Go to step 3

   No

   - Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

      NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

      Yes

      - Go to step 3

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Front Tire pressure.
   3. Check and adjust all other tire pressures.

4. Inspect for mismatched tires on vehicle.

   Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK THE LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE**

   NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

   1. Check the Left Front Tone Wheel/Bearing for damage.
   2. Check the Left Front Tone Wheel for dirt.

      Was the tone wheel dirty?

      Yes

      - Clean tone wheel and sensor. Clear codes and retest.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Replace the Left Front Tone Wheel/Bearing in accordance with the Service Information.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
RIGHT FRONT TONE WHEEL/BEARING DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
DIRTY TONE WHEEL/SENSOR

Diagnostic Test

1. **CHECK FOR A DTC C1042-RIGHT FRONT TONE WHEEL PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid. If DTC C1015 Right Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.
   5. Cycle the ignition switch off then on.

      CAUTION: Ensure brake capability is available before road testing.

   6. Test drive the vehicle in a straight line to 25 mph (40 km/h).

      NOTE: Vehicle must be driven above 25 mph (40 km/h) for set conditions to be meet.

   7. With the scan tool, read DTCs.

      Does the scan tool display: C1042-RIGHT FRONT TONE WHEEL PERFORMANCE?

      Yes

      - Go to step 3

      No

      - Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.

2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

   NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

3. Slowly accelerate as straight as possible from a stop to 25 mph (40 km/h).

   Is the Right Front WSS speed showing 0 mph (0 km/h) or not matching other wheels or showing erratic behavior?

   Yes

   - Go to step 3

   No

   - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

   Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK THE RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE**

   NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

   1. Check the Right Front Tone Wheel/Bearing for damage.
   2. Check the Right Front Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

- Clean tone wheel and sensor. Clear codes and retest.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Replace the Right Front Tone Wheel/Bearing in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1043-LEFT REAR TONE WHEEL PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT REAR TONE WHEEL/BEARING DAMAGE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
AXLE SHAFT FASTENER HARDWARE
DIRTY TONE WHEEL/SENSOR

Diagnostic Test

1. **CHECK FOR A DTC C1043-LEFT REAR TONE WHEEL PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.
   5. Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

6. Test drive the vehicle in a straight line to 40 km/h (25 mph).

   NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

7. With the scan tool, read DTCs.

   Does the scan tool display: C1043-LEFT REAR TONE WHEEL PERFORMANCE?

   Yes

   - Go to step 3

   No

   - Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

      NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

      Yes

      - Go to step 3

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Rear Tire pressure.

3. Check and adjust all other tire pressures.
4. Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

No

- Go to step 4

4. **CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**
   1. Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

   Was the Axle Shaft fastener loose?

   Yes

   - Repair as necessary.

   No

   - Go to step 5
5. **CHECK THE LEFT REAR TONE WHEEL FOR DAMAGE**

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

1. Check the Left Rear Tone Wheel for damage.
2. Check the Left Rear Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

- Clean tone wheel and sensor. Clear codes and retest.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Replace the Left Rear Tone Wheel in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1044-RIGHT REAR TONE WHEEL PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
RIGHT REAR TONE WHEEL/BEARING DAMAGE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
AXLE SHAFT FASTENER HARDWARE
DIRTY TONE WHEEL/SENSOR

Diagnostic Test

1. **CHECK FOR A DTC C1044-RIGHT REAR TONE WHEEL PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.
   3. Record DTC and Freeze Frame information.
   4. With the scan tool, erase DTCs.
   5. Cycle the ignition switch off then on.

      CAUTION: Ensure brake capability is available before road testing.

   6. Test drive the vehicle in a straight line to 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

   7. With the scan tool, read DTCs.

Does the scan tool display: C1044-RIGHT REAR TONE WHEEL PERFORMANCE?

Yes

- Go to step 3

No

- Go to step 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
    1. Turn the ignition on.
    2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

    NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

    3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

    Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

    Yes

    - Go to step 3

    No

    - Refer to the INTERMITTENT CONDITION diagnostic procedure. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

3. **CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES**
    1. Turn the ignition off.
    2. Check and adjust the Right Rear Tire pressure.
    3. Check and adjust all other tire pressures.
    4. Inspect for mismatched tires on vehicle.

    Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

    Yes

    - Repair as necessary.
    - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

No

- Go to step 4

4. **CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**
   1. Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

      Was the Axle Shaft fastener loose?

      Yes

      - Repair as necessary.

      No

      - Go to step 5

5. **CHECK THE RIGHT REAR TONE WHEEL FOR DAMAGE**

   NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

   1. Check the Right Rear Tone Wheel for damage.
   2. Check the Right Rear Tone Wheel for dirt.

      Was the tone wheel dirty?

      Yes

      - Clean tone wheel and sensor. Clear codes and retest.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

      No

      - Replace the Right Rear Tone Wheel in accordance with the Service Information.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING

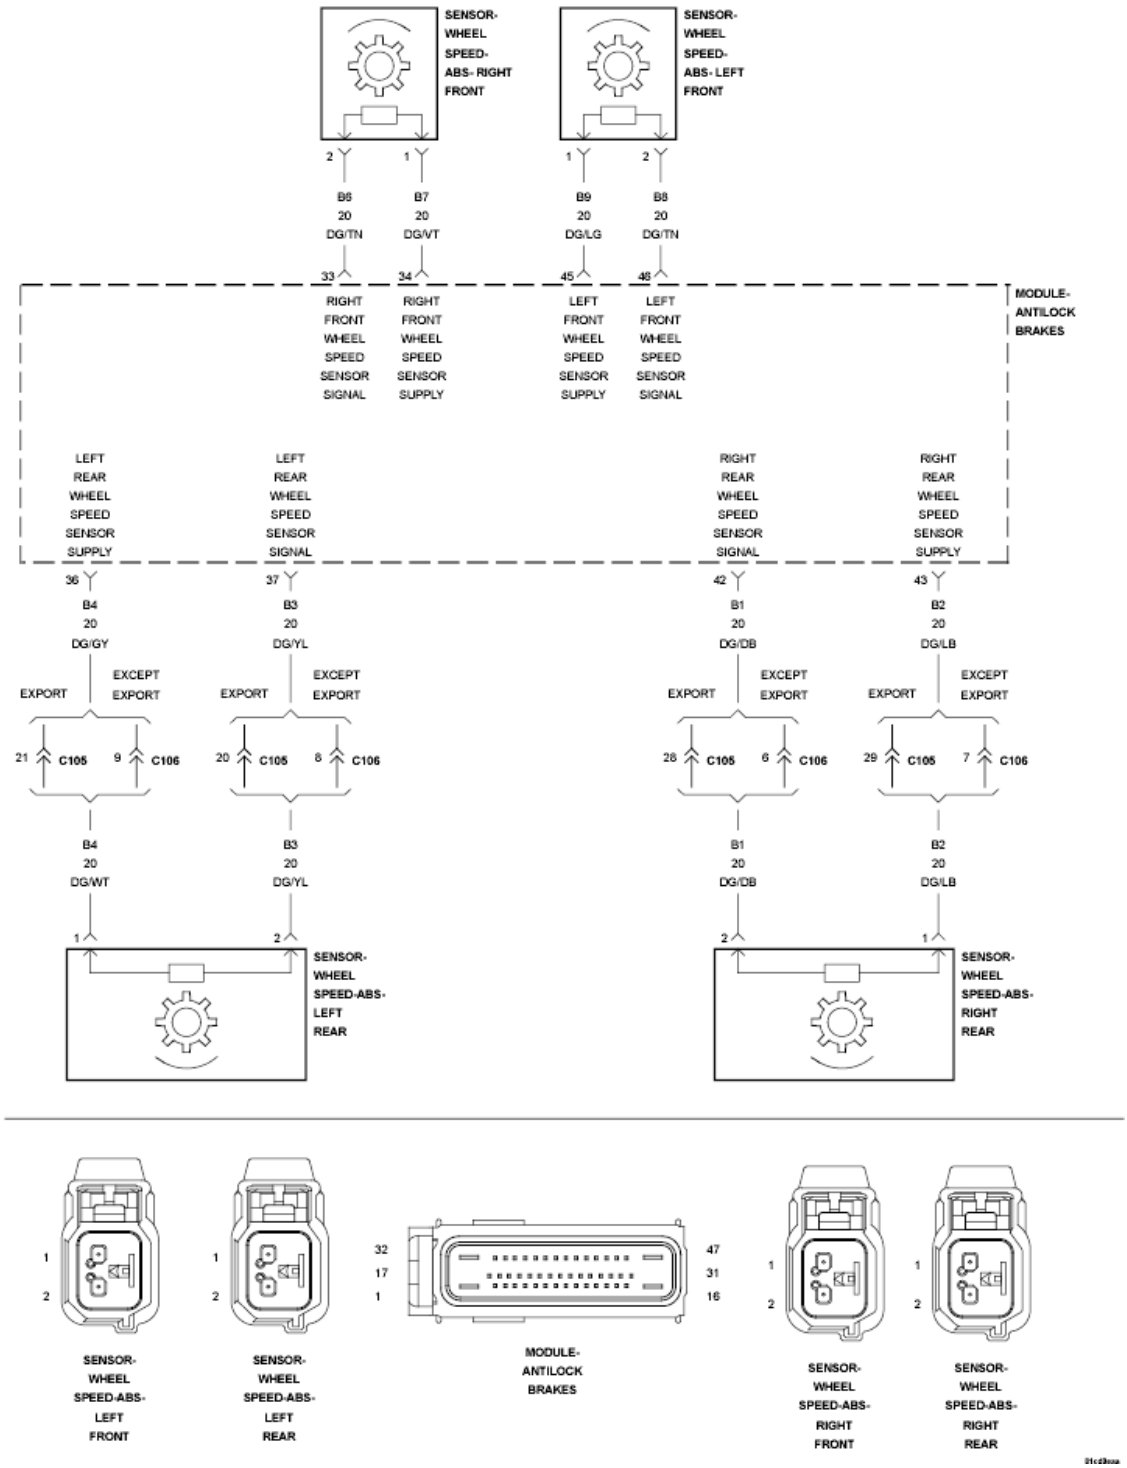

Fig. 41: Rear Wheel Speed Sensor Signal/Supply Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

During active ABS control.

- **Set Condition:**

  If the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
LEFT FRONT TONE WHEEL/BEARING DAMAGED
WHEEL SPEED SIGNALS SWAPPED
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **COMPARE WHEEL SPEED SENSOR SIGNALS**

   WARNING: Ensure brake capability is available before road testing.

   1. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
   2. Slowly accelerate as straight as possible from a stop to 25 mph (40 km/h).

      Does the Left Front WSS speed differ from the other WSS speeds by 5 mph (8 km/h) or show NO speed?

      Yes

      - Go to step 3

      No

      - Go to step 2
2. **CHECKING INSIDE WHEEL SPEED**
   1. Slowly accelerate as straight as possible from a stop to 25 mph (40 km/h) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

      Was the inside wheel slower than outside?

      Yes

      - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

- Go to step 3

3. **INSPECT TONE WHEEL/BEARING**
   1. Turn the ignition off.
   2. Visually inspect the tone wheel and bearing for damage.
   3. Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 4

4. **CHECK WHEEL SPEED SENSOR WIRING**
   1. Check the Anti-Lock Brake Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 5

5. **LEFT FRONT WHEEL SPEED SENSOR**
   1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 25 mph (40 km/h).

NOTE: Vehicle must be driven above 25 mph (40 km/h) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 7.5 mph (12 km/h) before it will extinguish the ABS indicators.

Did DTC C1046 LEFT FRONT WHEEL PRESSURE PHASE MONITORING reset?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Test complete.

C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING

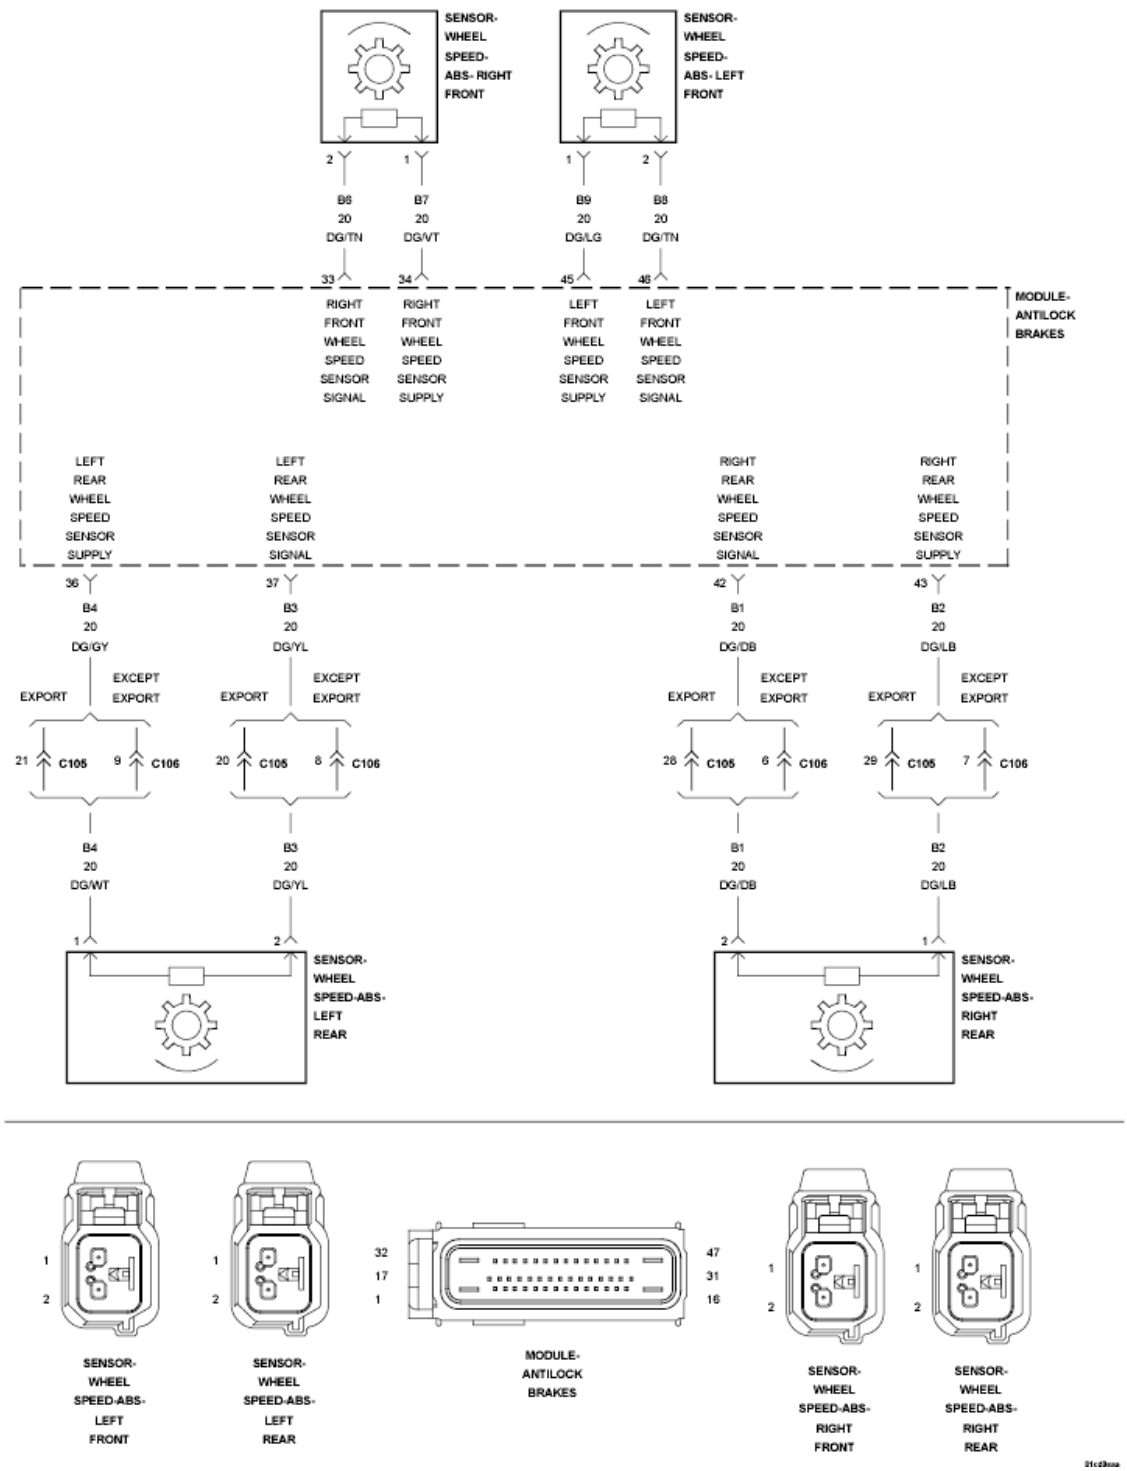

Fig. 42: Rear Wheel Speed Sensor Signal/Supply Circuit Schematic

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

During active ABS control.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
RIGHT FRONT TONE WHEEL DAMAGED
WHEEL SPEED SIGNALS SWAPPED
RIGHT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **COMPARE WHEEL SPEED SENSOR SIGNALS**

   WARNING: Ensure brake capability is available before road testing.

   1. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
   2. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Does the Right Front WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

      Yes

      - Go to step 3

      No

      - Go to step 2
2. **CHECKING INSIDE WHEEL SPEED**
   1. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

      Was the inside wheel slower than outside?

      Yes

      - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

      No

- Go to step 3

3. **INSPECT TONE WHEEL/BEARING**
   1. Turn the ignition off.
   2. Visually inspect the tone wheel and bearing for damage.
      - Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK WHEEL SPEED SENSOR WIRING**
   1. Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 5

5. **RIGHT FRONT WHEEL SPEED SENSOR**
   1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1047 RIGHT FRONT WHEEL PRESSURE PHASE MONITORING reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Test Complete.

C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING

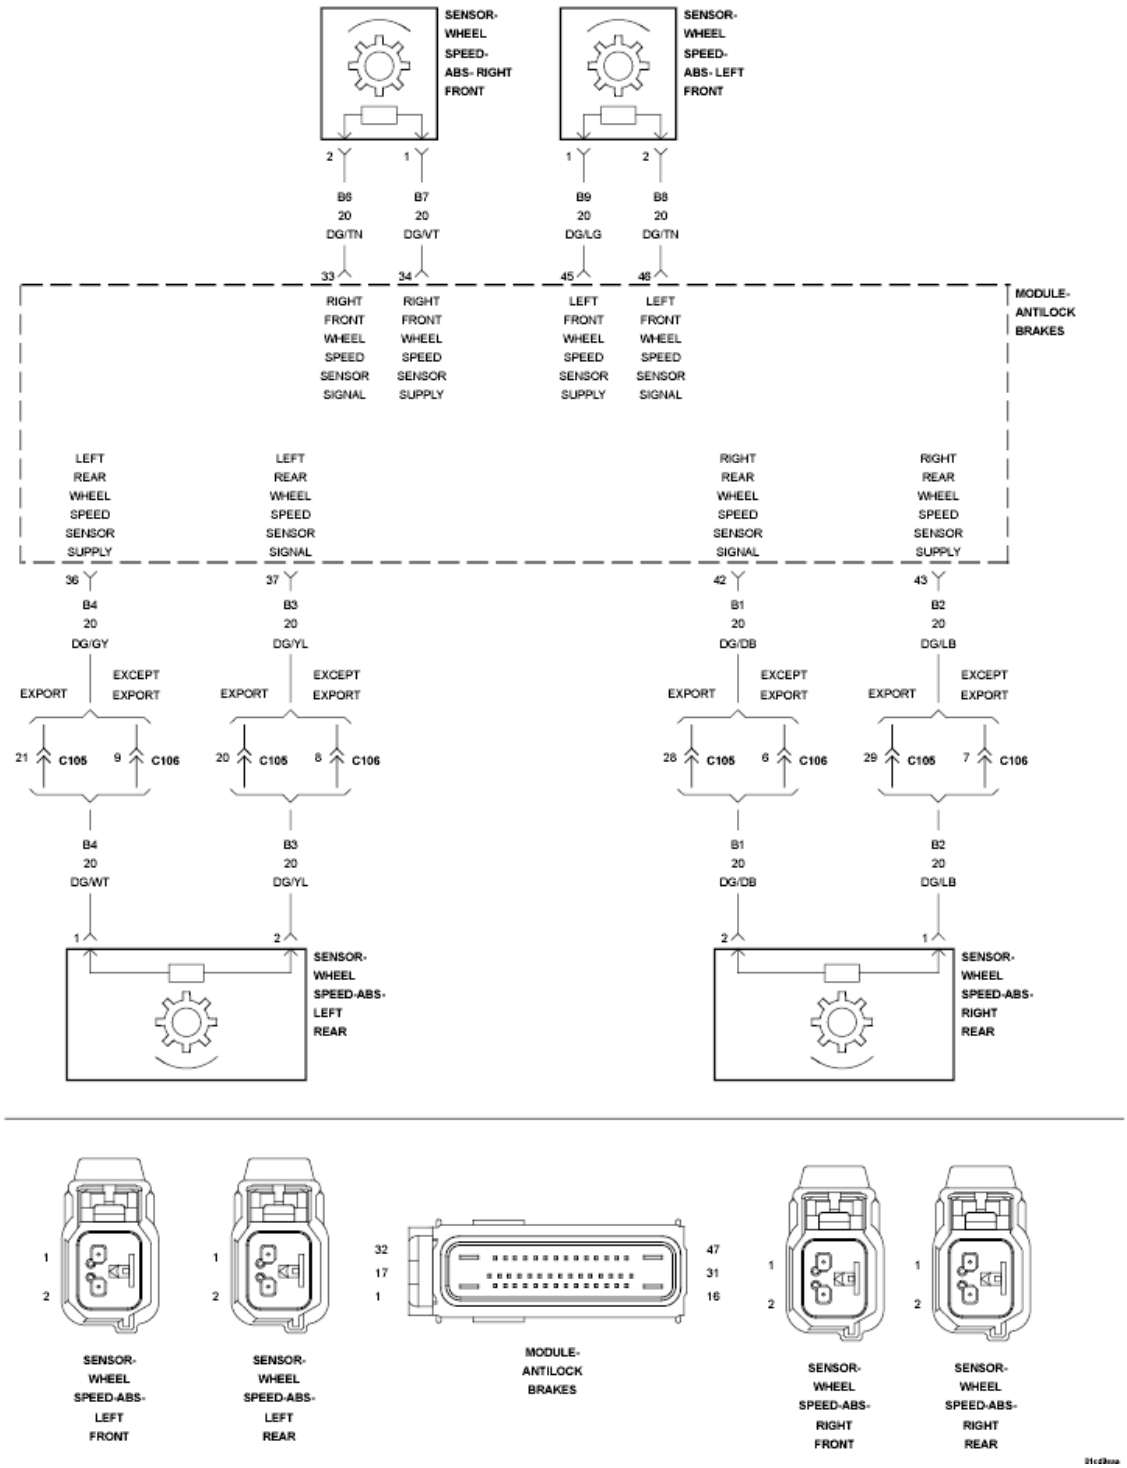

Fig. 43: Rear Wheel Speed Sensor Signal/Supply Circuit Schematic

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

During active ABS control.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
LEFT REAR TONE WHEEL/WHEEL BEARING
WHEEL SPEED SIGNALS SWAPPED
LEFT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **COMPARE WHEEL SPEED SENSOR SIGNALS**

   WARNING: Ensure brake capability is available before road testing.

   1. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
   2. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Does the Left Rear WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

      Yes

      - Go to step 3

      No

      - Go to step 2
2. **CHECKING INSIDE WHEEL SPEED**
   1. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

      Was the inside wheel slower than outside?

      Yes

      - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

- Go to step 3

3. **INSPECT TONE WHEEL/BEARING**
   1. Turn the ignition off.
   2. Visually inspect the tone wheel and bearing for damage.
      - Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK WHEEL SPEED SENSOR WIRING**
   1. Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 5

5. **LEFT REAR WHEEL SPEED SENSOR**
   1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1048 LEFT REAR WHEEL PRESSURE PHASE MONITORING reset?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Test Complete.

C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING

RIGHT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **COMPARE WHEEL SPEED SENSOR SIGNALS**

   WARNING: Ensure brake capability is available before road testing.

   1. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
   2. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Does the Right Rear WSS speed from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

      Yes

      - Go to step 3

      No

      - Go to step 2
2. **CHECKING INSIDE WHEEL SPEED**
   1. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

      Was the inside wheel slower than outside?

      Yes

      - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

- Go to step 3

3. **INSPECT TONE WHEEL/BEARING**
   1. Turn the ignition off.
   2. Visually inspect the tone wheel and bearing for damage.
      - Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK WHEEL SPEED SENSOR WIRING**
   1. Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 5

5. **RIGHT REAR WHEEL SPEED SENSOR**
   1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
   2. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      CAUTION: Ensure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1049 RIGHT REAR WHEEL PRESSURE PHASE MONITORING reset?

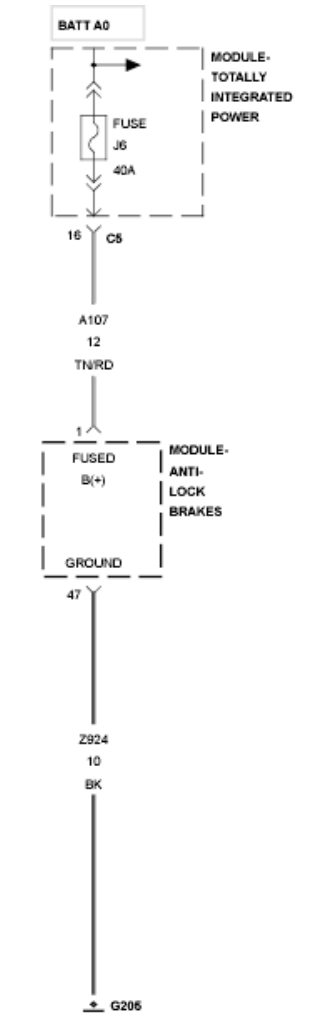
Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Test Complete.

C1073-ABS PUMP MOTOR CONTROL CIRCUIT



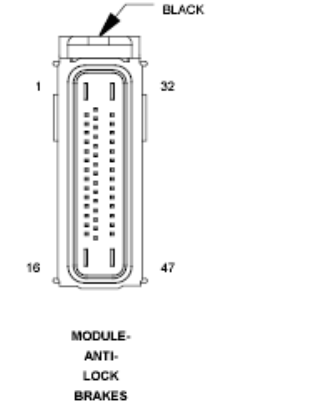


Fig. 45: Fused B+ Ground Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  The ABM detects low pump motor feedback voltage with actuation of the pump motor relay.

Possible Causes
BLOWN PUMP FUSE
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
INTEGRATED CONTROL UNIT

Diagnostic Test

1. **CHECK FOR A DTC C1073-ABS PUMP MOTOR CONTROL CIRCUIT**

   NOTE: This DTC must be active for the results of this test to be valid. If present, diagnose and repair DTC C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE before diagnosing this DTC.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

   5. With the scan tool, read DTCs.

      NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

      Does the scan tool display: C1073-ABS PUMP MOTOR CONTROL CIRCUIT?

      Yes

      - Go to step 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. See **DTC-Based**

Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure.

2. **CHECK THE ABS PUMP MOTOR FUSED B+ FOR AN OPEN**
    1. Turn the ignition off.
    2. Remove and visually inspect the ABS Pump Motor B+ fuse.

    Is the ABS Pump Motor B+ fuse open?

    Yes

    - Go to step 3

    No

    - Go to step 5
3. **CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND**

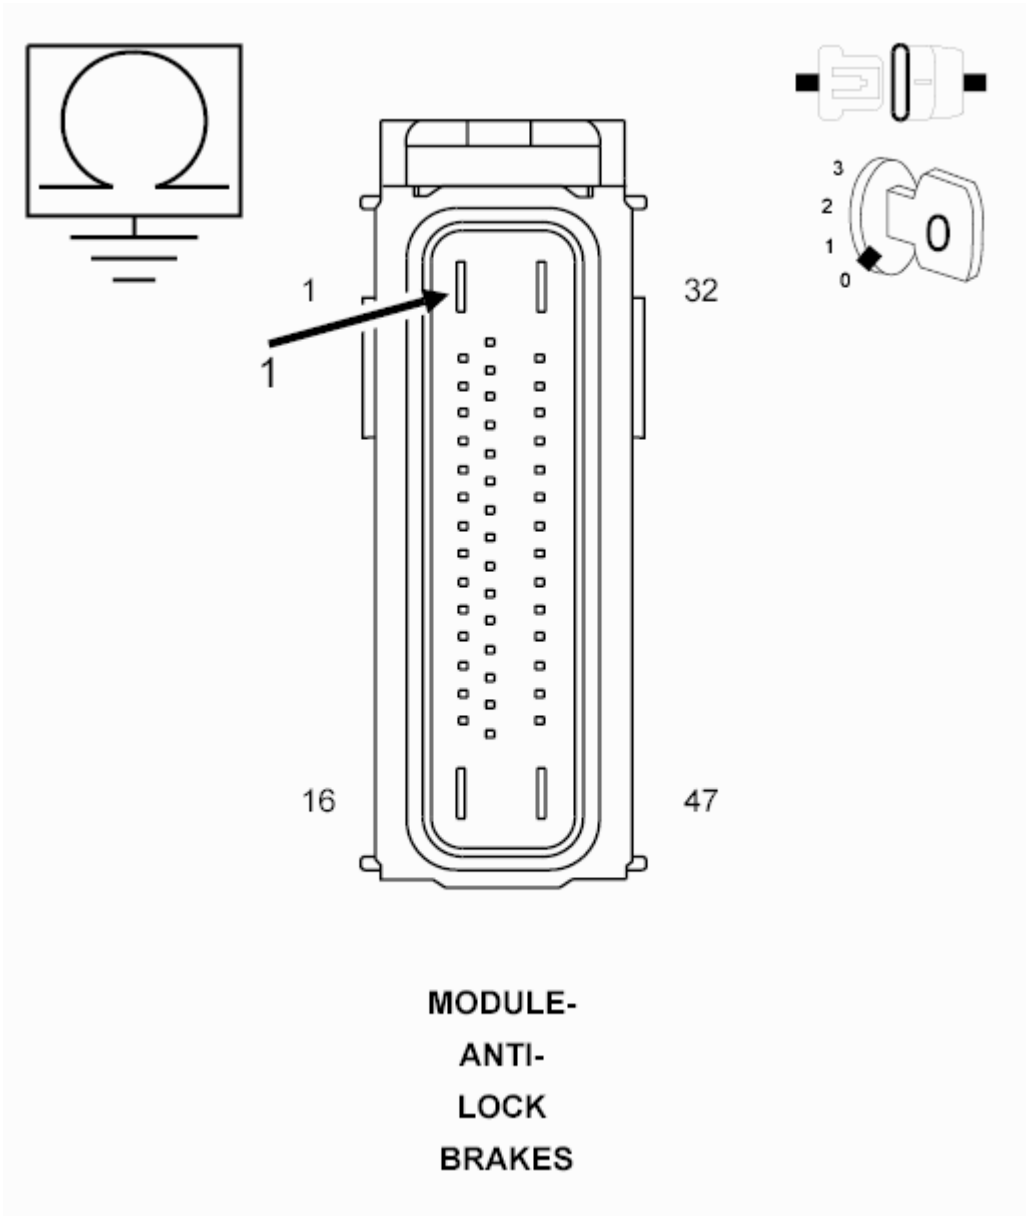

Fig. 46: Checking Fused B(+) For A Short To Ground
Courtesy of CHRYSLER LLC

1. Disconnect the Anti-Lock Brake Module harness connector.
2. Using a 12-volt test light connected to 12-volts, probe the (A107) Fused B+ circuit.

   Does the test light illuminate brightly?

   Yes

   - Repair the (A107) Fused B(+) circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

No

- Go to step 4

4. **CHECK THE (A107) FUSED B(+) CIRCUIT**
   1. Visually inspect the (A107) Fused B(+) circuit in the wiring harness.
   2. Look for any signs of intermittent short to ground.

   Is the wiring harness OK?

   Yes

   - Go to step 5

   No

   - Repair the (A107) Fused B(+) circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
5. **CHECK THE VOLTAGE ON THE (A107) FUSED B(+) CIRCUIT**

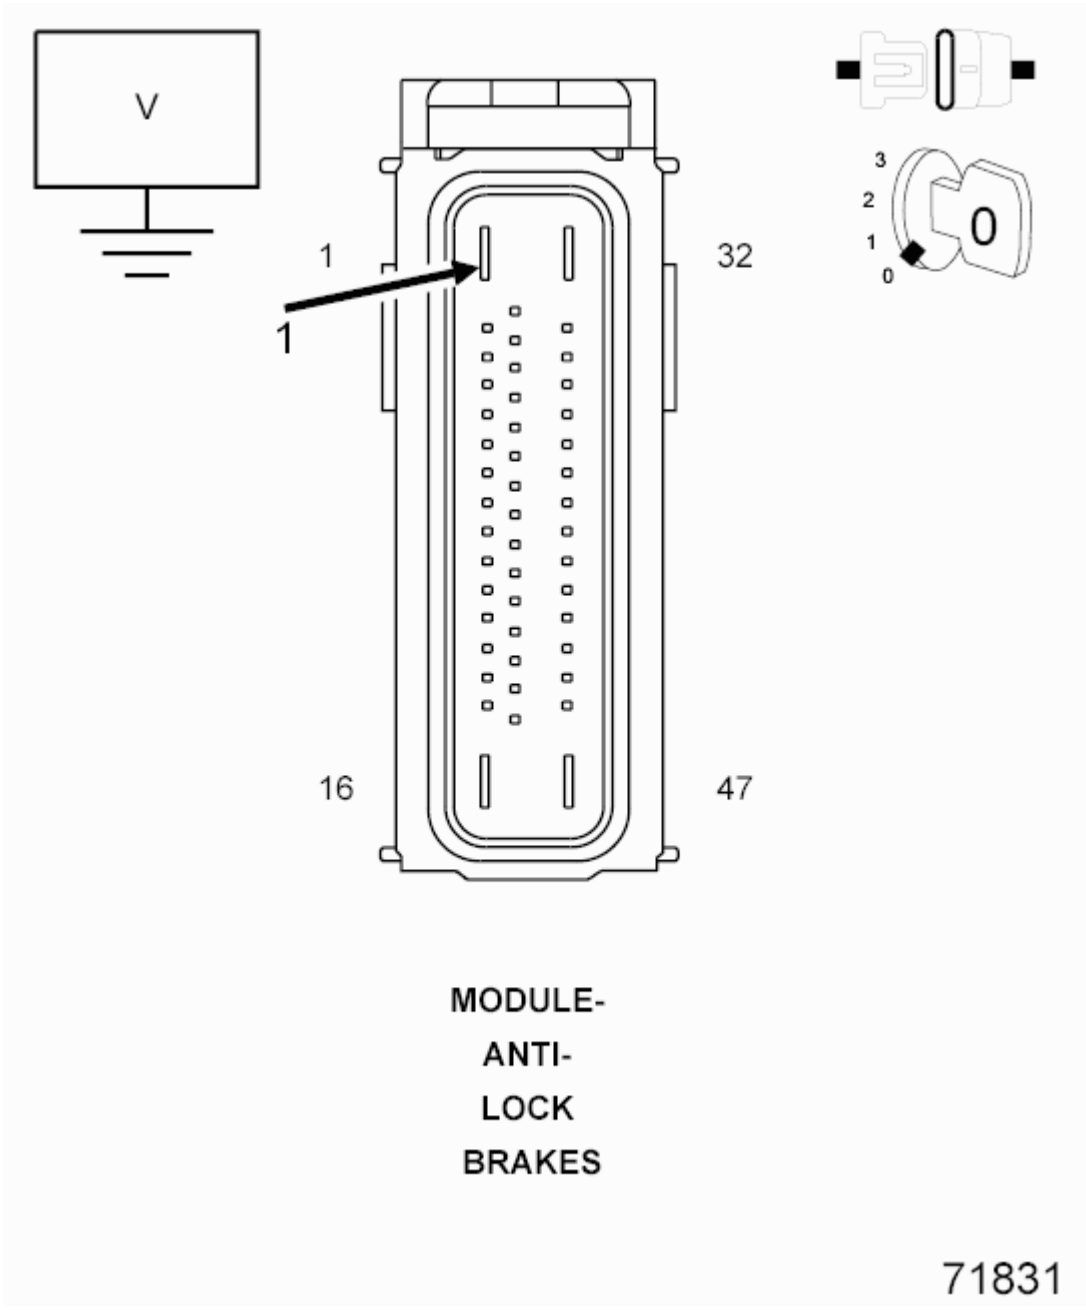

Fig. 47: Checking Voltage On Fused B(+) Circuit
Courtesy of CHRYSLER LLC

1. Disconnect the Anti-Lock Brake Module harness connector.
2. Measure the voltage of the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

   Is the voltage above 10 volts?

   Yes

- Go to step 6

No

- Repair the (A107) Fused B(+) circuit for an open.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

6. **CHECK THE (Z924) GROUND CIRCUIT FOR AN OPEN**

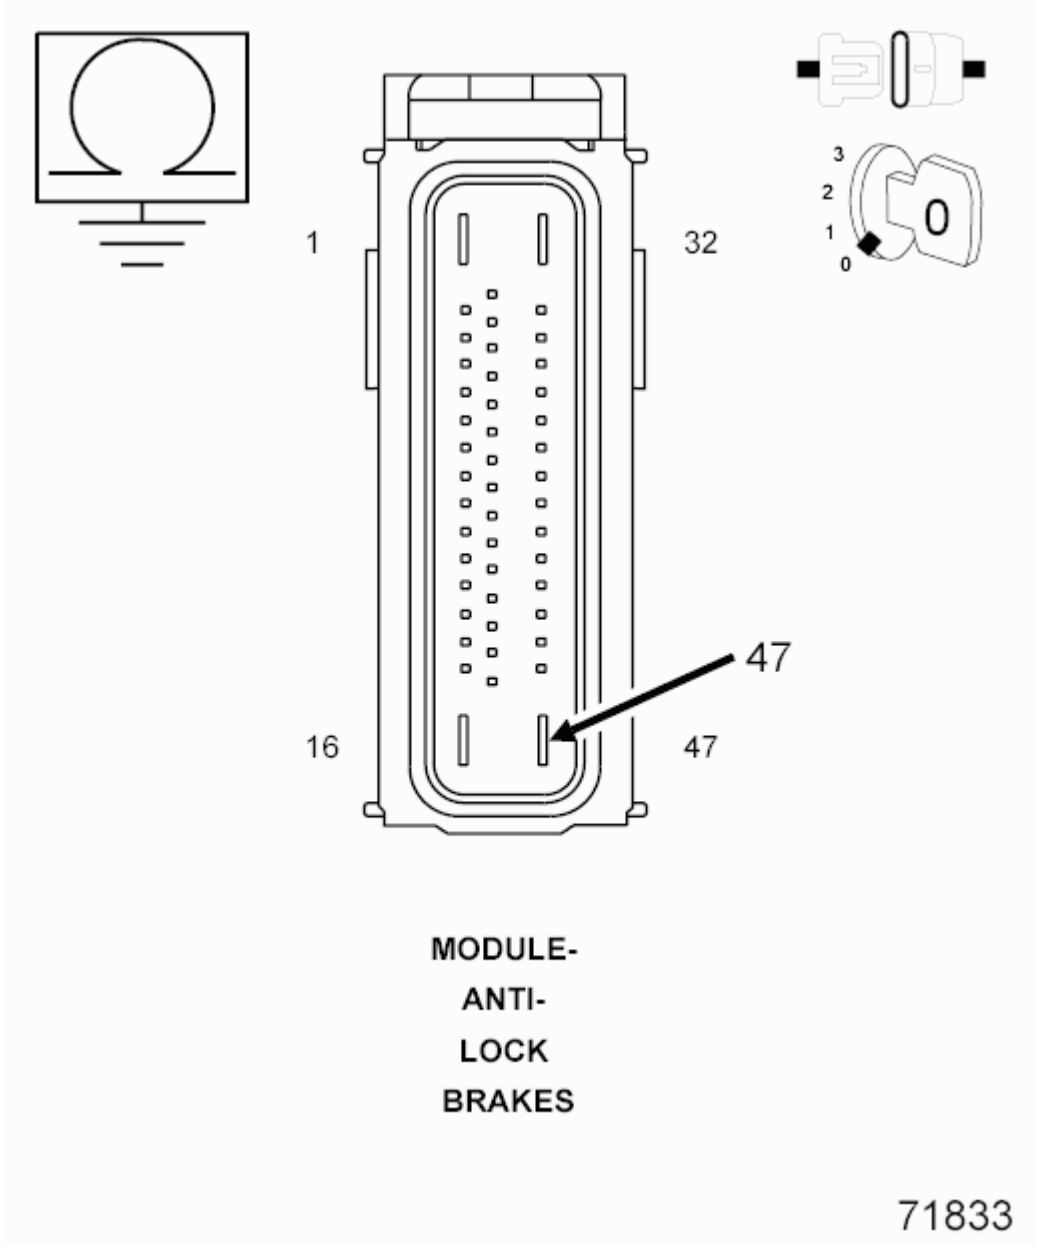

Fig. 48: Checking Ground Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (Z924) Ground circuit between the Anti-Lock Brake Module harness connector and ground

   Is the resistance below 5.0 ohms?

   Yes

   - Replace the ICU per service information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair the high resistance in the affected circuit.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuous.

- **Set Condition:**

  Programmed value for tire size is not within acceptable range.

Possible Causes
INCORRECT VALUE PROGRAMMED INTO TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **INCORRECT VALUE PROGRAMMED INTO TIPM**

TIRE SIZE	BODY STYLE	ENGINE SIZE	SALES CODE	TIRE CIRCUMFERENCE (MM PER REV)
P225/70R 16 ALL SEASON	JC	ALL	TRD	2206
225/65R 17 BSW TOURING	JC	ALL	TRF	2220
225/65R 16 BSW THREE SEASON	JC	ALL	TUJ	2130

P225/65R 17 BSW A/S TOURING	JC	ALL	TVK	2230
225/55R 19 BSW THREE SEASON	JC	ALL	TWC	2250
P225//55R 19 BSW AS TOURING	JC	ALL	TWV	2270

1. Verify the correct tire/wheel information is programmed in the TIPM.

   Is the correct value programmed in the TIPM according to the chart?

   Yes

   - Test complete.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

   No

   - Program the correct Tire/Wheel information in the TIPM.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

C107C-BRAKE PEDAL SWITCH 1/2 STUCK

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Diagnostic Test

1. **POWERTRAIN CONTROL MODULE (PCM) or ENGINE CONTROL MODULE (ECM) DTCS PRESENT**
   1. With the scan tool, read ECM/PCM Brake DTCs.

      Are there any ECM/PCM Brake DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** for gas engine applications or **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Diagnosis and Testing** for diesel engine applications.

      No

      - Using the schematics as a guide, check the ECM/PCM terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

- Perform the appropriate VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure** for gas engine applications or **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Standard Procedure** for diesel engine applications.

C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Diagnostic Test

1. **POWERTRAIN CONTROL MODULE (PCM) or ENGINE CONTROL MODULE (ECM) DTCS PRESENT**
   1. With the scan tool, read ECM/PCM Brake DTCs.

      Are there any ECM/PCM Brake DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** for gas engine applications or **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Diagnosis and Testing** for diesel engine applications.

      No

      - Using the schematics as a guide, check the ECM/PCM terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.
      - Perform the appropriate VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure** for gas engine applications or **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Standard Procedure** for diesel engine applications.

C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW

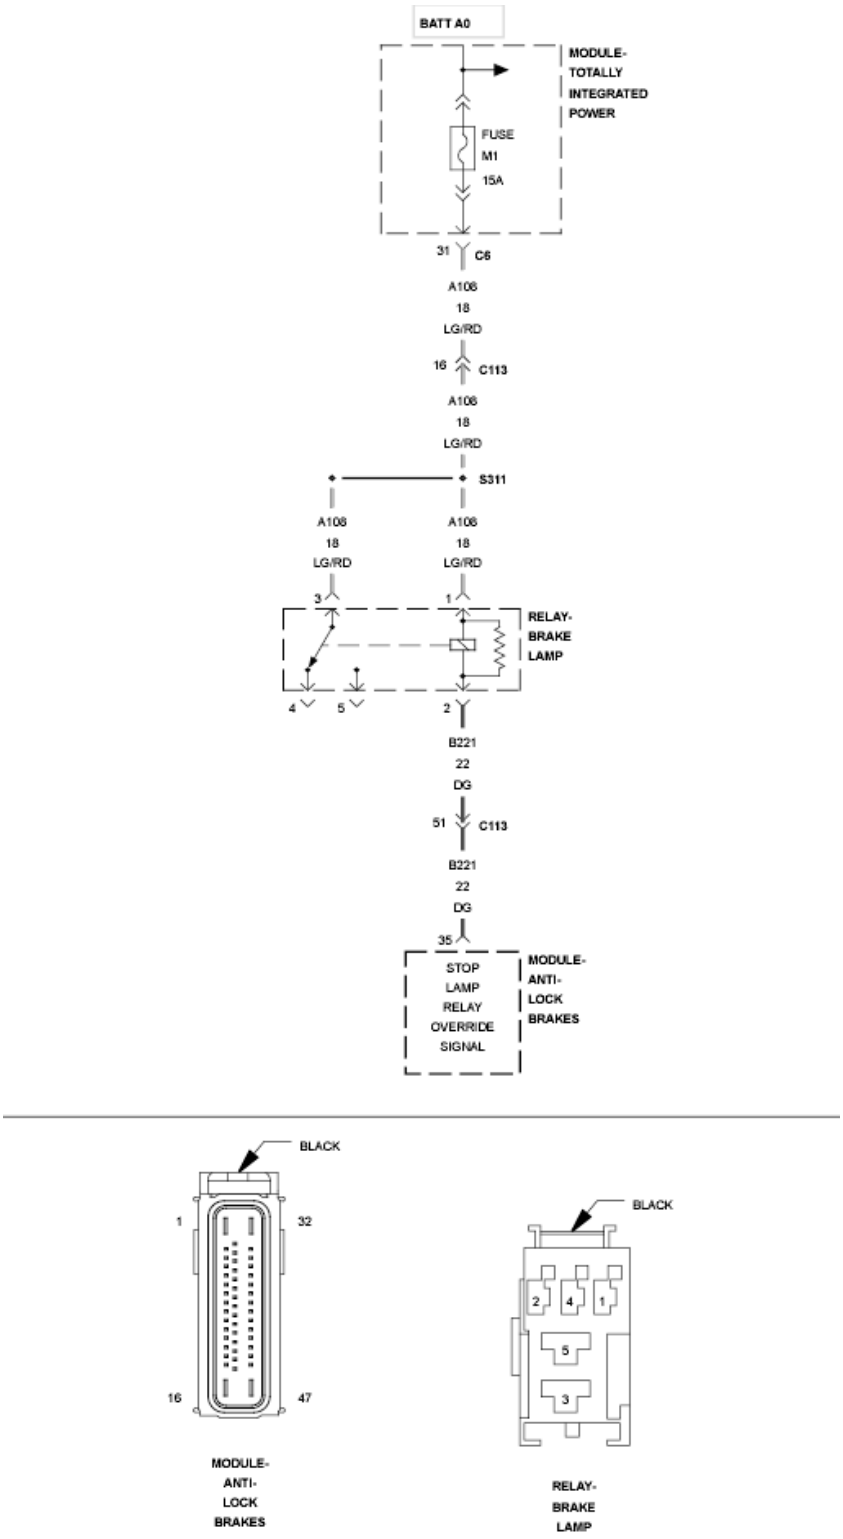

Fig. 49: Stop Lamp Relay Override Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When monitoring the Stop Lamp Relay Override Signal circuit the module detects a short to ground.

Possible Causes
(B221) STOP LAMP RELAY OVERRIDE SIGNAL OPEN OR SHORTED TO GROUND
BLOWEN FUSE
BRAKE LAMP RELAY
ANTI-LOCK BRAKE MODULE (ABM)

Diagnostic Test

1. **CHECK FOR DTC C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Start the engine.
   4. Apply pressure to the brake pedal firmly with at least 80 bar (1160 psi.).
   5. With the scan tool, read the DTCs.

      Does the scan tool display: C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW?

      Yes

      - Go to step 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out or corroded terminals.

   1. Turn the ignition off.
   2. Inspect the Anti-Lock Brake Module harness connector and the Brake Lamp Relay harness connector.

Is the Anti-Lock Brake Module or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 3

3. **CHECK (B221) STOP LAMP RELAY OVERRIDE SIGNAL SHORTED TO GROUND**

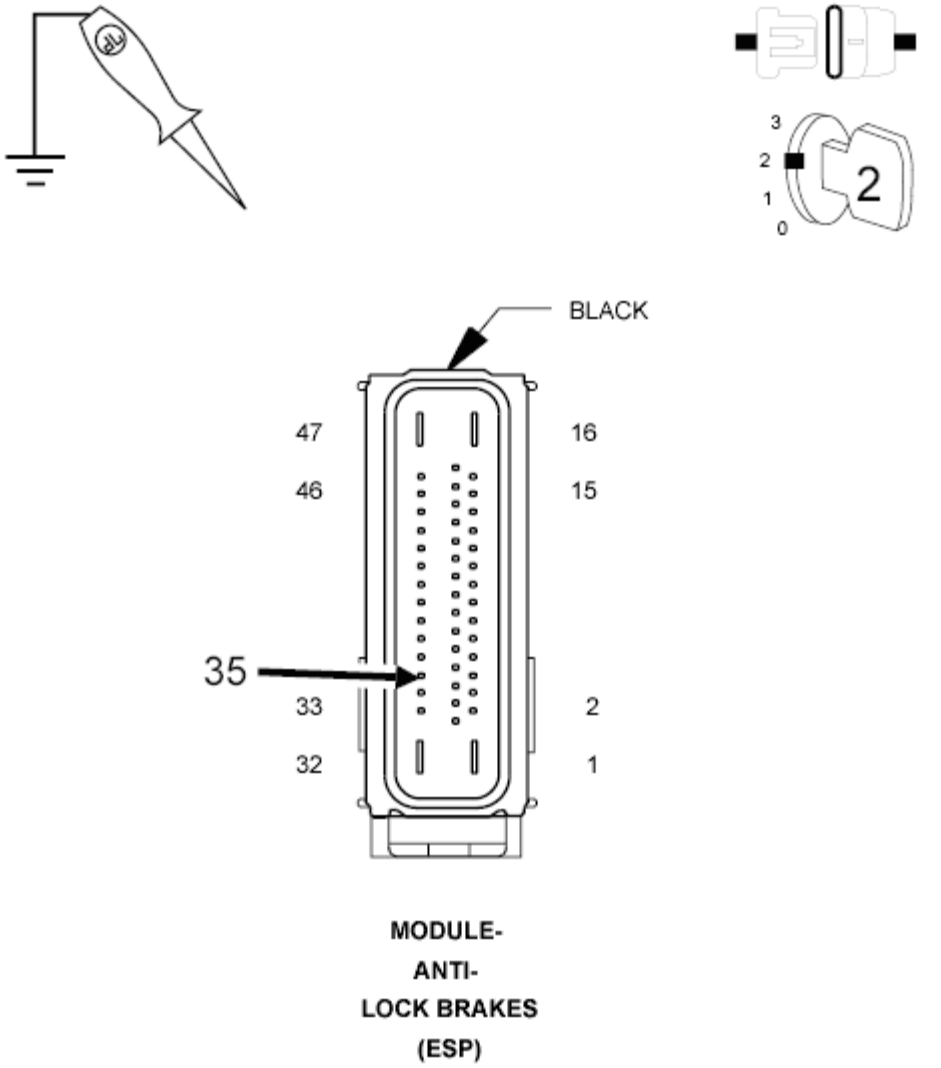

Fig. 50: Checking Stop Lamp Relay Override Signal Shorted To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Anti-Lock Brake Module
3. Turn the key on.
4. Using a 12-volt test light connected to ground, probe the (B221) Stop Lamp Relay Override Signal circuit at the Anti-Lock Brake Module harness connector.

   Does the test light illuminate?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the service information.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK (A108) FUSED B+**

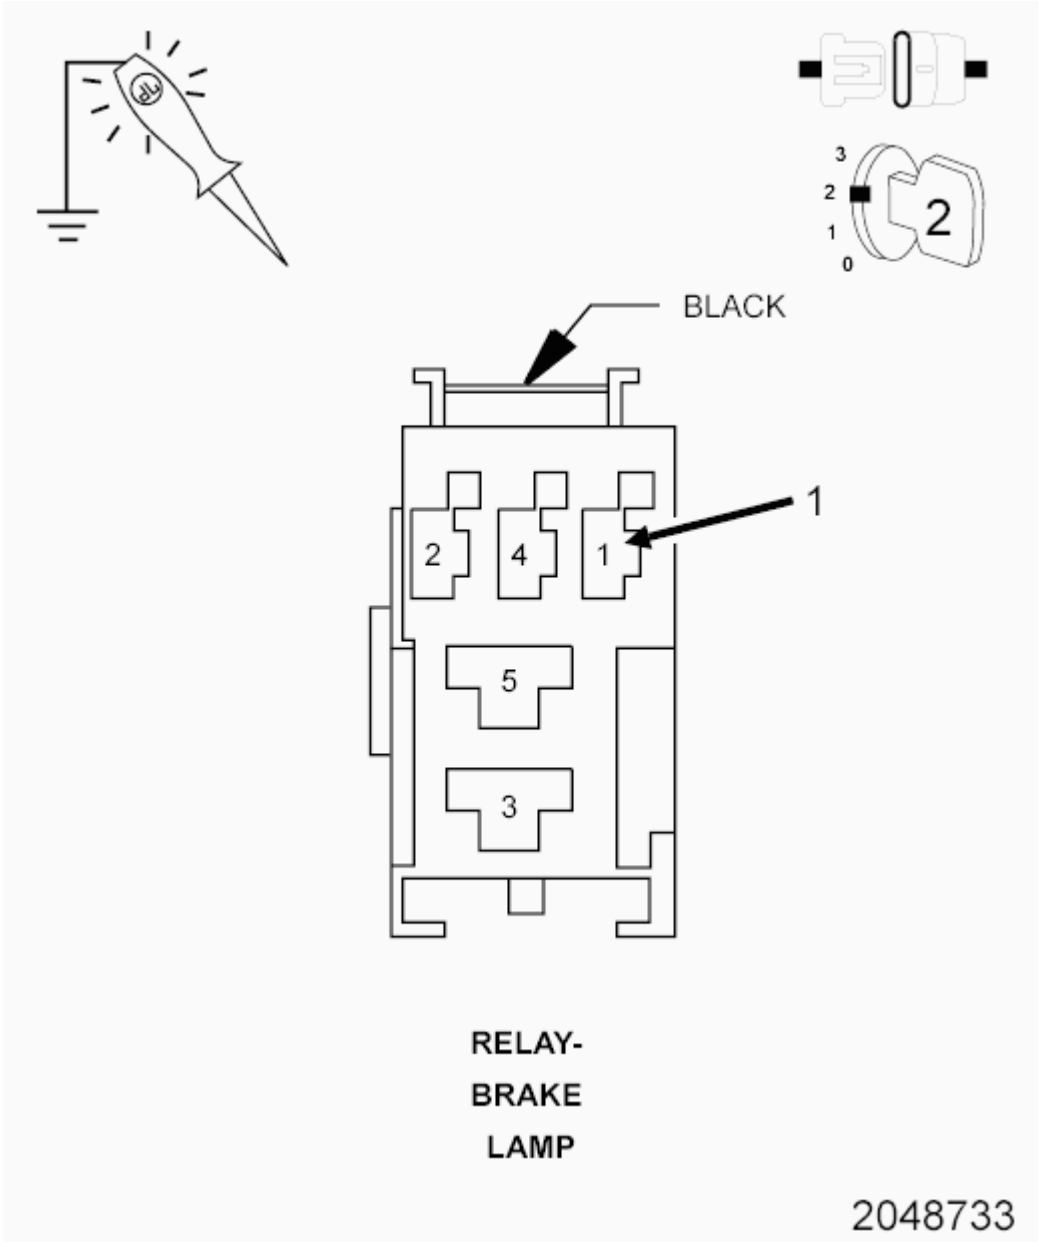

Fig. 51: Checking Brake Lamp Relay
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Brake Lamp Relay.
3. Turn the key on.
4. Using a 12-volt test light connected to ground, probe the (A108) Fused B+ circuit at the Brake Lamp Relay harness connector.

   Does the test light illuminate brightly?

   Yes

- Go to step 5

No

- Check for open fuse, if OK repair open or short to ground in the (A108) Fused B+ circuit.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

5. **BRAKE LAMP RELAY**

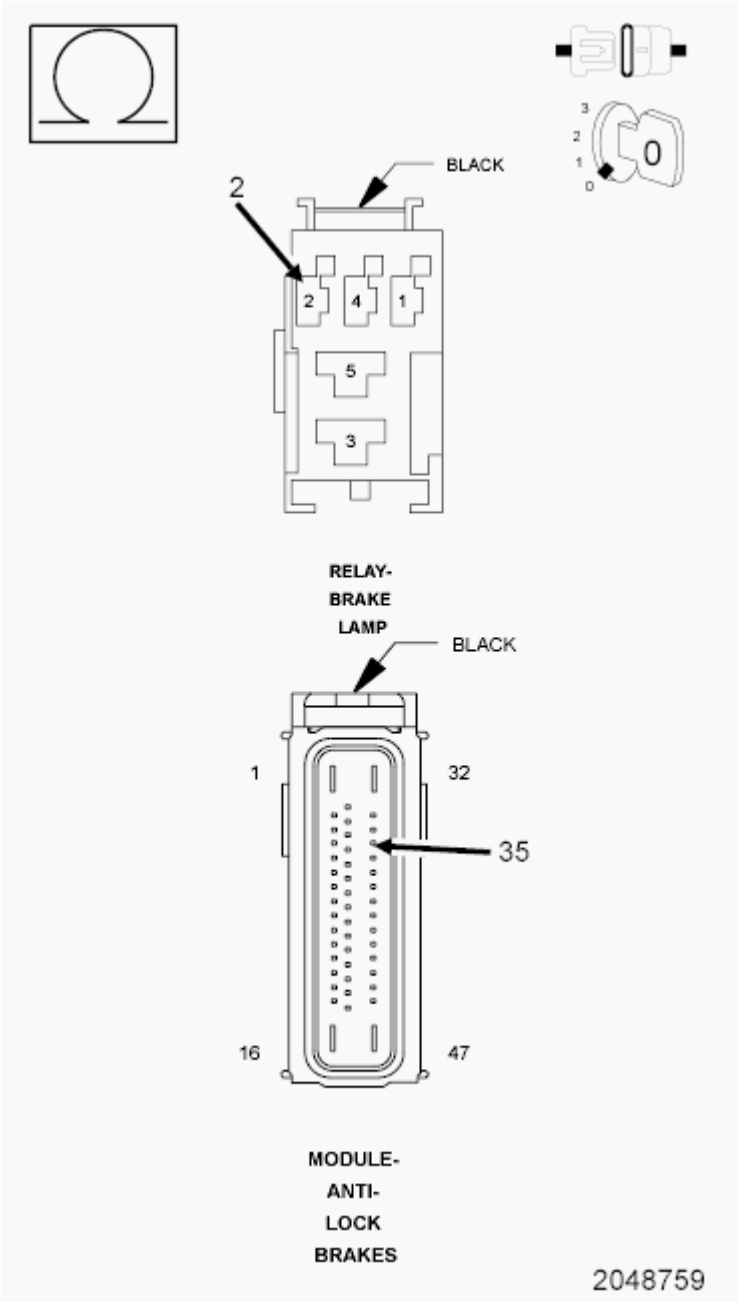

Fig. 52: Measuring Resistance Of Stop Lamp Relay Override Signal Circuit

Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance of the (B221) Stop Lamp Relay Override Signal Circuit between the Brake Lamp Relay and the Anti-Lock Brake Module.

   Is the resistance below 5 Ohms?

   Yes

   - Replace the Brake Lamp Relay in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair open in the (B221) Brake Lamp Inhibit Relay Control circuit.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1091-ABS BRAKE LAMP CONTROL CIRCUIT HIGH

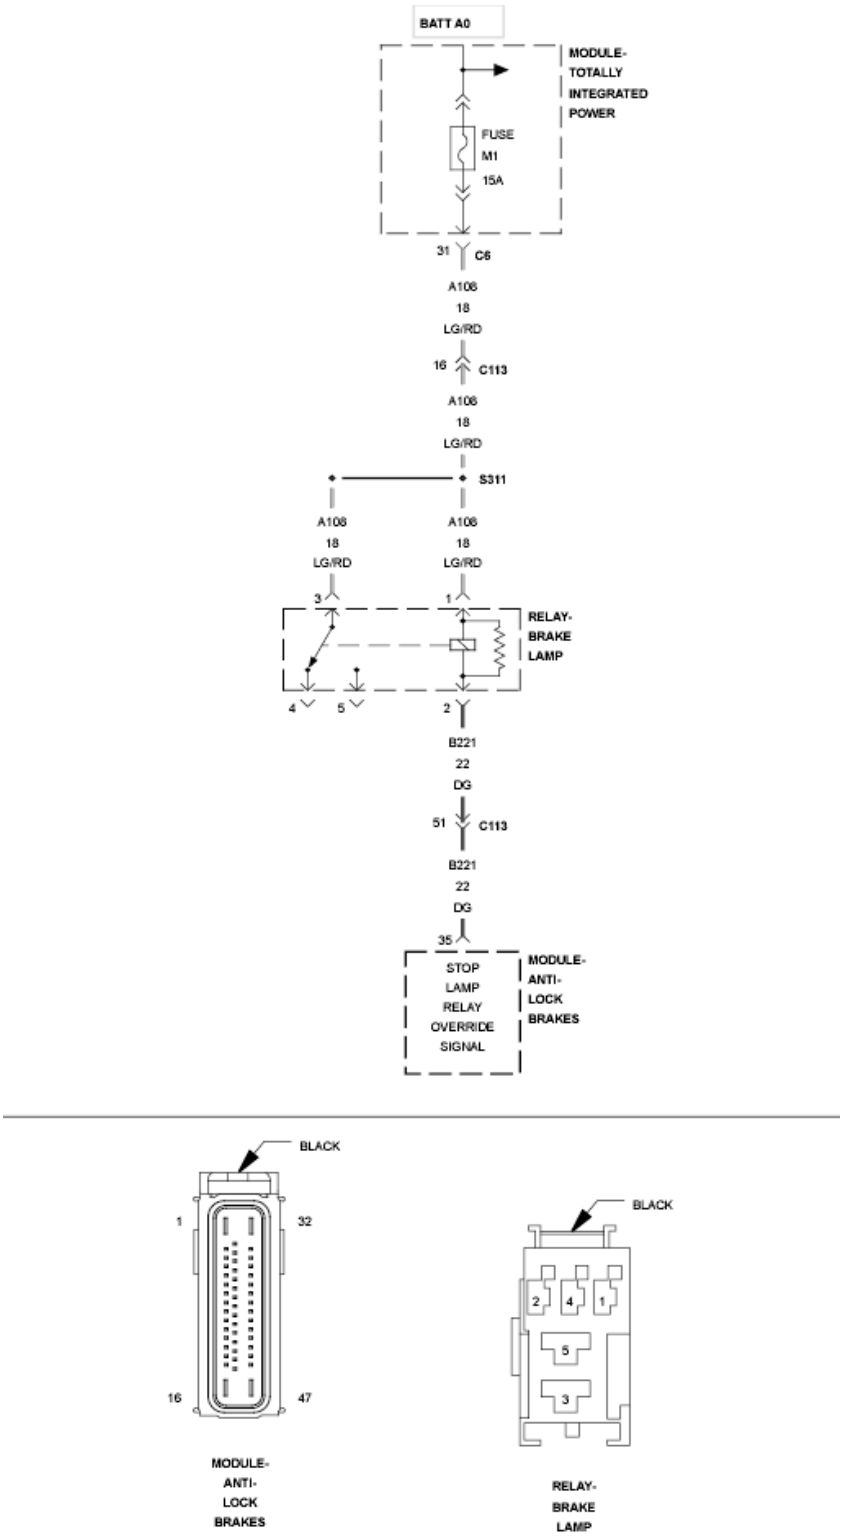

Fig. 53: Stop Lamp Relay Override Signal Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **When Set:**

  When monitoring the Stop Lamp Relay Override Signal circuit the module detects a short to B+.

Possible Causes
(B221) STOP LAMP RELAY OVERRIDE SIGNAL SHORTED TO VOLTAGE
BRAKE LAMP RELAY
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1091-ABS BRAKE LAMP CONTROL CIRCUIT HIGH**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Start the engine.
   4. Apply brake pedal firmly with at least 80 bar (1160 psi.).
   5. With the scan tool, read DTCs.

   Does the scan tool display: C1091-ABS BRAKE LAMP CONTROL CIRCUIT HIGH?

   Yes

   - Go to step 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off.
   2. Inspect the Anti-Lock Brake Module harness connector and the Brake Lamp Relay harness connector.

   Is the Anti-Lock Brake Module or any of the connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 3

3. **CHECK (B221) STOP LAMP RELAY OVERRIDE SIGNAL SHORTED TO VOLTAGE**

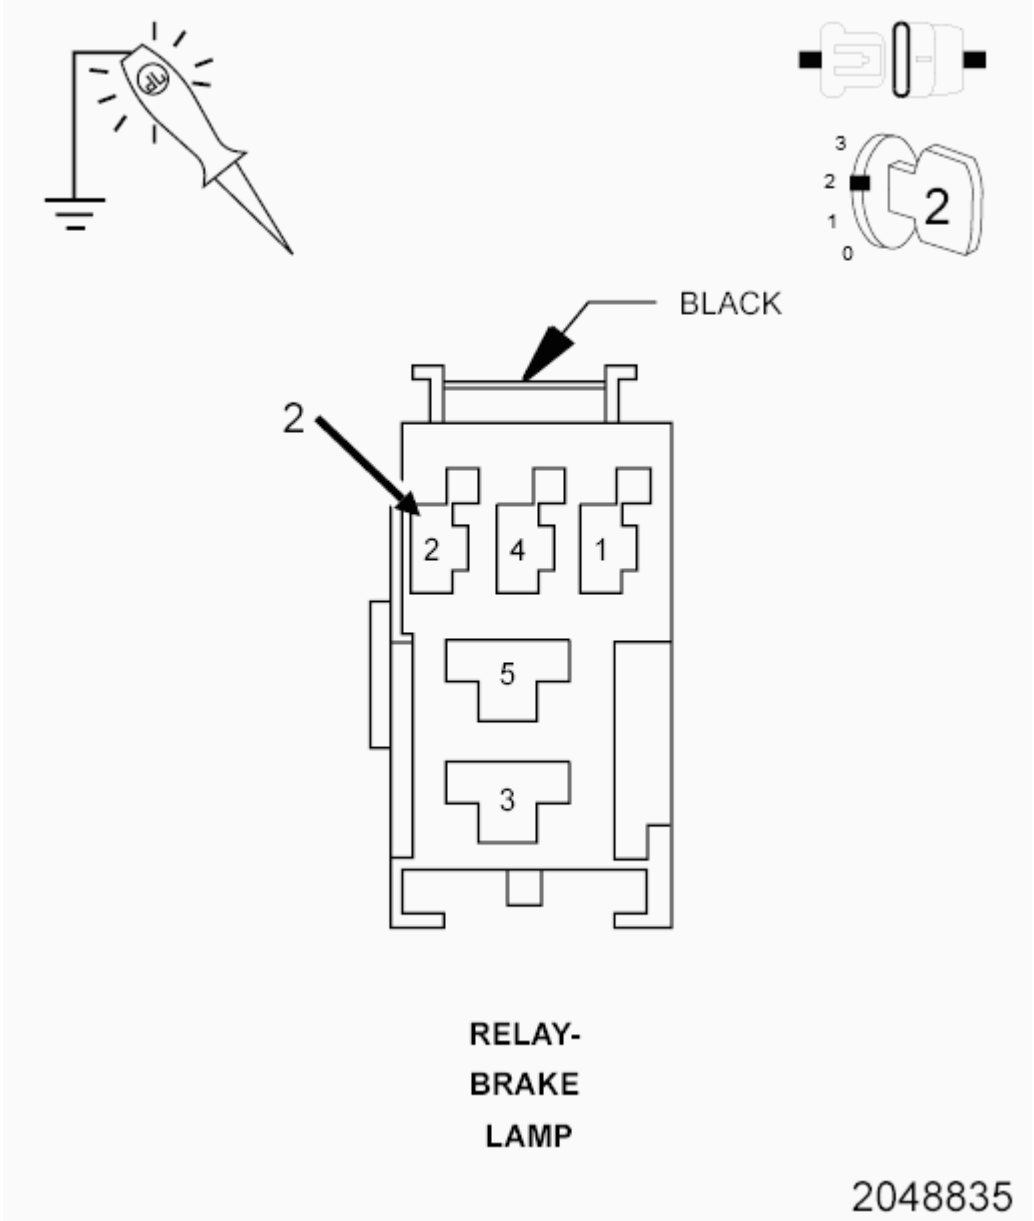

Fig. 54: Checking Stop Lamp Relay Override Signal Shorted To Voltage

Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Anti-Lock Brake Module.
3. Disconnect the Brake Lamp Relay.
4. Turn the ignition on.
5. Using a 12-volt test light connected to ground, probe the (B221) Stop Lamp Relay Override Signal circuit at the Brake Lamp Relay harness connector.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage in the (B221) Stop Lamp Relay Override Signal circuit.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **BRAKE LAMP RELAY**

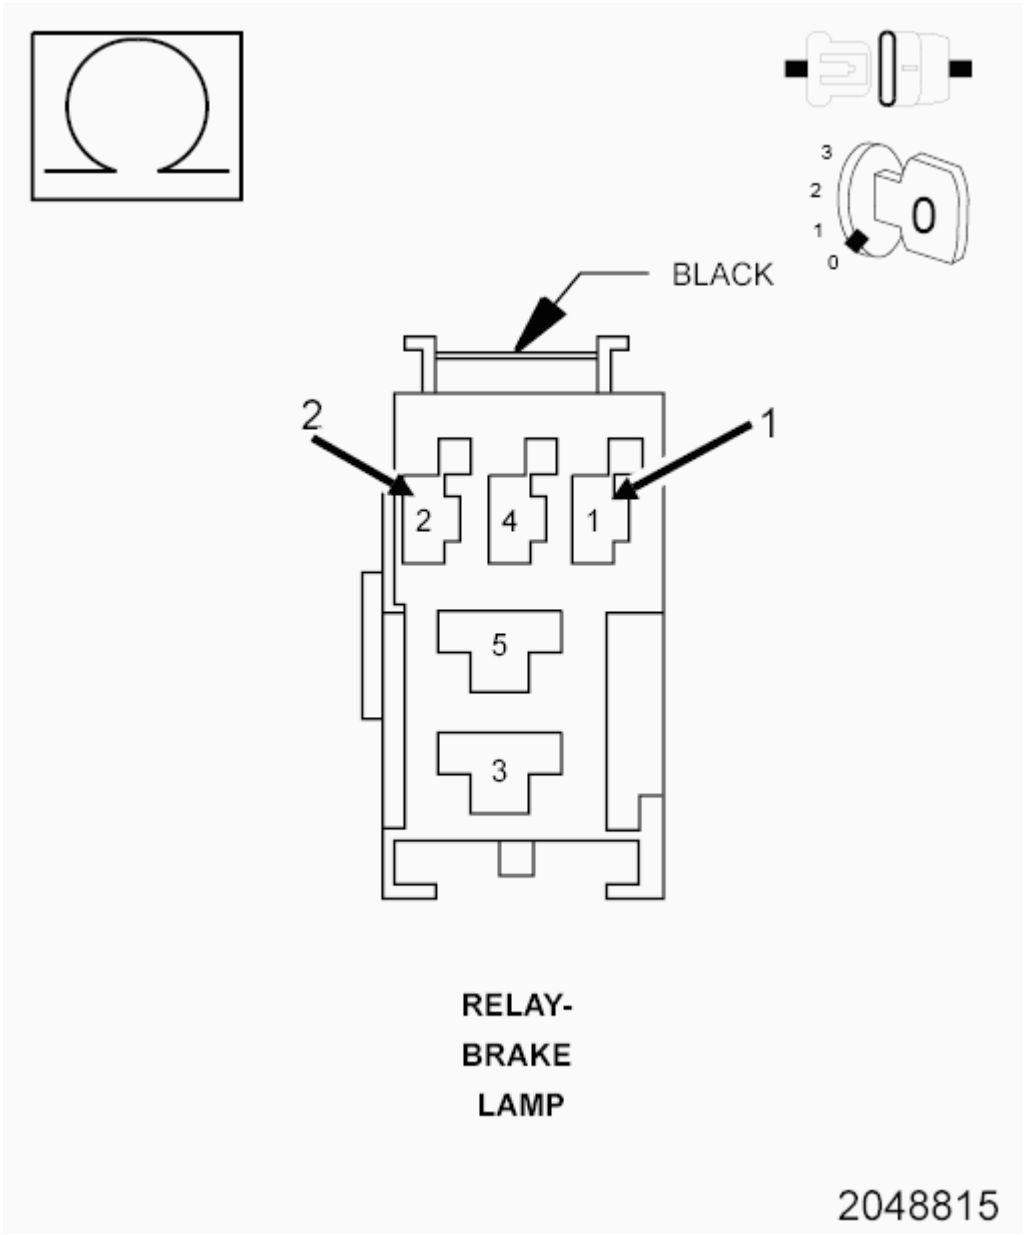

Fig. 55: Measuring Resistance Across Relay Between Stop Lamp Relay Override Signal Circuit
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance across the relay between the (B221) Stop Lamp Relay Override Signal circuit and the (A103) Fused B+ circuit.

   Is the resistance 75 ± 5 Ohms?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the service information.

- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Replace the Brake Lamp Relay in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1210-G SENSOR INPUT CIRCUIT PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 mph) for the first time, but not if the sensor voltage is out of range.

  Or, during diagnostic mode.

  Or, if the monitoring was inhibited by a corresponding diagnostics command.

- **Set Condition:**

  If the measured acceleration signal is higher than 0.8 g for longer than the specified detection time.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR

Diagnostic Test

1. **CHECK FOR A DTC C1210-G SENSOR INPUT CIRCUIT PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record information.
   4. With the scan tool, erase DTCs.
   5. Cycle the ignition switch from off to on.
   6. With the scan tool, read and record DTCs.

   Does the scan tool display: C1210-G SENSOR INPUT CIRCUIT PERFORMANCE?

Yes

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuous monitoring.

- **Set Condition:**

  If the Anti-Lock Brake Module detects that the calculated steering wheel angle and the actual steering angle disagree.

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING ANGLE SENSOR LOOSE
CLOCKSPRING (SAS)

Diagnostic Test

1. **PERFORM TEST DRIVE AND VERIFY DTC IS STILL ACTIVE**

   NOTE: If present, diagnose and repair DTC C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE before diagnosing this DTC.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. Perform ECU initialization with drive test. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

5. Test drive the vehicle by driving straight at a velocity between 10 and 25 km/hr (6 and 15 mph.) for 1 minute.
6. Park the vehicle.
7. Turn the steering wheel from stop to stop.
8. With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go to step 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK STEERING ANGLE SENSOR OUTPUT**
   1. Start the engine.
   2. Center the steering wheel.
   3. With the scan tool, read the Steering Angle Sensor Position.

   Is the Steering Angle Sensor Position within ±15°?

   Yes

   - Go to step 3

   No

   - Go to step 4
3. **INSPECT VEHICLE, STEERING COLUMN, AND INTERMEDIATE SHAFT FOR DAMAGE**

NOTE: If possible, check vehicle repair history for collision damage. ABS module must be reinitializes after repair.

1. Turn the ignition off.
2. Inspect the vehicle for damage causing tracking problems.

3. Inspect the steering column and intermediate shaft for damage.

   Were any problems found?

   Yes

   - Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK CLOCKSPRING (SAS) INSTALLATION**

   WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

   NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

   1. Verify that the Clockspring (SAS) is properly installed.

      Is the Steering Angle Sensor properly installed?

      Yes

      - Replace the Clockspring (SAS) in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

CLOCKSPRING (SAS)

Diagnostic Test

1. **CHECK FOR A DTC C121A-STEERING ANGLE SENSOR NOT INITIALIZED**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.
   5. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.) for 1 minute.
   6. With the scan tool, read and record DTCs.

   Does the scan tool display: C121A-STEERING ANGLE SENSOR NOT INITIALIZED?

   Yes

   - Go to step 2

   No

   - Perform the ABS-NTERMITTENT CONDITION diagnostic procedure. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

   WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service.

Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

1. Check the Clockspring (SAS) installation.
2. Check all related wiring for bruised, chafed, pierced, or partially broken wires.
3. Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 3

3. **CHECK THE VOLTAGE ON THE (F943) FUSED IGNITION SWITCH OUTPUT CIRCUIT**

1. Turn the ignition off.
2. Disconnect the Clockspring C3 (SAS) harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F943) Fused Ignition Switch Output circuit.

   Is the voltage above 10 volts?

   Yes

- Go to step 4

No

- Repair the (F943) Fused Ignition Switch Output circuit for an open.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

4. **CHECK THE RESISTANCE OF THE (Z926) GROUND CIRCUIT**

1. Turn the ignition off.
2. Measure the resistance between the (Z926) Ground circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair the (Z926) Ground circuit for an open.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C121C-TORQUE REQUEST SIGNAL DENIED

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the engine running.

- **Set Condition:**

  When the Powertrain Control Module indicates, for an extended period of time, that engine management relevant for Automatic Yaw Control/Traction Control System control can not be accomplished.

Possible Causes
ANTI-LOCK BRAKE MODULE POWERTRAIN CONTROL MODULE

Diagnostic Test

1. **CHECK FOR A DTC C121C-TORQUE REQUEST SIGNAL DENIED**

   NOTE: This DTC must be active for the results of this test to be valid and this DTC may set while driving under severe load conditions.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the

DTC was set.

4. With the scan tool, erase DTCs.
5. Cycle the ignition switch from off to on.
6. Start Engine.
7. With the scan tool, read and record DTCs and monitor ESP Torque Request status.

   Does the scan tool display: C121C-TORQUE REQUEST SIGNAL DENIED?

   Yes

   - Go to step 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK THE POWERTRAIN DTCS**
   1. With the scan tool, read and record Powertrain DTCs.

      Were any Powertrain related DTCs found?

      Yes

      - Repair the Powertrain Diagnostics. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** .

      No

      - Go to step 3

3. **ESP TORQUE REQUEST SIGNAL**
   1. Engine started.
   2. With the scan tool, read the Allow ESP Torque Request status bit.

      Was the Allow ESP Torque Request showing NOT set?

      Yes

      - Replace the Powertrain Module in accordance with the Service Information.
      - Perform POWERTRAIN VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure** .

      No

      - Replace the Anti-Lock Brake Module in accordance with the Service Information.

- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C121D-BRAKE PRESSURE SENSOR CIRCUIT

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS
ECU INTERNAL FAILURE
HCU INTERNAL FAILURE

Diagnostic Test

1. **CHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.
   5. Start the engine.
   6. Slowly depress and release the brake pedal.
   7. With the scan tool, read and record DTCs.

   Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?

   Yes

   - Go to step 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. See **DTC-Based**

Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure.

2. **HCU/ECU ISOLATION**
    1. Turn the ignition off.
    2. Separate the ECU from the HCU.
    3. With the scan tool, monitor brake pressure.

    Does the scan tool display brake pressure above 218 bar (3162 psi)?

    Yes

    - Replace the HCU in accordance with the Service Information.
    - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

    No

    - Replace the ECU in accordance with the Service Information.
    - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
ECU INTERNAL FAILURE HCU INTERNAL FAILURE

Diagnostic Test

1. **CHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE**

    NOTE: This DTC must be active for the results of this test to be valid.

    1. Turn the ignition on.
    2. With the scan tool, read and record the DTCs.

3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase the DTCs.
5. Start the engine.
6. Slowly press and release the brake pedal.
7. With the scan tool, read and record the DTCs.

   Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?

   Yes

   - Go to step 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **HCU/ECU ISOLATION**
   1. Turn the ignition off.
   2. Separate the ECU from the HCU.
   3. Turn the ignition on.
   4. With the scan tool, monitor the brake pressure.

      Does the scan tool display brake pressure above 218 bar (3162 psi)?

      Yes

      - Replace the HCU in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Replace the ECU in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1231-DRIVE TEST: STEERING ANGLE SENSOR

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

During the Drive Test.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects implausible Steering Angle Sensor data.

Possible Causes
CLOCKSPRING INSTALLATION
CLOCKSPRING (SAS)
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **CHECK FOR A DTC C1231 DRIVE TEST: STEERING ANGLE SENSOR**

   NOTE: This DTC must be active for the results of this test to be valid.

   NOTE: If any of the following DTCs are present they must be repaired before continuing.

   - **DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE**
   - **DTC C121A-STEERING ANGLE SENSOR NOT INITIALIZED**

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Freeze Frame information.
   4. Perform ECU initialization with drive test. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**
   5. **NOTE: The drive test requires a 90° turn.**
   6. Start the engine.
   7. With the scan tool, read and record DTCs.

   Does the scan tool display: C1231 DRIVE TEST: STEERING ANGLE SENSOR?

   Yes

   - Go to step 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS**

1. With the scan tool, select ECU View.
2. Verify that the Steering Angle Sensor is active on the bus.

   Is the Steering Angle Sensor active on the bus?

   Yes

   - Go to step 3

   No

   - Perform the appropriate diagnostic procedure. Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** .

3. **CHECK STEERING ANGLE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool check steering angle.

      Is the Steering Angle reading within 15°?

      Yes

      - Go to step 4

      No

      - Go to step 5

4. **CHECK STEERING ANGLE CHANGE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool check steering angle.
   3. Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

      Did the steering angle change accordingly?

      Yes

      - Replace the Anti-Lock Brake Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Replace the Clockspring (SAS) in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

5. **CHECK CLOCKSPRING INSTALLATION**

WARNING: To avoid possible serious or fatal injury, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

1. Turn the ignition off.
2. Verify that the Clockspring (SAS) is properly installed. Refer to **Restraints/CLOCKSPRING - Installation** .

   Is the Clockspring (SAS) properly installed?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1232-DRIVE TEST: PRESSURE SENSOR

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  During the Drive Test.

- **Set Condition:**

If the Pressure Sensor fails to activate.

Possible Causes
HYDRAULIC / BRAKE SYSTEM COMPONENT INSTALLATION
INTEGRATED CONTROL UNIT
PRESSURE SENSOR (HYDRAULIC CONTROL UNIT)

Diagnostic Test

1. **CHECK FOR A DTC C1232 DRIVE TEST: PRESSURE SENSOR**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Freeze Frame information.
   4. Perform ECU initialization with drive test. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   5. Start the engine and apply the brake firmly.
   6. With the scan tool, read and record DTCs.

   Does the scan tool display: C1232 DRIVE TEST: PRESSURE SENSOR?

   Yes

   - Go to step 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK HYDRAULIC SYSTEM AND BRAKE SYSTEM COMPONENT INSTALLATION AND FUNCTION**
   1. Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.
   2. Verify that the hydraulic system is properly filled and bled.
   3. Verify that the brake system components are installed and functioning properly.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE,**

Antilock Brake (ABS) - Standard Procedure.

No

- Clean contacts in HCU first if problem reoccurs replace the Integrated Control Unit in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1234-DRIVE TEST: SENSOR CLUSTER INSTALLATION

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  During the Drive Test.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects implausible Dynamics Sensor data.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **CHECK FOR A DTC C1234 DRIVE TEST: SENSOR CLUSTER INSTALLATION**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Freeze Frame information.
   4. Perform ECU initialization with drive test. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   5. **NOTE: The drive test requires a 90° turn.**
   6. Start the engine.
   7. With the scan tool, read and record DTCs.

   Does the scan tool display: C1234 DRIVE TEST: SENSOR CLUSTER INSTALLATION?

   Yes

- Go to step 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK THE DYNAMICS SENSOR INSTALLATION**

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

1. Turn the ignition off.
2. Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.
3. Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1238-DRIVE TEST: UNSUCCESSFUL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  During the Drive Test.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects a fault with the Steering Angle Sensor, the Pressure Sensor, or the Dynamics Sensor.

Possible Causes
STEERING ANGLE SENSOR

Diagnostic Test

1. **INITIALIZE ANTI-LOCK BRAKES MODULE**
   1. Initialize ECU refer to ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

      Does this DTC reset?

      Yes

      - Replace the Anti-Lock Brake Module in accordance with the Service Information.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**

      No

      - Test complete.

C123B-ESP SYSTEM CONTROL TOO LONG

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Anti-Lock Brake Module indicates ESP control lasting longer the 10 seconds.

Possible Causes
HYDRAULIC/BRAKE ISSUE
DYNAMICS SENSOR
INTEGRATED CONTROL MODULE
STEERING ANGLE SENSOR
WHEEL ALIGNMENT

Diagnostic Test

1. **CHECK FOR A DTC C123B-ESP SYSTEM CONTROL TOO LONG**

   NOTE: If other DTCs are set they must be repaired before continuing. To help in the service of the ESP System, it is recommend speaking to the customer to find out what type of environment they were driving in when the ESP concern took place, heavy rain, snow or ice. This should be considered normal operation and no repair is necessary. This DTC may set while driving under excessive driving conditions.

   1. Turn the ignition on.
   2. Perform ECU initialization with drive test. Refer to Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      NOTE: Drive test must be performed correctly for ECU to initialize.

   3. Cycle the ignition switch from off to on.

      Did the ECU initialization/drive test pass?

      Yes

      - Go to step 2

      No

      - Refer to associated drive test diagnostic procedure.
      - Refer to the DTC list. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Diagnosis and Testing**

2. **CHECK STEERING ANGLE SIGNAL**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool read Steering Angle Sensor Signal.

      Is the Steering Angle reading within ±6 degrees?

      Yes

- Go to step 4

No

- Go to step 3

3. **CHECK STEERING ANGLE INSTALLATION AND WHEEL ALIGNMENT**

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

1. Turn the ignition off.
2. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
3. Inspect the steering column and intermediate shaft for damage.
4. Verify that the Steering Angle Sensor is properly installed.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Replace the Steering Angle Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

4. **CHECK HYDRAULIC SYSTEM AND BRAKE SYSTEM COMPONENT INSTALLATION AND FUNCTION**

1. Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.
2. Verify that the hydraulic system is properly filled and bled.
3. Verify that the brake system components are installed and functioning properly.

1. Disconnect the Dynamics Sensor harness connector.
2. Measure the resistance between the (G94) Dynamics Sensor Ground circuit and ground.

   Is the resistance below 5.0 ohm?

   Yes

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Repair the (G94) Dynamics Sensor Ground circuit for an open circuit.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With ignition on, but not if a checksum failure of the stored offset values is detected.

  Or, a CAN time-out failure is detected.

  Or, a failure is detected by the Steering Angle Sensor.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects that either the calculated steering wheel angle offset or the steering wheel angle signal measured output is out of range.

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING WHEEL ALIGNMENT
STEERING ANGLE SENSOR LOOSE
CLOCKSPRING (SAS) IMPROPERLY INSTALLED (WRONG MOUNTING POSITION)
CLOCKSPRING (SAS)
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **PERFORM TEST DRIVE AND VERIFY DTC IS STILL ACTIVE**

   NOTE: If present, diagnose and repair DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE, C121A-STEERING ANGLE SENSOR NOT INITIALIZED, or C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE before diagnosing this DTC.

1. Turn the ignition on.
2. With the scan tool, erase ABS DTCs.
3. Cycle the ignition switch.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

4. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).
5. Park the vehicle.
6. With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

- Go to step 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK STEERING ANGLE SENSOR OUTPUT**
   1. Start the engine.
   2. Turn the steering wheel so wheels point in a straight ahead position.
   3. With the scan tool, read the Steering Angle Sensor position.

   Is the Steering Angle Sensor Position within 15° degrees?

   Yes

   - Go to step 5

   No

   - Go to step 3

3. **INSPECT VEHICLE, STEERING COLUMN, AND INTERMEDIATE SHAFT FOR DAMAGE**

NOTE: If possible, check vehicle repair history for collision damage.

1. Turn the ignition off.
2. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

3. Inspect the steering column and intermediate shaft for damage.

   Were any problems found?

   Yes

   - Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 4

4. **CHECK CLOCKSPRING (SAS) INSTALLATION**

   WARNING: To avoid possible serious or fatal injury, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

   NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

   1. Verify that the Clockspring (SAS) is properly installed.

      Is the Clockspring (SAS) properly installed?

      Yes

      - Go to step 5

      No

      - Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

5. **RE-INITIALIZE THE ESP MODULE**
   1. Perform ECU initialization with drive test to clear offsets. Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

Is DTC C123F STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE still active?

Yes

- Go to step 6

No

- Sensor was probably loose or calibrated with wheels not centered to vehicle. Test complete.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

6. **CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL**
   1. With the scan tool, read the Steering Angle Sensor position while rotating the steering wheel to the right and then to the left. The Steering Angle position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

      Did the steering angle change accordingly?

      Yes

      - Replace the Anti-Lock Brake Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Replace the Clockspring (SAS) in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With ignition on, but not if a CAN time out failure is detected.

  Or, if a fault is detected by the Steering Angle Sensor.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects that the absolute value of the measured steering wheel angle is

greater than 720 degrees.

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING WHEEL ALIGNMENT
STEERING ANGLE SENSOR LOOSE
CLOCKSPRING IMPROPERLY INSTALLED (WRONG MOUNTING POSITION)
CLOCKSPRING (SAS)

Diagnostic Test

1. **PERFORM TEST DRIVE AND VERIFY DTC IS STILL ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, erase ABS DTCs.
    3. Cycle the ignition switch.
    4. Turn steering wheel from lock to lock.
    5. With the scan tool, read ABS DTCs.

    Does this DTC reset?

    Yes

    - Go to step 2

    No

    - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
2. **CHECK STEERING ANGLE SENSOR OUTPUT**
    1. Start the engine.
    2. Center the steering wheel.
    3. With the scan tool, read the Steering Angle Sensor Position.

    Is the Steering Angle Sensor Position within 15" ?

    Yes

    - Go to step 4

    No

    - Go to step 3

3. **INSPECT VEHICLE, STEERING COLUMN, AND INTERMEDIATE SHAFT FOR DAMAGE**

NOTE: If possible, check vehicle repair history for collision damage.

1. Turn the ignition off.
2. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
3. Inspect the steering column and intermediate shaft for damage.
4. Center the steering wheel.
5. With the scan tool, read the Steering Angle Sensor Position.

Is the Steering Angle Sensor Position within 15" ?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 4

4. **CHECK STEERING ANGLE CHANGE**

1. Turn steering wheel so wheels point in a straight ahead position.
2. With scan tool check steering angle if reading travels to 720 degrees while rotating wheel from lock to lock.

NOTE: Sensor damage can occur if wheel is turned over 720 degrees.

3. Rotate steering wheel to the right and the degrees will decrease and rotate steering wheel to the left and the degrees will increase.

Did the steering angle change accordingly and display less than 720 degrees from lock to lock?

Yes

- Go to step 5

No

- Replace the Clockspring (SAS) in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

5. **CHECK CLOCKSPRING INSTALLATION**

WARNING: To avoid possible or fatal injury, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

1. Verify that the Clockspring is properly installed in accordance with the service information.

   Is the Clockspring properly installed?

   Yes

   - Replace the Clockspring (SAS) and clear offsets by initializing ECU with wheels pointing straight ahead, in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C1243-G SENSOR NOT INITIALIZED

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Once after ignition on.

- **Set Condition:**

  If the stored zero point calibration value of the longitudinal acceleration sensor is invalid.

Possible Causes

DYNAMICS SENSOR NOT CALIBRATED
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **PERFORM ECU INITIALIZATION**
    1. Turn the ignition on.
    2. With the scan tool, erase ABS DTCs.
    3. Cycle the ignition switch.

        WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

    4. Perform ECU initialization with drive test refer to ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

        NOTE: The ECU Initialization process must include driving the vehicle into a 90° turn.

    5. Park the vehicle.
        - Go to step 2
2. **VERIFY IF DTC IS STILL ACTIVE**
    1. Cycle the ignition switch.

        WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

    2. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).
    3. Park the vehicle.
    4. With the scan tool, read ABS DTCs.

        Does this DTC reset?

        Yes

        NOTE: Vehicles without a Dynamics Sensor replace Anti-Lock Brake Module.

        - Replace the Dynamics Sensor or Anti-Lock Brake Module in accordance with the Service Information.

- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C2100-BATTERY VOLTAGE LOW

Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects system voltage is below 7.5 volts.

Possible Causes
ECM OR PCM DTCs PRESENT
VEHICLE BATTERY/CHARGING SYSTEM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **DTCS IN THE PCM**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs from the PCM.
   3. With the scan tool, read and record Freeze Frame information.
   4. With the scan tool, erase DTCs.
   5. Start the engine.
   6. With the scan tool, read and record DTCs.
   7. With the scan tool read DTCs from the PCM.

      Are any charging system codes present?

      Yes

      - Repair the charging system DTC in the PCM.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 2

2. **CHARGING SYSTEM FAILURE**
   1. Start the engine.
   2. Connect voltmeter to vehicle battery.

      Is the vehicle battery voltage under 8.2 volts?

No

- Go to step 3

Yes

- Repair the charging system per service information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

3. **CHARGING POWER SUPPLY VOLTAGE**
   1. With a scan tool read Power Supply Voltage.

      Is Power Supply Voltage under 8.2 volts?

      No

      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Anti-Lock Brakes Module detects system voltage is above 17 volts.

Possible Causes
ECM/PCM DTCs PRESENT
VEHICLE BATTERY / CHARGING SYSTEM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, read and record DTCs from the ECM/PCM.
3. With the scan tool, read and record Freeze Frame information.
4. With the scan tool, erase DTC's.
5. Start the engine.
6. With the scan tool, read and record DTCs.
7. With the scan tool read DTCs from the PCM.

   Are any charging system codes present?

   Yes

   - Repair the charging system DTC in the ECM/PCM.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure** .

   No

   - Go to step 1

1. **CHARGING SYSTEM FAILURE**
   1. Start the engine.
   2. Connect voltmeter to vehicle battery.

      Is the vehicle battery voltage over 16.8 volts?

No

- Go to step 2

Yes

- Repair the charging system per service information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHARGING POWER SUPPLY VOLTAGE**
    1. With a scan tool read Power Supply Voltage.

       Is Power Supply Voltage over 16.8 volts?

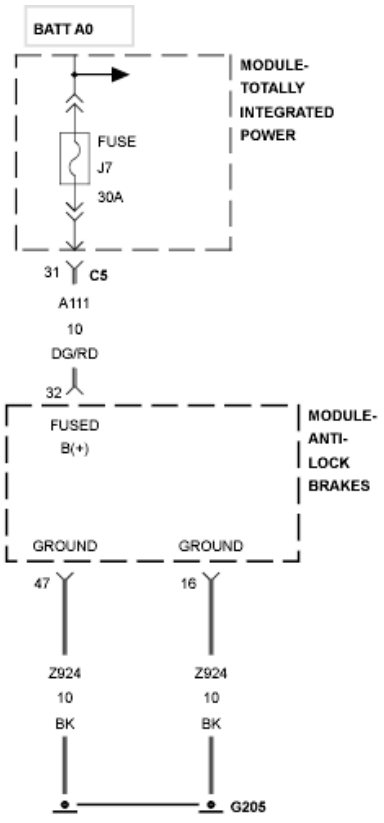
       No

       - Perform ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

       Yes

       - Replace the Anti-Lock Brakes Module in accordance with the Service Information.
       - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C2111-ANTI-LOCK BRAKE MODULE INTERNAL



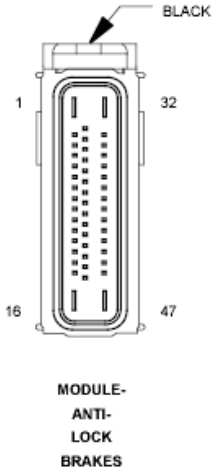


Fig. 64: Fused B+ Circuit Shorted To Ground, Voltage Or Open Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Anti-Lock Brake Module detects an internal fault, the DTC is set.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
FUSED B+ CIRCUIT(S) SHORTED TO GROUND, VOLTAGE, OR OPEN
GROUND CIRCUIT(S) OPEN
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR A DTC C2111-ANTI-LOCK BRAKE MODULE INTERNAL**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.
   5. Cycle the ignition switch from off to on.
   6. With the scan tool, read and record DTCs

      Does the scan tool display: C2111-ANTI-LOCK BRAKE MODULE INTERNAL?

      Yes

      - Go to step 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**
   1. Turn the ignition off.
   2. Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.
   3. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or

corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 3

3. **FUSED B+ CIRCUIT(S) OPEN OR HIGH RESISTANCE**

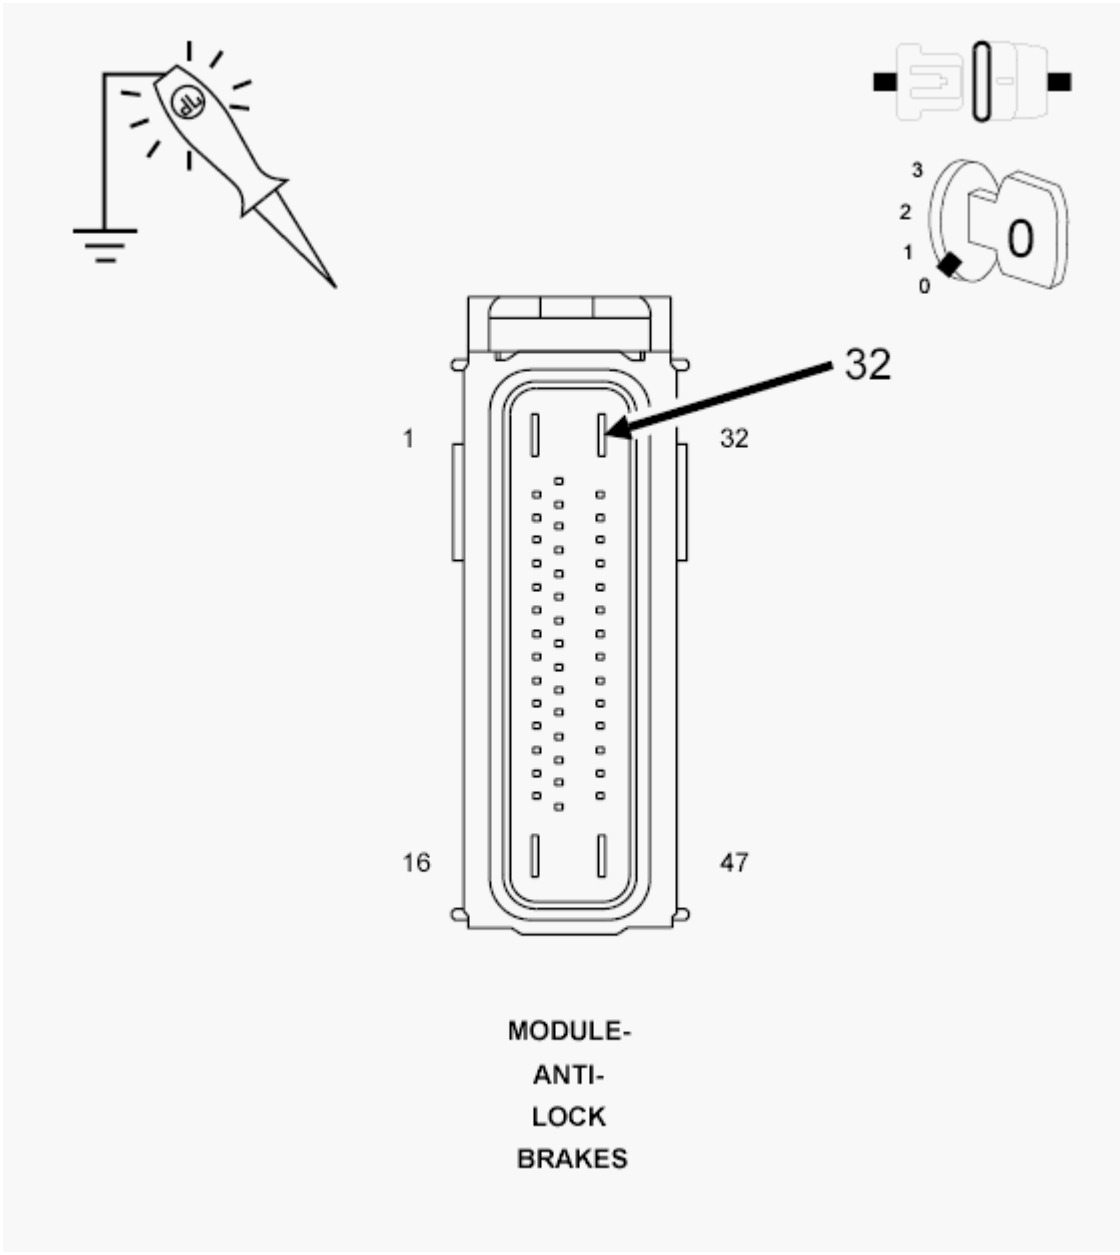

Fig. 65: Checking Anti-Lock Brake Module Harness Connector
Courtesy of CHRYSLER LLC

1. Disconnect the Anti-Lock Brake Module harness connector.
2. Using a 12-volt test light connected to ground, check the (A111) Fused B+ circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to step 4

No

- Repair the Fused B+ circuit(s) for an open circuit or high resistance.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

4. **GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

1. Using a 12-volt test light connected to 12-volts, check the (Z924) Ground circuits.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Repair the Ground circuit(s) for an open circuit or high resistance.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Dynamics Sensor status changes from initialized to not initialized due to low voltage on the (G4) Dynamics Sensor Supply circuit.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT HIGH RESISTANCE
(G94) DYNAMICS SENSOR GROUND CIRCUIT HIGH RESISTANCE
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **CHECK FOR A DTC C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW**

   NOTE: The Sensor Cluster is the same as the Dynamics sensor.

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record the DTCs.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Start the engine.

      NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set. It may be necessary to test drive the vehicle within the DTC monitoring and set conditions, in order for this DTC to set.

   6. With the scan tool, read and record the DTCs.

      Does the scan tool display: C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW?

Yes

- Go to step 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**
   1. Check the Dynamics Sensor installation and torque of the mounting bolts.
   2. Visually inspect the related wiring harness. Look for any bruised, chafed, pierced or partially broken wires.
   3. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out or corroded terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 3
3. **CHECK THE VOLTAGE ON THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT**

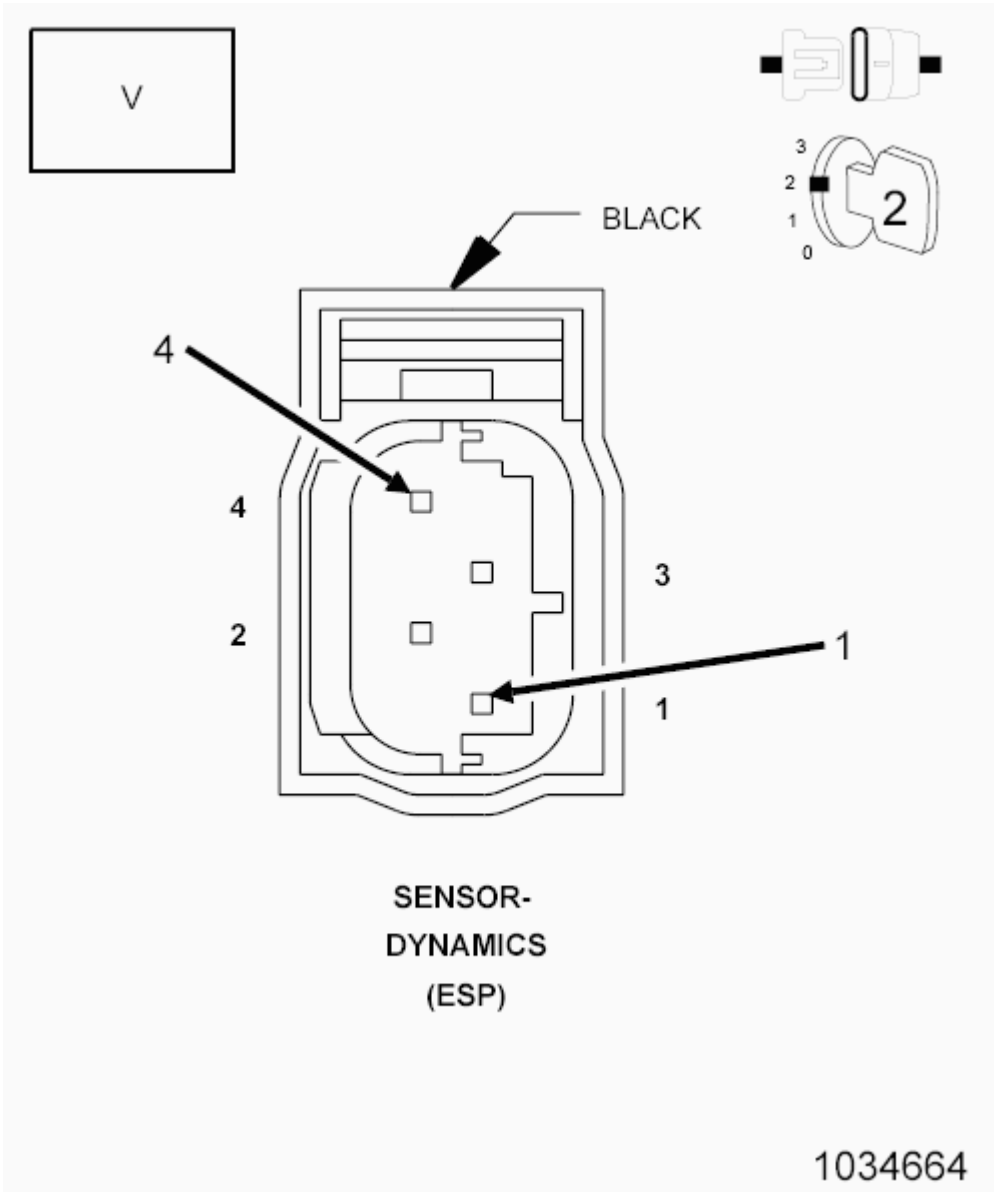

Fig. 68: Checking Voltage On Dynamics Sensor Supply Circuit
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Dynamics Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage across the (G4) Dynamics Sensor Supply Circuit and the (G94) Dynamics Sensor Ground Circuit.

   Is the voltage above 10 volts?

   Yes

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 4

4. **CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR HIGH RESISTANCE**

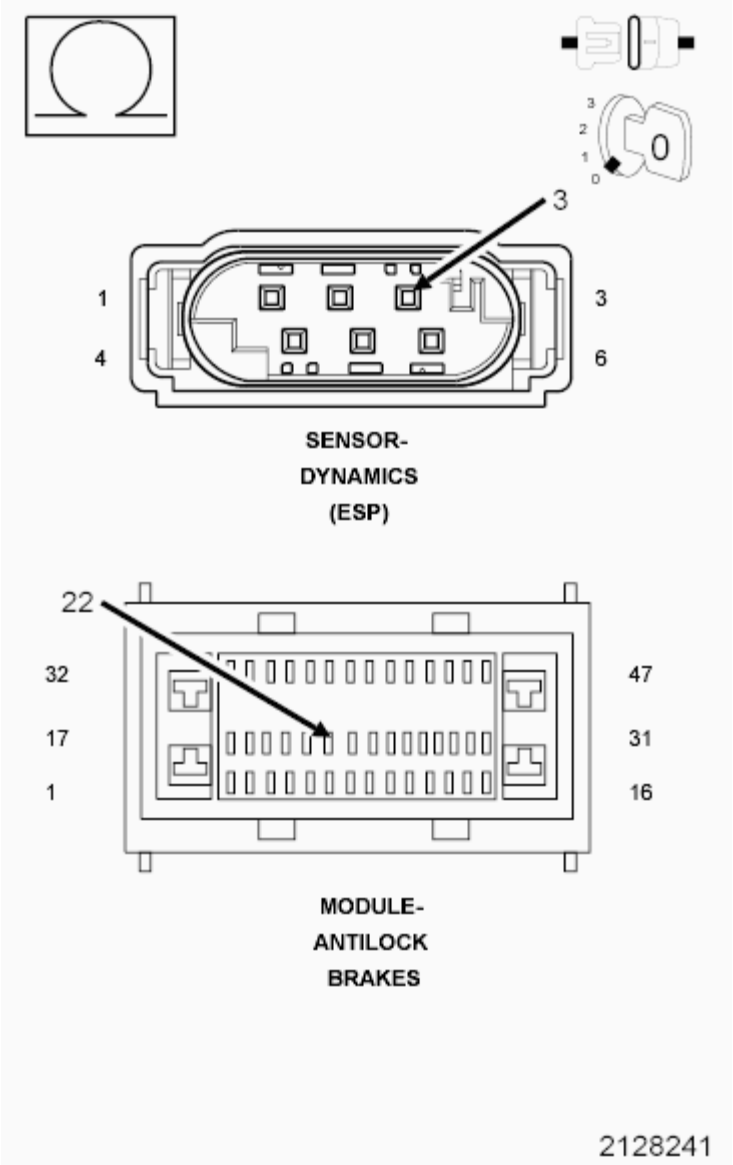

Fig. 69: Checking Dynamics Sensor Supply Circuit For High Resistance
Courtesy of CHRYSLER LLC

1. Turn the ignition off.

2. Disconnect the Anti-Lock Brakes Module harness connector.
3. Measure the resistance of the (G4) Dynamics Sensor Supply circuit between the Dynamics Sensor harness connector and the Anti-Lock Brake Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go to step 5

   No

   - Repair the (G4) Dynamics Sensor Supply circuit for high resistance.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

5. **CHECK (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE**

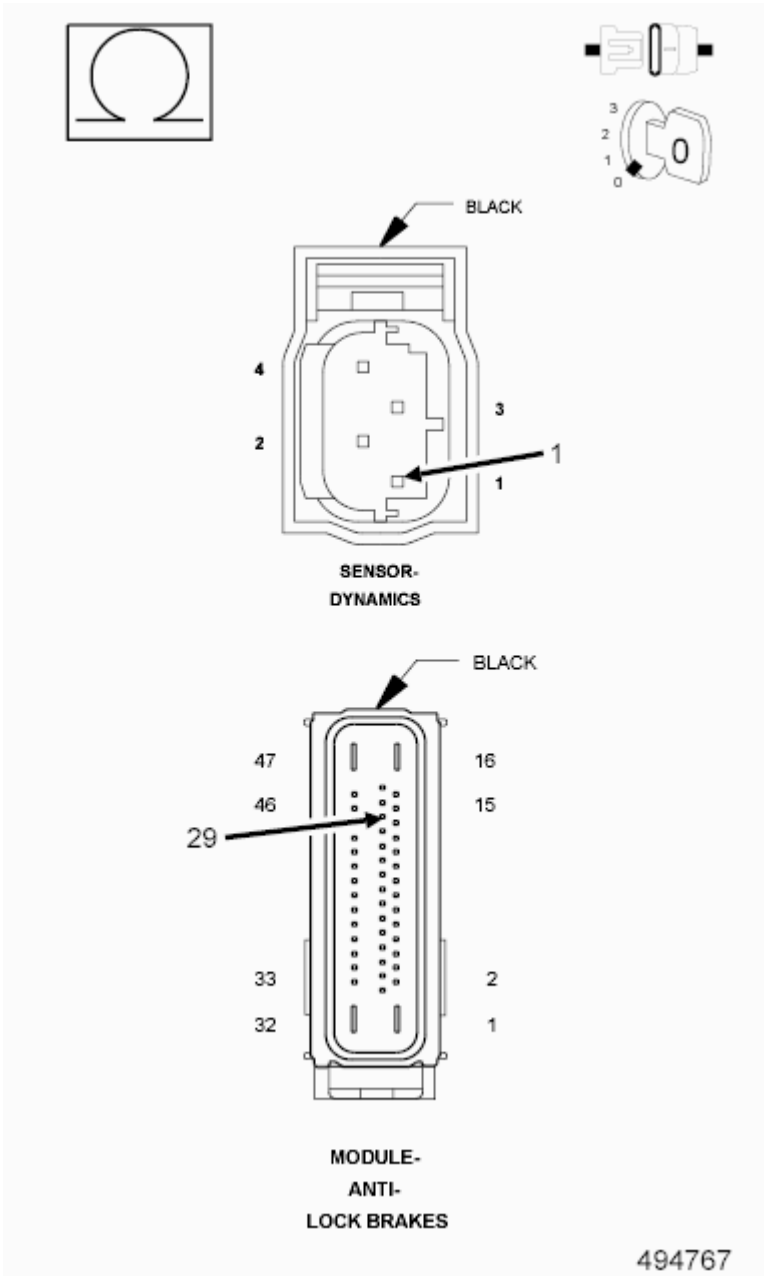

Fig. 70: Checking Dynamics Sensor Ground Circuit For High Resistance
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (G94) Dynamics Sensor Ground circuit between the Dynamics Sensor harness connector and the Anti-Lock Brake Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the Service Information.

- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Repair the (G94) Dynamics Sensor Ground circuit for high resistance.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

CHARGING SYSTEM
(G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORTED TO GROUND OR VOLTAGE
(G94) SENSOR CLUSTER GROUND CIRCUIT SHORTED TO VOLTAGE OR OPEN
SENSOR CLUSTER
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR A DTC C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH**

   NOTE: The Sensor Cluster is the same as the Dynamics sensor.

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.
   5. Cycle the ignition from off to on.
   6. With the scan tool, read and record DTCs.

   Does the scan tool display: C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH?

   Yes

   - Go to step 2

   No

- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**
   1. Turn ignition off.
   2. Check all related wiring for bruised, chafed, pierced, or partially broken wires.
   3. Check all related connectors for broken, bent, pushed out, or corroded terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 3
3. **CHECK THE VOLTAGE ON THE (G4) SENSOR CLUSTER SUPPLY CIRCUIT**

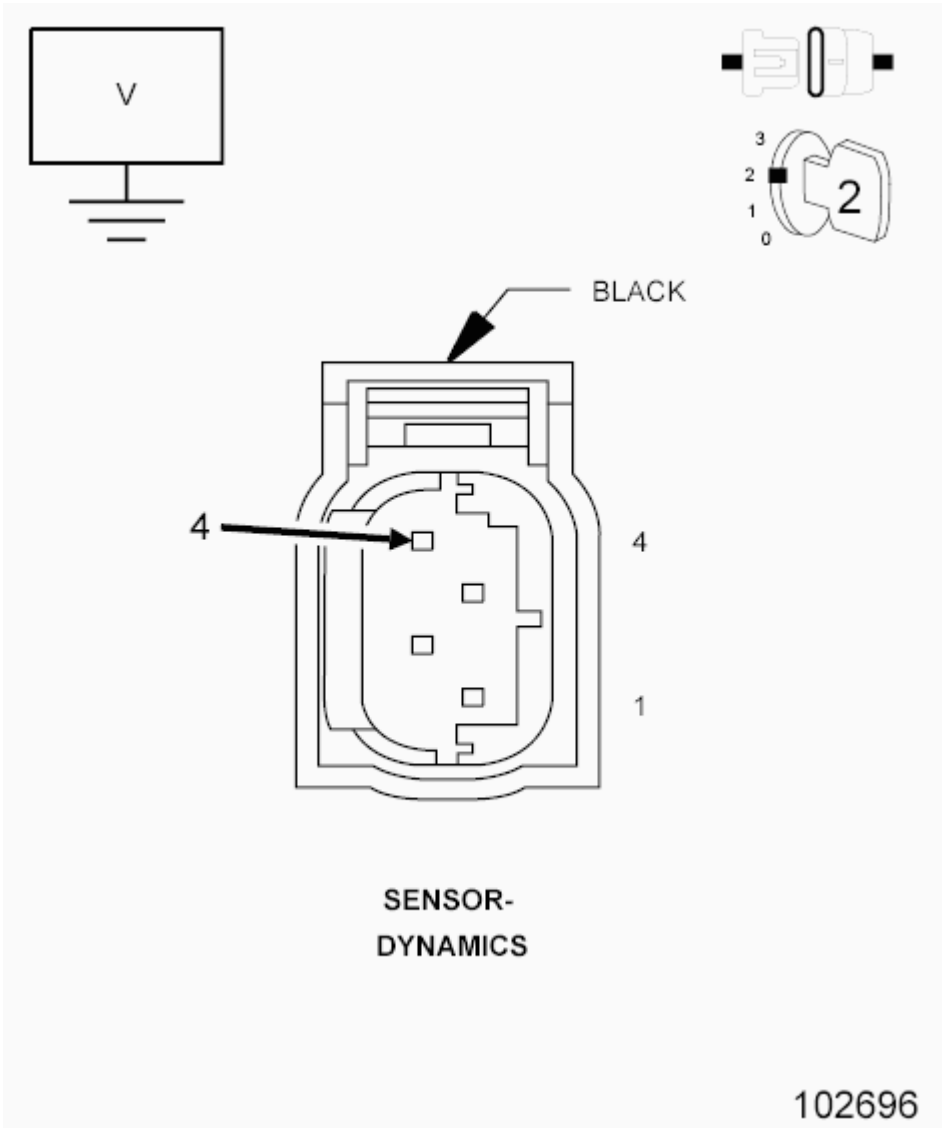

Fig. 72: Checking Voltage On Sensor Cluster Supply Circuit
Courtesy of CHRYSLER LLC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Sensor Cluster harness connector.
2. Start the engine.
3. Raise engine speed above 1800 RPM.
4. Measure the voltage of the (G4) Sensor Cluster Supply Circuit.

   Is the voltage above 17 volts?

Yes

- Go to step 4

No

- Go to step 7

4. **CHECK THE VOLTAGE ON THE FUSED B(+) CIRCUITS**

Courtesy of CHRYSLER LLC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Turn the ignition off.
2. Disconnect the Anti-Lock Brake Module harness connector.
3. Start the engine.
4. Raise engine speed above 1800 RPM.
5. Measure the voltage of the (A107) and the (A200) Fused B(+) circuits.

   Is the voltage above 17 volts?

   Yes

   - Refer to appropriate Service Information for Charging System testing and repair.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 5

5. **(G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORT TO GROUND**

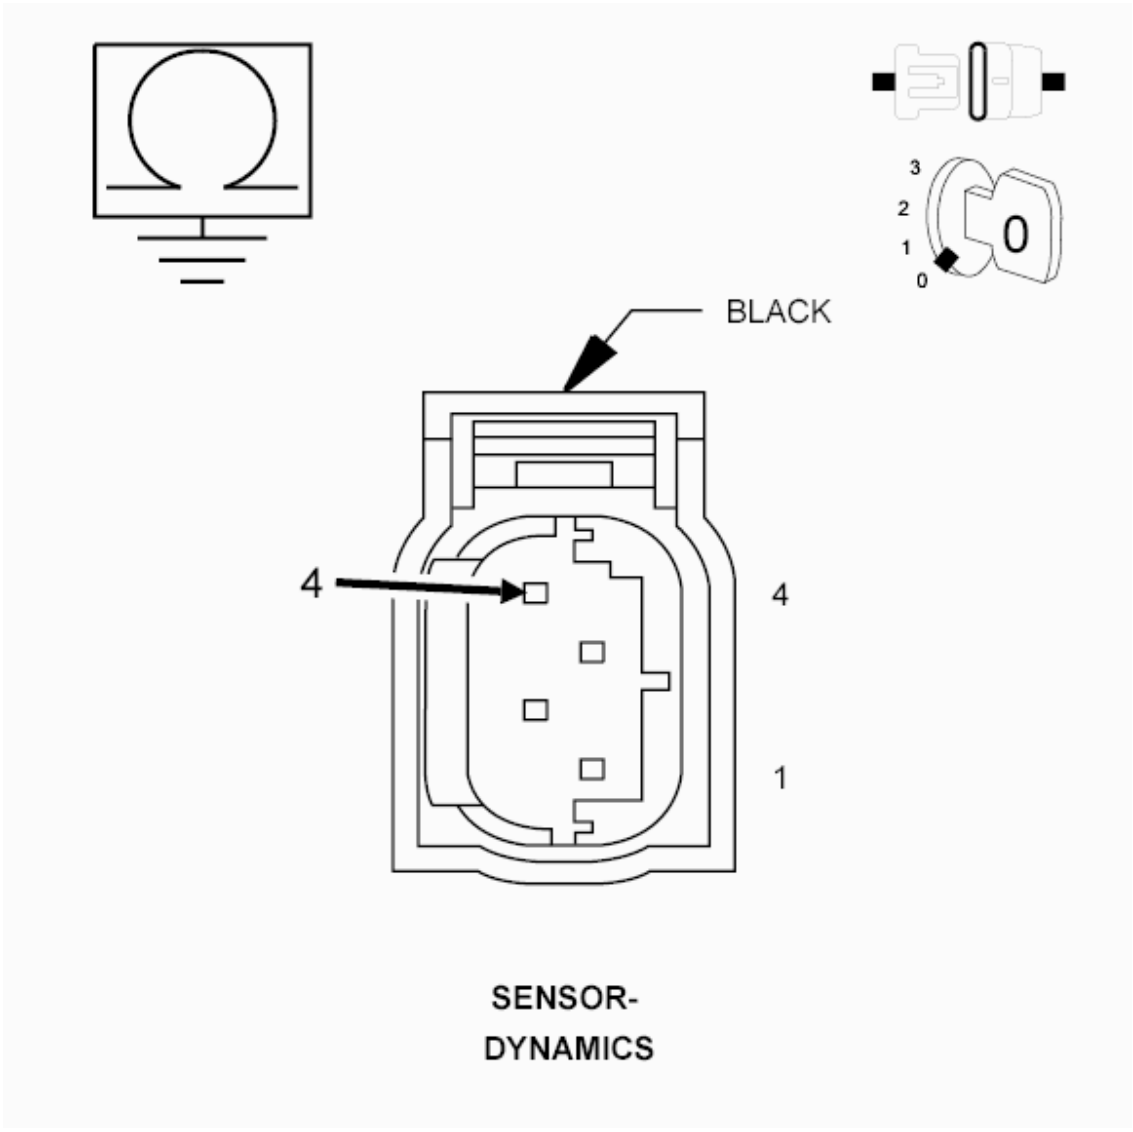

Fig. 74: Checking Sensor Cluster Supply Circuit Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (G4) Sensor Cluster Supply circuit.

   Is the resistance below 5.0 ohms?

   Yes

   - Repair the (G4) Sensor Cluster Supply circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

- Go to step 6

6. **(G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORT TO VOLTAGE**

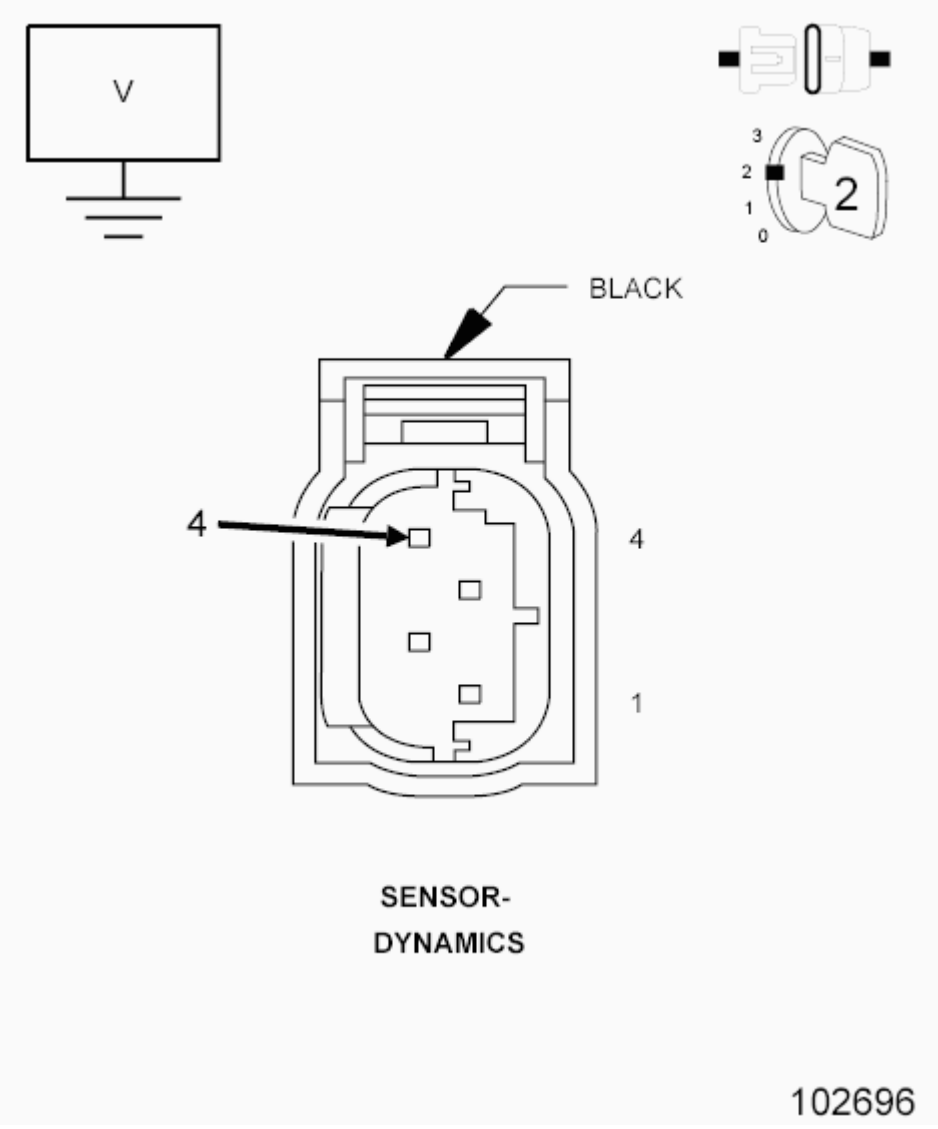

Fig. 75: Checking Voltage On Sensor Cluster Supply Circuit
Courtesy of CHRYSLER LLC

1. Turn the ignition on.
2. Measure the voltage of the (G4) Sensor Cluster Supply circuit.

   Is there any voltage present?

   Yes

   - Repair the (G4) Sensor Cluster Supply circuit for a short to voltage.

- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 7

7. **SENSOR CLUSTER**

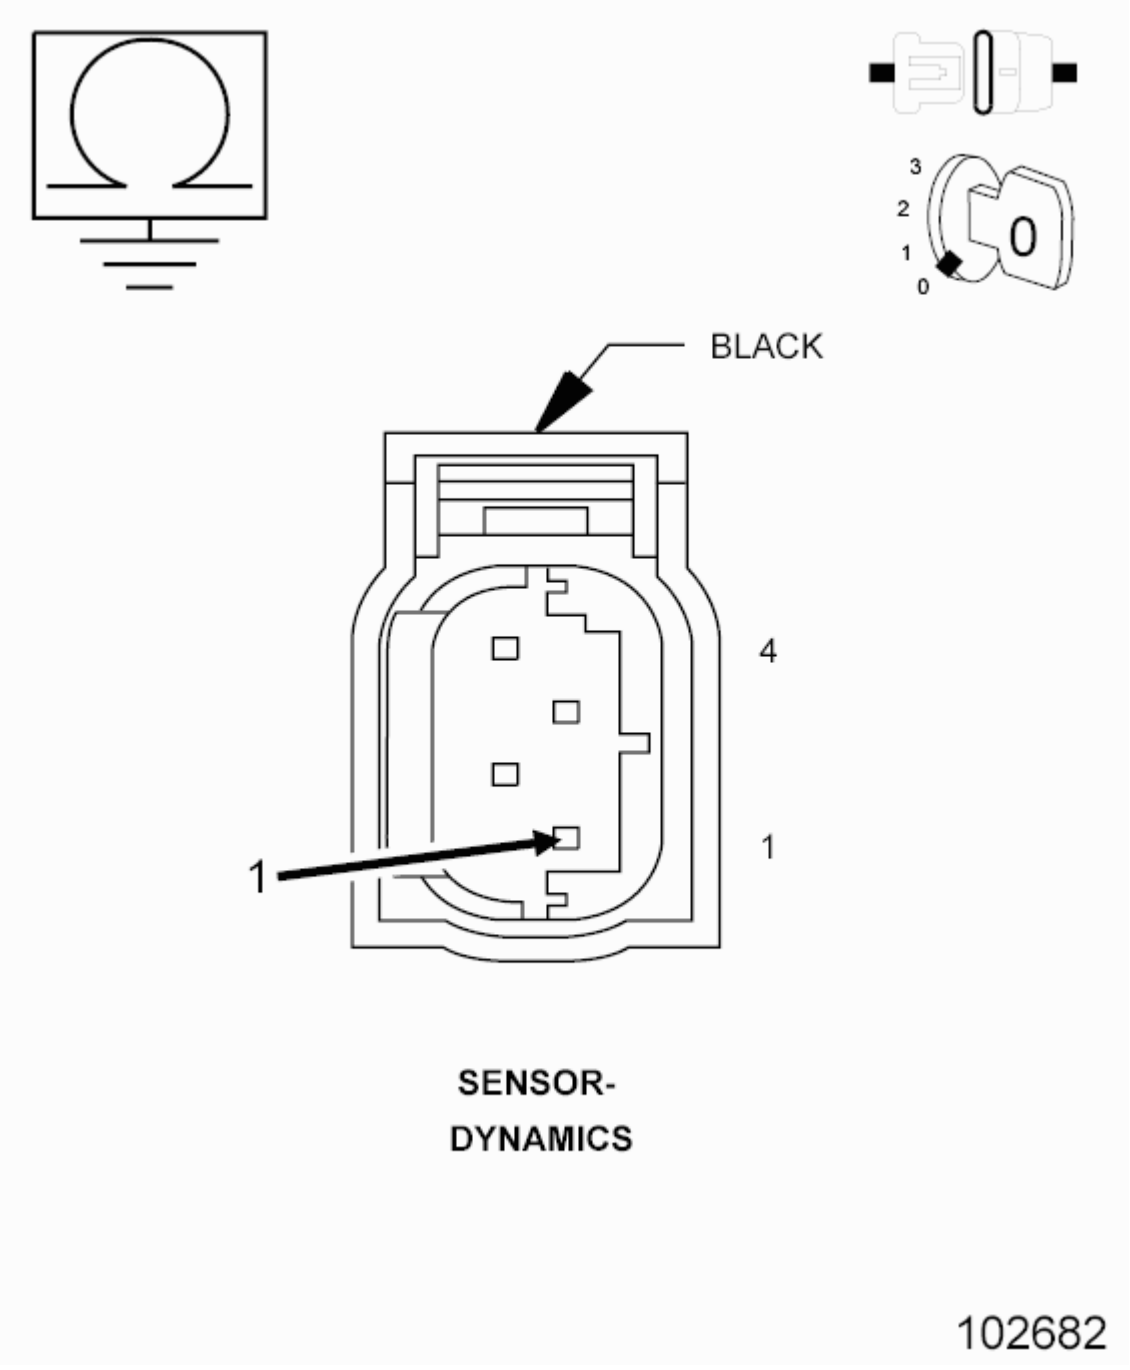

Fig. 76: Checking Resistance Between Dynamics Sensor Ground Circuit & Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. If necessary, disconnect the Sensor Cluster harness connector.
3. If necessary, connect the Anti-Lock Brake Module harness connector.
4. Measure the resistance between the (G94) Sensor Cluster Ground Circuit at the Sensor Cluster harness connector and ground.

   Is the resistance below 5.0 ohms?

   Yes

   - Replace the Sensor Cluster in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 8

8. **(G94) SENSOR CLUSTER GROUND CIRCUIT SHORT TO VOLTAGE**

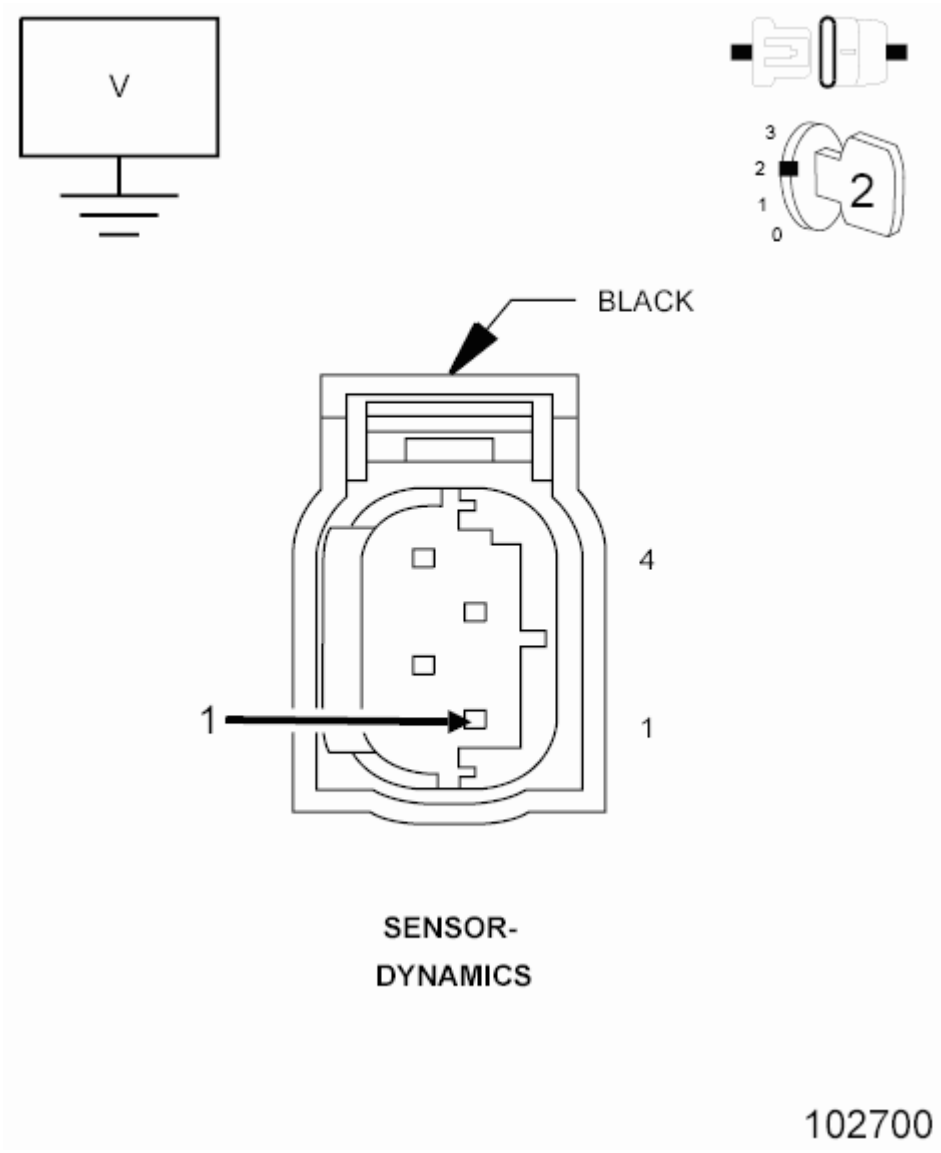

Fig. 77: Checking Sensor Cluster Ground Circuit Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.
2. Measure the voltage of the (G94) Sensor Cluster Ground circuit.

   Is there any voltage present?

   Yes

   - Repair the (G94) Sensor Cluster Ground circuit for a short to voltage.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 9

9. **(G94) SENSOR CLUSTER GROUND CIRCUIT OPEN**

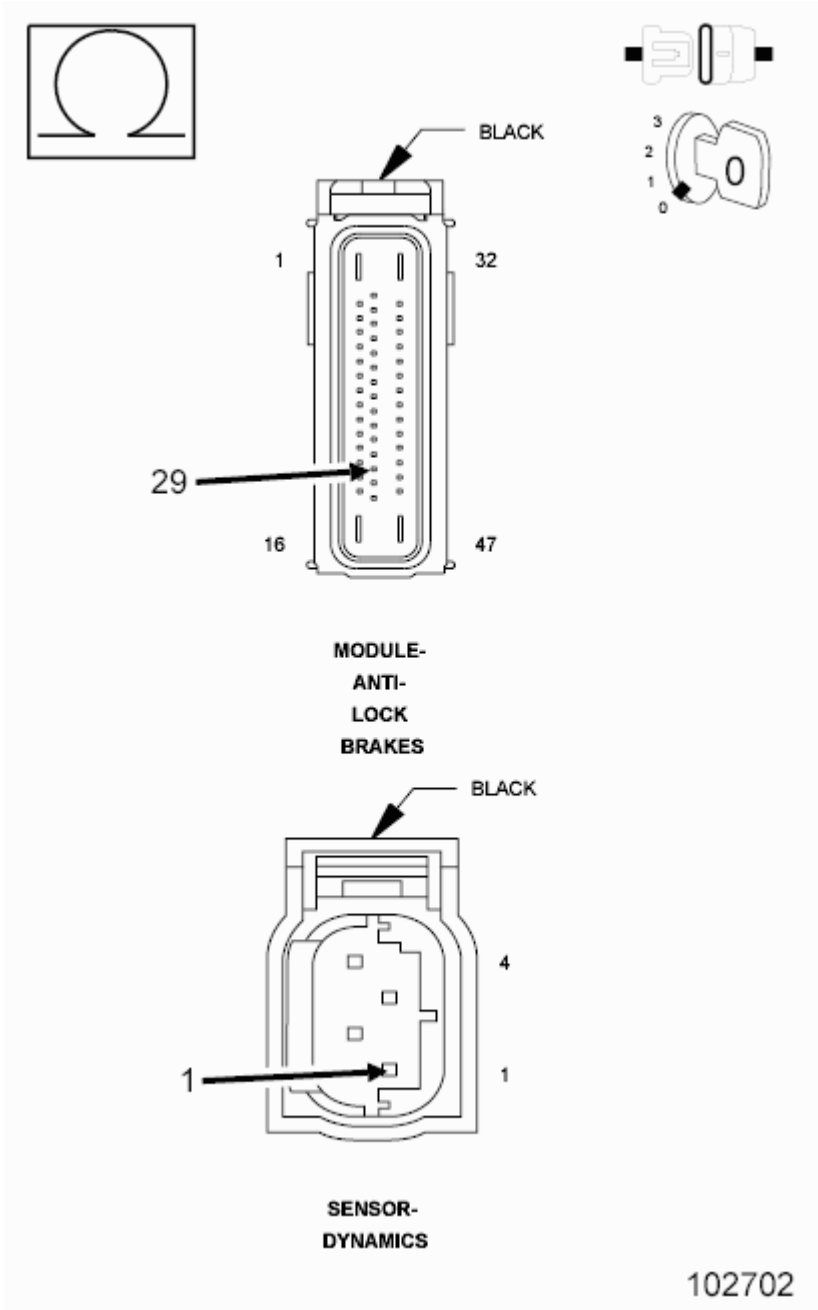

Fig. 78: Checking Sensor Cluster Ground Circuit Open
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance of the (G94) Sensor Cluster Ground circuit

Is the resistance below 5.0 ohms?

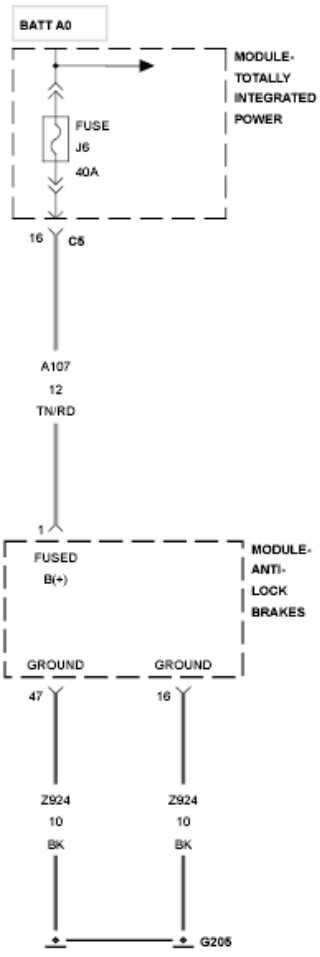
Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Repair the (G94) Sensor Cluster Ground circuit for an open.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE



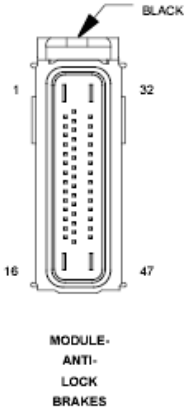


Fig. 79: ABS Pump Motor Fuse & Fused B(+) Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on and the ABS pump motor deactivated.

- **Set Condition:**

  When the Anti-Lock Brake Module indicates the ABS Pump Motor supply voltage is below 6.0 volts, the circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
ABS PUMP MOTOR FUSE OPEN
(A107) FUSED B(+) CIRCUIT SHORTED TO GROUND OR OPEN
(Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR A DTC C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.

      CAUTION: Make sure braking capability is available before road testing.

   5. Drive the vehicle over 40 Km/h (25 mph).
   6. Park the vehicle and cycle the ignition switch from off to on.
   7. With the scan tool, read and record DTCs

      Does the scan tool display: C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE?

      Yes

      - Go to step 2

      No

- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK ABS PUMP OPERATION WITH SCAN TOOL**
   1. Cycle ignition switch off to on.
   2. With the scan tool, actuate the ABS Pump Motor.

      Did the ABS Pump Motor operate?

      Yes

      - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 3
3. **CHECK THE ABS PUMP MOTOR FUSE FOR AN OPEN**
   1. Turn the ignition off.
   2. Remove and inspect the ABS Pump Motor fuse.

      Is the ABS Pump Motor fuse open?

      Yes

      - Go to step 4

      No

      - Go to step 5
4. **CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Check the (A107) Fused B(+) circuit in the wiring harness for a short to ground.

      Is the (A107) Fused B(+) circuit in the wiring harness OK?

      Yes

      - Go to step 5

      No

      - Repair the (A107) Fused B(+) circuit as necessary. Replace the fuse.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

5. **CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

   NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires. Check all related connectors for broken, bent, pushed out, or corroded terminals.

   1. Inspect the Anti-Lock Brake Module harness connector and (A107) Fused B(+) circuit in the wiring harness.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Go to step 6

6. **(A107) FUSED B(+) CIRCUIT OPEN**

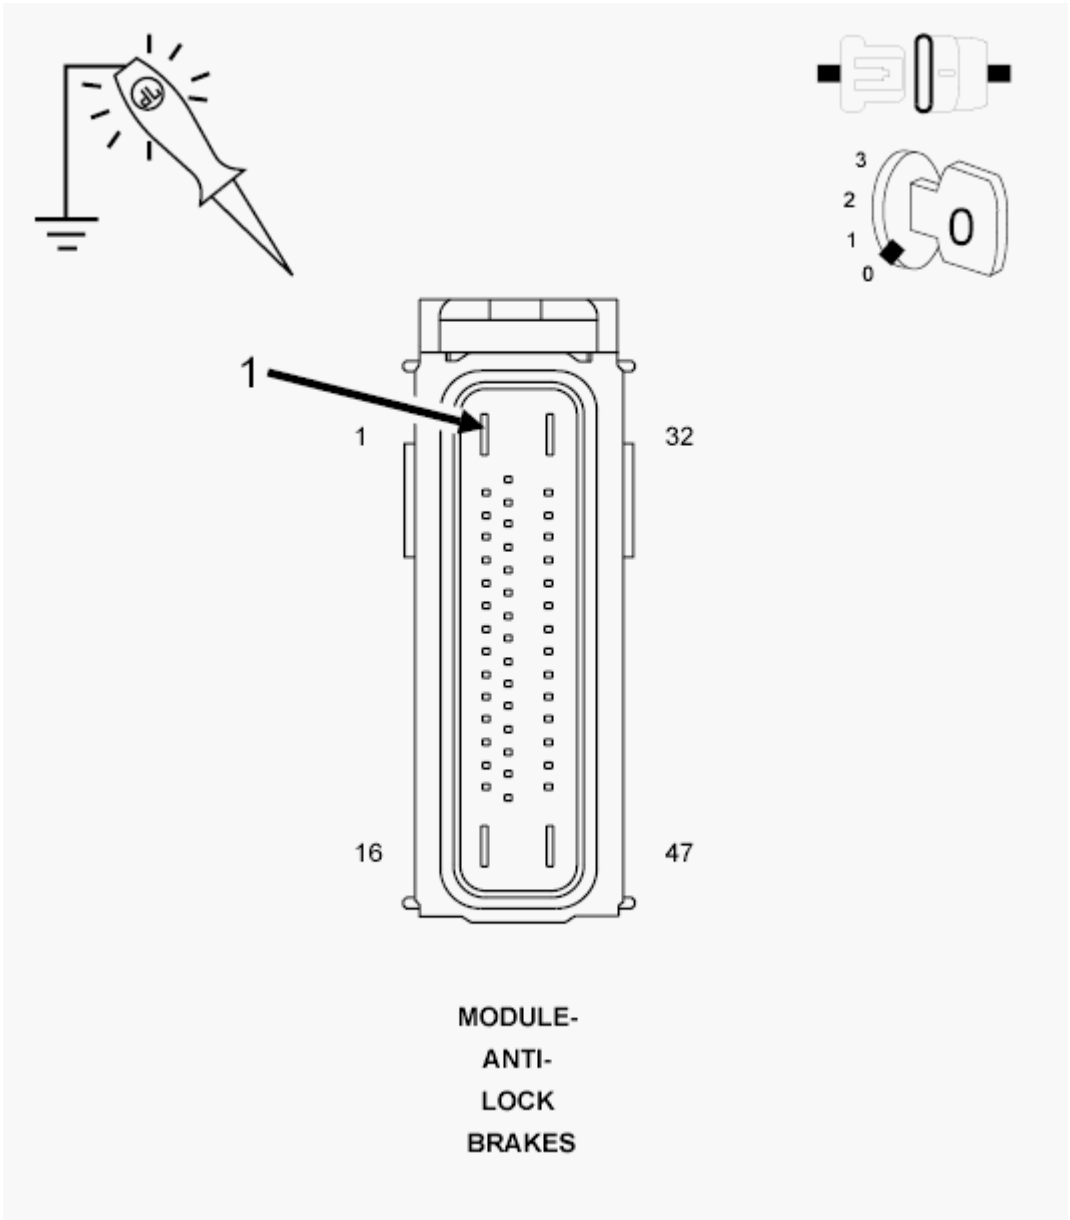

Fig. 80: Checking Anti-Lock Brake Module Harness Connector
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Anti-Lock Brake Module harness connector.
3. Using a 12-volt test light connected to ground, check the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to step 7

No

- Repair the (A107) Fused B(+) circuit for an open circuit or high resistance.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

7. **GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE**

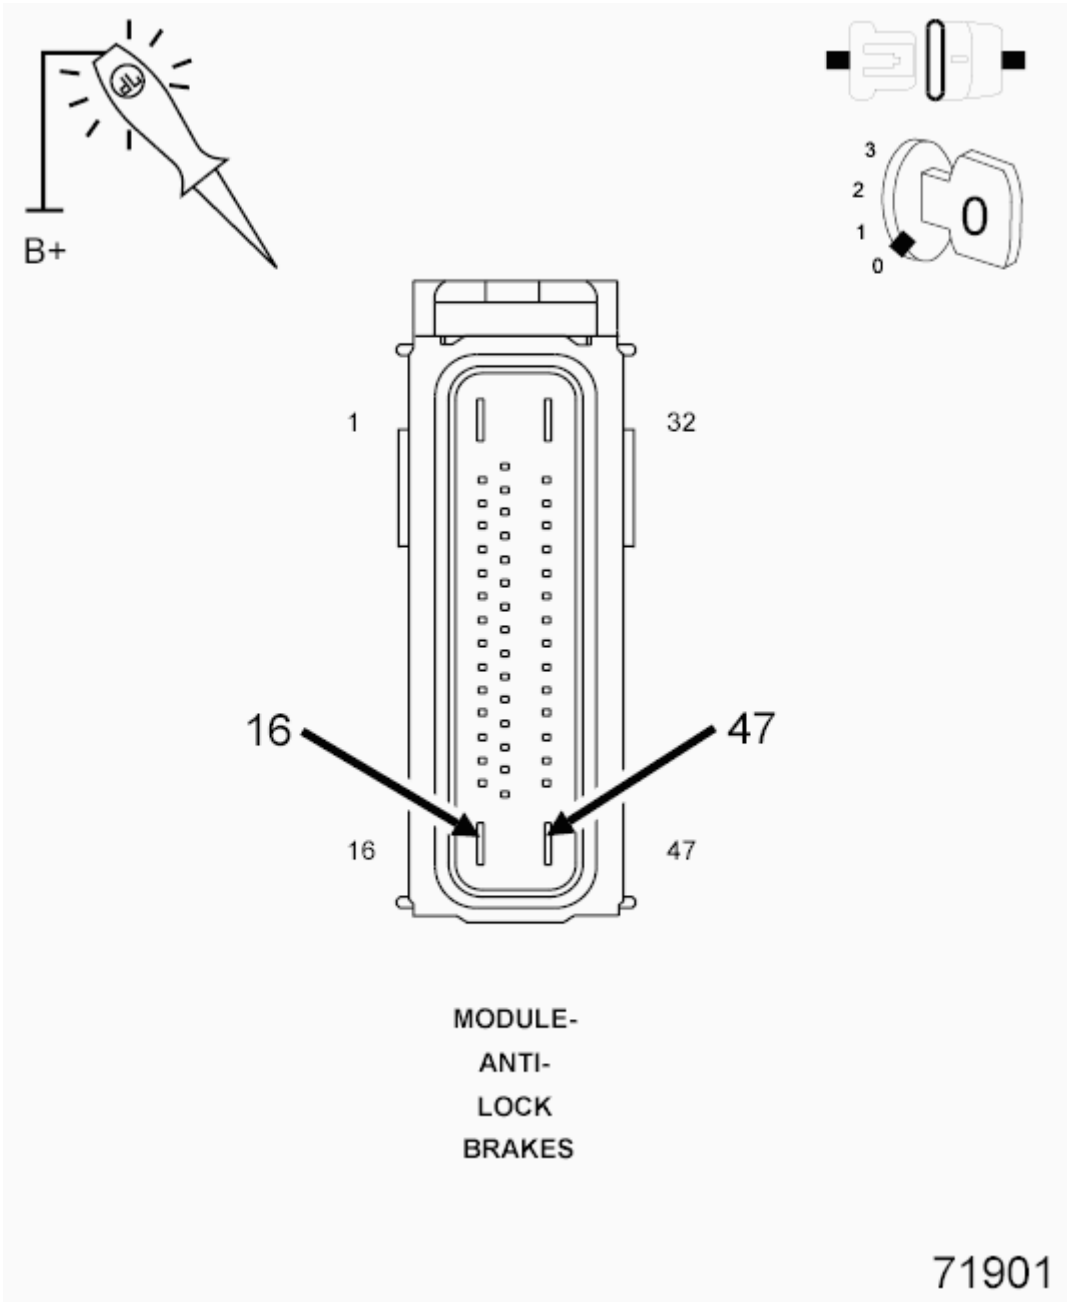

Fig. 81: Checking Ground Circuit Open Or High Resistance
Courtesy of CHRYSLER LLC

1. Using a 12-volt test light connected to 12-volts, check the (Z924) Ground circuits.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Repair the Ground circuit(s) for an open circuit or high resistance.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C2202-ORIGINAL VIN MISMATCH/MISSING

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  At power up, VIN is read off the CAN bus.

- **Set Condition:**

  The VIN stored in the ABM does not match the VIN read off of the CAN bus.

Possible Causes
ABM MOVED FROM DIFFERENT VEHICLE WRONG VIN PROGRAMMED INTO VEHICLE

Diagnostic Test

1. **CHECK FOR A DTC C2202-ORIGINAL VIN MISMATCH/MISSING**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. Perform ECU initialization with drive test. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.
   5. Start the engine.
   6. With the scan tool, read and record DTCs.

   Does the scan tool display: C2202-ORIGINAL VIN MISMATCH/MISSING?

Yes

- Go to step 2

No

- ABM has learned new VIN.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **WRONG VIN PROGRAMMED INTO VEHICLE**

   Is the VIN stored in the ABM and PCM the same?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Reprogram the VIN per service information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C2204-DYNAMICS SENSOR INTERNAL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously, with ignition on, until vehicle speed exceeds 12.4 mph (20 km/h) for the first time, but not if the sensor voltage is out of range.

- **Set Condition:**

  If the Anti-Lock Brake Module detects that the Yaw or Lateral Sensor signal is out of range.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: If present, diagnose and repair DTC C123C-DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE before diagnosing this DTC.

1. Turn the ignition on.
2. With the scan tool, read and record the ABS DTCs.
3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase the ABS DTCs.
5. Cycle the ignition switch.

WARNING: Make sure brake capability is available before road testing.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set. It may be necessary to test drive the vehicle within the DTC monitoring and set conditions in order for this DTC to set.

6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 6 and 12 mph (10 and 20 km/h).
7. Park the vehicle.
8. With the scan tool, read the ABS DTCs.

Does this DTC reset?

Yes

- Replace the Dynamics Sensor in accordance with the Service Information.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C2205-STEERING ANGLE SENSOR INTERNAL

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With ignition on, but not if supply voltage faults are detected.

- **Set Condition:**

If the Anti-Lock Brake Module detects that the Steering Angle Sensor sends an internal failure message.

Possible Causes
CLOCKSPRING (SAS)

Diagnostic Test

1. **CHECK FOR A DTC C2205-STEERING ANGLE SENSOR INTERNAL**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase DTCs.

   WARNING: Ensure brake capability is available before road testing.

   5. Start the vehicle and turn the wheel from lock to lock.
   6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).
   7. Park the vehicle.
   8. With the scan tool, read and record DTCs.

   Does the scan tool display: C2205-STEERING ANGLE SENSOR INTERNAL?

   Yes

   - Replace the Clockspring (SAS) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Perform the ABS-INTERMITTENT CONDITION diagnostic procedure. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

C2206-VEHICLE CONFIGURATION MISMATCH

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  When the Anti-Lock Brake Module detects the signal from the gateway module relevant for vehicle characteristic is missing for a period greater than the specified fault duration.

Possible Causes
VEHICLE CONFIGURATION MISMATCH

Diagnostic Test

1. **CHECK FOR A DTC C2206-VEHICLE CONFIGURATION MISMATCH**

   NOTE: This DTC must be active for the results of this test to be valid. Diagnose and repair any communication DTCs in the Front Control Module (FCM) before continuing with this test.

   NOTE: Diagnose and repair any system under voltage or over voltage DTCs before continuing with this test.

   1. Turn the ignition on.
   2. With the scan tool, read the DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Cycle the ignition switch off then on.
   6. With the scan tool, read the DTCs.

   Does the scan tool display: C2206-VEHICLE CONFIGURATION MISMATCH?

   Yes

   - With the scan tool select FCM under ECU selection then Misc Functions and Restore Vehicle Configuration.

   No

   - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

U0100-LOST COMMUNICATION WITH ECM/PCM

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 volts.

  IOD fuse installed.

  TIPM is configured correctly.

- **Set Condition:**

  Bus messages not received from the Engine Control Module/Powertrain Control Module (ECM/PCM) for approximately 2 to 5 seconds.

Possible Causes
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ECM/PCM POWER AND GROUND
ECM/PCM
MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

   NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** .

      No

      - Perform the appropriate Stored Lost Communication test procedure. Refer to **Non-DTC**

Diagnostics/Communication - Diagnosis and Testing .

U0101-LOST COMMUNICATION WITH TCM

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

  Battery voltage between 10 and 16 volts.

  IOD fuse installed.

  TIPM is configured correctly.

- **Set Condition:**

  Bus messages not received from the Transmission Control Module (TCM) for approximately 2 to 5 seconds.

Possible Causes
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TCM POWER AND GROUND
TCM
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

   NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

No

- Refer to the Stored Lost Communication test procedure. Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** .

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Diagnose and repair the DTC. Check the Index for a complete list of the symptoms.

      No

      - Go to step 3

3. **VERIFY THAT THE TCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, select Network Diagnostics.
   3. Verify that the TCM is active on the bus.

      Is the TCM active on the bus?

      Yes

      - Go to step 4

      No

      - Refer to the No Response test procedure. Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** .

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTCs "Logged Against" the TCM?

      Yes

      - Replace/update the Transmission Control Module in accordance with the service information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **DTC-Based**

Diagnostics/MODULE, Transmission Control (TCM) - Standard Procedure .

No

- Go to step 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the TCM.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the service information.
   - Perform the appropriate VERIFICATION TEST.

   No

   - Go to step 6
6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go to step 7

   No

   - The condition is not present at this time. Using the **SYSTEM WIRING DIAGRAMS** as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
   - Perform the appropriate VERIFICATION TEST.
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, select Network Diagnostics.

   Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

   Yes

   - Go to step 8

No

- Replace/update the module that set this DTC in accordance with the service information.
- Perform the appropriate VERIFICATION TEST.

8. **(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

      Is the voltage above 5 volts?

      Yes

      - Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Standard Procedure** .

      No

      - Go to step 9

9. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D65) CAN C Bus (+) circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Standard Procedure** .

      No

      - Replace the Anti-Lock Brake Module in accordance with the service information.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Anti-Lock Brake Module fails to receive bus messages from the Dynamics Sensor.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(G94) DYNAMICS SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN
DYNAMICS SENSOR
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

   NOTE: If present, diagnose and repair DTC C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read and record the ABS DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the ABS DTCs.
   5. Start the engine.

      NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set. It may be necessary to test drive the vehicle within the DTC monitoring and set conditions in order for this DTC to set.

   6. With the scan tool, read the ABS DTCs.

Does this DTC reset?

Yes

- Go to step 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **INSPECT RELATED WIRING HARNESS, TERMINALS, AND CONNECTORS**
    1. Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.
    2. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

    No

    - Go to step 3
3. **CHECK THE VOLTAGE ON THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT**

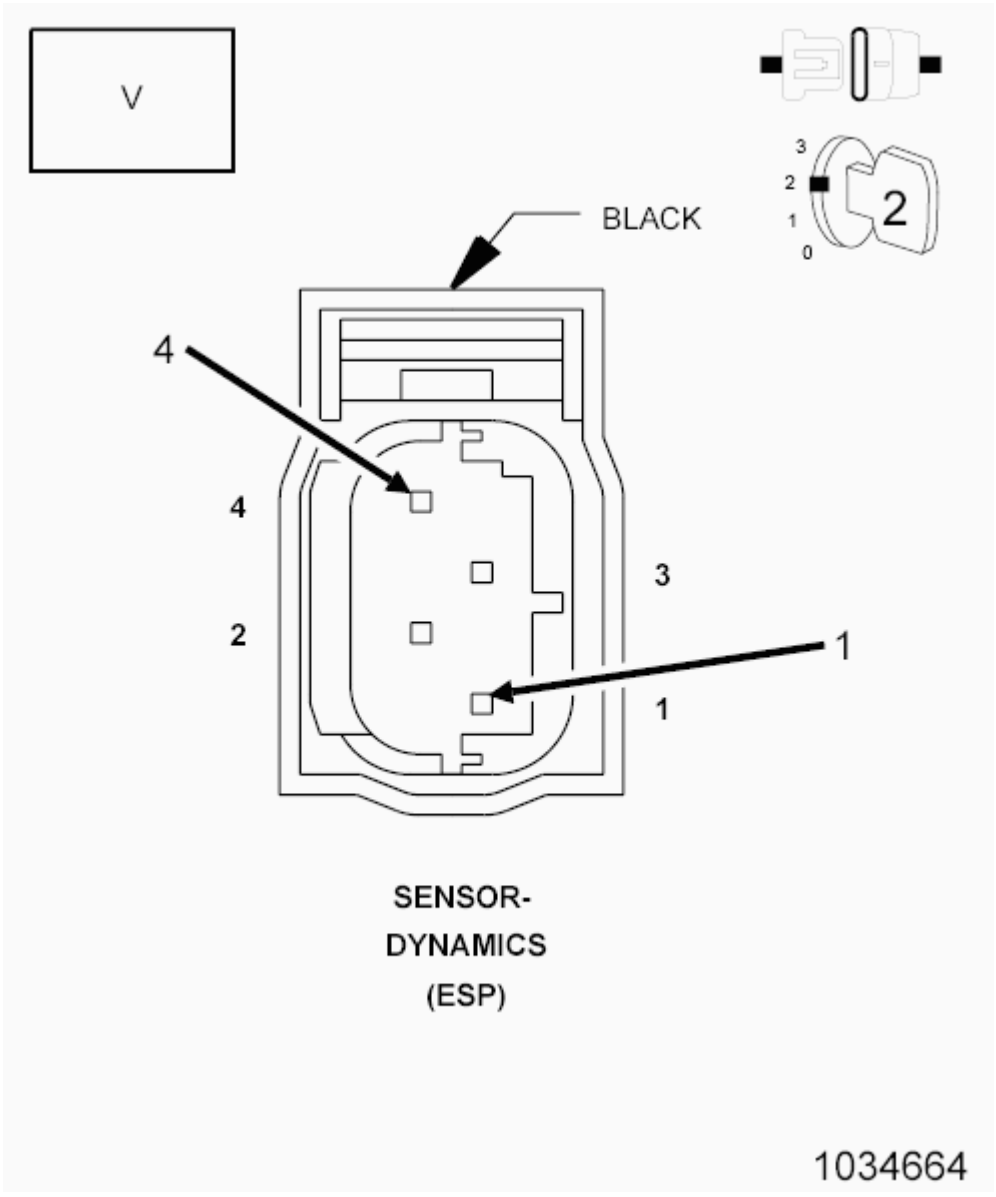

Fig. 83: Checking Voltage On Dynamics Sensor Supply Circuit
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Dynamics Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage across (G4) Dynamics Sensor Supply Circuit and (G94) Dynamics Sensor Ground Circuit.

   Is the voltage above 10 volts?

   Yes

- Go to step 10

No

- Go to step 4

4. **(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORT TO GROUND**

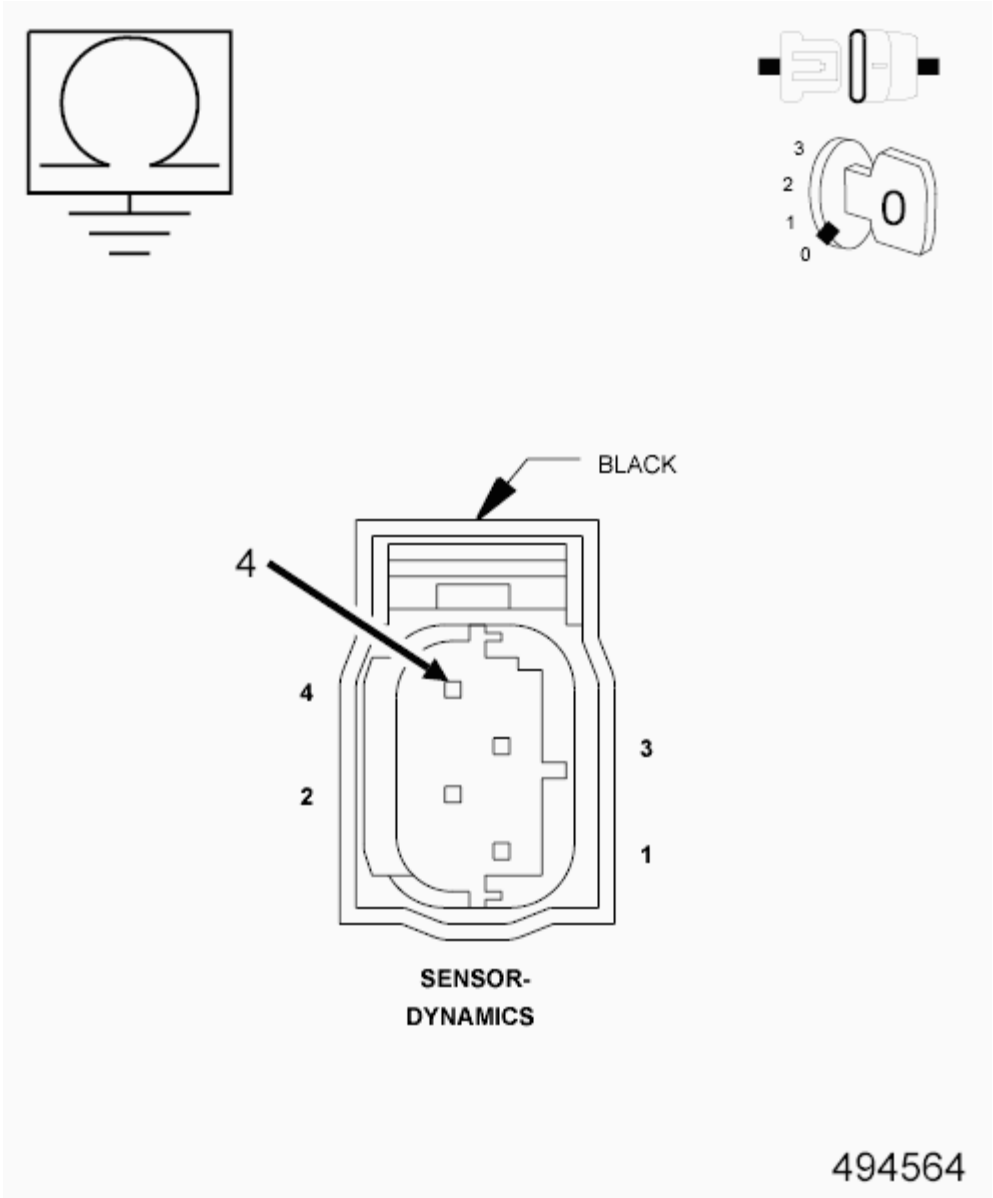

Fig. 84: Checking Dynamics Sensor Supply Circuit Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Anti-Lock Brake Module harness connector.

3. Measure the resistance between ground and the (G4) Dynamics Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (G4) Dynamics Sensor Supply circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 5

5. **(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE**

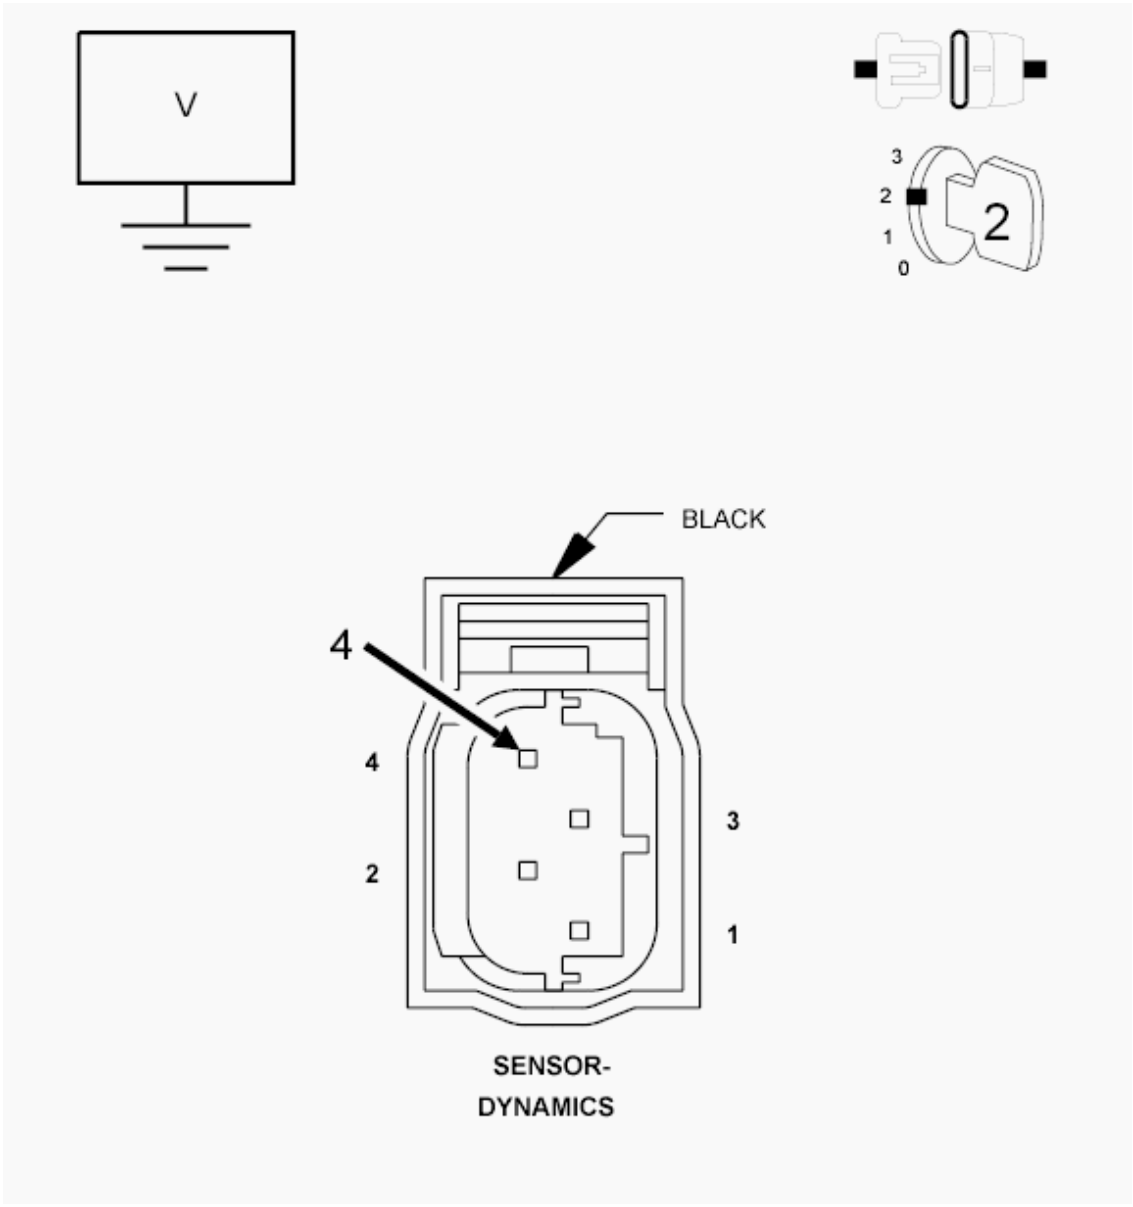

Fig. 85: Checking Dynamics Sensor Supply Circuit Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.
2. Measure the voltage of the (G4) Dynamics Sensor Supply circuit.

   Is there any voltage present?

   Yes

   - Repair the (G4) Dynamics Sensor Supply circuit for a short to voltage.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 6

6. **(G4) DYNAMICS SENSOR SUPPLY CIRCUIT OPEN**

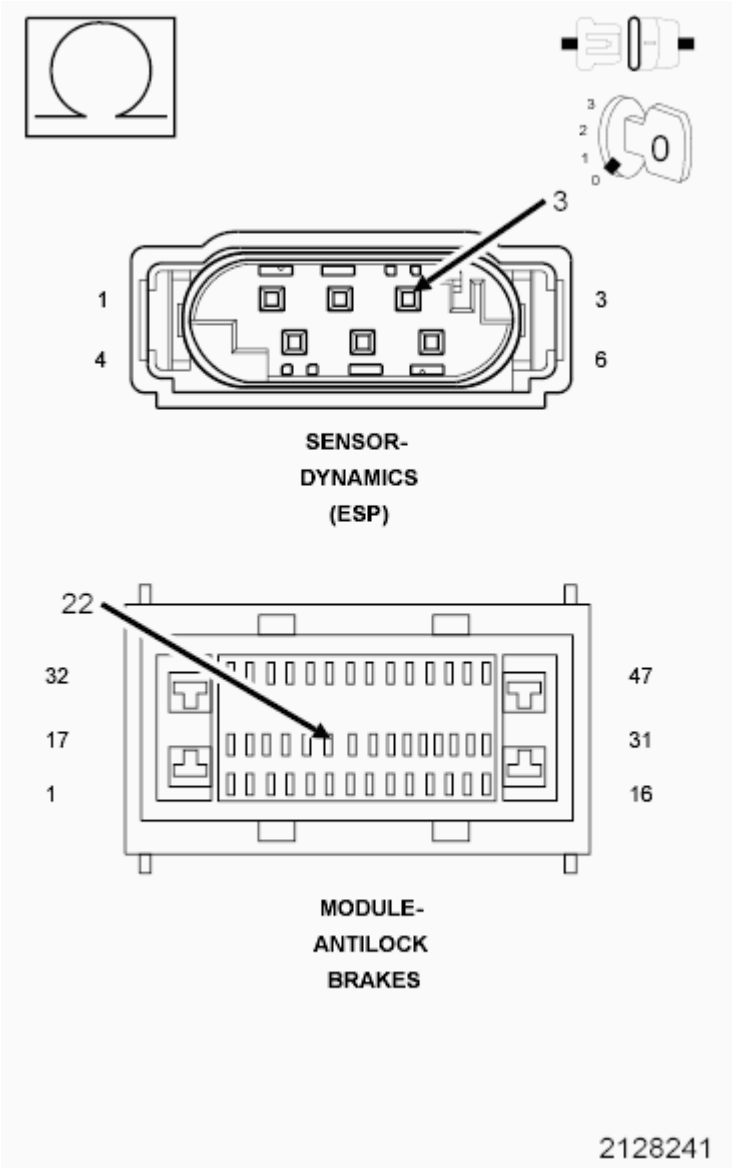

Fig. 86: Checking Dynamics Sensor Supply Circuit For High Resistance
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance of the (G4) Dynamics Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

- Go to step 7

No

- Repair the (G4) Dynamics Sensor Supply circuit for an open.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

7. **CHECK THE RESISTANCE BETWEEN THE (G94) DYNAMICS SENSOR GROUND CIRCUIT AND GROUND**

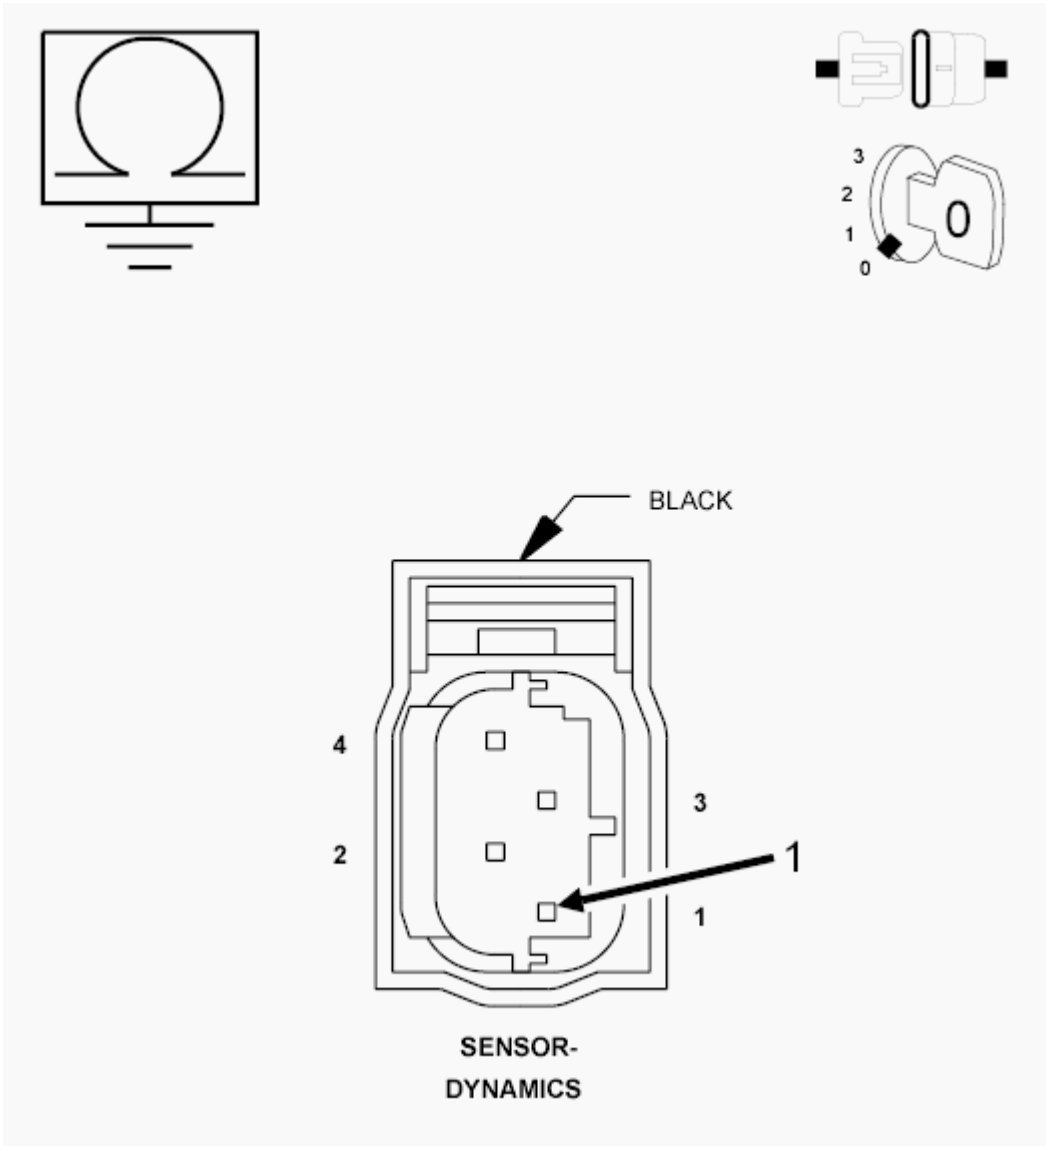

Fig. 87: Checking Resistance Between Dynamics Sensor Ground Circuit & Ground
Courtesy of CHRYSLER LLC

1. Disconnect the Dynamics Sensor harness connector.

2. Measure the resistance between the (G94) Dynamics Sensor Ground Circuit and Ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 8

8. **(G94) DYNAMICS SENSOR GROUND CIRCUIT SHORT TO VOLTAGE**

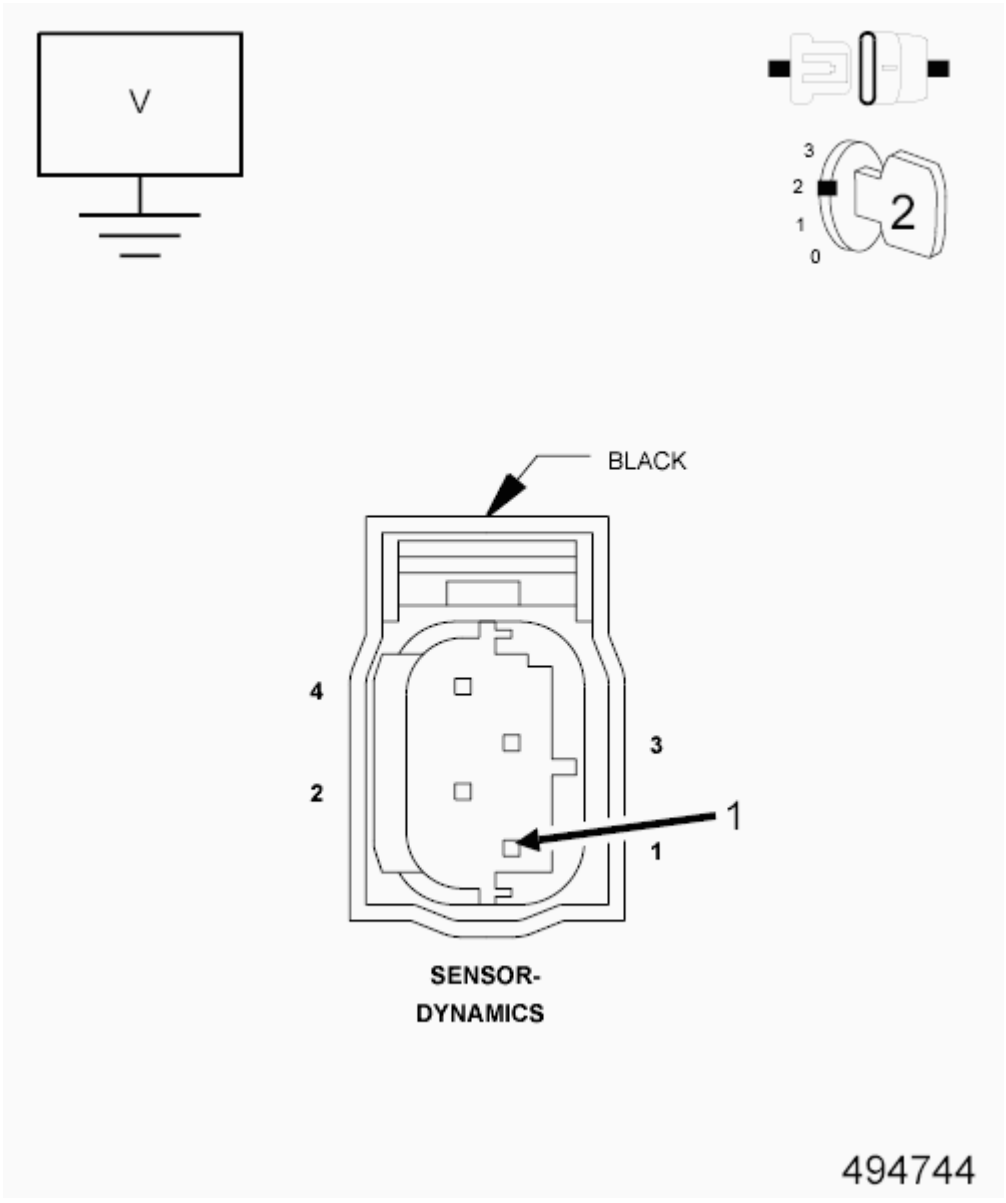

Fig. 88: Checking Dynamics Sensor Ground Circuit Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Anti-Lock Brake Module harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (G94) Dynamics Sensor Ground circuit.

   Is there any voltage present?

   Yes

   - Repair the (G94) Dynamics Sensor Ground circuit for a short to voltage.

- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 9

9. **(G94) DYNAMICS SENSOR GROUND CIRCUIT OPEN**

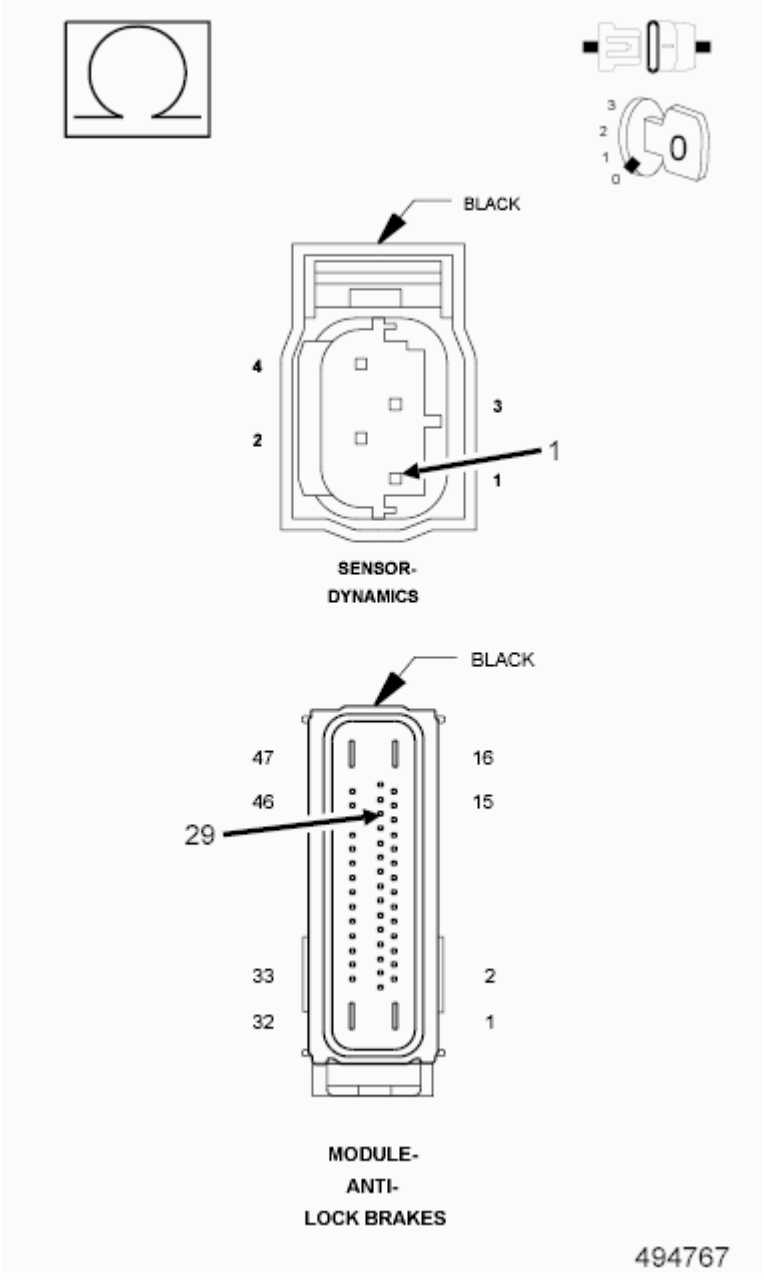

Fig. 89: Checking Dynamics Sensor Ground Circuit For High Resistance
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance of the (G94) Dynamics Sensor Return circuit between the Dynamics Sensor and the Anti-Lock Brake Module.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Repair the (G94) Dynamics Sensor Ground circuit for an open.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

10. **CHECK THE DATA LINK OUTPUT**

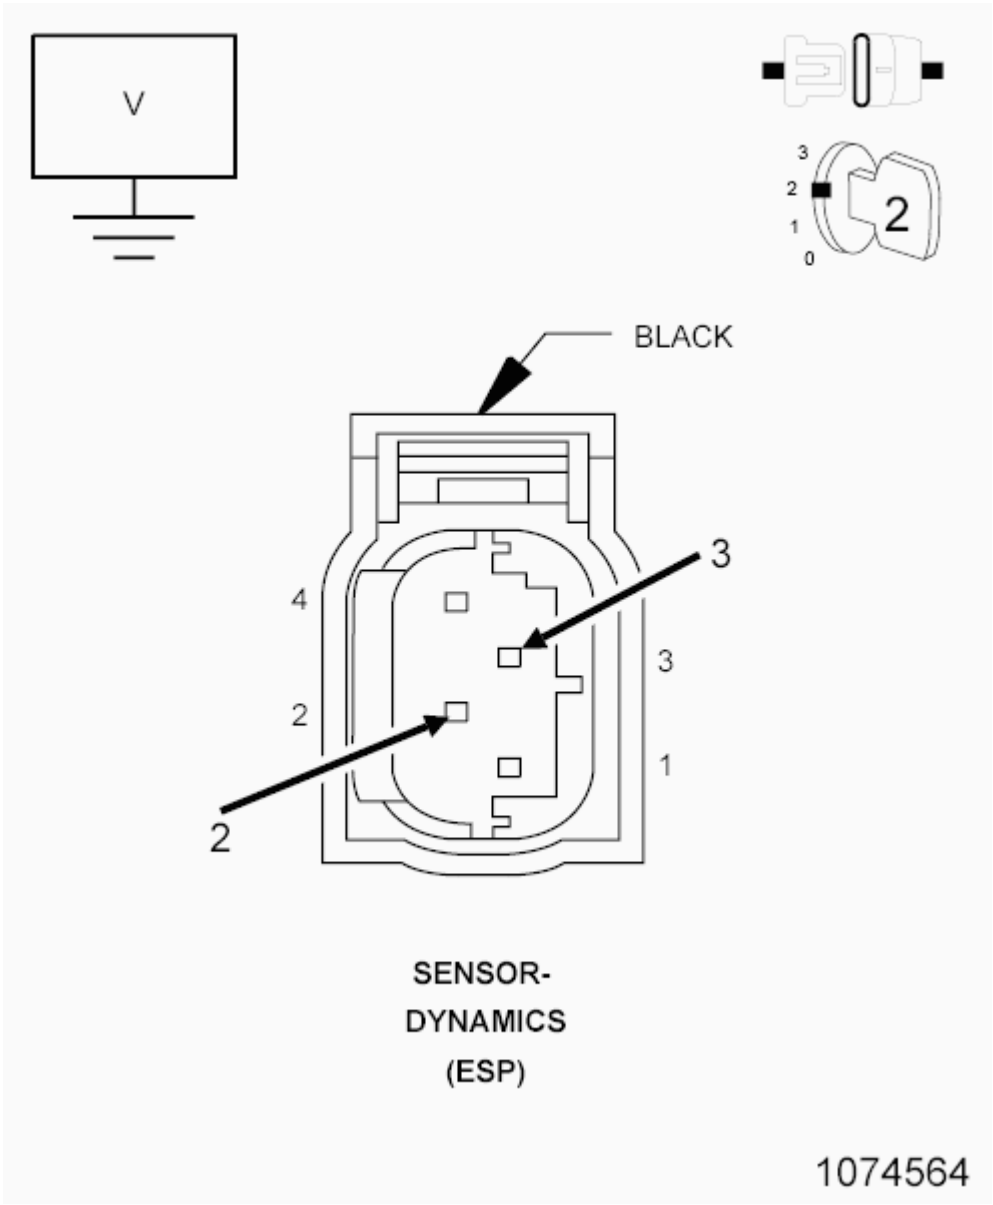

Fig. 90: Checking Data Link Output
Courtesy of CHRYSLER LLC

1. Measure the voltage of the Data Links Circuits the (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT will measure a minimum of 3 volts and the (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT will measure a minimum of 2 volts

   Is the voltage within specifications?

   Yes

   - Replace the Dynamic Sensor in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock**

Brake (ABS) - Standard Procedure.

No

- Go to step 11

11. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**

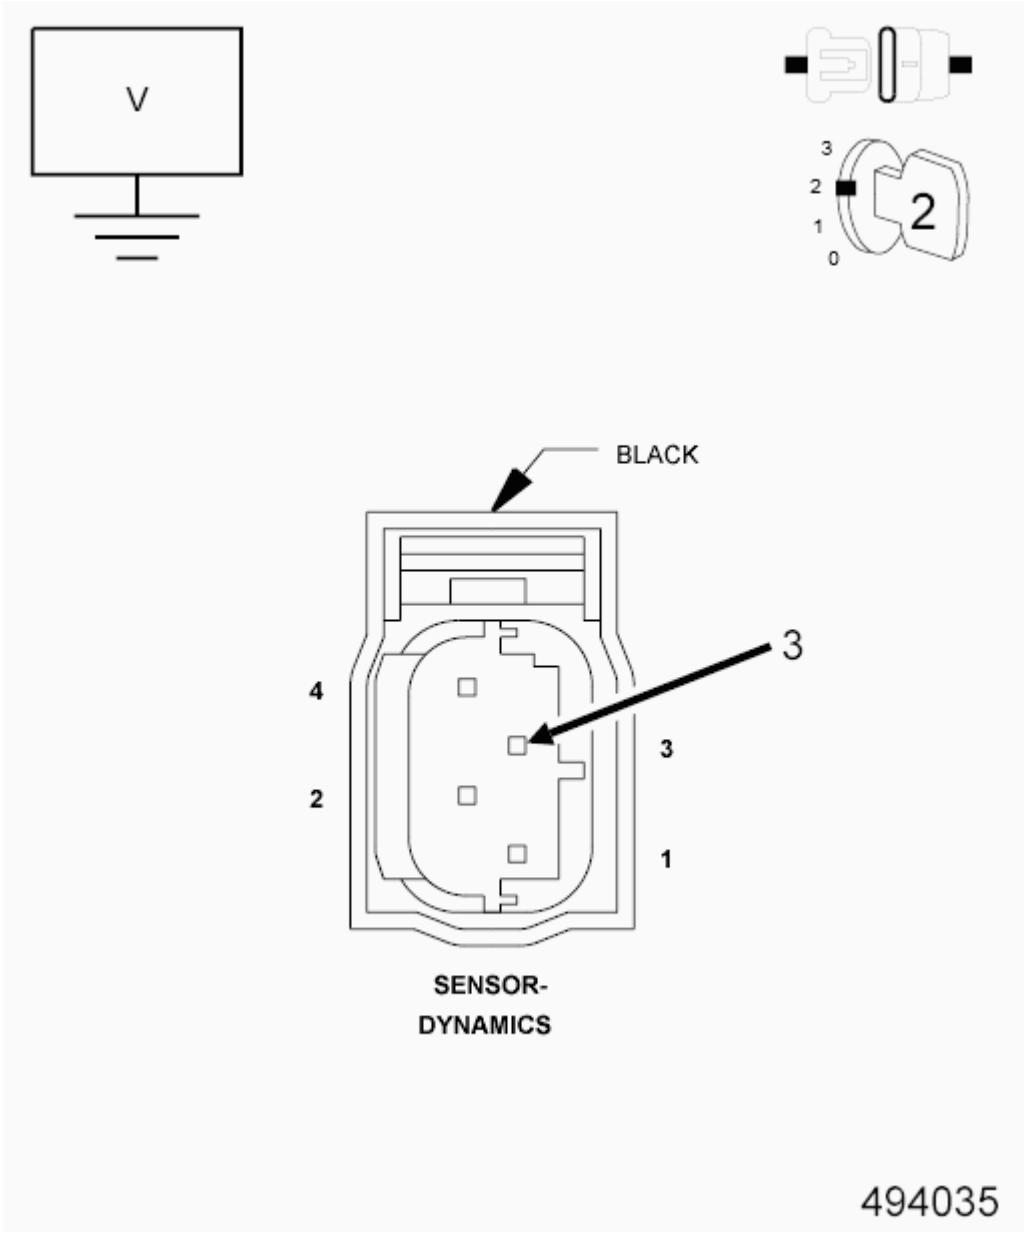

Fig. 91: Checking Dynamics Sensor High Data Link Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Disconnect the Anti-Lock Brakes Module harness connector.

2. Disconnect the Dynamics Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

   Is there any voltage present?

   Yes

   - Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 12

12. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND**

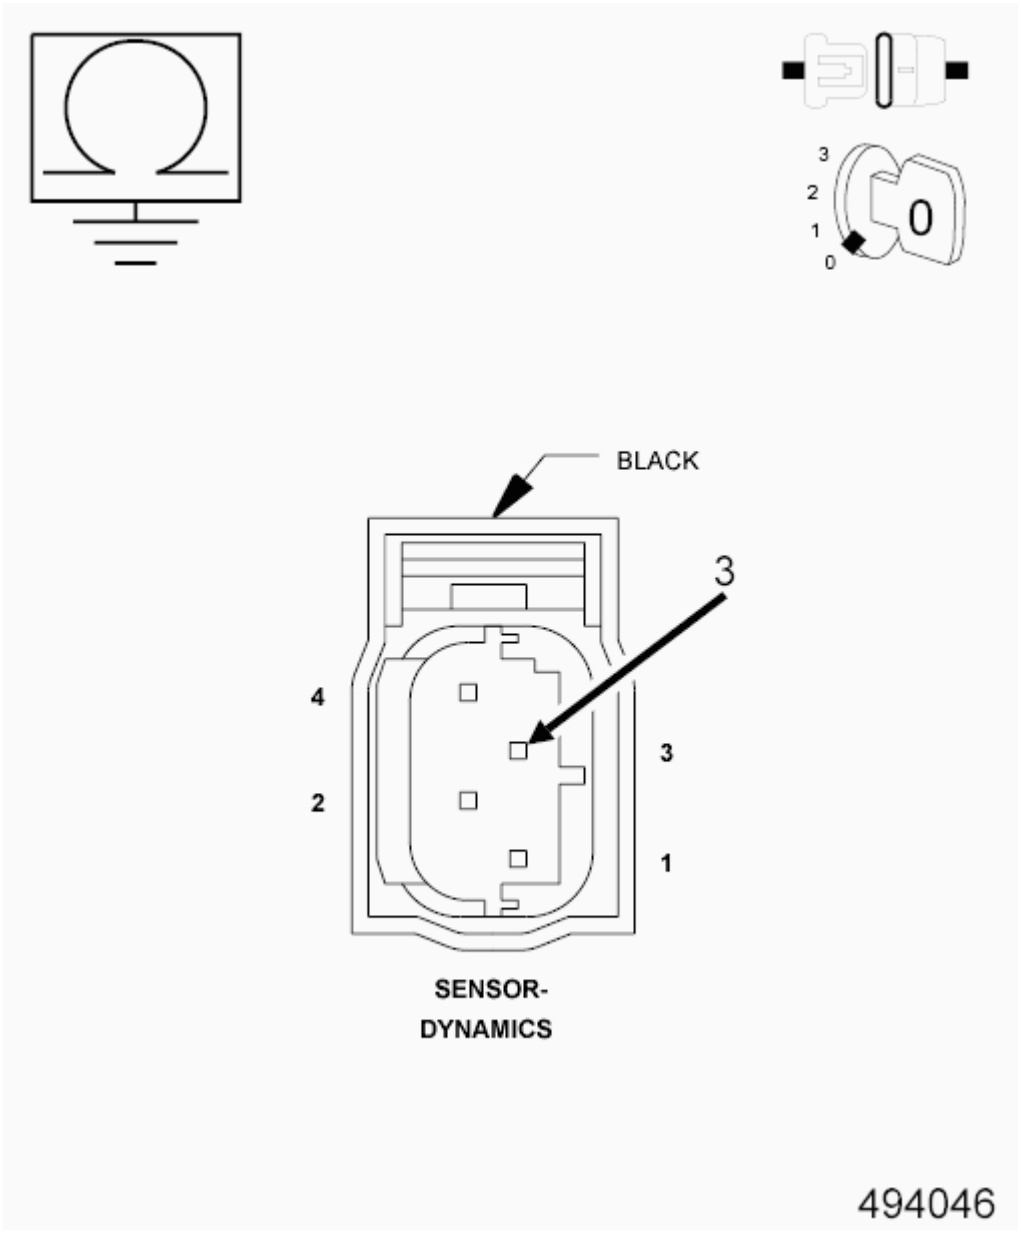

Fig. 92: Checking Dynamics Sensor High Data Link Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.

- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 13

13. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN**

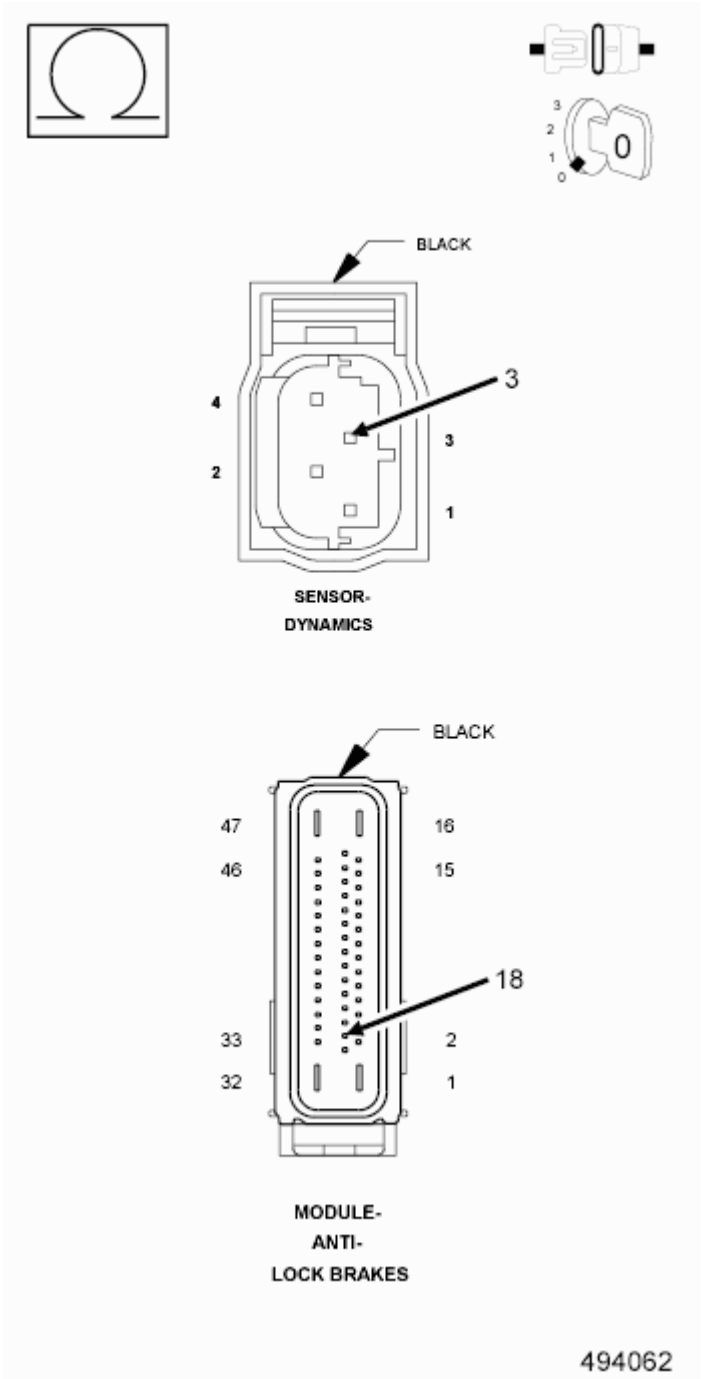

Fig. 93: Checking Dynamics Sensor High Data Link Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go to step 14

   No

   - Repair the (D465) Dynamics Sensor High Data Link circuit for an open.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

14. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**

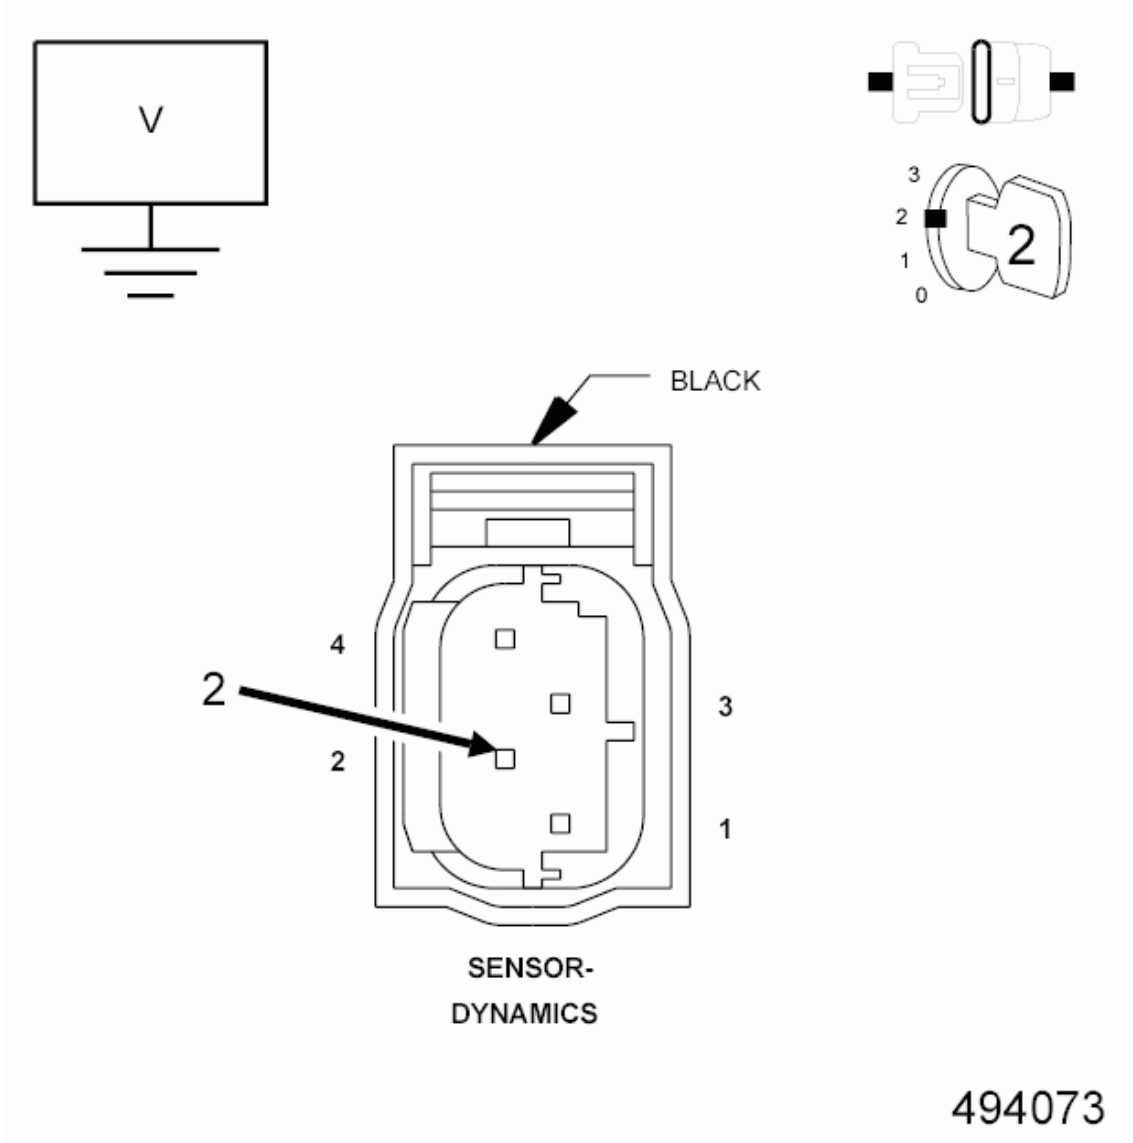

Fig. 94: Checking Dynamics Sensor Low Data Link Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.
2. Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

   Is there any voltage present?

   Yes

   - Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 15

15. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND**

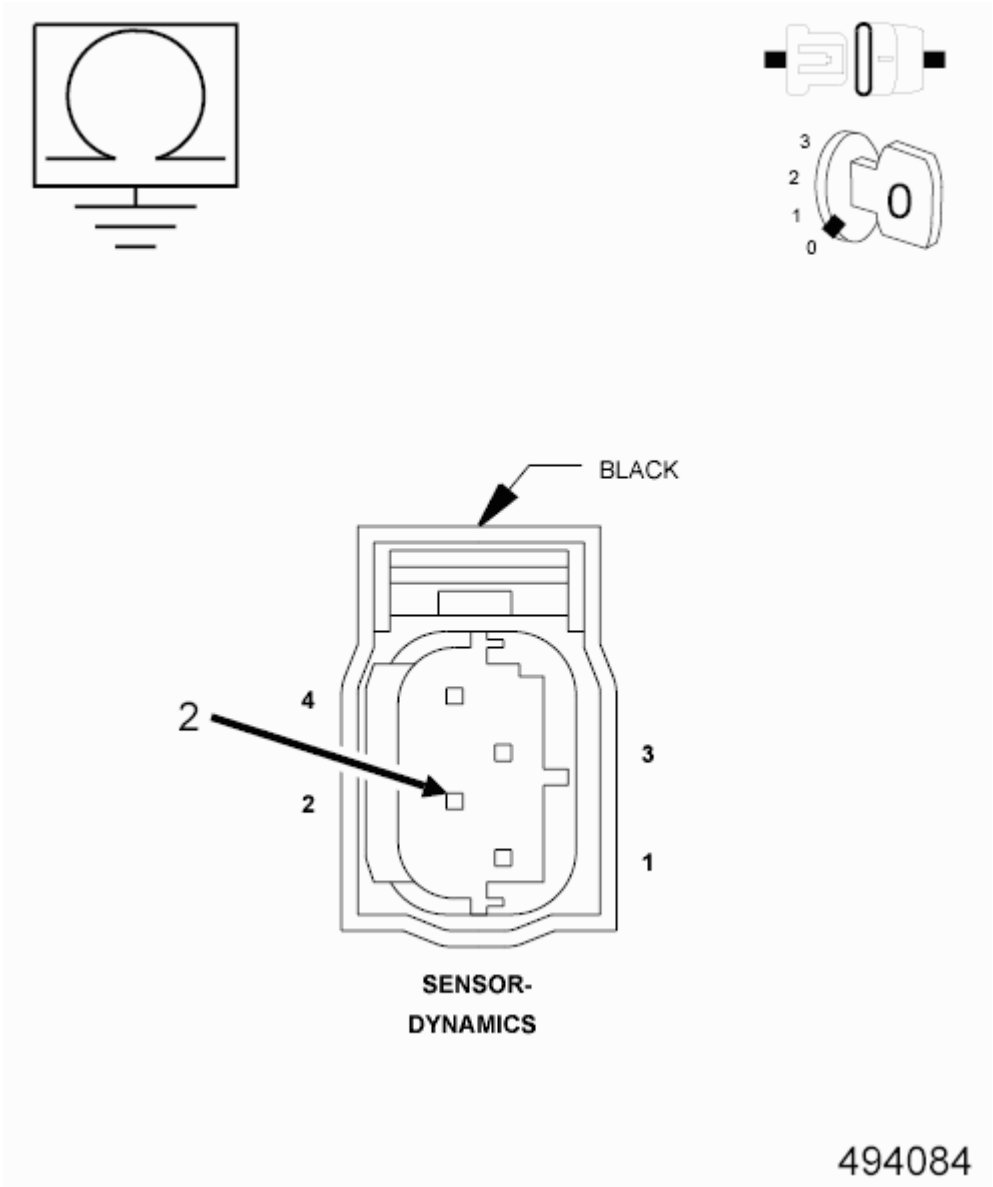

Fig. 95: Checking Dynamics Sensor Low Data Link Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 16

16. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN**

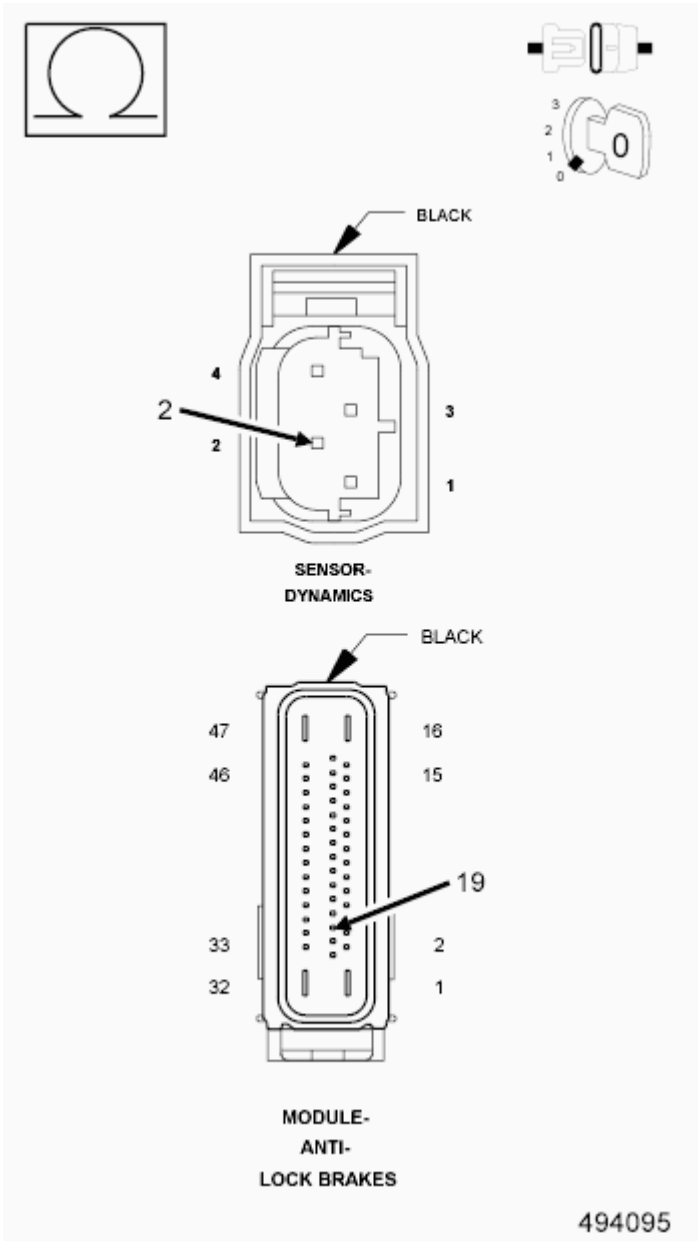

Fig. 96: Checking Dynamics Sensor Low Data Link Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brake Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Anti-Lock Brake Module in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock**

Brake (ABS) - Standard Procedure.

No

- Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR

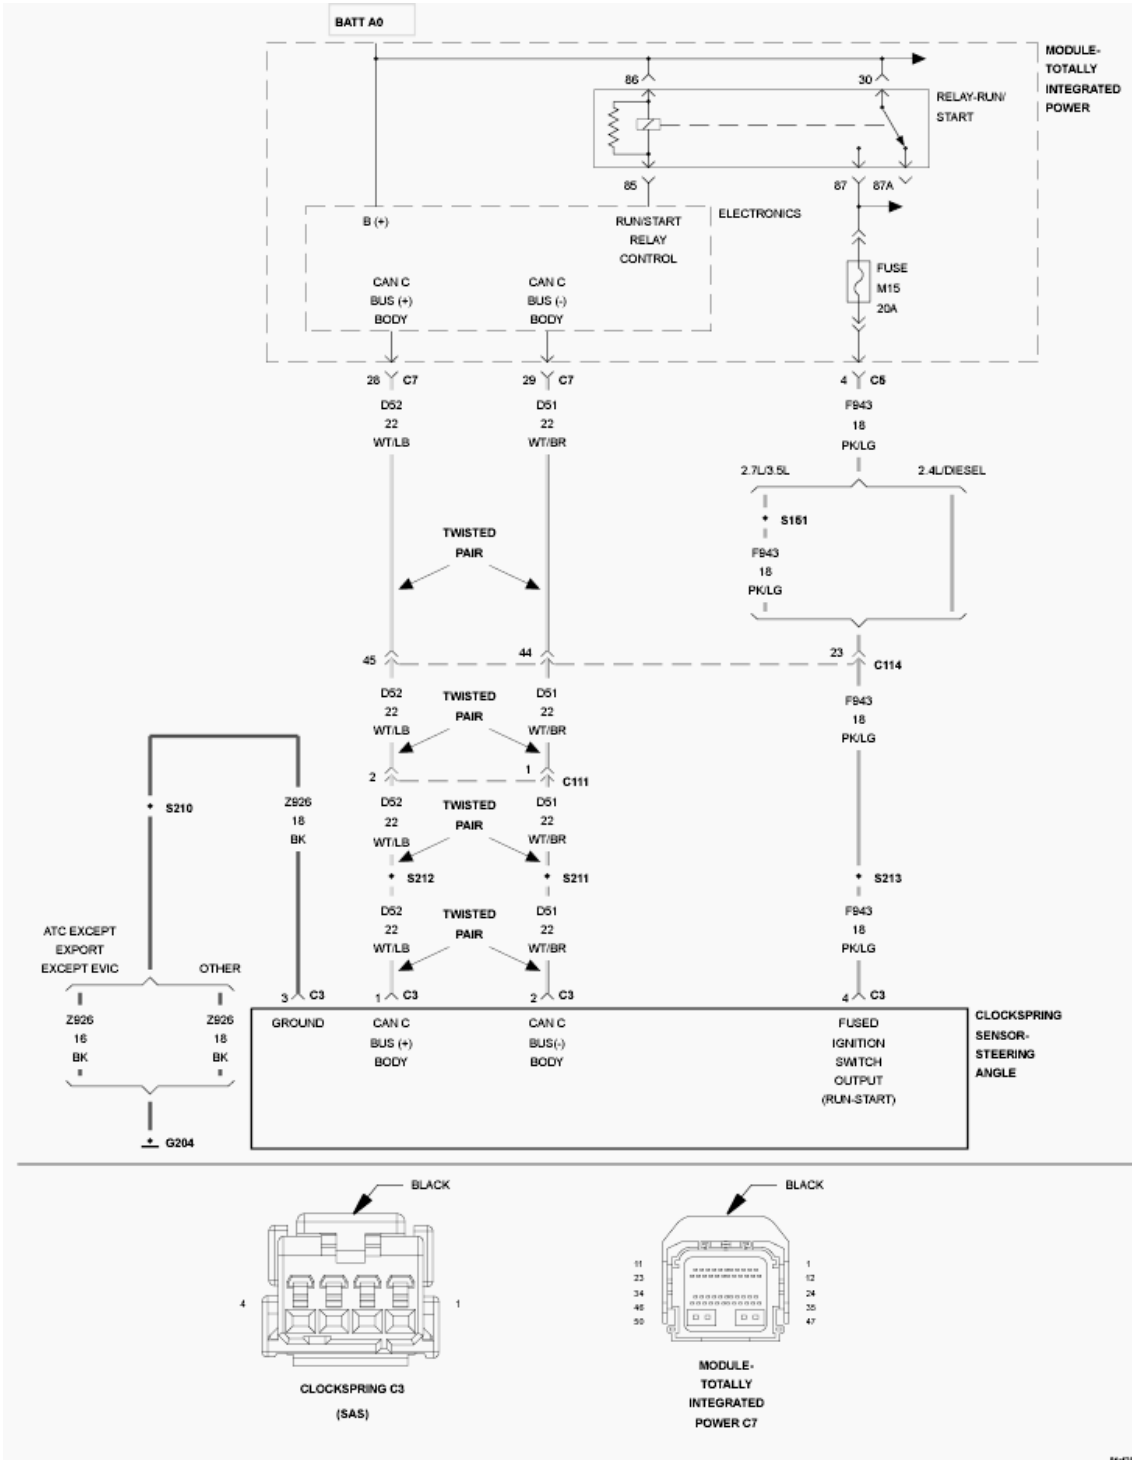

Fig. 97: Fused Ignition Switch Output Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- Ignition Off Draw (IOD) fuse installed

- **Set Condition:**

  If the Anti-Lock Brake Module fails to receive bus messages from the Steering Angle Sensor for approximately 100 ms.

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
STEERING ANGLE SENSOR POWER AND GROUND
CLOCKSPRING (SAS)

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read and record ABS DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase ABS DTCs.
   5. Cycle the ignition switch.
   6. With the scan tool, read ABS DTCs.

   Does this DTC reset?

   Yes

   - Go to step 2

   No

   - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
   - Perform the ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs**

1. With the scan tool, read all active DTCs from all CAN C Bus modules.

   NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

   Does the scan tool display any active DTCs related to the conditions listed above?

   Yes

   - Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX**.

   No

   - Go to step 3

3. **CHECK THE VOLTAGE ON THE (F943) FUSED IGNITION SWITCH OUTPUT CIRCUIT**

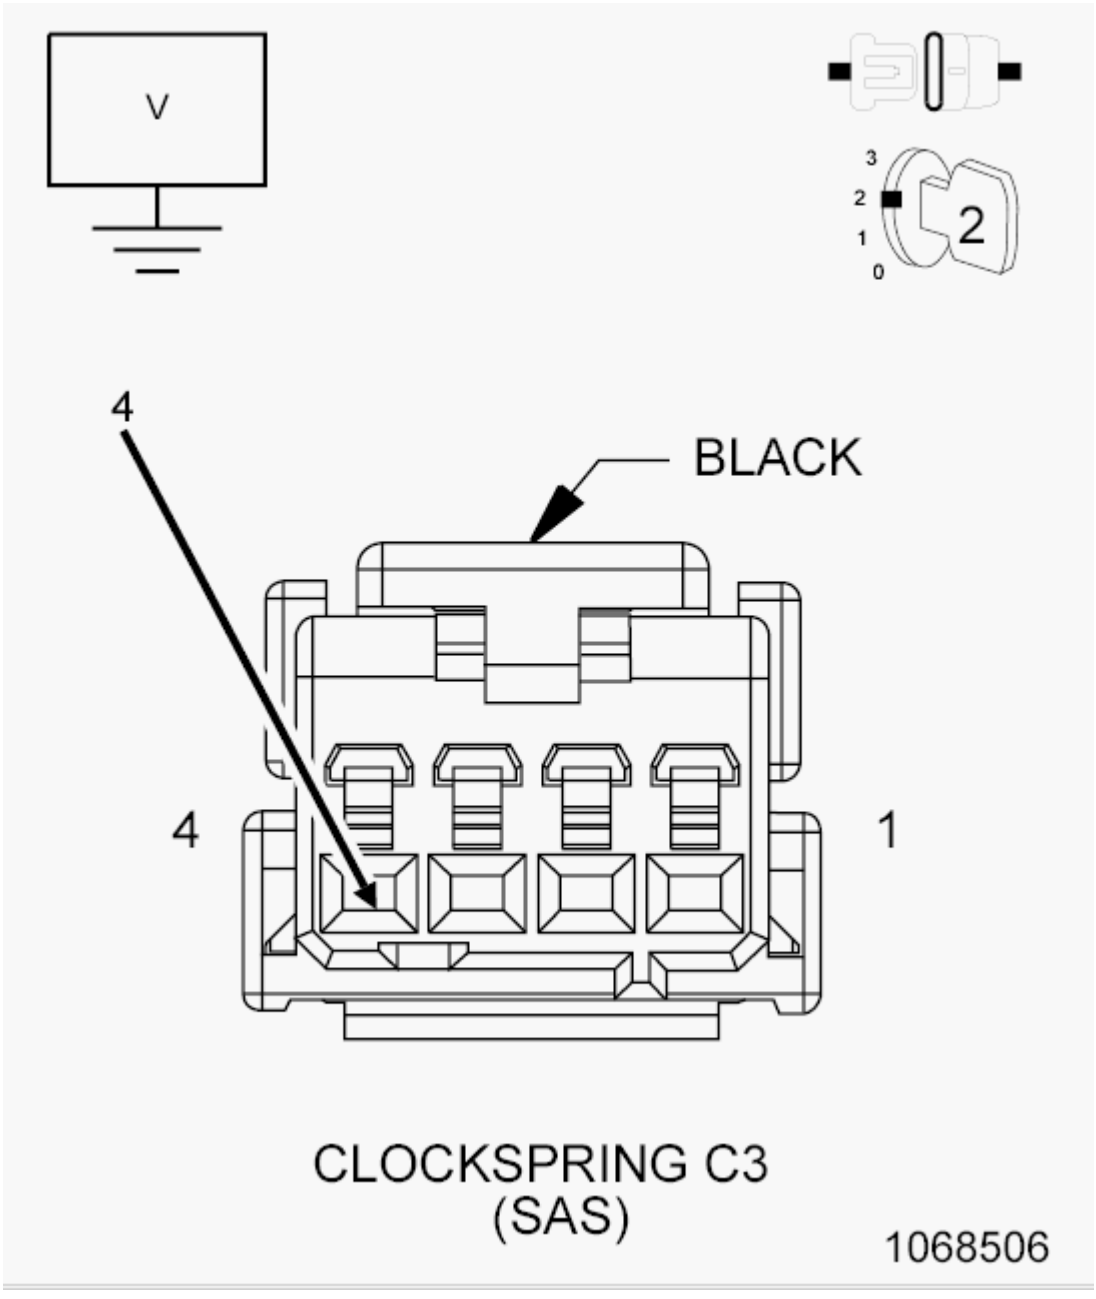

Fig. 98: Checking Clockspring Circuit
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Clockspring C3 (SAS) harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F943) Fused Ignition Switch Output circuit.

   Is the voltage above 10 volts?

Yes

- Go to step 4

No

- Repair the (F943) Fused Ignition Switch Output circuit for an open.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

4. **CHECK THE RESISTANCE OF THE (Z926) GROUND CIRCUIT**

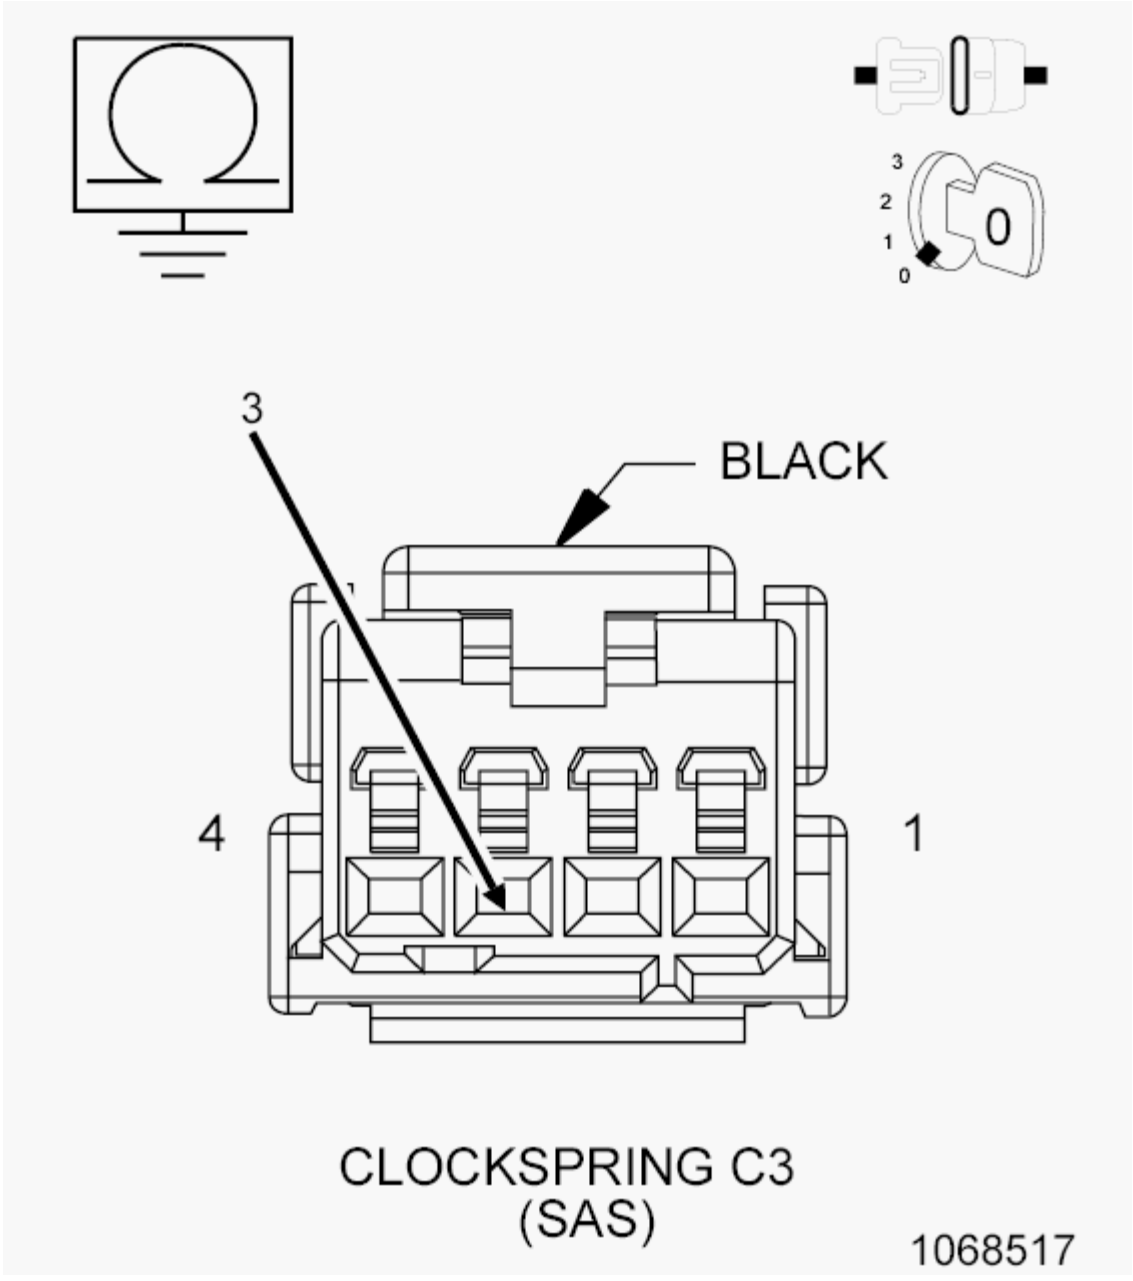

Fig. 99: Checking Clockspring Circuit
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance between the (Z926) Ground circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go to step 5

   No

   - Repair the (Z926) Ground circuit for an open.
   - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

5. **VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS**
   1. With the scan tool, select ECU View.
   2. Verify that the Steering Angle Sensor is active on the bus.

      Is the Steering Angle Sensor active on the bus?

      Yes

      - Replace the Clockspring (SAS) in accordance with the service information.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

      No

      - Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** and perform the Stored Lost Communication DTC diagnostic procedure.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM)

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - TIPM is configured correctly
- **Set Condition:**

Bus messages not received from the TIPM for approximately 2 to 5 seconds.

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

   NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go to step 2

      No

      - Perform the appropriate Stored Lost Communication test procedure. Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** .

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** .

      No

      - Go to step 3

3. **VERIFY THAT THE TIPM IS ACTIVE ON THE BUS**
    1. Turn the ignition on.
    2. With the scan tool, select Network Diagnostics.
    3. Verify that the TIPM is active on the bus.

    Is the TIPM active on the bus?

    Yes

    - Go to step 4

    No

    - For No Response diagnostic procedures. Refer to **Non-DTC Diagnostics/Communication - Diagnosis and Testing** .
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
    1. With the scan tool, select Network Diagnostics.

    Is there more than one module with active DTCs Logged Against the TIPM?

    Yes

    - Replace/update the Totally Integrated Power Module in accordance with the service information.
    - Perform BODY VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Standard Procedure** .

    No

    - Replace the Anti-Lock Brake Module in accordance with the service information
    - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.

- **Set Condition:**

  When the Anti-Lock Brake Module detects an incorrect CAN message from the Powertrain Control

Module (PCM) or Engine Control Module (ECM).

Possible Causes
ABM CAN BUS DTCS
ENGINE DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

   Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?

   Yes

   - Go to step 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK IF TIPM CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read TIPM DTCs.

   Are there any TIPM CAN BUS DTCs present?

   Yes

   - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedures.

   No

   - Go to step 3

3. **POWERTRAIN CONTROL MODULE (PCM) or ENGINE CONTROL MODULE (ECM) DTCS ARE PRESENT**
   1. With the scan tool, read PCM or ECM DTCs.

Are there any PCM or ECM DTCs present?

Yes

- Refer to **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Diagnosis and Testing** for diesel engine applications or **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** for gas engine applications and perform the appropriate diagnostic procedure.

No

- Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.

- **Set Condition:**

  When the Anti-Lock Brake Module detects an incorrect CAN message from the Transmission Control Module (TCM).

Possible Causes
TIPM CAN BUS DTCS
TRANSMISSION DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK IF TIPM CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read TIPM DTCs.

      Are there any TIPM CAN BUS DTCs present?

      Yes

- Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** .

No

- Go to step 2

2. **CHECK IF TRANSMISSION DTCS ARE PRESENT**
   1. With the scan tool, read Transmission DTCs.

      Are there any Transmission DTCs present?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Transmission Control (TCM) - Diagnosis and Testing** .

      No

      - Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module in accordance with the Service Information.
      - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

U0429-IMPLAUSIBLE DATA RECEIVED FROM SCM

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.

- **Set Condition:**

  When the Anti-Lock Brake Module detects an incorrect CAN message from the Clockspring (steering angle sensor or SAS) for approximately 200 mSec.

Possible Causes
CLOCKSPRING (SAS) ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK IF STEERING ANGLE SENSOR DTCS ARE PRESENT**
    1. With the scan tool, read Steering Angle Sensor DTCs.

       Are there any Steering Angle Sensor DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Diagnosis and Testing**.

       No

       - Replace the Anti-Lock Brake Module in accordance with the Service Information.
       - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Anti-Lock Brake Module detects too many CAN Bus off events on the Dynamics Sensor Data Link circuits.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
DYNAMICS SENSOR
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR A DTC U1003-ESP CAN C BUS PERFORMANCE**

   NOTE: This DTC must be active for the results of this test to be valid.

   NOTE: If present, diagnose and repair DTC U0125-LOST COMMUNICATION WITH DYNAMICS SENSOR before diagnosing this DTC.

   1. Turn the ignition on.
   2. With the scan tool, read and record the DTCs.
   3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Start the engine.

      NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set. It may be necessary to test drive the vehicle within the DTC monitoring and set conditions in order for this DTC to set.

   6. With the scan tool, read and record the DTCs

Does the scan tool display: U1003-ESP CAN C BUS PERFORMANCE?

Yes

- Go to step 2

No

- Perform ABS INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

1. Check the Dynamics Sensor installation and torque of the mounting bolts.
2. Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.
3. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 3

3. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**

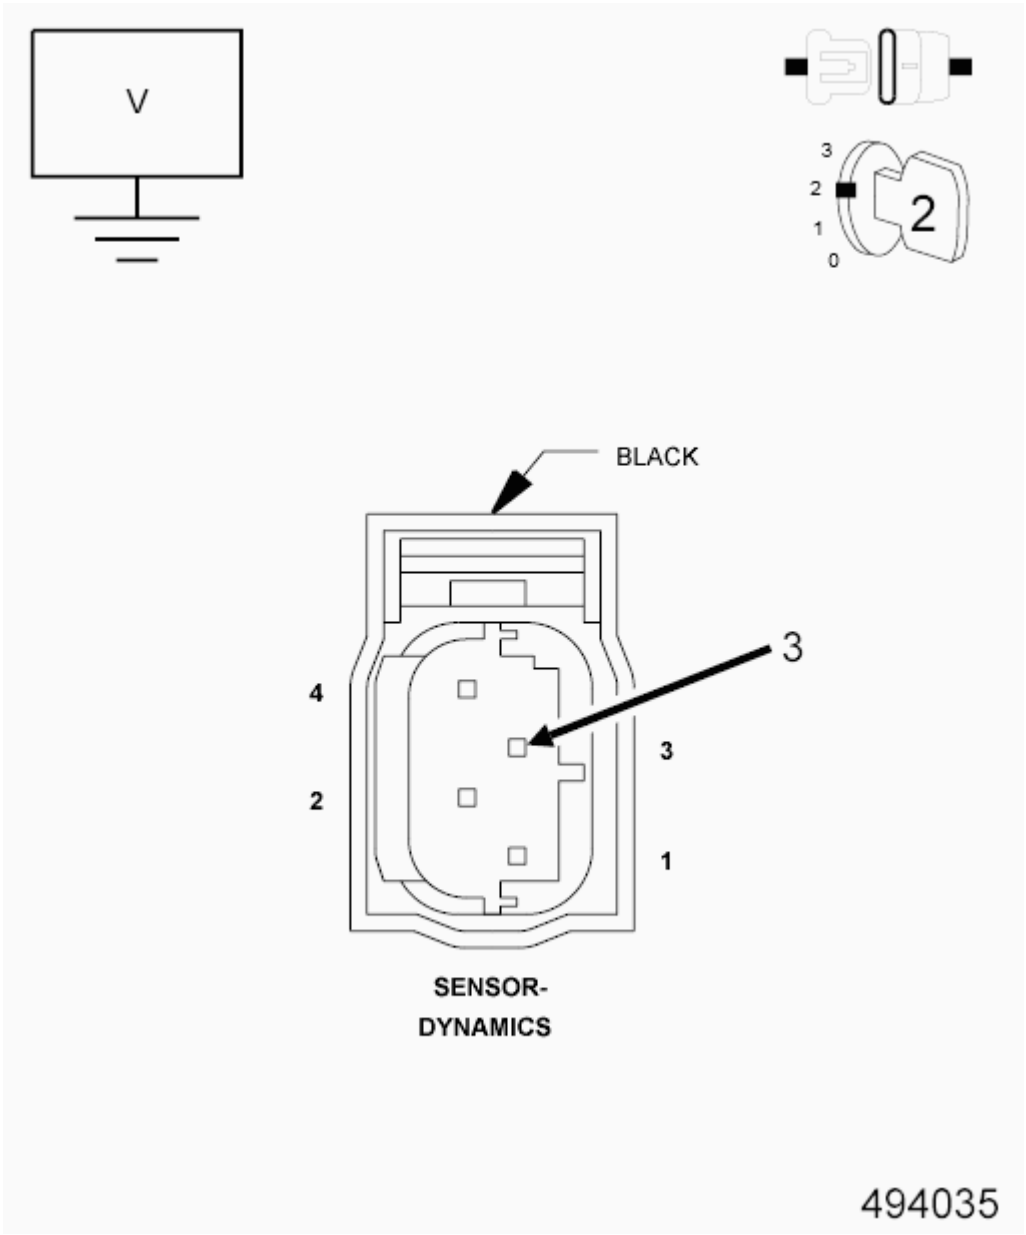

Fig. 101: Checking Dynamics Sensor High Data Link Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Anti-Lock Brake Module harness connector.
3. Disconnect the Dynamics Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

   Is there any voltage present?

   Yes

- Repair the (D465) Dynamics Sensor High Data link circuit for a short to voltage.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND**

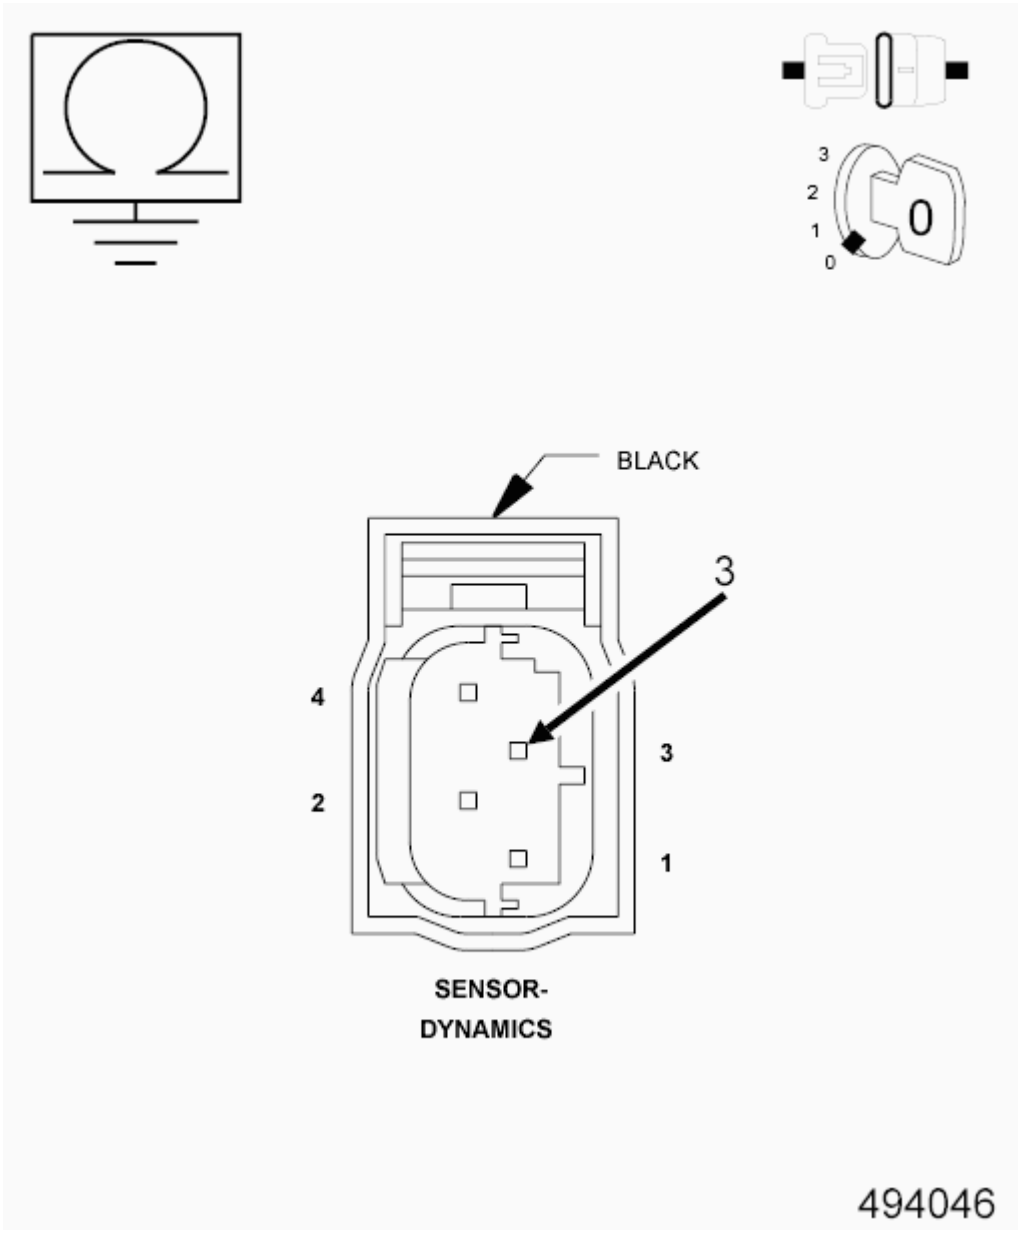

Fig. 102: Checking Dynamics Sensor High Data Link Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Disconnect the Anti-Lock Brake Module harness connector.
3. Disconnect the Dynamics Sensor harness connector.
4. Measure the resistance between ground and the (D465) Dynamics Sensor High Data Link circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (D465) Dynamics Sensor High Data link circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 5

5. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN**

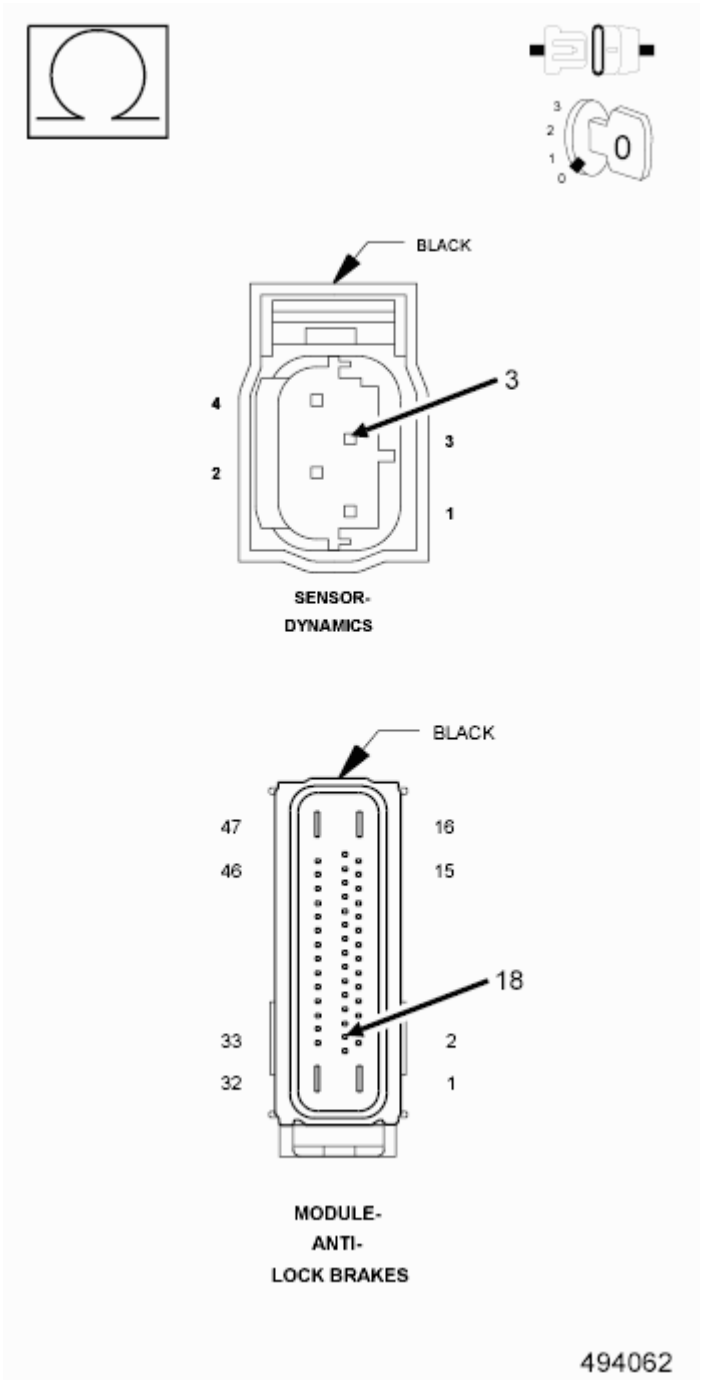

Fig. 103: Checking Dynamics Sensor High Data Link Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit.

   Is the resistance below 5.0 Ohms?

   Yes

- Go to step 6

No

- Repair the (D465) Dynamics Sensor High Data link circuit for an open.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

6. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**

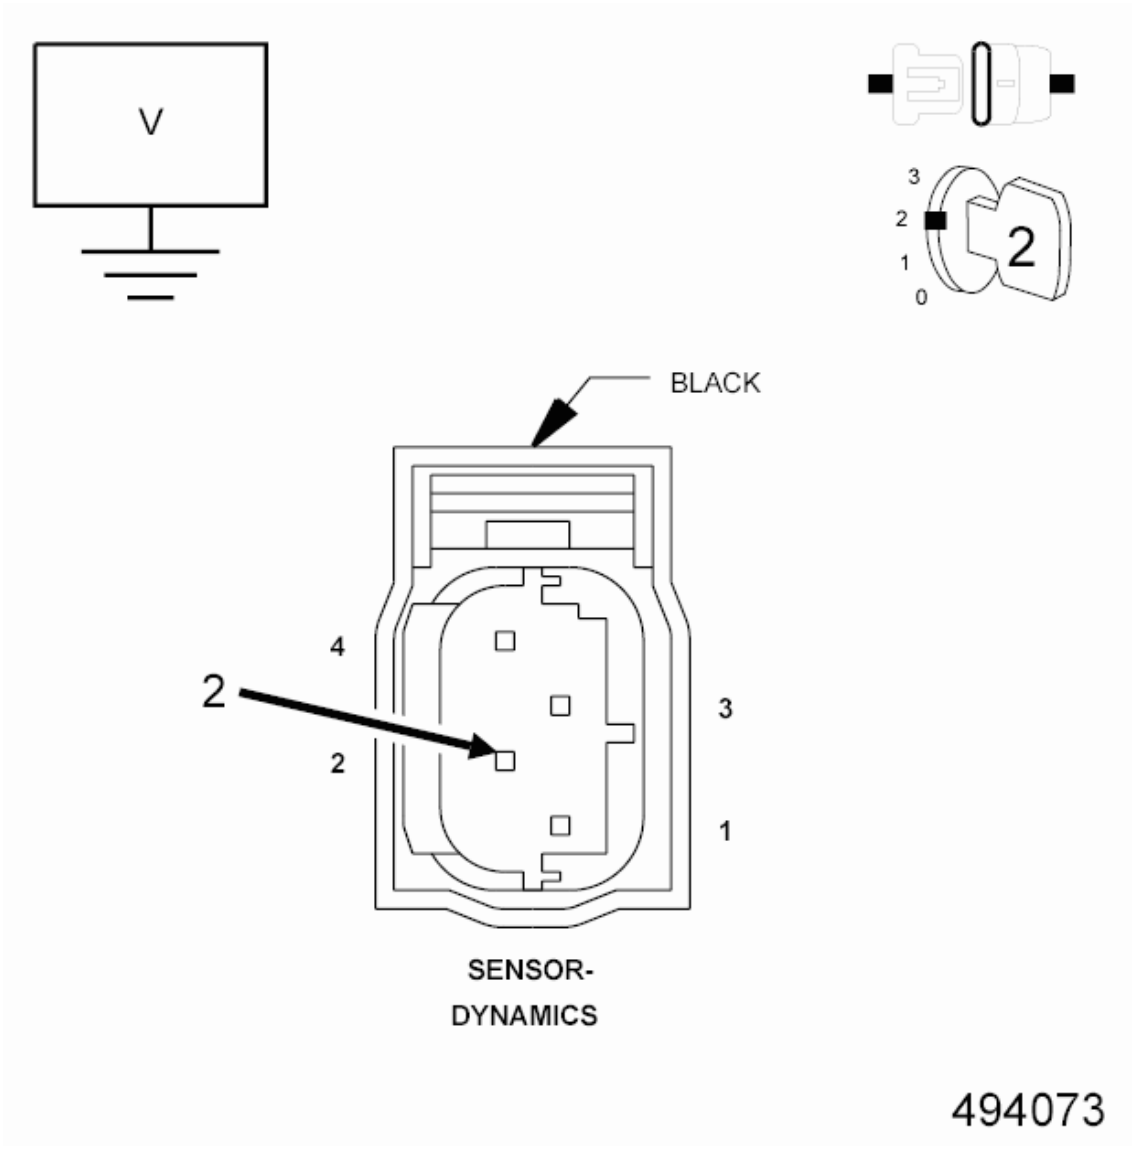

Fig. 104: Checking Dynamics Sensor Low Data Link Circuit For A Short To Voltage
Courtesy of CHRYSLER LLC

1. Turn the ignition on.

2. Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

   Is there any voltage present?

   Yes

   - Repair the (D464) Dynamics Sensor Low Data link circuit for a short to voltage.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

   No

   - Go to step 7

7. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND**

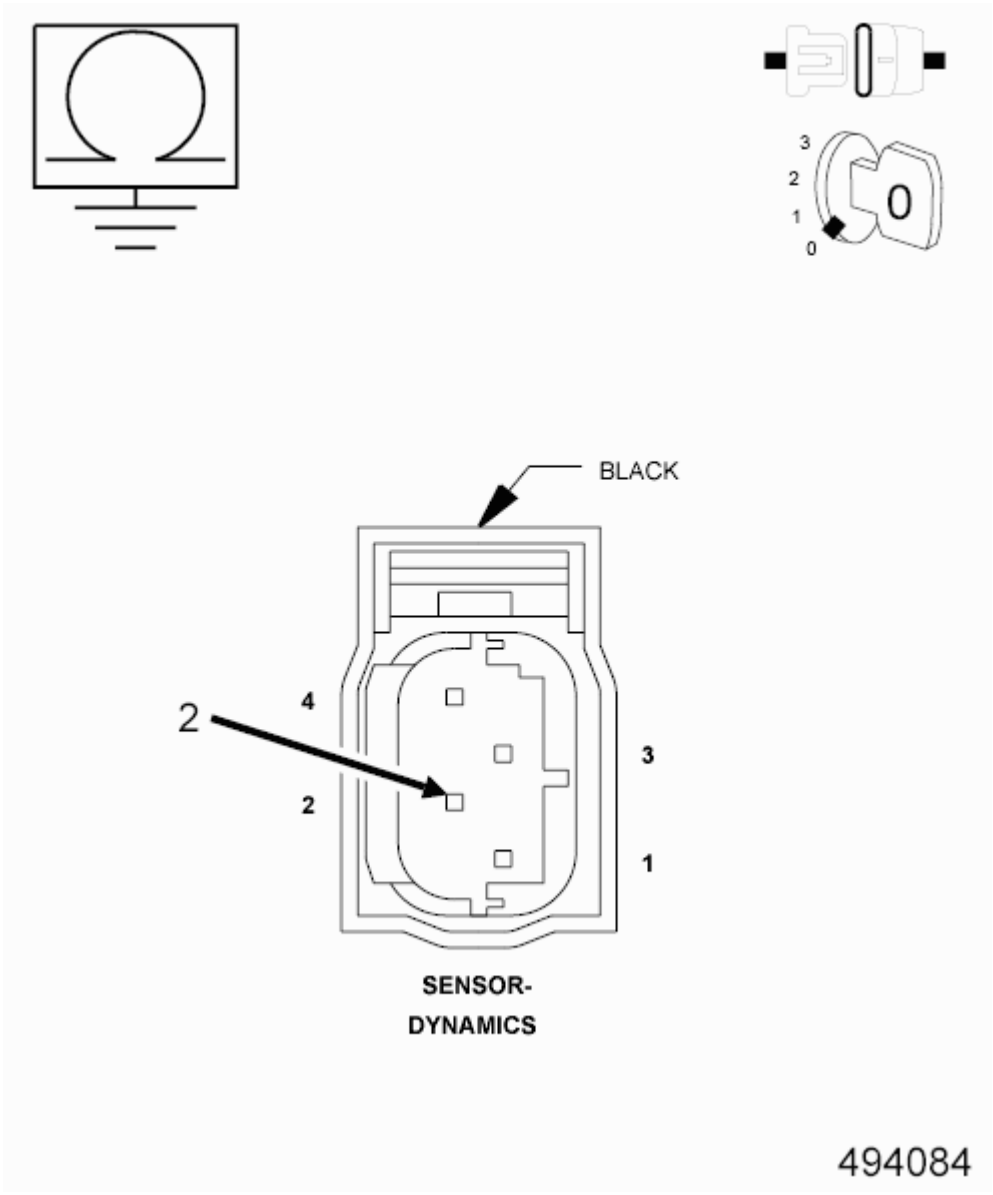

Fig. 105: Checking Dynamics Sensor Low Data Link Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D464) Dynamics Sensor Low Data Link circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (D464) Dynamics Sensor Low Data link circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

No

- Go to step 8

8. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN**

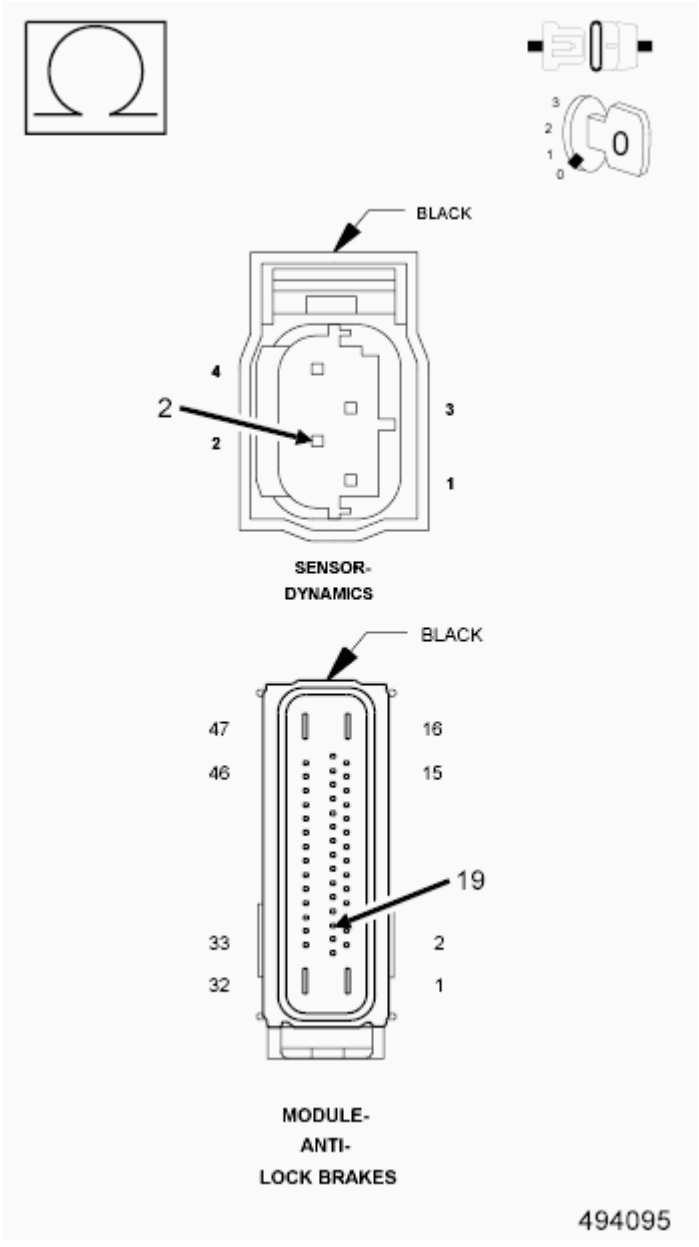

Fig. 106: Checking Dynamics Sensor Low Data Link Circuit For An Open
Courtesy of CHRYSLER LLC

1. Measure the resistance of the (D464) Dynamics Sensor Low Data link circuit.

   Is the resistance below 5.0 Ohms?

Yes

- Go to step 9

No

- Repair the (D464) Dynamics Sensor Low Data link circuit for an open.
- Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

9. **REPLACE DYNAMICS SENSOR & VERIFY IF DTC IS STILL ACTIVE**
    1. Replace the Dynamics Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**
    2. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 6 and 15 mph (10 and 25 km/h).
    3. Park the vehicle. With the scan tool, read ABS DTCs.

    Does this DTC reset?

    Yes

    - Replace the Anti-Lock Brake Module in accordance with the Service Information.
    - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

    No

    - Test complete.

- Go to step 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS-INTERMITTENT CONDITION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs**
   1. With the scan tool, read all active DTCs from all CAN C Bus modules.

      NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs related to the conditions listed above?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

      No

      - Go to step 3

3. **VERIFY CORRECT TIPM CONFIGURATION**
   1. With the scan tool, verify that the TIPM part number is correct for the vehicle and programmed correctly by selecting TIPM from ECU view then Misc Functions and Restore Vehicle Configuration

      Is the correct TIPM installed in the vehicle?

      No

      - Replace and program the TIPM in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Standard Procedure** .

      Yes

      - Go to step 4

4. **CHECK IF ECM OR PCM DTCs ARE PRESENT**
   1. With the scan tool, read ECM or PCM DTCs.

Are any DTCs present?

Yes

- Refer to **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Diagnosis and Testing** for diesel engine applications or **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** for gas engine applications and perform the appropriate diagnostic procedure.

No

- Go to step 5

5. **VERIFY CORRECT ECM OR PCM IS INSTALLED IN THE VEHICLE**
   1. With the scan tool, verify that the ECM or PCM part number is correct for the vehicle.

   Is the correct ECM or PCM installed in the vehicle?

   No

   - Replace and program the ECM or PCM in accordance with the Service Information.
   - Perform appropriate VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Standard Procedure** or **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure** .

   Yes

   - Go to step 6
6. **VERIFY ECM OR PCM IS PROGRAMMED WITH CORRECT VIN**
   1. With the scan tool, verify that the ECM or PCM is programmed with the correct VIN.

   Is the ECM or PCM programmed with the correct VIN?

   No

   - Using the scan tool, perform ECM/PCM Replaced to update the VIN in the ECM/PCM.
   - Perform appropriate VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Standard Procedure** or **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure** .

   Yes

   - Go to step 7
7. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs**
   1. With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs Logged Against the ECM or PCM?

Yes

- Replace/update the ECM or PCM in accordance with the service information.
- Perform appropriate VERIFICATION TEST. Refer to **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Standard Procedure** or **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure** .

No

- Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brake Module in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

U1501-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM PCM

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

- **Set Condition:**

  When the Anti-Lock Brake Module detects an incorrect CAN message from the Powertrain Control Module (PCM) Engine Control Module (ECM).

Possible Causes
TIPM CAN BUS DTCS
ENGINE DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK IF TIPM CAN BUS DTCs ARE PRESENT**
   1. With the scan tool, read TIPM DTCs.

      Are there any TIPM CAN BUS DTCs present?

      Yes

- Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 2

2. **POWERTRAIN CONTROL MODULE (PCM) or ENGINE CONTROL MODULE (ECM) DTCS ARE PRESENT**
   1. With the scan tool, read PCM or ECM DTCs.

      Are there any PCM or ECM DTCs present?

      Yes

      - Refer to **DTC-Based Diagnostics/MODULE, Engine Control (ECM) - Diagnosis and Testing** for diesel engine applications or **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** for gas engine applications and perform the appropriate diagnostic procedure.

      No

      - Replace the Anti-Lock Brake Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

Diagnostic Test

1. **CHECK IF TIPM CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read TIPM DTCs.

       Are there any TIPM CAN BUS DTCs present?

       Yes

       - Refer to **DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing** .

       No

       - Go to step 2
2. **CHECK IF TRANSMISSION DTCS ARE PRESENT**
    1. With the scan tool, read Transmission DTCs.

       Are there any Transmission DTCs present?

       Yes

       - Refer to **DTC-Based Diagnostics/MODULE, Transmission Control (TCM) - Diagnosis and Testing** .

       No

       - Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module in accordance with the Service Information.
       - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

STANDARD PROCEDURE

ABS INTERMITTENT CONDITION TEST

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Diagnostic Test

1. **PERFORM ABS INTERMITTENT CONDITION TEST**

   NOTE: If the conditions that set the DTC are not present at this time, the following list may help in identifying an intermittent condition.

   WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

   1. Refer to any Technical Service Bulletins (TSBs) that may apply.
   2. Review the scan tool Environmental Data information. If possible, try to duplicate the conditions under which the DTC set.
   3. Turn the ignition off.

4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Wiggle the wires while checking for shorts and open circuits.
6. Perform a voltage drop test on the related circuits between the suspected faulty component and the Anti-Lock Brake Module.
7. Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.
8. If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits
9. For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
10. Use the scan tool to perform a System Test if one applies to the failing component.
11. A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

    Were any problems found during the above inspections?

    Yes

    - Perform the necessary repairs.
    - Perform ABS VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure**.

    No

    - Test Complete.

ABS VERIFICATION TEST

Diagnostic Test

1. **Perform ABS Verification Test**

   WARNING: Ensure braking capability is available before road testing.

   NOTE: If the ABM (Anti-Lock Brake Module), SAS (Steering Angle Sensor), Dynamics Sensor was replaced, or if any mounting problems with SAS or Dynamics Sensor, ABM must be initialized using the scan tool. If not initialized, the ABS indicator will flash continuously with no DTCs. To initialize the ABM and clear offsets have wheels pointing straight ahead and follow the directions on the scan tool. The drive test requires a 90? turn. If the Dynamics Sensor was replaced, test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 6

and 15 mph (10 and 25 km/h).

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Ensure all accessories are turned off and the battery is fully charged.
4. Ensure that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes from All modules. Start the engine and allow it to run for two minutes and fully operate the system that was malfunctioning.
5. Turn the ignition off and wait five seconds. Turn the ignition on and using the scan tool, read DTCs from all modules.
6. If any Diagnostic Trouble Codes are present, return to DTC list and perform the appropriate diagnostic procedure.

NOTE: For Sensor Signal and Pump Motor faults, the ABM must sense all 4 wheels at 7.5 mph (12 km/h) before it will extinguish the ABS indicator.

7. If there are no DTCs present after turning ignition on, road test the vehicle for at least five minutes. Perform several anti-lock braking stops.
8. Again, with the scan tool read DTCs. If any DTCs are present, refer to **DIAGNOSTIC CODE INDEX** for the diagnostic test procedure and perform the appropriate diagnostic procedure.
9. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

Are any DTCs present or is the original concern still present?

Yes

- Repair is not complete, perform the appropriate diagnostic procedure. See **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Diagnosis and Testing**.

No

- Repair is complete.

DESCRIPTION

VEHICLE IDENTIFICATION

Throughout this part, references to the Chrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. Refer to **Vehicle Data/Vehicle Information/Vehicle Identification Number - Description** . If a procedure is common to all vehicles covered in this article, no reference will be made to a vehicle family code.

WARNING

WARNINGS

WARNINGS

Disconnect the battery negative cable when servicing electrical components that are live when the ignition is OFF.

Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, or potentially serious or fatal injury.

Use an OSHA approved breathing filter when spraying paint or solvents in a confined area. Serious or fatal injury can result.

Avoid prolonged skin contact with petroleum or alcohol-based cleaning solvents. Serious or fatal injury can result.

Do not stand under a hoisted vehicle that is not properly supported on safety stands. Serious or fatal injury can result.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Serious or fatal injury can result.

SAFETY PRECAUTIONS

Disconnect the battery negative cable from servicing electrical components that are live when the ignition is OFF.

When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the

repair area.

Always have a fire extinguisher ready for use when welding.

Do not use harsh alkaline-based cleaning solvents on painted or upholstered surfaces.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate part for proper procedures.

WATER LEAK TESTS

> **WARNING: Do not use electric shop lights or tools in water test area. Serious or fatal injury can result.**

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component

alignment or sealing is necessary, refer to the appropriate part for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

BODY LUBRICATION

Lubrication Requirements

Locks and all body pivot points, including such items as seat tracks, door hinge pivot points and rollers , liftgate, tailgate, sliding doors and hood hinges, should be lubricated periodically with a lithium based grease such as Mopar ® Spray White Lube to ensure quiet, easy operation and to protect against rust and wear. Prior to the application of any lubricant, wipe the parts clean, to remove dust and grit. After lubricating, excess oil and grease should be removed. Particular attention should also be given to hood latching components to make sure they function properly. When performing other underhood services, clean and lubricate the hood latch release mechanism and safety catch.

The external lock cylinders should be lubricated twice a year, preferably in the fall and spring. Apply a small amount of a high quality lubricant such as Mopar ® Lock Cylinder Lubricant directly into the lock cylinder.

Lubricant Application

Door Lock Cylinders

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.

5. Wipe all lubricant from exterior of lock cylinder and key.

All Other Body Mechanisms

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

Lubricant Usage

Engine Oil

- door hinges - hinge pin and pivot contact areas
- hood hinges - pivot points
- liftgate hinges

Mopar ® Spray White Lube or Equivalent

- door check straps
- liftgate latches
- liftgate prop pivots
- ash receiver
- fuel filler door remote control latch mechanism
- parking brake mechanism
- sliding seat tracks
- liftgate latch

Mopar ® Multipurpose Grease or Equivalent

- all other hood mechanisms

Mopar ® Lock Cylinder Lubricant or Equivalent

- door lock cylinders
- liftgate lock cylinder

BUZZ, SQUEAKS AND RATTLES

Buzz, Squeaks and Rattles (BSR's) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.

- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using various tapes or lubricants. Tapes including foam, flock and anti-squeak, can be used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the **BUZZ, SQUEAKS AND RATTLES** table for materials and usage.

BUZZ, SQUEAKS AND RATTLES

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
ITCH AND SQUEAK TAPE	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 107° C (-40° to 225° F)
BLACK NYLON FLOCK	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 82° C (-40° to 180° F)
HIGH DENSITY URETHANE FOAM	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 82° C (-40° to 180° F)
OPEN CELL FOAM TAPE	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 82° C (-40° to 180° F)
CLOSED CELL LOW DENSITY FOAM TAPE	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 82° C (-40° to 180° F)
NYE® GREASE 880	Long life.	Suspensions. Examples: Strut bushings, sway bars.	-40° to 200° C (-40° to 390° F)
KRYTOX® OIL	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-34° to 205° C (-30° to 400° F)
KRYTOX® GREASE	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass.	-34° to 205° C (-30° to 400° F)

		Examples: Weatherstrips, backlight and windshield moldings.	

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on Chrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**

- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement. Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can

cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.
12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.
14. Apply a coat of adhesive to the exposed ends of the support squares.
15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.
17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.
18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.
20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
    a. If the heat staked or component seam location is loose, hold the two components tightly together

and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

2. Install the mounting fasteners. Tighten the bolts to 28 N.m (21 ft. lbs.).
3. Connect the liftgate latch cable.
4. Connect the electrical connector to the latch.
5. Install the liftgate trim panel. See **Body/Decklid/Hatch/Liftgate/Tailgate/PANEL, Trim - Installation**.
6. Close the liftgate and verify proper operation. See **Body/Decklid/Hatch/Liftgate/Tailgate/LIFTGATE - Adjustments**.

LIFTGATE

Removal

REMOVAL

WARNING: Do not disconnect the support rod cylinders with the liftgate closed. The support rod pistons are operated by high pressure gas. This pressure could cause damage and/or personal injury if they are removed while the pistons are compressed.

1. Open and support the liftgate.
2. Using a trim stick C-4755 or equivalent, remove the upper rear headliner trim.
3. Remove the support cylinders from the liftgate. See **Body/Decklid/Hatch/Liftgate/Tailgate/PROP, Gas - Removal**.
4. Disconnect the wire harnesses and the washer hose.
5. Using a grease pencil or equivalent, mark the hinge location.
6. Remove the liftgate to body fasteners (1) and remove liftgate from vehicle.

Installation

INSTALLATION

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Position the liftgate onto the vehicle using the reference marks made during the Removal procedure and install the body fasteners (1).
2. Tighten the bolts to 28 N.m (21 ft. lbs.).
3. Connect the wire harness and washer hose.
4. Install the support struts. See **Body/Decklid/Hatch/Liftgate/Tailgate/PROP, Gas - Installation**.
5. Install the upper rear headliner trim.
6. Close the liftgate and verify proper operation. See **Body/Decklid/Hatch/Liftgate/Tailgate/LIFTGATE - Adjustments**.

Adjustments

ADJUSTMENTS

NOTE: The position of the liftgate can be adjusted upward or downward by the use of slots in the hinge. An inward or outward adjustment is achieved by use of slots in the body. If an inward or outward adjustment is needed, use a body sealer on the hinge to body mating surface.

In/out

3. Adjust the liftgate up/down position and tighten the hinge bolts to 28 N.m (21 ft. lbs.). See **Body/Body Structure/Gap and Flush - Specifications**
4. Confirm the lower liftgate in/out position and tighten the striker screws to 28 N.m (21 ft. lbs.).

PANEL, TRIM, LIFTGATE

Removal

REMOVAL

1. Remove the left and right side trim panels.
2. Using a trim stick C-4829A or equivalent, separate the push-pin fasteners and remove the upper trim panel.
3. Remove the two lower screws.
4. Remove the lower trim panel and disconnect the electrical connector.

Installation

INSTALLATION

1. Connect the electrical connector and install the lower trim panel.
2. Install the two lower screws.
3. Install the left and right side trim panels.
4. Position the upper trim into place and seat the push pin fasteners fully.

1. Install the striker (2) and install the bolts (1).
2. Tighten the bolts to 28 N.m (21 ft. lbs.).
3. Adjust the striker if needed. See **Body/Decklid/Hatch/Liftgate/Tailgate/STRIKER - Adjustments**.

Adjustments

ADJUSTMENT

1. Using a grease pencil or equivalent, mark the position of the striker to aid in adjustment.
2. Loosen the striker bolts.
3. Change the striker position to adjust the lower liftgate gap and flush measurement. See **Body/Body Structure/Gap and Flush - Specifications**
4. Tighten the bolts to 28 N.m (21 ft. lbs.).

DOOR - FRONT

DOOR

Removal

REMOVAL

1. Open and support door on a suitable lifting device.
2. Mark hinges attachment locations with a grease pencil or other suitable device to aid installation.
3. Disengage wire connector at hinge A-pillar.
4. Remove the nuts attaching the door to the door hinges and remove the door from the vehicle.

Installation

INSTALLATION

1. Position door onto the door hinges and install the nuts. Tighten nuts to 13 N.m (115 in.lbs.)
2. Connect wire connector at hinge pillar.
3. Verify door fit and operation. Adjust the door for flushness and parallel gaps as necessary. See **Body/Door - Front/DOOR - Adjustments**.

Adjustments

ADJUSTMENTS-FRONT DOOR

1. Align door to achieve equal spacing to surrounding body panels.
2. Panels should be flush across all gaps. See **Body/Body Structure/Gap and Flush - Specifications**.
3. If door needs to be adjusted Fore/Aft loosen A-pillar to hinge bolts.
4. If door needs to be adjusted In/Out loosen door to hinge nuts.

5. If in/out alignment can not be achieved, it may be necessary to enlarge (drill) the hinge/door flange holes to 12.5 mm (1/2 inch) maximum.
6. This may allow extra movement to achieve the proper alignment.
7. Remove door and hinge as necessary.

GLASS, DOOR

2. Connect the latch cable (1) and rods (2) to the latch assembly.
3. Snap the latch assembly into place onto the door module.
4. Install the door module. See **Body/Door - Front/PLATE, Carrier - Installation**.
5. Install the door trim panel. See **Body/Door - Front/PANEL, Door Trim - Installation**.

Adjustments

ADJUSTMENTS

1. Insert a suitable Allen wrench through the elongated slot in door end frame and loosen bolt 1/2 to one full turn.
2. Cycle outside door handle twice.
3. Tighten adjusting screw.
4. Verify latch operation.

MOLDING, INTERIOR WINDOW TRIM

1. Position door latch striker and any shims on vehicle.
2. Loosely install mounting fasteners attaching latch striker to B-pillar.
3. Align latch striker to marks on B-pillar made previously.
4. Tighten all fasteners.
5. Verify door fit and operation. Adjust door latch striker as necessary. See **Body/Door - Front/LATCH, Door - Adjustments**.

DOORS - REAR

DOOR, REAR

Removal

REMOVAL

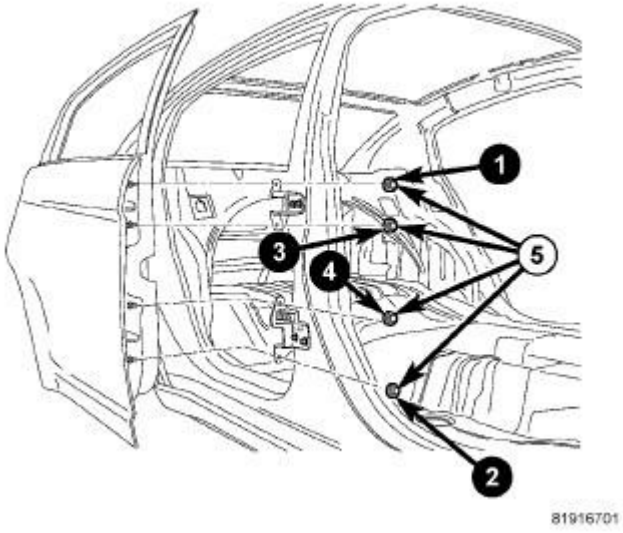

Fig. 46: Door Fasteners
Courtesy of CHRYSLER LLC

1. Open and support door on a suitable lifting device.
2. Mark hinges attachment locations with a grease pencil or other suitable device to aid installation.
3. Disengage wire connector at hinge B-pillar.
4. Remove the nuts attaching the door to the door hinges and remove the door from the vehicle.

Installation

INSTALLATION

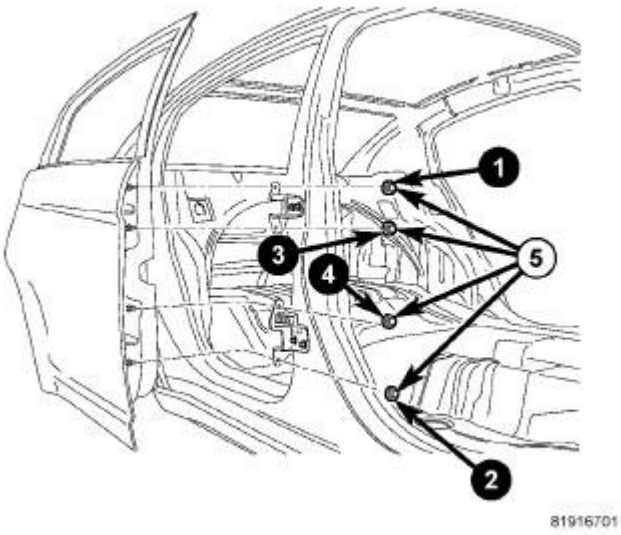

Fig. 47: DOOR FASTENERS
Courtesy of CHRYSLER LLC

1. Position door onto the door hinges and install the nuts. Tighten nuts to 13 N.m (115 in.lbs.)
2. Connect wire connector at hinge pillar.
3. Verify door fit and operation. Adjust the door for flushness and parallel gaps as necessary. See **Body/Door - Front/DOOR - Adjustments**.

Adjustments

REAR DOOR

1. Align door to achieve equal spacing to surrounding body panels.
2. Panels should be flush across all gaps. See **Body/Body Structure/Gap and Flush - Specifications**.
3. If door needs to be adjusted Fore/Aft loosen B-pillar to hinge bolts.
4. If door needs to be adjusted In/Out loosen door to hinge nuts.
5. If door alignment can not be achieved, it maybe necessary to enlarge (drill) the hinge flange holes to 12.5 mm (1/2 inch).
6. This may allow extra movement to achieve the proper alignment.
7. Remove door and hinge as necessary.

GLASS, DOOR

Removal

REMOVAL

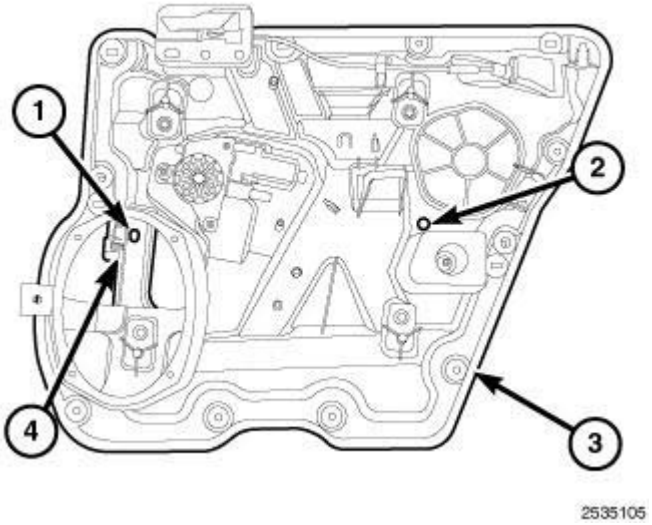

Fig. 48: Glass Lift Plates
Courtesy of CHRYSLER LLC

1. Remove door trim panel and re-install the window switches, if equipped. See **Body/Doors - Rear/PANEL, Rear Door Trim - Removal**
2. Remove the interior window trim molding. See **Body/Doors - Rear/MOLDING - Removal**
3. Remove the door speaker. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Removal**
4. Drill a hole large enough to get a small punch through into the carrier plate (2).
5. Lower glass to approximately mid position and line up the glass lift plates (4) with the holes (1 and 2).
6. Using a punch or equivalent, press tabs releasing glass from window regulator (1 and 2).
7. Remove glass from channel by rotating the front of the glass up 90° and carefully pulling the glass up and out of the door.

Installation

INSTALLATION

1. With the front of the glass in the up position, carefully lower the glass into the door.
2. Slowly rotate the front of the glass downward 90° as the glass is being lowered into the glass run channels, making sure the glass is seated properly into the window weatherstrips.
3. Slide glass downward make sure the glass holes properly lock into snaps.
4. Install the interior window trim molding. See **Body/Doors - Rear/MOLDING - Installation**
5. Install the door speaker. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Installation**
6. Install door trim panel. See **Body/Doors - Rear/PANEL, Rear Door Trim - Installation**

HANDLE, EXTERIOR

Removal

REMOVAL

1. Move the glass to the full up position.
2. Remove the door trim panel. See **Body/Doors - Rear/PANEL, Rear Door Trim - Removal**.
3. Disconnect the link rod from the door handle.
4. Remove the mounting fasteners.
5. Remove the handle from the door.

Installation

INSTALLATION

1. Place the door handle into position in the door.
2. Install the mounting fasteners.
3. Connect the link rod to the door handle.
4. Install the door trim panel. See **Body/Doors - Rear/PANEL, Rear Door Trim - Installation**.
5. Verify proper operation.

HANDLE, INTERIOR

Removal

REMOVAL

1. Remove the door trim panel. See **Body/Doors - Rear/PANEL, Rear Door Trim - Removal**.
2. Remove the mounting fastener.
3. Disconnect the door handle cable from the interior handle.
4. Remove the handle.

Installation

INSTALLATION

1. Connect the interior door handle cable.
2. Align the handle to the door module assembly.
3. Install the mounting fastener.
4. Install the door trim panel. See **Body/Doors - Rear/PANEL, Rear Door Trim - Installation**.
5. Verify proper operation.

1. Position the door module (3) into the door (2).
2. Install the door module mounting fasteners (4).
3. Install the door latch fasteners (1).
4. Connect the exterior door handle connecting rods.
5. Install the wiring harness to the door module and connect all electrical connectors.
6. Install the rear door window. See **Body/Doors - Rear/GLASS, Door - Installation**.
7. Install the door trim panel. See **Body/Doors - Rear/PANEL, Rear Door Trim - Installation**.
8. Verify latch adjustments and adjust as necessary. See **Body/Door - Front/LATCH, Door - Adjustments**.

REGULATOR, WINDOW

Removal

REMOVAL

1. Remove door trim panel. See **Body/Doors - Rear/PANEL, Rear Door Trim - Removal**.
2. Remove the door module assembly. See **Body/Doors - Rear/PANEL, Rear Door Trim - Removal**.
3. Remove the power window lift motor. Refer to **Electrical - Power Systems/Power Windows/MOTOR, Window Regulator - Removal**
4. Remove the regulator mounting fasteners.
5. Remove regulator from door module assembly.

Installation

INSTALLATION

1. Install regulator to door module assembly.
2. Install the regulator mounting fasteners.
3. Install the power window lift motor. Refer to **Electrical - Power Systems/Power Windows/MOTOR, Window Regulator - Removal** .
4. Install the door module assembly. Refer to **Electrical - Power Systems/Power Windows/MOTOR, Window Regulator - Removal** .
5. Install door trim panel. Refer to **Electrical - Power Systems/Power Windows/MOTOR, Window Regulator - Removal** .
6. Verify Proper operation of the window.

STRIKER, DOOR LATCH

Removal

REMOVAL

NOTE: Be sure to check for any shims between door latch striker and C-pillar. If any shims are found, they must be reinstalled with the new door latch striker to maintain proper door operation.

GRILLE

Description

DESCRIPTION

The grille is removed as part of the front fascia. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Removal** .

MIRROR, OUTSIDE REARVIEW

Removal

REMOVAL

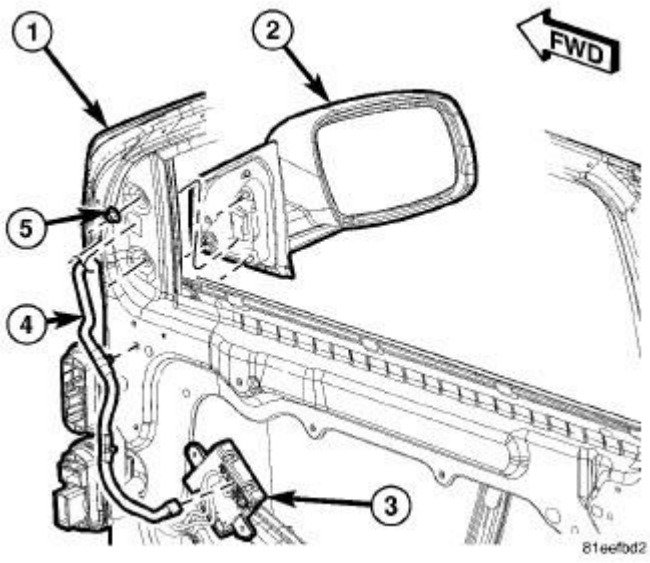

Fig. 84: Rearview Outside Mirror
Courtesy of CHRYSLER LLC

1. Remove the door trim panel. See **Body/Door - Front/PANEL, Door Trim - Removal**.
2. Remove the interior window trim molding as necessary to gain access to the mounting fasteners. See **Body/Door - Front/MOLDING - Removal**.
3. Disconnect power window mirror motor wire connector, if so equipped.
4. Disconnect manual mirror adjuster from side mirror cover, if so equipped.
5. Remove nuts attaching side view mirror to mirror flag.
6. Remove side view mirror from vehicle.

Installation

INSTALLATION

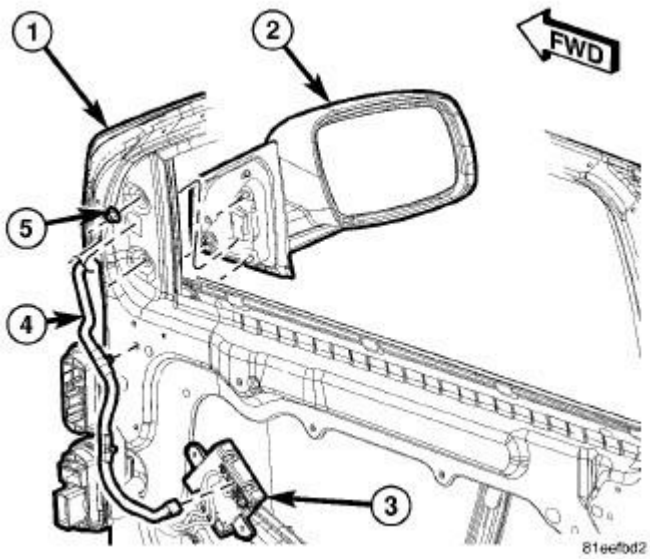

Fig. 85: Rearview Outside Mirror
Courtesy of CHRYSLER LLC

1. Feed power mirror wire harness through hole in mirror flag and seat grommet. Do not pull on wire harness to seat grommet, if so equipped.
2. Position side view mirror to vehicle.
3. Install nuts attaching side view mirror to mirror flag.
4. Engage push in fastener attaching power mirror wire connector to inner door panel, if so equipped.
5. Engage power mirror motor wire connector.
6. Install the interior window trim molding.
7. Install door trim panel. See **Body/Door - Front/PANEL, Door Trim - Installation**.

MIRROR, OUTSIDE REARVIEW, GLASS

Removal

REMOVAL

WARNING: Always wear eye and hand protection when servicing the mirror assembly. Failure to observe these warnings may result in personal injury from broken glass.

1. Carefully pull/pry the broken glass holder from the mirror assembly.
2. Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

Installation

INSTALLATION

CAUTION: It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.

1. Position the new mirror glass holder to the mirror assembly.

NOTE: Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.

2. Align the mirror glass holder's attaching fingers to the mirror motor housing.

NOTE: Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.

3. Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.

4. Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

NAMEPLATE

Removal

REMOVAL

NOTE: Exterior nameplates are attached to body panels with adhesive tape.

1. Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.
2. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.
3. Insert a plastic trim stick or a hard wood wedge behind the emblem to separate the adhesive backing from the body.
4. Clean adhesive residue from body with MOPAR® Super Kleen solvent or equivalent.

Installation

INSTALLATION

1. Remove carrier from adhesive tape on back of emblem.
2. Position emblem properly on body.
3. Press emblem firmly to body with palm of hand.
4. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

RACK, LUGGAGE

Removal

REMOVAL

1. Remove the luggage rack crossbars.
2. Remove the front and rear covers of the luggage rack rails.
3. Remove the mounting fasteners.
4. Carefully remove the luggage rack rails from the top of the vehicle.

Installation

INSTALLATION

1. Carefully install the luggage rack rails to the top of the vehicle.
2. Install the mounting fasteners.
3. Install the front and rear covers of the luggage rack rails.
4. Install the luggage rack crossbars.

SHIELD, SPLASH, FRONT WHEELHOUSE

Removal

REMOVAL

NOTE: The front splash shields are a two piece assembly.

1. Remove the appropriate front wheel. Refer to **Tires and Wheels - Removal**
2. Remove push pins.
3. Remove fasteners.
4. Remove splash shield from wheel well.

Installation

INSTALLATION

1. Place splash shield up to wheelhouse opening.

2. Install push pins.
3. Install fasteners.
4. Install the front wheel. Refer to **Tires and Wheels - Installation** .

SHIELD, SPLASH, REAR WHEELHOUSE

Removal

REMOVAL

1. Remove the appropriate rear wheel. Refer to **Tires and Wheels - Removal** .
2. Remove push pins.
3. Remove fasteners.
4. Remove splash shield from wheel well.

Installation

INSTALLATION

1. Place splash shield up to wheelhouse opening.
2. Install push pins.
3. Install fasteners.
4. Install the rear wheel. Refer to **Tires and Wheels - Installation** .

HOOD

CABLE, HOOD RELEASE

Removal

REMOVAL

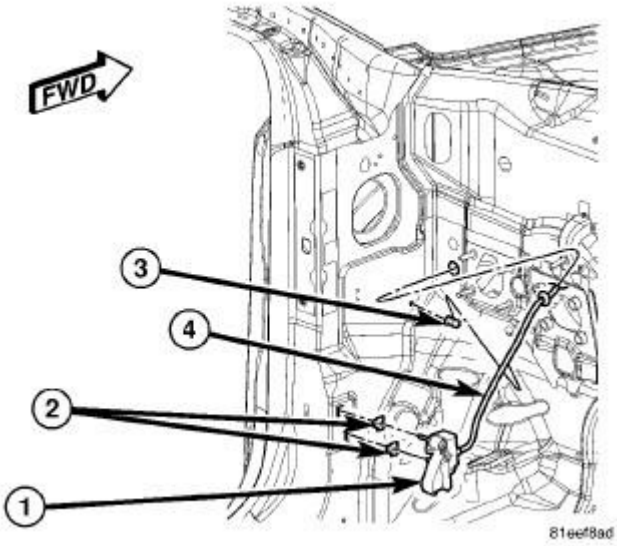

Fig. 86: Hood Release Handle
Courtesy of CHRYSLER LLC

1. Remove left front cowl trim panel.
2. Remove screws (2) attaching hood release handle (1) to inner cowl panel.
3. Disconnect the hood release cable from the latch handle.
4. Disengage rubber grommet at lower dash panel.
5. Disengage push-in fastener (3) attaching hood release cable (4) to dash panel.

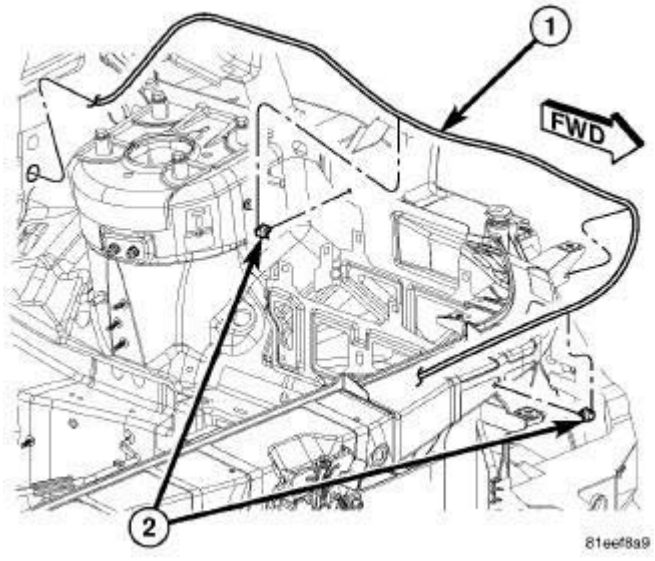

Fig. 87: Hood Release Cable
Courtesy of CHRYSLER LLC

6. Remove hood latch. See **Body/Hood/LATCH, Hood - Removal**.
7. Release clips (2) attaching hood release cable to left inner frame rail.
8. Remove hood release cable (1) from vehicle.

Installation

INSTALLATION

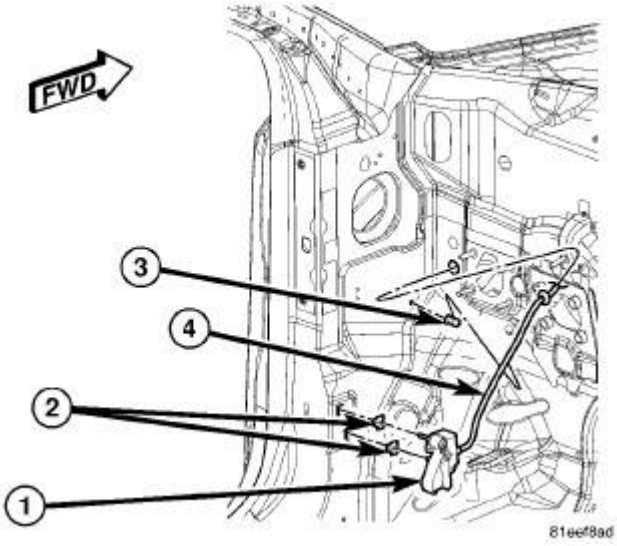

Fig. 88: Hood Release Handle
Courtesy of CHRYSLER LLC

1. Route hood release cable (4) through hole in lower dash panel and along inner frame rail.
2. Engage rubber grommet to lower dash panel.
3. Engage push-in fastener (3) attaching hood release cable to lower dash panel.
4. Install screws attaching hood release cable handle (1) to inner cowl panel.
5. Tighten screws (2) to 1.8 N.m (16 in. lbs.) torque.
6. Install left front cowl trim panel.

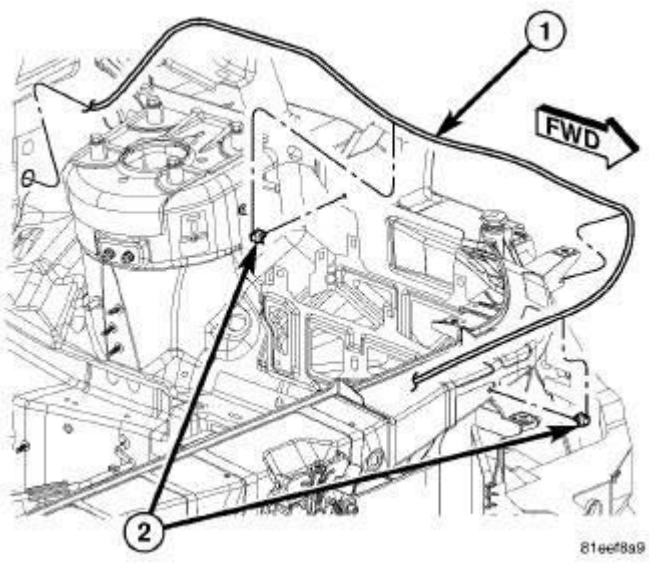

Fig. 89: Hood Release Cable

7. Engage hood release cable into clips (2) along inner frame rail.
8. Install hood latch. See **Body/Hood/LATCH, Hood - Installation**.

HINGE, HOOD

Removal

REMOVAL

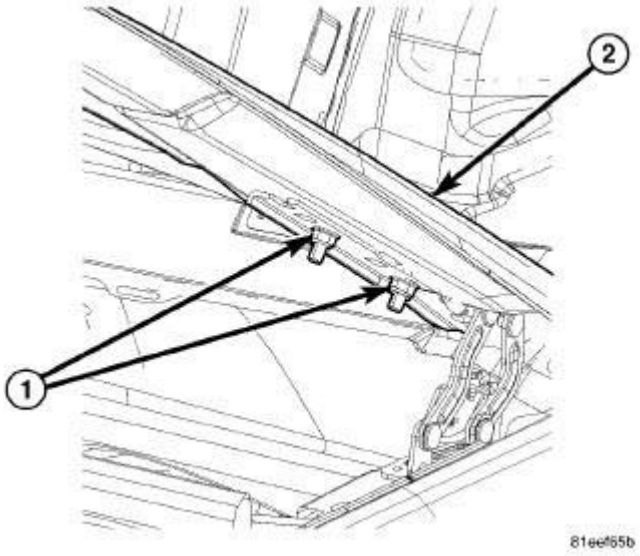

Fig. 90: Bolts Attaching Hood Hinge To Load Beam Inner

Courtesy of CHRYSLER LLC

1. Support hood on the side that requires hinge replacement.
2. Mark hinge attachment locations with a grease pencil or other suitable device to aid installation.
3. Remove cowl cover. See **Body/Exterior/COVER, Cowl Panel - Removal**.
4. Remove bolts attaching hood to hinge.
5. Remove bolts attaching hood hinge to load beam inner and remove hinge from vehicle.

Installation

INSTALLATION

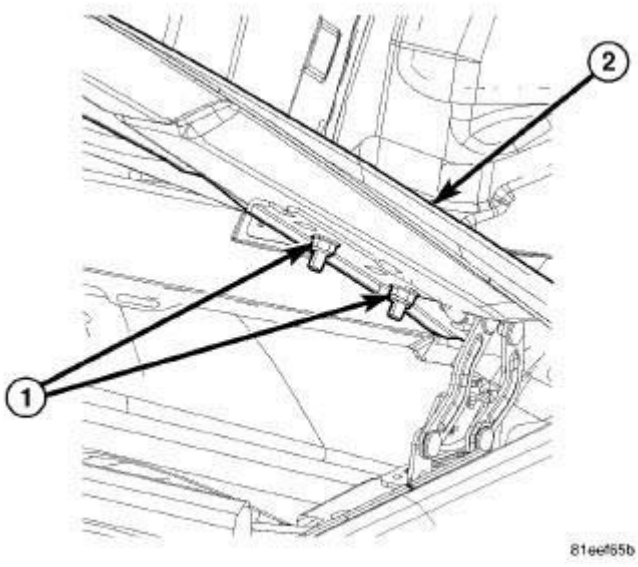

Fig. 91: Bolts Attaching Hood Hinge To Load Beam Inner
Courtesy of CHRYSLER LLC

1. If necessary, paint new hinge before installation.
2. Place hinge in position on vehicle.
3. Install bolts to attach hood hinge to load beam inner.
4. Install bolts to attach hood to hinge.
5. Align all marks and secure bolts.
6. Tighten bolts to 28 N.m (20 ft. lbs.) torque.
7. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders. Shims can be added or removed under hood hinge to achieve proper hood height.
8. Install cowl cover. See **Body/Exterior/COVER, Cowl Panel - Installation**.
9. Verify hood latch operation. Adjust as necessary.

HOOD

Removal

REMOVAL

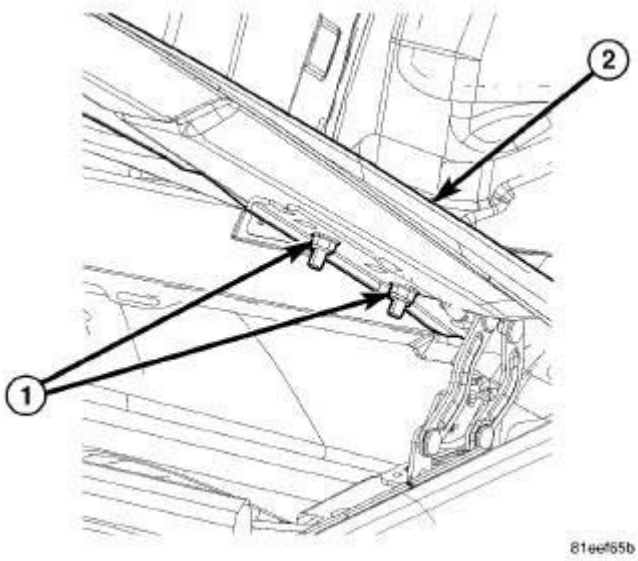

Fig. 92: Bolts Attaching Hood Hinge To Load Beam Inner
Courtesy of CHRYSLER LLC

1. Open hood (2).
2. Mark outline of hinges on inside of hood to aid installation.
3. Disconnect under hood lamp wire connector to engine compartment wire harness if equipped.
4. Disconnect windshield washer hose from hood.
5. Remove the top bolts attaching hood to hinge and loosen the bottom fasteners (1) until they can be removed by hand.
6. With assistance from a helper at the opposite side of the vehicle to support the hood, remove bottom fasteners attaching hood to hinge.
7. Remove the hood from the vehicle.
8. Transfer parts as necessary.

Installation

INSTALLATION

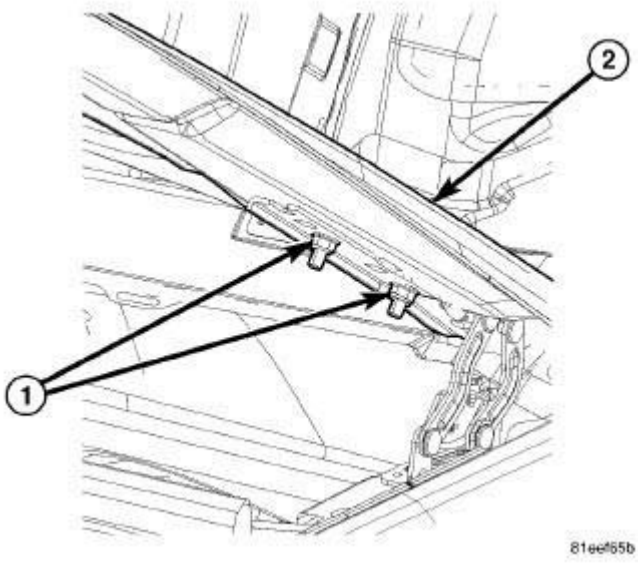

Fig. 93: Bolts Attaching Hood Hinge To Load Beam Inner

1. With assistance from a helper, place hood (2) in position on vehicle.
2. Install bottom fasteners (1) to attach hood to hinge finger tight.
3. Install top fasteners to attach hood to hinge finger tight.
4. Position bolts at outline marks and tighten bolts (3) to 20 N.m (15 ft. lbs.). The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders.
5. Connect under hood lamp wire connector to engine compartment wire harness, if equipped.
6. Route and connect windshield washer hose to hood.
7. Verify hood latch operation and alignment. Adjust as necessary.

LATCH, HOOD

Removal

REMOVAL

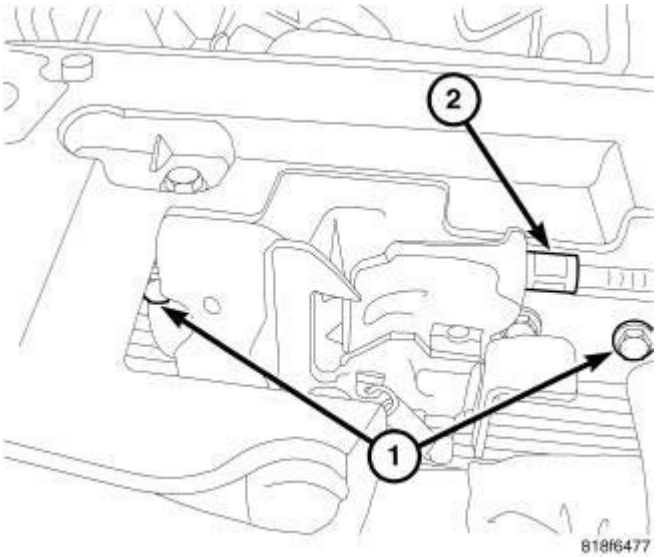

Fig. 94: Latch
Courtesy of CHRYSLER LLC

1. Release hood latch and open hood.
2. Support hood on prop rod.
3. Mark outline of hood latch on radiator support crossmember with a grease pencil or other suitable device to aid installation.
4. Remove nuts (1) attaching hood latch to upper radiator support crossmember.
5. Remove hood latch from vehicle.
6. Disengage remote release cable (2) from hood latch. See **Body/Hood/CABLE, Hood Release - Removal**

Installation

INSTALLATION

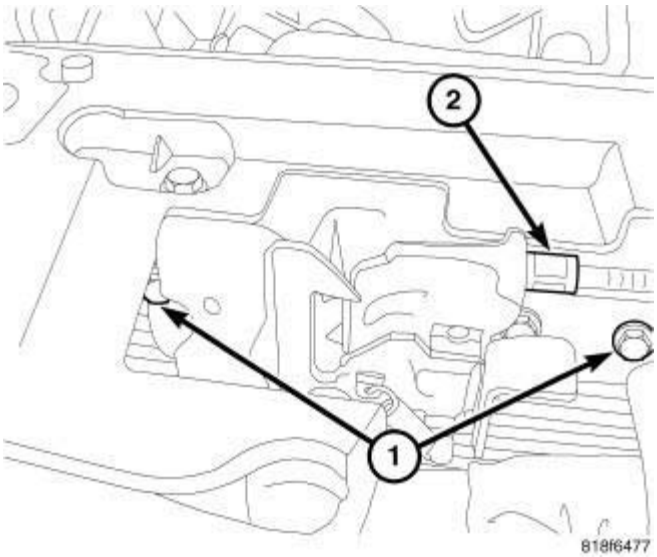

Fig. 95: Latch
Courtesy of CHRYSLER LLC

1. Engage remote release cable into hood latch.
2. Position hood latch on vehicle.
3. Install nuts attaching hood latch onto upper radiator support crossmember.
4. Tighten nut to 28 N.m (20 ft.lbs.) torque.
5. Verify operation. Adjust as necessary.

INSTRUMENT PANEL

BEZEL, INSTRUMENT CLUSTER

Removal

REMOVAL

1. Remove the left instrument panel air outlet. Refer to **Heating and Air Conditioning/Distribution/OUTLET, Air - Removal** .
2. Using a trim stick special tool C-4755 or equivalent, disengage clips holding the cluster bezel to instrument panel.
3. Remove cluster bezel from vehicle.

Installation

INSTALLATION

1. Position the cluster bezel in place and align the spring retainers with the instrument panel.
2. Hand tap cluster bezel in place ensuring proper seat.
3. Install the left instrument panel air outlet. Refer to **Heating and Air Conditioning/Distribution/OUTLET, Air - Installation** .

BEZEL, INSTRUMENT PANEL, CENTER

Removal

REMOVAL

1. Using a trim stick special tool C-4755 or equivalent, disengage clips holding the center bezel to instrument panel.
2. Remove center bezel from vehicle.

Installation

INSTALLATION

1. Position the center bezel in place and align the spring retainers with the instrument panel.
2. Hand tap center bezel in place ensuring proper seat.

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

3. If the vehicle is so equipped, route the electrochromic (automatic dimming) mirror takeout and connector

(1) and/or the telematic (hands-free phone) mirror takeout and connector (2) of the headliner wire harness to the left of the mirror support bracket and reconnect it to the connector receptacle on the back (windshield side) of the mirror housing (3).

4. If the vehicle is equipped with either the electrochromic or the telematic mirror option, reconnect the battery negative cable.

REAR VIEW MIRROR BUTTON

NOTE: The rear view mirror button is permanently bonded to the inside of the windshield glass. If the button should become separated from the glass, it may be re-bonded using the following procedure. This procedure requires the use of a Rear View Mirror Adhesive kit that is available through Mopar® in single application packages that include a two-part adhesive and an accelerant with applicator.

1. Mark the proper position for the mirror button on the outside of the windshield glass with a wax pencil. The residual adhesive on the inside of the glass from the prior mirror button installation can be used as a guide.
2. Clean the button contact area on the inside of the glass. Use a mild powdered cleanser on a cloth saturated with rubbing alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the bonding surface (the smaller side) of the support button with fine grit-sandpaper. Wipe the button surface clean with a paper towel.
4. Apply accelerant to the bonding surface of the button according to the following instructions:
   - Crush the accelerant vial to saturate the felt applicator.
   - Remove the paper sleeve.
   - Apply accelerant to the bonding surface of the button.
   - Allow the accelerant to dry for five minutes.
   - Do not touch the button bonding surface after the accelerant has been applied.
5. Apply adhesive accelerant to the button contact area on the inside of the windshield glass. Allow the accelerant to dry for one minute. Do not touch the button contact area of the glass after the accelerant has been applied.
6. Install the button according to the following instructions:
   - Apply one drop of adhesive at the center of the button contact area on the inside of the windshield glass.
   - Apply an even coat of adhesive to the bonding surface of the button.
   - Align the button with the marked position on the windshield glass.
   - Press and hold the button in place for at least one minute.

NOTE: Verify that the mirror button is correctly aligned, because the adhesive will cure rapidly.

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.

8. Allow the adhesive to cure for an additional 8-10 minutes before reinstalling the mirror.

BASECOAT/CLEARCOAT FINISH

Description

DESCRIPTION

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clearcoat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

FINESSE SANDING, BUFFING, AND POLISHING

Description

DESCRIPTION

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing.**If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

PAINT CODE

Description

DESCRIPTION

The paint code is identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The codes listed in the Color Code Chart are used for manufacturing purposes.

PAINT TOUCH-UP

Description

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch Up Paints and Clear Top Coat. For a description of the paint codes. See **Body/Paint - Specifications**.

WARNING: Use an OSHA approved respirator and safety glasses when spraying paint or solvents in a confined area. Personal injury can result.

TOUCH UP PROCEDURE

1. Scrape loose paint and corrosion from inside scratch or chip.
2. Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch up paint. Do not overlap touch up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch up paint to dry hard.
5. On vehicles without clearcoat, the touch up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
6. On vehicles with clearcoat, apply clear top coat to touch up paint with the same technique as described in 4. Allow clear top coat to dry hard. If desired, 5 can be performed on clear top coat.

WARNING: Avoid prolonged skin contact with petroleum or alcohol - based cleaning solvents. Personal injury can result.

Removal

REMOVAL

1. Remove the headrest.
2. Slide seat forward.
3. Remove both rear seat adjuster bolts.
4. Slide seat rearward.
5. While pulling the release tab located under the seat, pull the seat up and remove the plastic covers to gain access to the front adjuster bolts.
6. Remove both front seat adjuster bolts.
7. Remove front seat from vehicle.

Installation

INSTALLATION

1. Place seat in position in vehicle. Make sure tracks are in time and locked in place. In time means that both tracks are in the same fore/aft position, same locking window on each track.
2. Install bolts to attach front of seat adjuster to the floor. Tighten bolts to 95 N.m (70 ft. lbs.).
3. Slide seat forward and then push back on the seat to ensure that both tracks are locked into position. Ensure tracks are still in time before tightening bolts and install bolts attaching rear of seat track to the floor. Tighten bolts to 95 N.m (70 ft. lbs.).
4. Verify seat operation.

1. Remove the recliner handle cover and mounting fasteners.
2. Remove the recliner handle
3. Remove the folding seat handle cover, mounting fasteners and handle, if equipped.
4. Remove the outboard shield.
5. Remove the headrest and headrest guides.
6. Fold the seat flat and remove the seat back panel by carefully prying up on the panel until the retainers disengage.
7. For the 60 split seat only, remove the seat belt anchor mounting fastener.
8. Remove the seat cover clips and pull back to expose the inboard seat back mounting fasteners.

NOTE: On the 40 split seat, the inboard mounting fasteners are located on the outside of the seat back frame. On the 60 split seat, they are located on the inside of the seat back frame which will require the seat back cushion/cover to be removed. See Body/Seats/SEAT BACK - Removal.

STATIONARY GLASS

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- **Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.**
- **Chrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.**
- **Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.**
- **Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.**
- **Skin contact with urethane adhesive should be avoided. Personal injury may result.**
- **Always wear eye and hand protection when working with glass.**

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

Courtesy of CHRYSLER LLC

1 - T-HANDLE
2 - WINDSHIELD ADHESIVE
3 - COUNTER SUPPORT
4 - CUTTING WIRE

NOTE: Windshield removal shown, backlight similar.

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Stationary Glass - Warning**
2. Remove liftgate trim panels. See **Body/Decklid/Hatch/Liftgate/Tailgate/PANEL, Trim - Removal**
3. Remove rear window wiper arm, if equipped. Refer to **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Removal**
4. Disconnect the heated backlight electrical connectors, if equipped.
5. Using a windshield cut-out wire or other suitable tool, separate the adhesive.
6. Carefully remove backlight.

Installation

INSTALLATION

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider

(if available) before installing backlight to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The backlight fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers should be replaced with new parts. Replace any missing or damaged spacers around the perimeter of the liftgate opening.

5. Carefully lay down the backlight and press on.

CAUTION: It is no longer possible to move the backlight after installation. The backlight should never be pressed into place by more than one person, because the backlight can break if pressed simultaneously on both sides.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing backlight to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

6. Install the rear wiper arm, if equipped. Refer to **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Installation**
7. Install the liftgate trim panels.

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing quarter glass to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The quarter glass fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

6. Install quarter panel trim. See **Body/Interior/PANEL, Quarter Trim - Installation**

WINDSHIELD

Description

DESCRIPTION

The windshield is attached to the window frame (fence) with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the rubber seals are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and seals from the parts supplier.

Removal

REMOVAL

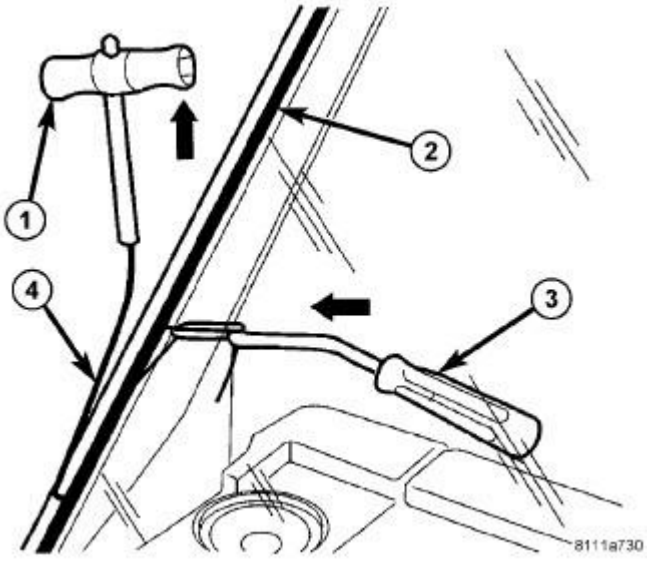

Fig. 227: ADHESIVE SEPARATION
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Stationary Glass - Warning**.
2. Remove the rear view mirror. See **Body/Interior/MIRROR, Rearview - Removal**.
3. Remove the cowl grille. See **Body/Exterior/COVER, Cowl Panel - Removal**

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

4. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the windshield to the windshield fence.
5. Carefully remove the windshield from the vehicle.
6. Remove molding from the sides of the windshield.

Installation

INSTALLATION

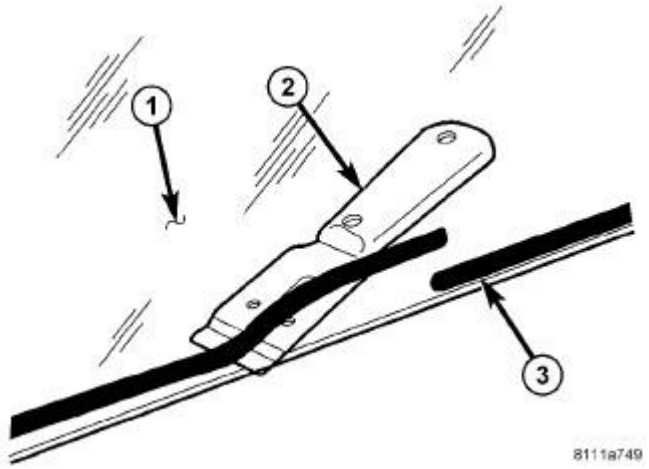

Fig. 228: Glass Adhesive Preparation
Courtesy of CHRYSLER LLC

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

1. If the windshield (1) is being reused, remove as much of the original urethane (3) as possible from the glass surface using a razor knife (2).

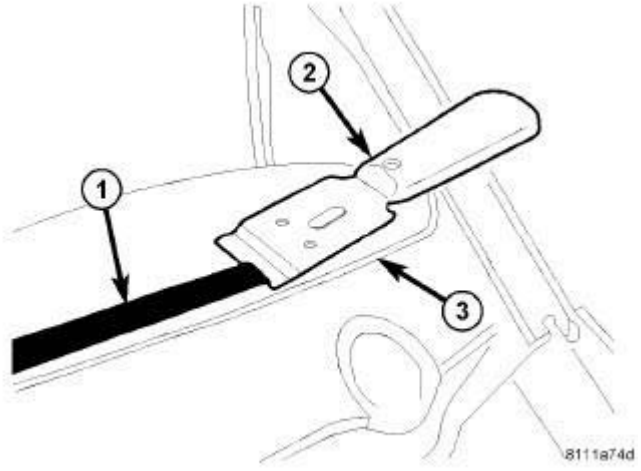

Fig. 229: WINDSHIELD OPENING PREPARATION
Courtesy of CHRYSLER LLC

CAUTION: To prevent corrosion, do not damage paint on windshield fence when removing original urethane.

CAUTION: The windshield fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm (.039 in.) in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

CAUTION: Support spacers located near the cowl at the bottom of the windshield fence should be replaced with new spacers. Replace any missing or damaged spacers around the perimeter of the windshield fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the windshield fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove any damaged adhesive backed spacers.
3. Install new adhesive backed spacers along the windshield fence as required.
4. Install a new rubber seal along the sides of the windshield.
5. Using an assistant, position the windshield into the windshield opening and against the windshield fence and spacers.
6. Verify the windshield lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the windshield.
7. Mark the windshield and the windshield fence with a grease pencil or pieces of masking tape to use as a reference for installation.

8. Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.

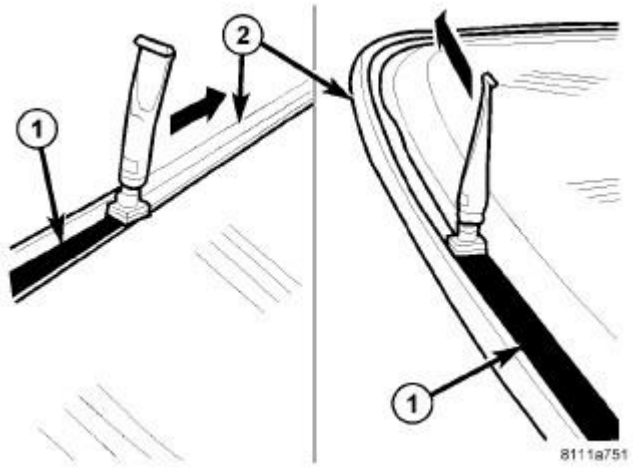

Fig. 230: WINDSHIELD PRIMER
Courtesy of CHRYSLER LLC

WARNING: Do not use solvent based glass cleaners to clean the windshield before applying glass prep and primer or poor glass adhesion may result.

9. Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
10. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
11. Apply glass primer 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
12. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.
13. Re-prime any area that is not fully and evenly primed.

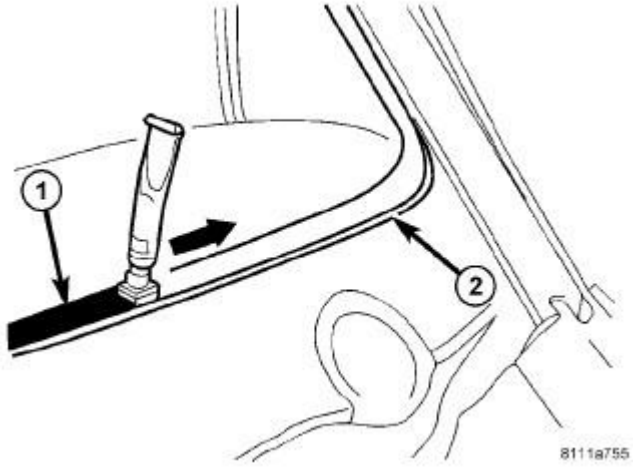

Fig. 231: WINDSHIELD OPENING PRIMER

14. Clean the windshield fence with an ammonia based glass cleaner and a lint-free cloth.
15. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the windshield fence (2). Allow at least three minutes drying time.
16. Using a flashlight, verify that the primer is completely and evenly installed along the windshield fence.
17. Re-prime any area that is not fully and evenly primed.

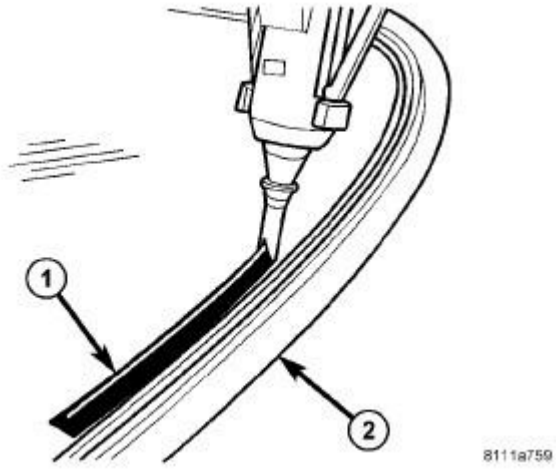

Fig. 232: WINDSHIELD ADHESIVE APPLICATION
Courtesy of CHRYSLER LLC

CAUTION: Always apply the bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing

new adhesive.

18. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the windshield.

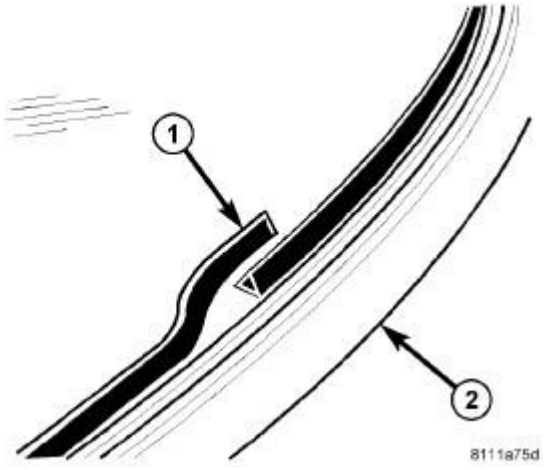

Fig. 233: WINDSHIELD ADHESIVE OVERLAP
Courtesy of CHRYSLER LLC

19. Run the end of the adhesive bead (1) on the windshield (2) parallel to the start of the bead and smooth the ends flush.
20. Using an assistant, position the windshield over the windshield opening.
21. Using the grease pencil marks or tape as reference points, align the windshield to the windshield opening.
22. Carefully lower the windshield into the windshield opening. Guide the windshield and the rubber seals on the sides of the windshield into its proper location.

CAUTION: It is not possible to move the windshield after installation. The windshield should never be pressed into place by more than one person, because the windshield can break if pressed simultaneously on both sides.

23. Push the windshield inward until the windshield comes into contact with the spacers ocated on each side and the bottom of the windshield fence.
24. Install the cowl grill. See **Body/Exterior/COVER, Cowl Panel - Removal**.
25. Install the rear view mirror onto the windshield. See **Body/Interior/MIRROR, Rearview - Installation**.

SUNROOF

DESCRIPTION

DESCRIPTION

SUNROOF ASSEMBLY BREAKDOWN

1 - DRAIN TROUGH	6 - MOTOR SCREWS (3) 3 N.m (26 in. lbs.)
2 - GLASS ASSEMBLY	7 - GLASS ASSEMBLY SCREWS (4) 3.5 N.m (31 in. lbs.)
3 - SUN SHADE	8 - FRAME ASSEMBLY
4 - WIND DEFLECTOR	9 - BRACKETS
5 - MOTOR	10 - END CAPS

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

DIAGNOSIS AND TESTING

WATER DRAINAGE AND WIND NOISE

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a piece of paper between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. See **Body/Sunroof/GLASS, Sunroof - Adjustments**.

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

1. Remove A-pillar trim, sun visors, and map lamps/mini console.
2. Lower headliner as necessary to gain access to sunroof housing drain tubes. See **Body/Interior/HEADLINER - Removal**.
3. Repair as necessary.
4. Install headliner. See **Body/Interior/HEADLINER - Installation**.

1. Position glass panel (2) on to mechanism lift arm.
2. Start the four attaching screws (1).
3. Center glass in opening by running a business card around the glass.
4. Adjust glass panel. See **Body/Sunroof/GLASS, Sunroof - Adjustments**.

Adjustments

GLASS PANEL

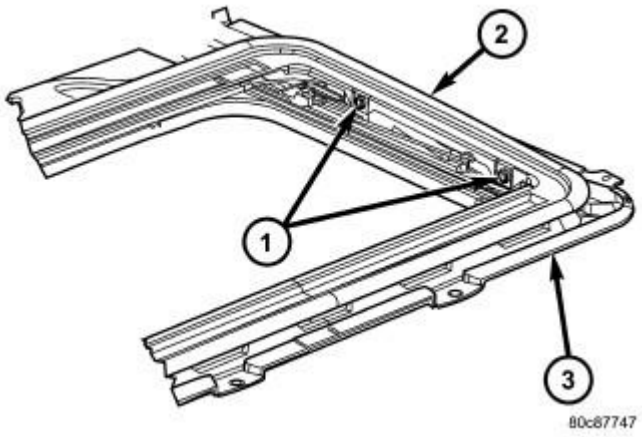

Fig. 241: GLASS PANEL
Courtesy of CHRYSLER LLC

1. Move the sunshade rearward to the open position.
2. Move the sunroof glass panel to the fully closed position.
3. Adjust the glass one corner at a time.
    a. Loosen four glass screws (1).
    b. Lift glass assembly and align the top of the glass panel to the top of the roof panel.
    c. Tighten screw to 3 N.m (26 in. lbs.).
    d. Repeat steps a. and b. for each corner of the glass panel.
    e. When properly adjusted, the front of the glass panel is 1.0 mm (0.04 in.) to 2.0 mm (0.08 in.) lower than the roof surface and the rear edge of the glass panel is 1.0 mm (0.04 in.) to 2.0 mm (0.08 in.) higher than the roof surface.

NOTE: When properly adjusted, the rear edge of the glass panel (3) is 1.0 mm (0.04 in.) to 2.0 mm (0.08 in.) higher than the roof surface (2).

4. Verify sunroof operation and alignment. Check fit and re-adjust as necessary.

MOTOR, SUNROOF, WITH CONTROL UNIT

Standard Procedure

DRIVE MOTOR TEACH PROCEDURE

REPLACEMENT DRIVE MOTOR

1. Press and hold the sunroof switch open until the sunroof glass fully opens, automatically reverses direction, and stops at a position just forward of the full open position.
2. Release sunroof switch.
3. Within five seconds of releasing sunroof switch, press and hold the sunroof switch open again until the sunroof glass closes, goes into vent position, and then finally stops in the closed position.
4. Release sunroof switch. Sunroof will now operate normally.

ORIGINAL DRIVE MOTOR

1. Press and hold sunroof switch open until the sunroof glass opens and stops.
2. Release sunroof switch.
3. Press and hold sunroof switch open once again for at least 10 seconds. After 10 seconds of pressing the switch open, the sunroof glass will automatically move and stop at a new location.
4. Release sunroof switch.
5. Within five seconds of releasing the sunroof switch, press and hold the switch open again until the sunroof glass closes, goes into vent position, and then finally stops in the closed position.
6. Release sunroof switch. The sunroof will now operate normally.

2009 ACCESSORIES AND EQUIPMENT

Audio and Video - Service Information - Journey

DESCRIPTION

DESCRIPTION

Several combinations of radio receivers and speaker systems are offered. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the RUN or ACCESSORY positions.

The audio system includes the following components:

- Antenna (Radio and Satellite)
- Power amplifier (with premium speaker system only)
- Radio noise suppression components
- Radio receiver
- Remote radio switches (if equipped)
- Satellite Receiver (integrated within the radio)
- Speakers

OPERATION

OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The audio system components operate on battery current received through a fuse in the Power Distribution Center (PDC) (Diesel Only) or the Totally Integrated Control Module (TIPM) on a fused ignition switch output (run-acc) circuit so that the system will only operate when the ignition switch is in the Run or Accessory positions.

DIAGNOSIS AND TESTING

VIDEO

VIDEO SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO VIDEO (DVD PLAYER WILL NOT	1. Fuse inoperative.	1. Check fuses. Replace fuses if required.
	2. Loose or damaged	2. Check for loose or corroded DVD player connector

LOAD OR EJECT)	DVD player connector	(16 pin). Repair or replace as required.
	3. Loose or damaged wiring/DVD player inoperative	3. Check pin 1 (b+) and pin 9 (ground) of the 16 pin connector, then check pin 1 (b+) and pin 7 (ground) of the 12 pin connector. If the 16 pin connector does not show voltage, the 12 pin connector will not show voltage (the 12 pin is fed from the 16 pin). If voltage is ok on the 16 pin, but not present on the 12 pin, unplug the 12 pin harness from the player and check the connector pins on the back of the player. If voltage is present on the 12 pin connector, the screen or the 12 pin harness should be replaced. If there is still no voltage on the 12 pin connector, the DVD player should be replaced.
	4. Ground connection damaged	4. Check for continuity between DVD player and a known good ground. There should be continuity. Repair ground if required.
	5. DVD player damaged	5. Exchange or replace DVD player if required.
-	6. DVD damaged. **NOTE:** **Avoid using CD's or DVD's that have adhesive type labels, as they may cause the disc to become jammed.**	6. Insert known good DVD and test operation.
NO DISPLAY. AUDIO HEARD THROUGH SPEAKERS	1. Loose or damaged connectors	1. Check for loose or corroded DVD player connector (12 pin). Check for loose or corroded video screen connector. Repair if required. Check for loose or damaged in-line connector.
-	2. Wiring damaged	2. With harness connected, check for video signal voltage at DVD player and at video screen harness. Place known good DVD into DVD player. Place positive lead of voltmeter on pin 5 (video signal) of the 12 pin connector. Place negative lead on pin 6 (video ground). Readings should be between 0.1v to 2v dc.
-	3. Video screen damaged	3. Exchange or replace video screen if required.
WHITE DISPLAY	1. Low voltage	1. Check for battery voltage (9v-16v) at DVD player 12 pin connector (pin 1-battery, pin 7-ground). Display will be white if voltage drops below 6v.
-	2. Video screen damaged	2. Exchange or replace video screen if required.

DARK OR BRIGHT SPOTS ON SCREEN	1. Brightness setting requires adjustment.	1. Adjust brightness setting of video screen by pressing buttons on side of video screen until desired level is reached. Start with a black screen, then press button up 16-20 times. There are 64 total steps of brightness.
BRIGHT OR DARK DISPLAY	1. Video screen display pixel defect.	1. The acceptable level of dots on the screen is (green-1, red-2) or a total (green+red+blue+white+black) = 8. Replace or exchange video screen if necessary.
VIDEO SELECTIONS DO NOT APPEAR FULL SCREEN WIDTH -	1. Aspect ratio is set incorrectly.	1. Using mode button, adjust until video appears correctly.
	2. Some DVD's are two sided. One side is wide screen format and the other is full screen or there may be a wide screen or standard screen format on the disc.	2. Ensure that DVD is inserted correctly.
BUTTONS ON VIDEO SCREEN INOPERATIVE	1. Video screen damaged.	1. Place known good DVD into DVD player. Once image appears on video screen, press top button on side of video screen to adjust width of display. Press bottom buttons to adjust brightness. Once DVD menu appears on video screen, press middle button on video screen. Highlighted selection will begin to play. If any of the buttons do not function, replace or exchange video screen.

AUDIO

Any diagnosis of the Audio system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS .

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

AUDIO SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AUDIO AT ALL SPEAKERS - RADIO DISPLAY AND CONTROLS ARE OPERATIONAL	1. Amplifier fuse faulty, if equipped.	1. Check and replace fuses, if required.
-	2. Radio faulty.	2. Exchange or replace radio, if required.
-	3. Wiring to amplifier faulty, if equipped.	3. Verify radio on/off input to amplifier and verify battery and ground connections. Repair wiring as necessary.
-	4. Amplifier faulty, if equipped.	4. Replace amplifier.
NO AUDIO AT SOME SPEAKERS - RADIO DISPLAY AND CONTROLS ARE OPERATIONAL	1. Radio faulty.	1. Exchange or replace radio, if required.
-	2. Speaker(s) faulty.	2. Refer to speaker diagnostics.
-	3. Wiring faulty between radio and speaker.	3. Check wiring for open or short, repair wiring as necessary.
-	4. Wiring faulty between radio and amplifier.	4. Refer to speaker diagnostics. Repair wiring as necessary.
-	5. Wiring faulty between amplifier and speaker.	5. Repair wiring as necessary.
-	6. Amplifier faulty.	6. Replace amplifier.
POOR AUDIO AT ALL SPEAKERS - RADIO DISPLAY AND CONTROLS ARE OPERATIONAL	1. Radio faulty.	1. Exchange or replace radio, if required.
-	2. Power/ground wiring open or shorted.	2. Repair wiring as necessary.
-	3. Amplifier faulty.	3. Replace amplifier.
-	4. Power/ground wiring to amplifier open or shorted.	4. Repair wiring as necessary.
POOR AUDIO AT SOME SPEAKERS - RADIO DISPLAY AND CONTROLS ARE OPERATIONAL	1. Radio faulty.	1. Exchange or replace radio, if required.
-	2. Speakers faulty.	2. Refer to speaker diagnostics.
-	3. Wiring faulty between radio and speaker.	3. Check wiring for open or short, repair wiring as necessary.
-	4. Wiring faulty between radio and amplifier.	4. Refer to speaker diagnostics. Repair wiring as necessary.
-	5. Wiring faulty between amplifier and speaker.	5. Wiring faulty between amplifier and speaker.
-	6. Amplifier faulty.	6. Replace amplifier.

SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners.	1. Inspect door trim panel and correct as necessary. Replace any missing fasteners.
-	2. Water shield loose or misaligned.	2. Inspect water shield and adjust as required.
-	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	3. Remove items from door trim panel. Ensure that vibration is no longer present.
NO RADIO DISPLAY - AUDIO AND CONTROLS ARE OPERATIONAL	1. Radio faulty.	1. Exchange or replace radio, if required.
NO RADIO DISPLAY - AUDIO AND CONTROLS ARE NOT OPERATIONAL	1. Fuse faulty.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Junction Block (JB). Replace fuses, if required.
-	2. Radio connector faulty.	2. Check for loose or corroded radio connector. Repair, if required.
CLOCK WILL NOT KEEP SET TIME	1. Radio connector faulty.	1. Check for loose or corroded radio connector. Repair, if required.
-	2. WIN connector faulty.	2. Check for loose or corroded WIN connector. Repair, if required.
-	3. WIN module faulty.	3. Replace WIN, if required. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Removal** .
-	4. Radio faulty.	4. Exchange or replace radio, if required.
POOR RADIO RECEPTION WITH KEY IN ACCESSORY OR IGNITION ON POSITION	1. Antenna faulty.	1. **BODY AND CABLE, Antenna** .
-	2. Radio ground faulty.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
-	3. Radio noise suppression faulty.	3. Repair or replace ground strap as necessary.
-	4. Radio faulty.	4. Exchange or replace radio, if required.
-	5. Faulty rear window defogger.	5. Verify that the rear defogger grid is functioning properly, repair as necessary. Refer to **Electrical - Heated/Cooled Systems/Heated Glass - Diagnosis and Testing**
NO COMPACT DISC OPERATION	1. Faulty CD.	1. Insert known good CD and test operation.

-	2. Foreign material on CD.	2. Clean CD and test operation.
-	3. Condensation on CD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
-	4. Faulty CD player.	4. Exchange or replace radio, if required.

AMPLIFIER

DESCRIPTION

DESCRIPTION

The optional premium speaker system includes a separate audio power amplifier. The amplifier is an eight channel unit. The amplifier is located behind the right cowl trim panel.

OPERATION

OPERATION

The power amplifier electronically increases the frequency response of the normal audio signal output from the radio amplifier in order to improve the acoustic performance of the speakers. On vehicles equipped with an amplifier, the amplifier information of the radio becomes a pre-amplifier.

The amplifier receives audio signal inputs for speaker channels from the radio, then sends amplified audio outputs through eight separate channels with dedicated feed and return circuits to the individual speakers.

REMOVAL

REMOVAL

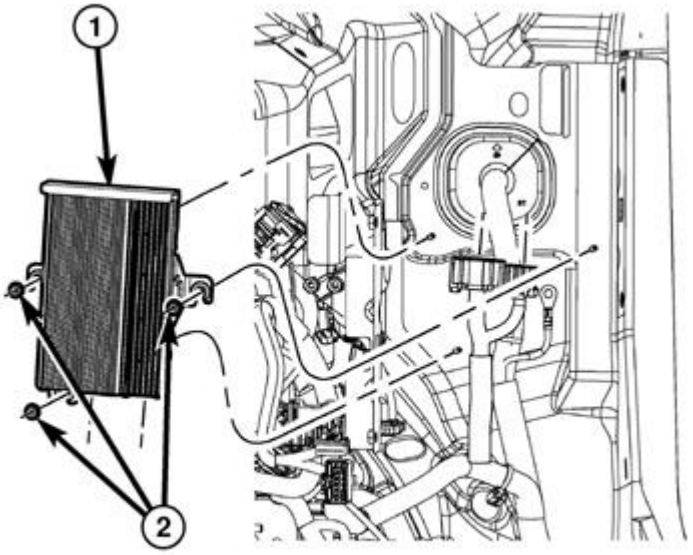

Fig. 1: Amplifier
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Lower the glove box as necessary to gain access to the amplifier.
3. Disconnect the electrical connectors.
4. Loosen the mounting fasteners and remove the amplifier and bracket.
5. Remove the amplifier from the bracket.

INSTALLATION

INSTALLATION

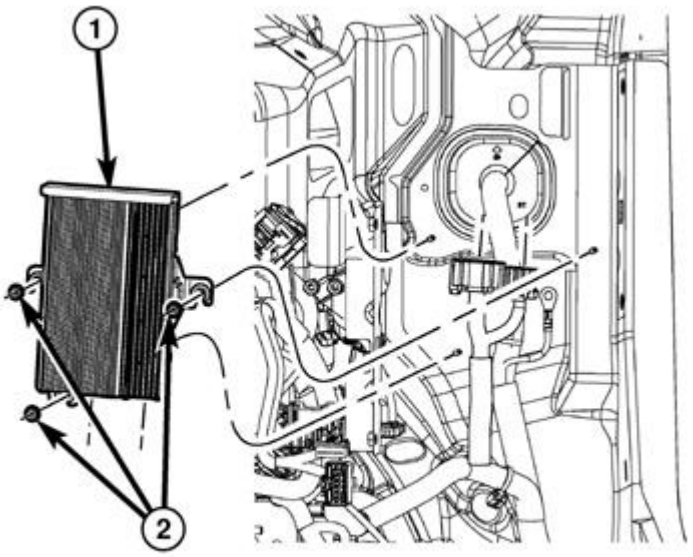

Fig. 2: Amplifier
Courtesy of CHRYSLER LLC

1. Install the amplifier to the mounting bracket.
2. Install amplifier. Tighten the forward screw to 3 N.m (26.5 in. lbs.) and the rear nut to 2 N.m (18 in. lbs.).
3. Connect the electrical connectors.
4. Raise the glove box.
5. Connect the battery negative cable.

ANTENNA, SATELLITE, AUDIO

DESCRIPTION

DESCRIPTION

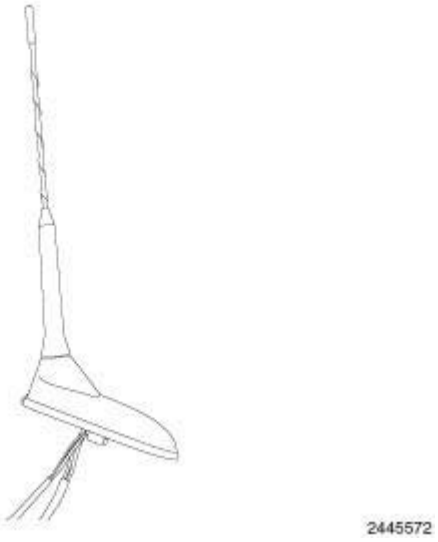

Fig. 3: Satellite Audio

If the vehicle is equipped with satellite audio, a combined antenna for AM/FM and satellite is used. For removal. See **Removal** and for installation, see **Installation** .

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lower the appropriate portion of the headliner as necessary to access the underside of the antenna. Refer to **Body/Interior/HEADLINER - Removal** .
3. Disconnect the antenna electrical connectors.
4. Remove the fastener and retainer.
5. From inside the vehicle, using a flat bladed tool, depress one of the retaining tabs on the antenna. Push one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.

INSTALLATION

INSTALLATION

1. Insert the antenna electrical connector through the hole in the roof panel.
2. Press the antenna into position until both retainers snap into place. Tighten to 9 N.m (80 in. lbs.).
3. Connect the antenna electrical connector to the antenna.
4. Install headliner. Refer to **Body/Interior/HEADLINER - Installation** .
5. Connect negative battery cable.

ANTENNA, SATELLITE, VIDEO

DESCRIPTION

DESCRIPTION

The satellite video antenna cable connects the roof mounted antenna to the satellite receiver. It has two connectors at each end and is routed above the headliner, then down the right side A-pillar to the cowl area.

OPERATION

OPERATION

The satellite video antenna receives signals from orbiting satellites and sends these signals to the satellite receiver module. The satellite video antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lower the appropriate portion of the headliner as necessary, to access the underside of the antenna.
3. Disconnect the electrical connectors from the antenna.
4. Remove the fastener and retainer.
5. From inside the vehicle, using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.

INSTALLATION

INSTALLATION

1. From inside the vehicle, using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.
2. Connect the electrical connector to the antenna.
3. Install the headliner. Refer to **Body/Interior/HEADLINER - Installation** .
4. Connect battery negative cable.

BODY AND CABLE, ANTENNA

REMOVAL

REMOVAL

NOTE: The antenna cables are integrated into the body wiring harnesses. New antenna cables is overlaid on the body wiring harness.

SATELLITE AUDIO ONLY

1. Disconnect and isolate the battery negative cable
2. Lower the rear portion of the headliner as necessary to gain access to the audio antenna. Refer to **Body/Interior/HEADLINER - Removal** .
3. Disconnect the antenna cable(s).
4. Remove antenna mast by unscrewing mast from antenna body.
5. Remove the fastener from the mounting bracket.
6. Remove the antenna bracket.
7. Remove the antenna base from the roof of the vehicle.
8. Remove the passenger side quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
9. Remove the passenger side C-pillar. Refer to **Body/Interior/PANEL, C-Pillar Trim - Removal** .
10. Remove the passenger side scuff plates. Refer to **Body/Interior/PLATE, Scuff - Removal** .
11. Remove the passenger side cowl panel. Refer to **Body/Interior/PANEL, Cowl Trim - Removal** .
12. Remove the glove box. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
13. Remove the radio. See **Removal** .

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

14. Disconnect the antenna.

SATELLITE AUDIO AND VIDEO

AUDIO CABLE TO MODULE

NOTE: The antenna cables are integrated into the body wiring harnesses. New antenna cables is overlaid on the body wiring harness.

1. Disconnect and isolate the battery negative cable.
2. Lower the rear portion of the headliner as necessary to gain access to the audio antenna. Refer to **Body/Interior/HEADLINER - Removal** .
3. Disconnect the antenna cable(s).
4. Remove antenna mast by unscrewing mast from antenna body.
5. Remove the fastener from the mounting bracket.
6. Remove the antenna bracket.
7. Remove the antenna base from the roof of the vehicle.

8. Remove the passenger side quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
9. Remove the passenger side C-pillar. Refer to **Body/Interior/PANEL, C-Pillar Trim - Removal**
10. Remove the passenger side scuff plates. Refer to **Body/Interior/PLATE, Scuff - Removal** .
11. Position the passenger seat forward.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

12. Disconnect the audio antenna from the module.

VIDEO CABLE TO MODULE

NOTE: The antenna cables are integrated into the body wiring harnesses. New antenna cables is overlaid on the body wiring harness.

1. Disconnect and isolate the battery negative cable.
2. Lower the front portion of the headliner as necessary to gain access to the video antenna. Refer to **Body/Interior/HEADLINER - Removal** .
3. Disconnect the antenna cable(s).
4. Remove antenna mast by unscrewing mast from antenna body.
5. Remove the fastener from the mounting bracket.
6. Remove the antenna bracket.
7. Remove the antenna base from the roof of the vehicle.
8. Remove the passenger side front scuff plate. Refer to **Body/Interior/PLATE, Scuff - Removal** .
9. Remove the passenger side cowl panel. Refer to **Body/Interior/PANEL, Cowl Trim - Removal** .
10. Position the passenger seat forward.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

11. Disconnect the video antenna from the module.

SIGNAL (RADIO FEED) ANTENNA CABLE FROM MODULE TO COWL

NOTE: The antenna cables are integrated into the body wiring harnesses. New antenna cables is overlaid on the body wiring harness.

1. Disconnect and isolate the battery negative cable.
2. Remove the passenger side front scuff plate. Refer to **Body/Interior/PLATE, Scuff - Removal** .
3. Remove the passenger side cowl panel. Refer to **Body/Interior/PANEL, Cowl Trim - Removal** .

4. Position the passenger seat forward.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

5. Disconnect the signal (radio feed) antenna from the module.
6. Disconnect the antenna cable from the instrument panel antenna cable in the cowl area.

SIGNAL (RADIO FEED) ANTENNA FROM COWL TO RADIO

NOTE: The antenna cables are integrated into the body wiring harnesses. New antenna cables is overlaid on the body wiring harness.

1. Disconnect and isolate the battery negative cable.
2. Remove the passenger side cowl panel. Refer to **Body/Interior/PANEL, Cowl Trim - Removal** .
3. Remove the glove box. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
4. Remove the radio. See **Removal** .

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

5. Disconnect the antenna from the radio.

INSTALLATION

INSTALLATION

SATELLITE AUDIO ONLY

NOTE: The antenna cables are integrated into the body wiring harnesses. New antenna cables is overlaid on the body wiring harness.

1. Route the cable behind the glove box, up to the radio and secure.
2. Connect the antenna to the radio.
3. Install the radio. See **Installation** .
4. Install the glove box. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
5. Route the antenna cable along the path of the old antenna wiring harness, securing where necessary.
6. Install the passenger side cowl panel. Refer to **Body/Interior/PANEL, Cowl Trim - Installation** .
7. Install the passenger side quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .
8. Install the passenger side scuff plates. Refer to **Body/Interior/PLATE, Scuff - Installation** .

9. Install the passenger side C-pillar. Refer to **Body/Interior/PANEL, C-Pillar Trim - Installation** .
10. Install the antenna base to the roof of the vehicle.
11. Install the antenna bracket and mounting fastener.
12. Install the antenna cable(s).
13. Install the headliner. Refer to **Body/Interior/HEADLINER - Installation** .

CAMERA

DESCRIPTION

DESCRIPTION

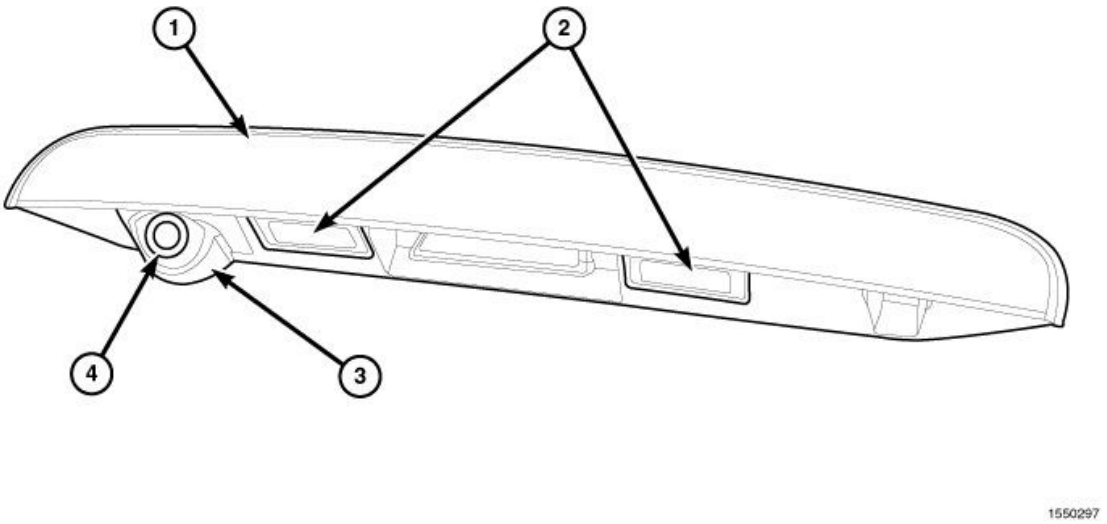

Fig. 4: Rear View Camera
Courtesy of CHRYSLER LLC

The Rear View Camera (RVC) (4) (also known as ParkView™), is a camera on chip device utilizing Complementary Metal Oxide Semiconductor (CMOS) technology. CMOS technology is used for a wide variety of digital or analog circuits. In this application, it supports the analog image sensor of the RVC. The RVC function is to provide a wide angle video image of the area behind the vehicle, including areas that might not be normally visible from the seated position of the vehicle operator, only while the transaxle gear selector is in the Reverse position. This video image then displays to the vehicle operator within the display screen of the audio system receiver unit near the center of the instrument panel.

The RVC is intended to be an auxiliary viewing aid and is not promoted as an obstacle detection or safety device. It does not remove vehicle operator responsibility to recognize and obey official traffic laws or regulations or to take sensible precautions and care to avoid pedestrians, other vehicle traffic or both fixed and moving obstacles through the habitual use of safe and defensive driving techniques.

The RVC is located on the underside of the light bar (1) mounted above the license plate tub on the vehicle liftgate. The camera lens is visible just to the left of the vehicle center line, while the body of the camera and the camera connections are concealed within the light bar above a camera mounting bracket (3), to which the camera is secured with three screws. The camera mounting bracket secures to the light bar assembly to the left of the left license plate lamp (2) with two additional screws. A light bar wire harness routes through a rubber grommet into the interior of the liftgate where it connects the RVC and both license plate lamps to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

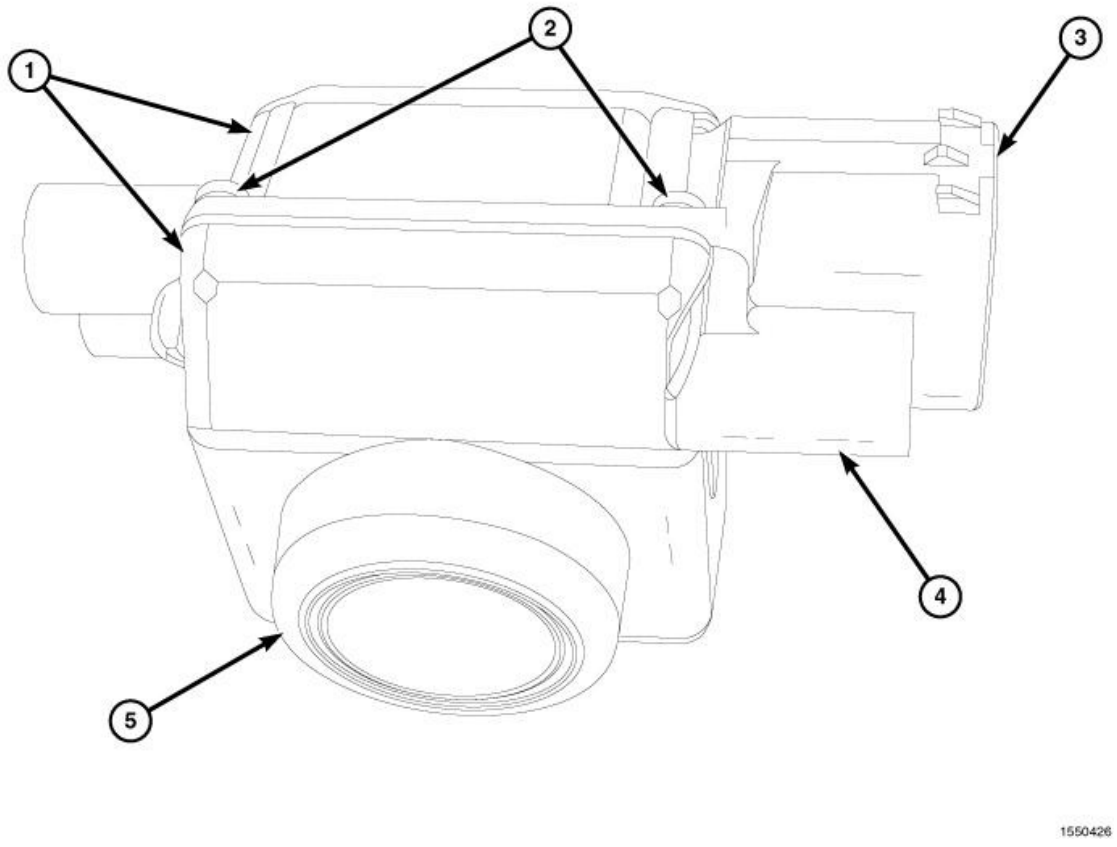

Fig. 5: Camera Image Sensor & Electronics
Courtesy of CHRYSLER LLC

The camera image sensor and electronics are sealed and protected within a two-piece die cast zinc housing (1), held together by four screws (2). The camera lens (5) extends from the lower surface of the housing and an integral connector receptacle (3) containing five terminal pins that extends from the right side of the housing. Additionally, there are three mounting bosses (4) integral to the camera housing, two on the left side and one on the right. The mounting bosses receive the three self-tapping screws securing the unit to the camera bracket.

Hardwired circuitry connects the RVC to the electrical system of the vehicle. These hardwired circuits are integral to several wire harnesses, which routes throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The RVC cannot be adjusted or repaired. If the RVC is damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The Rear View Camera (RVC) is powered by a battery feed received through the backup lamp switch output circuit from the Totally Integrated Power Module (TIPM) so that is only active when the transaxle is shifted into the REVERSE position. In addition, the radio receiver monitors messages on the Controller Area Network (CAN) data bus to determine the selected transaxle gear and overrides any other display to show the RVC video output, whenever it detects that the transaxle is in REVERSE. A momentary blank video display screen immediately following the gearshift transition into the REVERSE position is considered normal operation. The camera electronics receive a path to ground at all times through a takeout and eyelet terminal of the liftgate wire harness that is secured by a ground screw to the right side of the liftgate inner panel.

The output of the camera is a video signal compatible to the National Television System Committee (NTSC) standard composite video M format, or NTSC-M. The video signal is delivered to the radio video display unit through the entire length of the vehicle by camera signal and the camera return circuits that are arranged as a twisted pair, with an additional grounded foil jacket to protect the video signal from corruption due to stray radiated signals within the vehicle environment. The ground shield is terminated only at the video display (radio) end, not at the camera. Portions of these video signal wires are contained within the liftgate lightbar wire harness, the liftgate wire harness, the body wire harness and a jumper harness located between the radio and the body harness connector below the instrument panel at the right cowl side inner panel.

DIAGNOSIS AND TESTING

Rear Camera

The hardwired circuits of the Rear View Camera (RVC) and those between the RVC and the radio receiver may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RVC or the radio receiver. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to radio receiver operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Be certain to confirm both of the following prior to attempting any further diagnosis or testing of the RVC. Use a diagnostic scan tool to confirm the rear view camera is setup in the vehicle configuration. From the initial start up

screen of the diagnostic scan tool, navigate to ECU VIEW , select TIPMCGW CENTRAL GATEWAY , MORE OPTIONS , ECU DETAILS and then CONFIG INFO . Verify that REAR CAMERA PRESET - - - - SET is present. If not, the Sales Code XAC (Park View Rear Back-Up Camera) will have to be added to the vehicle configuration to enable the RVC, in vehicles equipped with a MyGIG multimedia entertainment system (Sales Codes RE1, REN, REP, RER, REU, REW, REX or REZ), be certain that the RVC is set to ENABLED using the CAMERA SETUP option in the MyGIG system settings.

RADIO

STANDARD PROCEDURE

RADIO BACKUP

The radio hard disk drive (HDD) can be backed up to save customer data in the event that a radio replacement is required. This procedure can only be done with all radios with a hard disk drive. All other radios do not have a HDD.

1. Turn the ignition to RUN, engine OFF.
2. Power on the external HDD.
3. Connect the external HDD to the radio using the USB (Universal Serial Bus) cable. The radio display will change to the "Manage My Files" screen.
4. Connect the scan tool and preform the following steps to place the radio into "Dealership Mode":
   - ECU View
   - Radio
   - Misc. Functions
   - Service Mode
   - Start
   - Next
5. Follow the on screen instructions on the radio to back up the radio HDD.

NOTE: REQ RADIO , After installation of the radio, remove the radio from "Transportation Mode" by pulling the IOD fuse or using the scan tool and perform a battery reset.

SPEAKER

OPERATION

OPERATION

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output

signal electrical current to flow through the voice coil. For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

SPEAKER

Any diagnosis of the Audio system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS .

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

1. If all speakers are inoperative, check the radio fuses in the Totally Integrated Power Module (TIPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Check the amplifier fuse (if equipped) in the TIPM. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
3. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.
4. Turn the radio receiver OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with a amplifier, remove the radio receiver. If vehicle is equipped with an amplifier. disconnect wire harness connector at output side of amplifier. Go to Step 5.
5. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the radio receiver wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required.
6. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector or if equipped, the amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-

) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuit(s) as required.

SWITCH, REMOTE RADIO

DESCRIPTION

DESCRIPTION

Remote radio control switches are rocker-type switch units are mounted in the upper spoke covers of the rear (instrument panel side) steering wheel trim cover. The switch unit on the left side is the seek switch and has seek up, seek down, and preset station advance switch functions. The switch unit on the right side is the volume control switch and has volume up, volume down, and mode advance switch functions.

The two remote radio switch units are each retained in a mounting hole located on opposite sides of the rear steering wheel trim cover by four integral snap features. A plastic bracket on the back of each switch unit provides additional support for the unit by extending towards the center of the steering wheel where it is clamped between the steering wheel armature and the steering wheel rear trim cover mounting boss by the trim cover mounting screw.

The two remote radio switch units share a common steering wheel wire harness with the vehicle speed control switches. The steering wheel wire harness is connected to the instrument panel wire harness through the clockspring.

DIAGNOSIS AND TESTING

REMOTE SWITCHES

Any diagnosis of the Audio system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS .

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the battery negative cable. Remove the remote radio switch(es) from the steering wheel.
2. Use an ohmmeter to check the switch resistances as shown in **REMOTE RADIO SWITCH TEST**. If the remote radio switch resistances check OK , go to 3. If not OK, replace the faulty switch.

REMOTE RADIO SWITCH TEST

Switch	Switch Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
Right (White)	Volume Up	6.732 ohms	6.8 ohms	6.868 ohms
Right (White)	Volume Down	14.850 ohms	15 ohms	15.151 ohms
Right (White)	Mode Advance	0 ohms	0 ohms	0 ohms

FRAME

SPECIFICATIONS

FRAME DIMENSIONS

Frame dimensions are listed in metric scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

4. Remove the fore-aft crossmember forward mounting bolts at the radiator support.
5. Remove the fore-aft crossmember rearward mounting bolts at the crossmember.
6. Remove the fore-aft crossmember.
7. Remove the front engine mount mounting bolts (2) and damper (1). Remove the mount (3) from the crossmember.

Installation

INSTALLATION

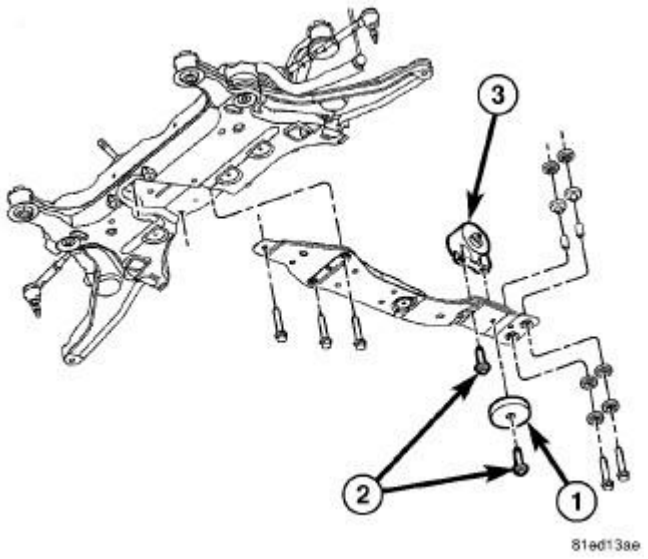

Fig. 31: Fore-Aft Crossmember Forward Mounting Bolts

3. Install the front engine mount thru-bolt (4). Tighten the bolt to 60 N.m (44 ft. lbs.).
4. If equipped, install the engine belly pan.
5. Lower the vehicle.

CROSSMEMBER, FRONT SUSPENSION

Removal

REMOVAL

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

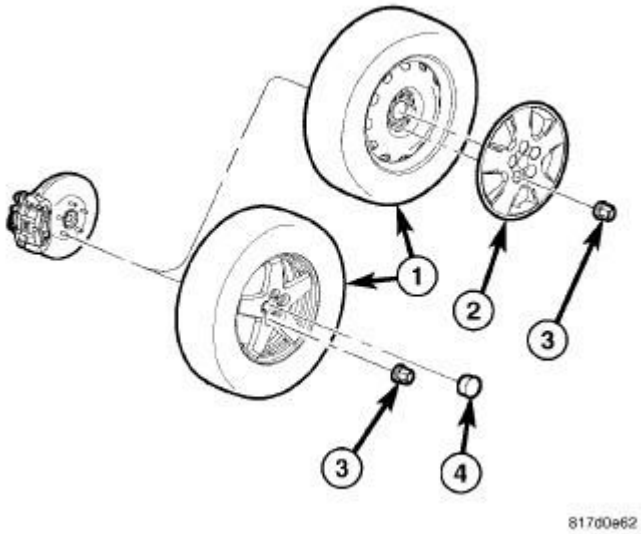

Fig. 33: Tire And Wheel Mounting

4. On each side of the vehicle, release the lower ball joint (3) from the lower control arm (1) using Remover (2), Special Tool 9360. Do not lift the knuckle out of the lower control arm at this time.
5. If equipped, remove the engine belly pan.
6. Remove the fore/aft crossmember. See **Removal**.
7. Remove the rear engine mount. Refer to **Engine/Engine Mounting/INSULATOR, Engine Mount - Removal** .

9. Remove the screws and push-pins securing the heat shield (1) over the right side of the steering gear (2).

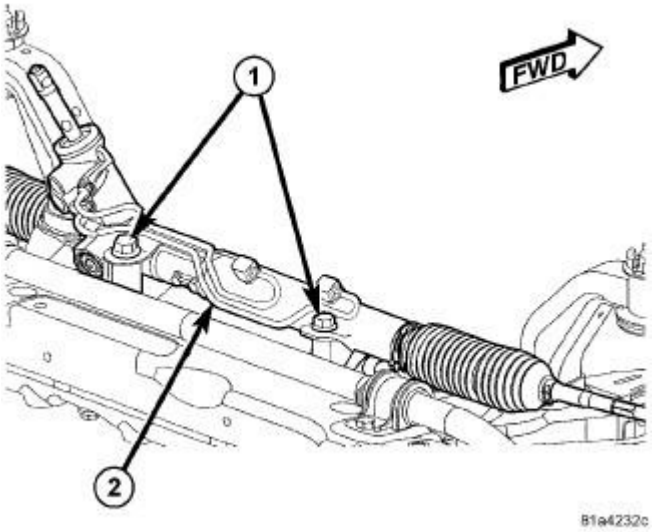

Fig. 38: Steering Gear Mounting
Courtesy of CHRYSLER LLC

10. Remove the two bolts (1) securing the steering gear (2) to the crossmember.
11. Support the steering gear using a bungee cord or other to keep the steering gear from lowering when the crossmember is lowered.

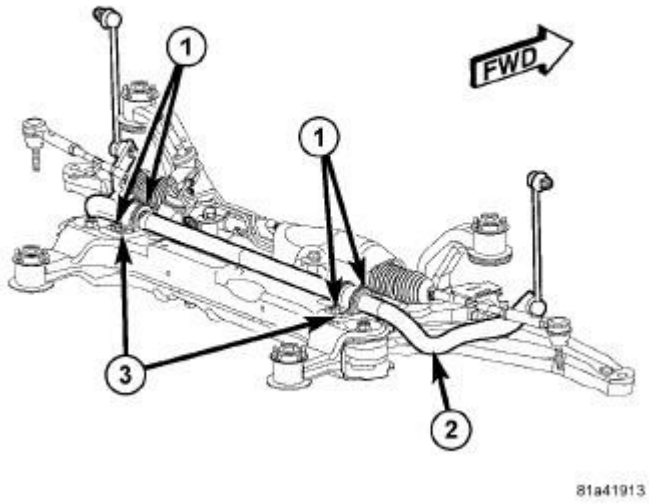

Fig. 39: Stabilizer Bar Mounting
Courtesy of CHRYSLER LLC

12. Remove the screws (1) securing the stabilizer bushing retainers (3) to the crossmember.

NOTE: Before lowering the front suspension crossmember, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.

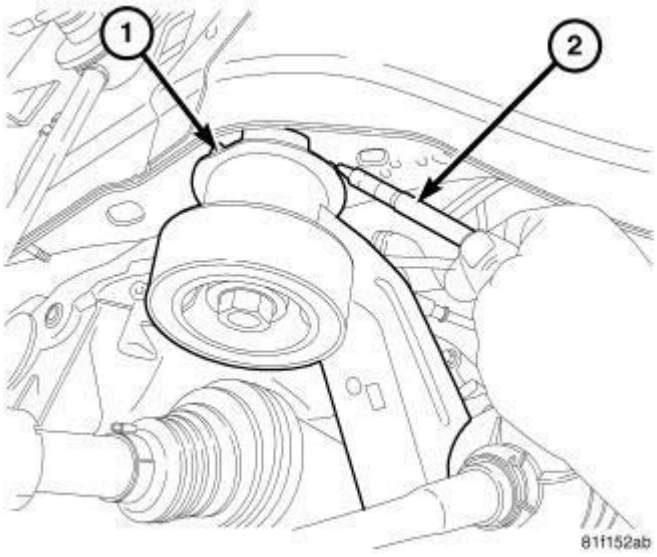

Fig. 40: Marking Location Of Crossmember

Courtesy of CHRYSLER LLC

13. Using a crayon or marker (2) that will not break the paint surface, mark the location of the front crossmember (1) on the body near each mounting bolt. **Do not use any type of sharp instrument that will damage the underbody of the vehicle.**

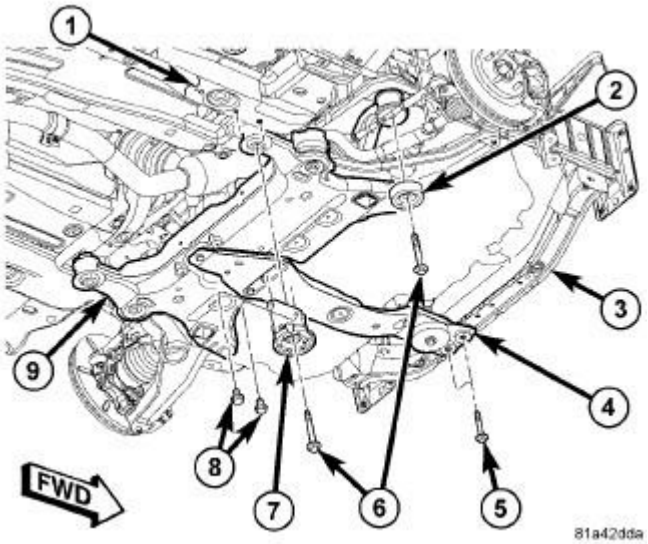

Fig. 41: Front Crossmember Mounting
Courtesy of CHRYSLER LLC

14. Support the crossmember (9) with a transmission jack. Secure the crossmember to the jack.
15. Remove the four mounting bolts (6) securing the front crossmember (9) to the body.
16. Remove the mounting screws (8) securing the front crossmember reinforcement brackets (7) (one each side of vehicle) to the body (1). Remove the brackets.
17. Slowly lower the crossmember and control arms to a comfortable working height using the jack.

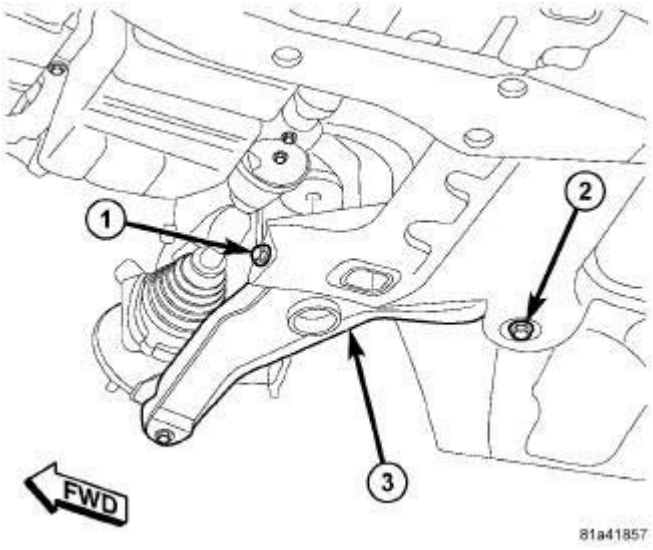

Fig. 42: Lower Control Arm Mounting
Courtesy of CHRYSLER LLC

18. To remove each lower control arm:
    a. Remove the front bolt (1) attaching the lower control arm (3) to the front suspension crossmember.
    b. Remove the nut on the rear bolt (2) attaching the lower control arm (3) to the front suspension crossmember. Remove the bolt.
    c. Remove the lower control arm (3) from the crossmember.

Installation

INSTALLATION

1. Support the crossmember with a transmission jack. Secure the crossmember to the jack.

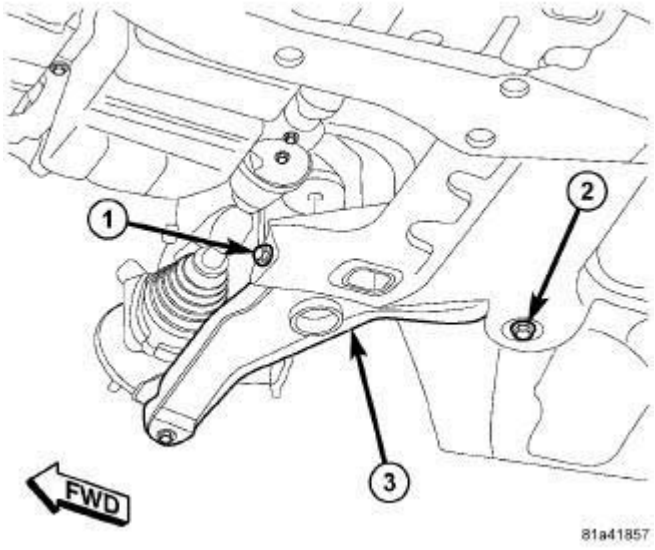

Fig. 43: Lower Control Arm Mounting
Courtesy of CHRYSLER LLC

2. To install each lower control arm on the crossmember:
   a. Place the lower control arm (3) into the front suspension crossmember.
   b. Insert the rear bolt (2) up through the crossmember and lower control arm (3). Install the nut on the top-end of the bolt, but do not tighten it at this time.
   c. Install, but do not fully tighten, the front bolt (1) attaching the lower control arm (3) to the crossmember.
   d. With no weight or obstruction on the lower control arm, tighten the lower control arm **front** mounting bolt (2) to 145 N.m (107 ft. lbs.).
   e. With no weight or obstruction on the lower control arm, tighten the lower control arm **rear** mounting bolt nut to 145 N.m (107 ft. lbs.).

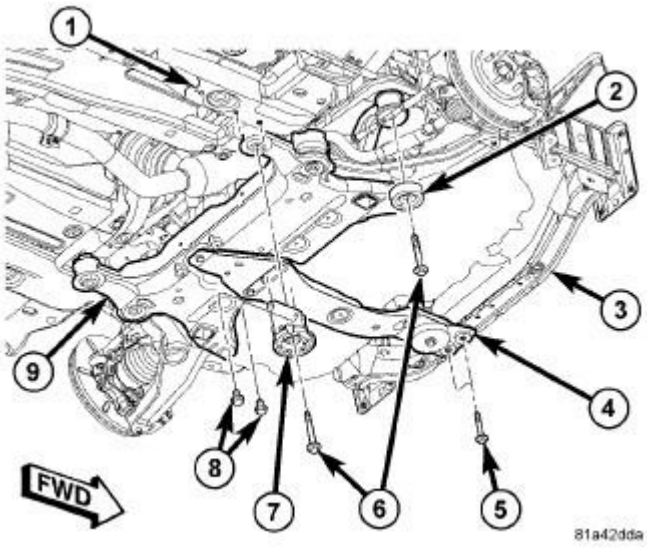

Fig. 44: Front Crossmember Mounting
Courtesy of CHRYSLER LLC

3. Slowly raise the crossmember (9) into mounted position using the transmission jack matching the crossmember to the marked locations on the body made during removal. As the crossmember is raised, guide the lower ball joints into the mounting holes in the lower control arms. Also, make sure the stabilizer bar is properly positioned on the crossmember.
4. Position the front crossmember reinforcement brackets (7) (one each side of vehicle) over the crossmember rear mounting bushings and install the mounting screws (8), but do not tighten at this time.

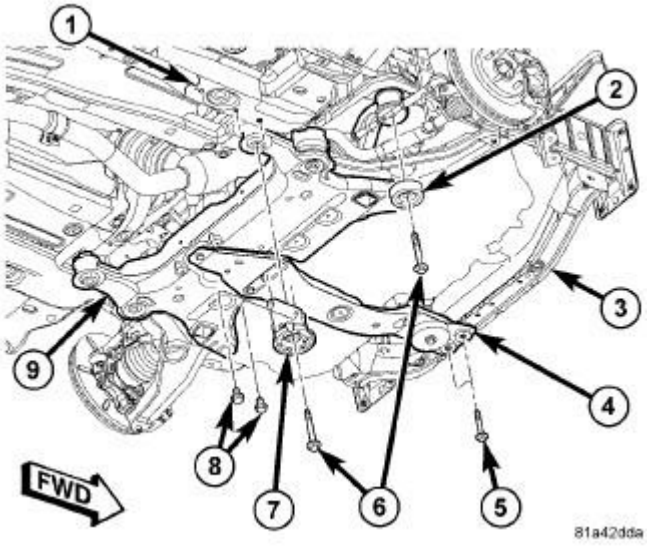

Fig. 45: Front Crossmember Mounting
Courtesy of CHRYSLER LLC

5. Install the four mounting bolts (6) securing the front crossmember (1) to the body. Tighten the crossmember mounting bolts to 135 N.m (100 ft. lbs.).
6. Tighten the crossmember reinforcement bracket mounting screws (8) to 55 N.m (41 ft. lbs.).
7. Remove the transmission jack.

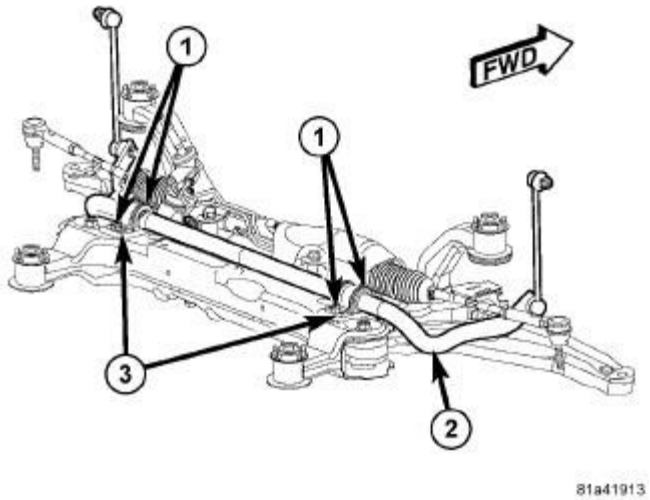

Fig. 46: Stabilizer Bar Mounting
Courtesy of CHRYSLER LLC

8. Position both stabilizer bar bushing retainers and install the screws (1) securing the stabilizer bushing retainers (3) to the crossmember. Tighten all four stabilizer bar cushion retainer screws to 60 N.m (44 ft. lbs.).

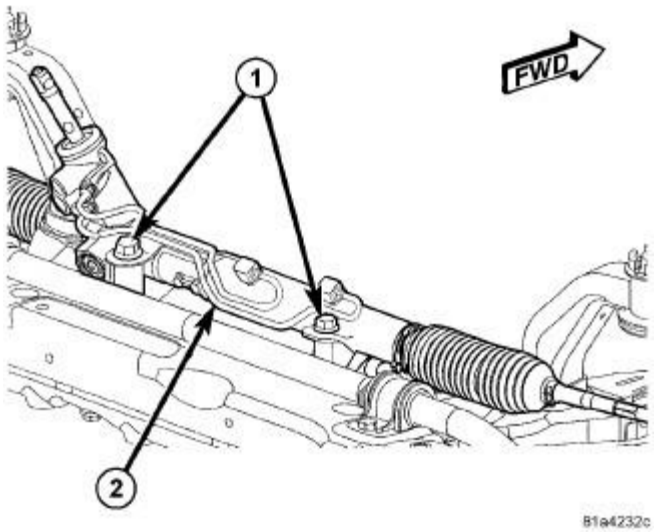

Fig. 47: Steering Gear Mounting

Courtesy of CHRYSLER LLC

9. Remove the bungee cord or other supporting the steering gear (2).
10. Install the two bolts (1) securing the steering gear (2) to the crossmember. Tighten the steering gear mounting bolts to 100 N.m (74 ft. lbs.).

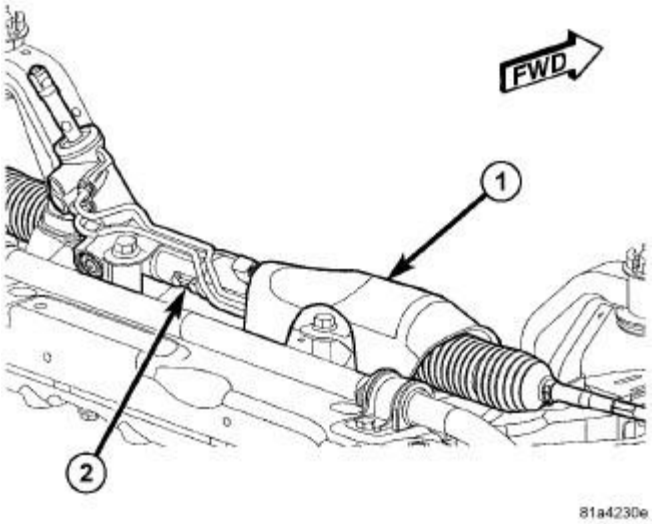

Fig. 48: Heat Shield Over Gear
Courtesy of CHRYSLER LLC

11. Position the heat shield (1) over the steering gear (2). Install the mounting screws and push-pins. Tighten the screws to 6 N.m (53 in. lbs.).

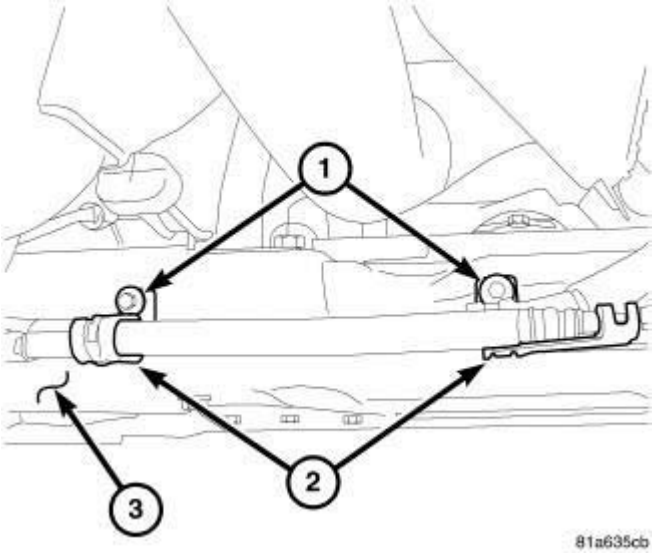

Fig. 49: Hoses At Rear Of Crossmember
Courtesy of CHRYSLER LLC

12. Position the power steering hose routing clamps (2) on the crossmember. Install and tighten the screws to 8 N.m (71 in. lbs.).
13. Install the rear engine mount. Refer to appropriate Engine SERVICE INFORMATION article.
14. Install the fore/aft crossmember. See **Installation**.
15. If equipped, install the engine belly pan.

NOTE: If a new or cleaned lower control arm is being installed, it is important to have a film of general purpose grease around the ball joint mounting hole on the lower control arm to avoid any future corrosion issues. Make sure the grease does not get inside the ball joint mounting hole or on the ball joint stud during installation.

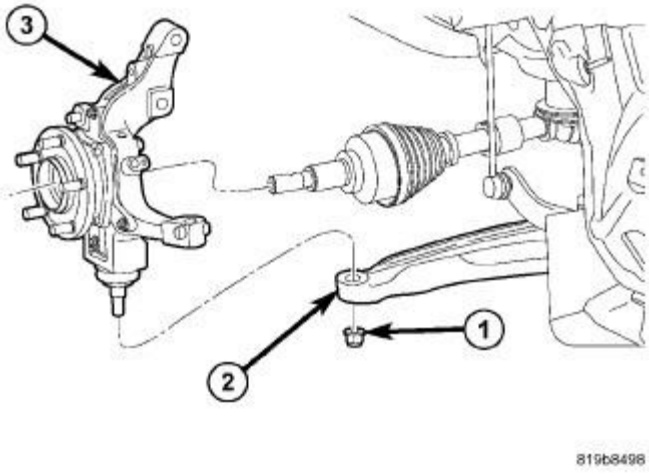

Fig. 50: Lower Ball Joint To Control Arm
Courtesy of CHRYSLER LLC

16. On each side of the vehicle, install a NEW ball joint stud nut (1). Tighten the nut to 95 N.m (70 ft. lbs.).

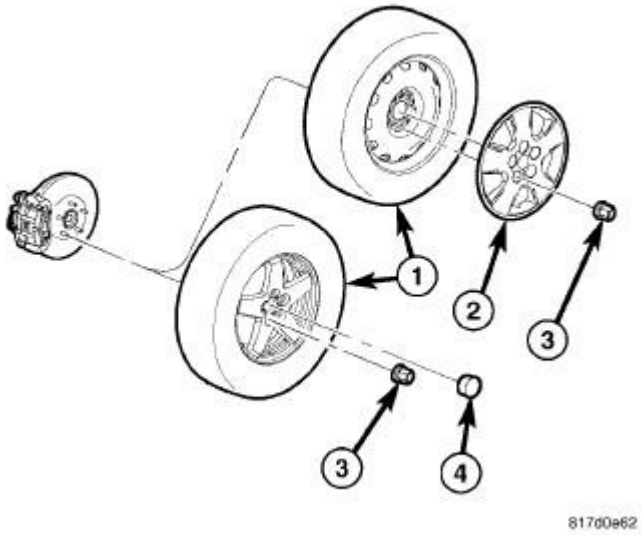

Fig. 51: Tire And Wheel Mounting
Courtesy of CHRYSLER LLC

17. On each side of the vehicle, install the tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten the wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
18. Lower the vehicle.
19. Perform wheel alignment as necessary. Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

CROSSMEMBER, REAR SUSPENSION

Removal

REMOVAL

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

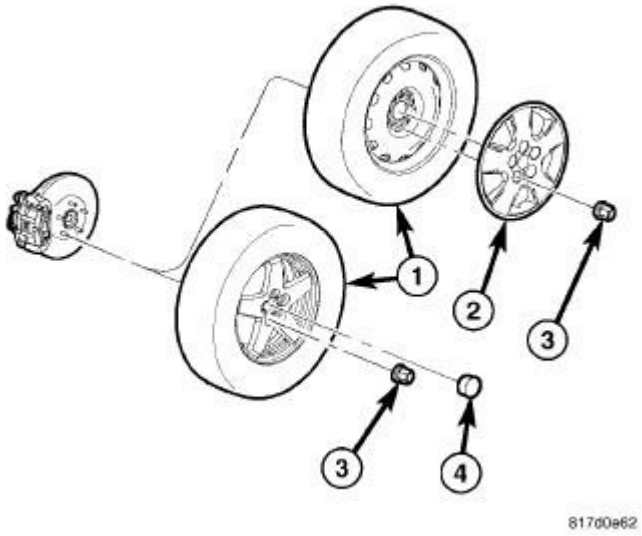

Fig. 52: Tire And Wheel Mounting

7. On each side of the vehicle, if equipped with load-leveling shocks, support the lower shock (1) with a jack (2) using just enough force to allow easy removal of the lower shock mounting bolt in the following step. Lower the jack following bolt removal.

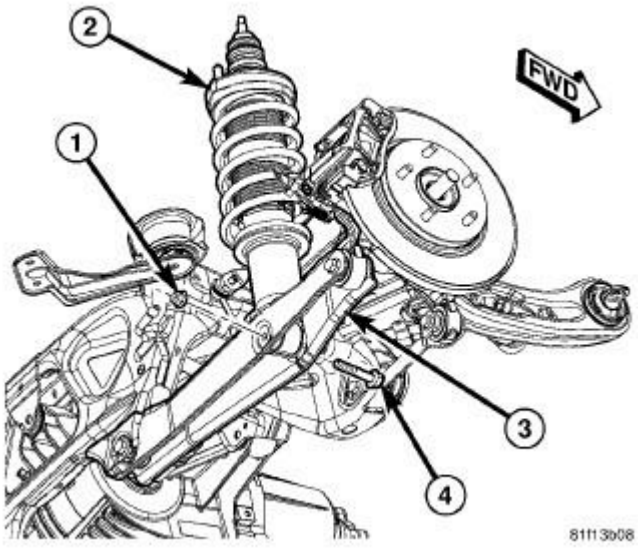

Fig. 57: Rear Lower Shock Mounting
Courtesy of CHRYSLER LLC

8. On each side of the vehicle, remove the lower shock mounting nut (1) and bolt (4).
9. If equipped with all-wheel-drive, remove the rear driveline module, but instead of using a drive-on hoist, place jacks under the outboard ends of the lower control arms and adjust the rear suspension height at the hub and bearings to simulate curb riding height. Refer to **Differential and Driveline/Rear Driveline**

Module - Removal . Once the rear driveline module is removed, remove the jacks.

10. If equipped with all-wheel-drive, slide the half shaft out of the hub and bearing on each side of the vehicle and remove it.

11. On each side of the vehicle, while holding the stabilizer bar link upper stud stationary, remove the nut (2) securing the link (4) to the stabilizer bar (3).
12. On each side of the vehicle, remove the screws (1) securing the stabilizer bar retainer (5) to the crossmember.
13. Remove the stabilizer bar (3) from the vehicle.

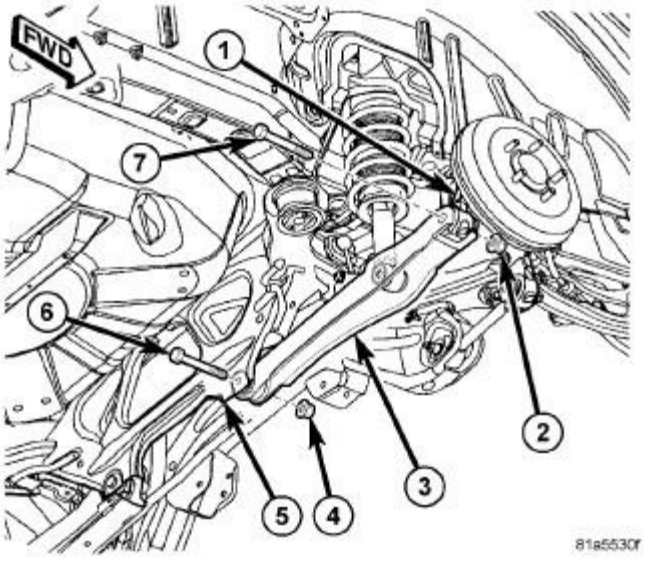

Fig. 59: Rear Lower Control Arm Mounting

14. On each side of the vehicle:
    a. Loosen (do not remove) the nut (2) and bolt (7) securing the lower control arm (3) to the knuckle (1).
    b. Remove the nut (4) and bolt (6) securing the lower control arm (3) to the rear crossmember (5).
    c. Swing the lower control arm down away from the rear crossmember.

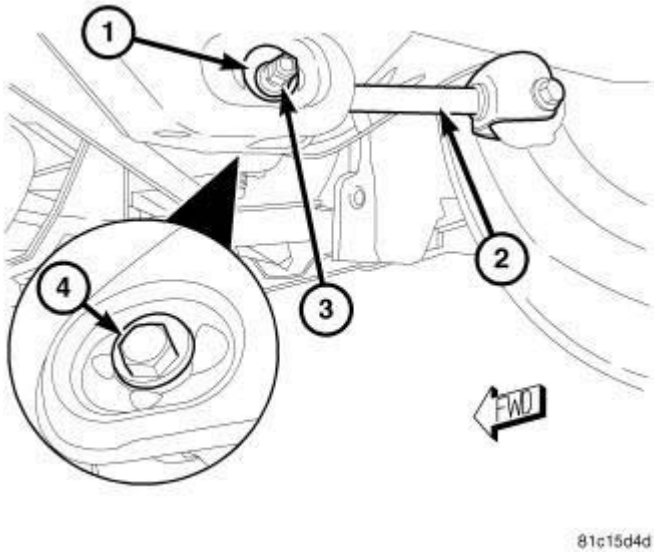

Fig. 60: Rear Toe Adjustment Cam Bolt
Courtesy of CHRYSLER LLC

15. On each side of the vehicle:
    a. Mark the position of the cam bolt (4) cams on the crossmember using a paint marker or crayon. Do not use any type marker that will scratch or damage the surface of the crossmember.
    b. While holding the cam bolt (4) head stationary, loosen and remove the toe link mounting cam bolt nut (3) and washer (1). Remove the cam bolt.

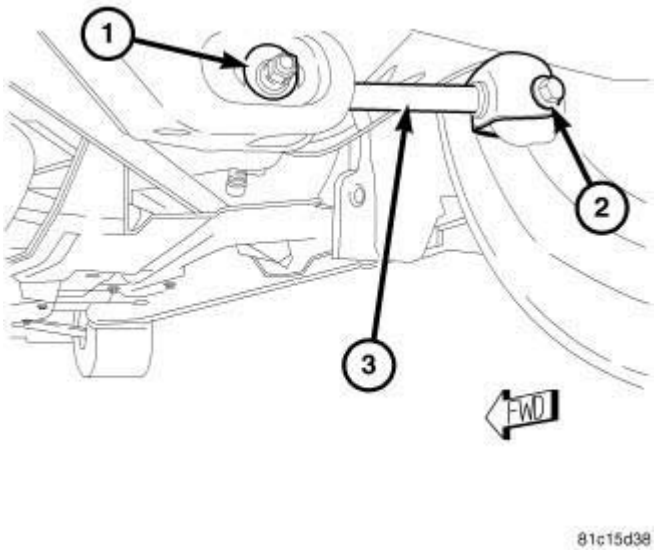

Fig. 61: Toe Link
Courtesy of CHRYSLER LLC

16. On each side of the vehicle, loosen (do not remove) the mounting bolt (2) and nut securing the toe link (3) to the knuckle.

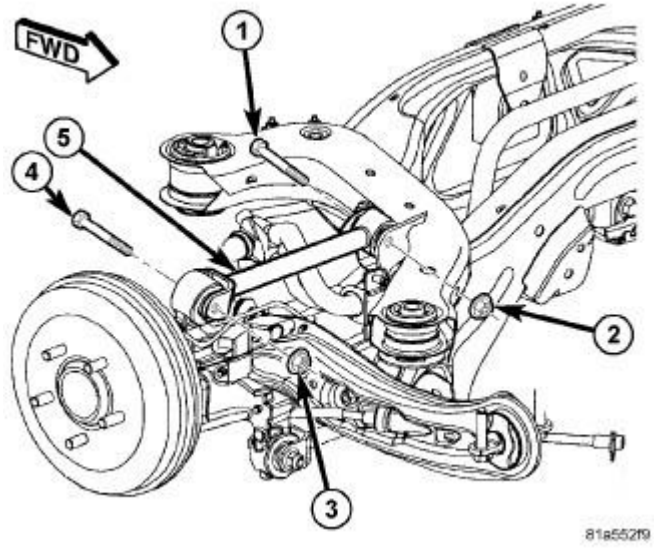

Fig. 62: Upper Control Arm Mounting
Courtesy of CHRYSLER LLC

17. On each side of the vehicle:
    a. Loosen (do not remove) the nut (3) and bolt (4) securing the upper control arm (5) to the knuckle.
    b. Remove the nut (2) and bolt (1) securing the upper control arm (5) to the crossmember.
18. On each side of the vehicle, using wire or a bungee cord, support the knuckle to keep it from sagging.

NOTE: Before lowering the rear suspension crossmember, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the crossmember is not reinstalled in exactly the same location as before removal, the rear wheel alignment settings may be lost.

19. Using a crayon or marker that will not break the paint surface, mark the location of the rear suspension crossmember on the body near each mounting bolt. **Do not use any type of sharp instrument that will damage the underbody of the vehicle.**
20. Support the crossmember with a transmission jack. Secure the crossmember to the jack.
21. Remove the two mounting screws securing each crossmember reinforcement bracket (one each side of vehicle) to the body.
22. Remove the mounting nuts securing the crossmember reinforcement brackets to the crossmember rear mounting bolts. Remove the brackets.
23. Remove the four mounting bolts securing the crossmember to the body.
24. Slowly lower the crossmember using the jack.

Installation

INSTALLATION

1. Support the rear suspension crossmember with a transmission jack. Secure the crossmember to the jack.
2. Slowly raise the crossmember into mounted position using the transmission jack matching the crossmember to the marked locations on the body made during removal. As the crossmember is raised, guide the rear suspension components into place.
3. Install the four mounting bolts (rear bolts have stud heads) securing the crossmember to the body. Tighten the crossmember mounting bolts to 95 N.m (70 ft. lbs.).
4. Position the crossmember reinforcement brackets (one each side of vehicle) over the crossmember rear mounting bolt head-studs and install the mounting nuts, but do not tighten at this time.
5. Install the mounting screws securing the crossmember reinforcement brackets to the body. Tighten the screws to 55 N.m (41 ft. lbs.).
6. Tighten the mounting nuts securing the reinforcement brackets to the rear crossmember mounting bolts to 50 N.m (37 ft. lbs.).
7. Remove the transmission jack.

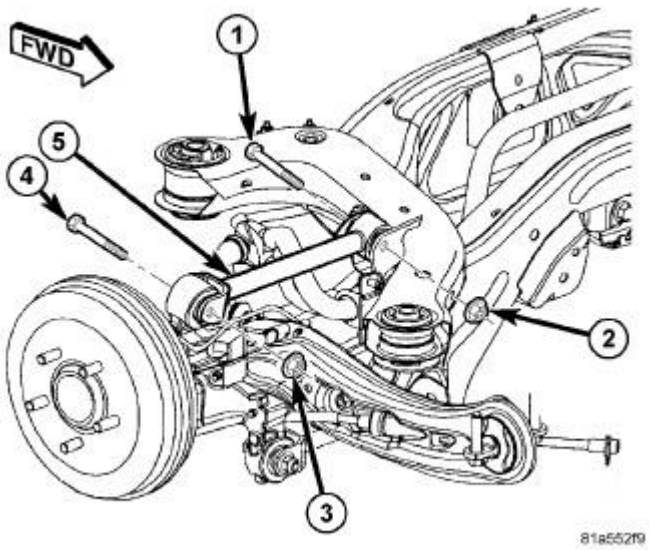

Fig. 63: Upper Control Arm Mounting
Courtesy of CHRYSLER LLC

8. On each side of the vehicle, position the upper control arm (5) and install the bolt (1) and nut (2) securing the arm to the crossmember. Do not tighten either upper control arm mounting bolts at this time.

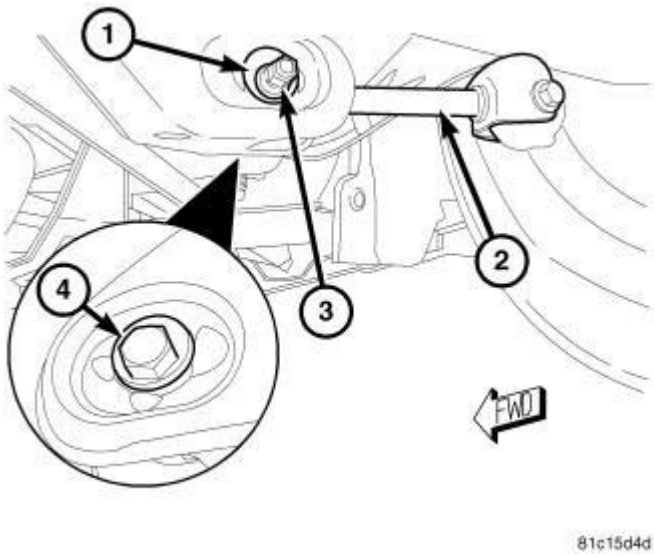

Fig. 64: Rear Toe Adjustment Cam Bolt
Courtesy of CHRYSLER LLC

CAUTION: When installing the cam bolt (4) and washer make sure the cams stay inside the abutments built into the crossmember. Failure to do so can damage the abutments and make toe adjustment difficult.

9. On each side of the vehicle:

a. Position the toe link (2) and install the cam bolt (4) from the front through the crossmember and link. Match the cam on the bolt to the marks made during removal or position the top of the cam to the 12 O'clock position if not available.
b. Install the cam washer (1) and nut (3) securing the toe link (2) to the crossmember. Do not tighten at this time.

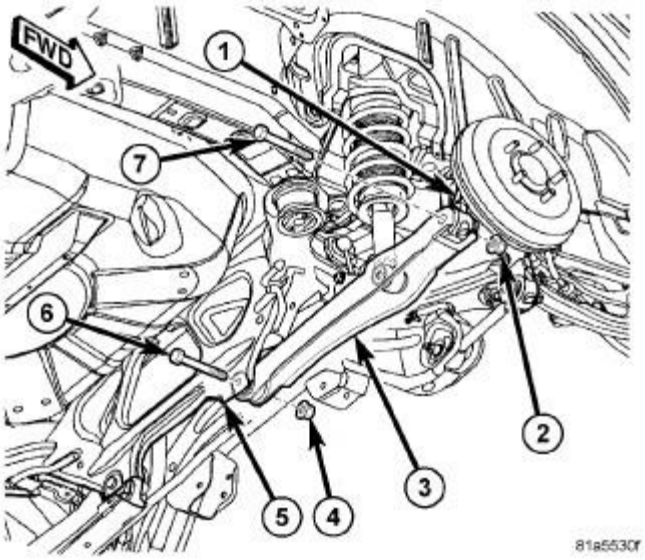

Fig. 65: Rear Lower Control Arm Mounting
Courtesy of CHRYSLER LLC

10. On each side of the vehicle, position the lower control arm (3) and install the bolt (6) and nut (4) securing the lower control arm to the crossmember (5). Do not tighten nut and bolt at crossmember or knuckle at this time.

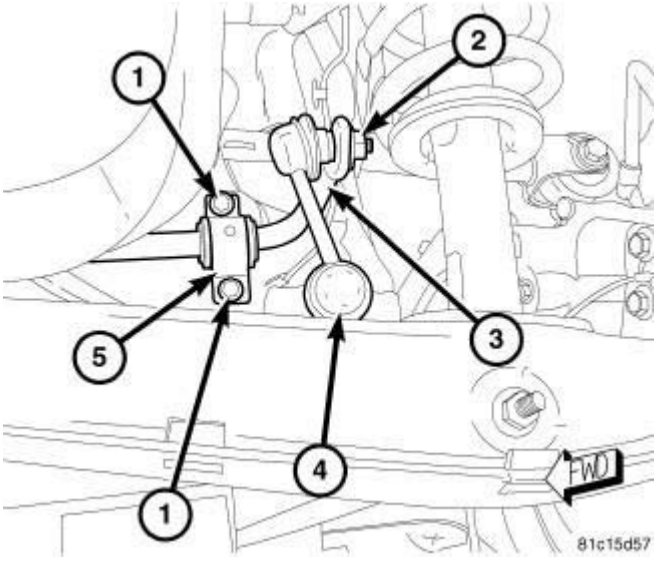

Fig. 66: Rear Stabilizer Bar Retainer

Courtesy of CHRYSLER LLC

NOTE: When installing the stabilizer bar on a vehicle with all-wheel-drive, position the bar so that the bar loops over the axle half shafts once installed, not under the axle half shafts.

11. Position the stabilizer bar (3) on the rear crossmember.

CAUTION: Before installing the screws in the following step, it is especially important to clean the threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

12. Install the two retainers (5 - right side shown in illustration) over the cushions at the mounting holes and install the retainer screws (1). Do not tighten the screws at this time.

CAUTION: Before installing the nut in the following step, it is especially important to clean the threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

13. On each side of the vehicle, install the stabilizer link (4) upper stud in the end of the stabilizer bar (3). Install the nut (2) on the upper stud and while holding the stabilizer link stud stationary, tighten the nut to 48 N.m (35 ft. lbs.).
14. On each side of the vehicle, tighten the stabilizer bar retainer screws (1) to 25 N.m (18 ft. lbs.).

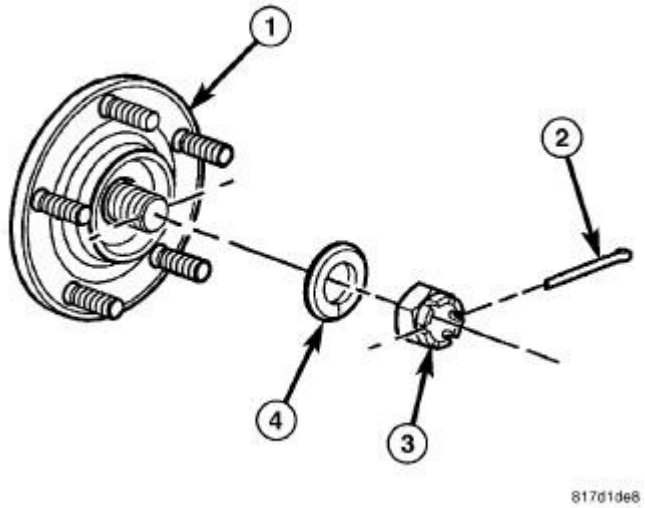

Fig. 67: Hub Nut And Washer
Courtesy of CHRYSLER LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only

and should be discarded when removed.

15. If equipped with all-wheel-drive, slide the half shaft into the hub and bearing on each side of the vehicle and hand-start the washer and hub nut (3) Support the shafts to keep them from overextending the joints.
16. If equipped with all-wheel-drive, install the rear driveline module. In place of using a drive-on hoist, place jacks under the outboard ends of the lower control arms and adjust the rear suspension height at the hub and bearings to simulate curb riding height. Refer to **Differential and Driveline/Rear Driveline Module - Removal** . Once the rear driveline module is installed, remove the jacks.

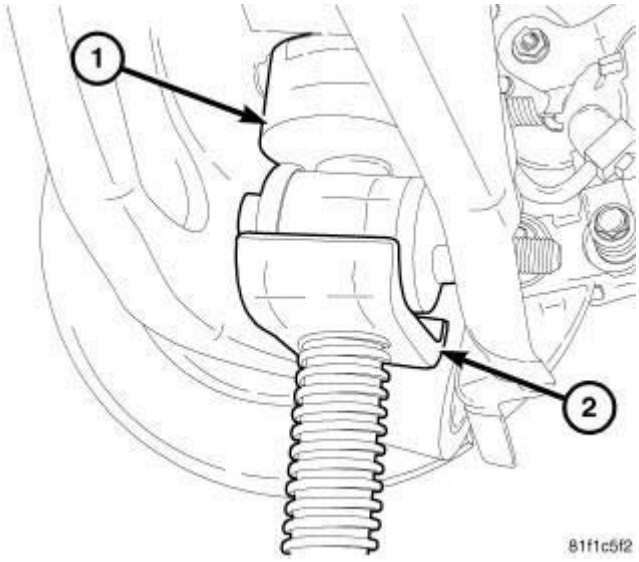

Fig. 68: Supporting Rear Shock
Courtesy of CHRYSLER LLC

17. On each side of the vehicle, if equipped with load-leveling shocks, place a jack (2) against the lower shock eye and support the lower end of the shock assembly (1). Lift the shock assembly using the jack until the hole in the lower shock eye lines up with that in the lower control arm.

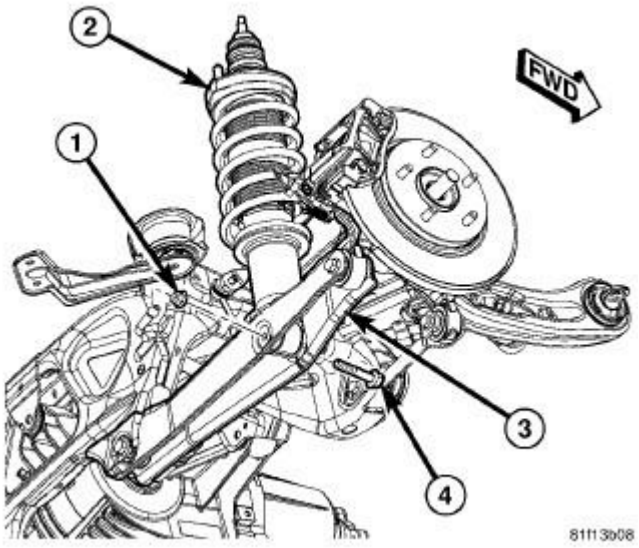

Fig. 69: Rear Lower Shock Mounting
Courtesy of CHRYSLER LLC

18. On each side of the vehicle, install the mounting bolt (4) and nut (1) fastening the shock assembly (2) to the lower control arm (3). Do not tighten at this time.

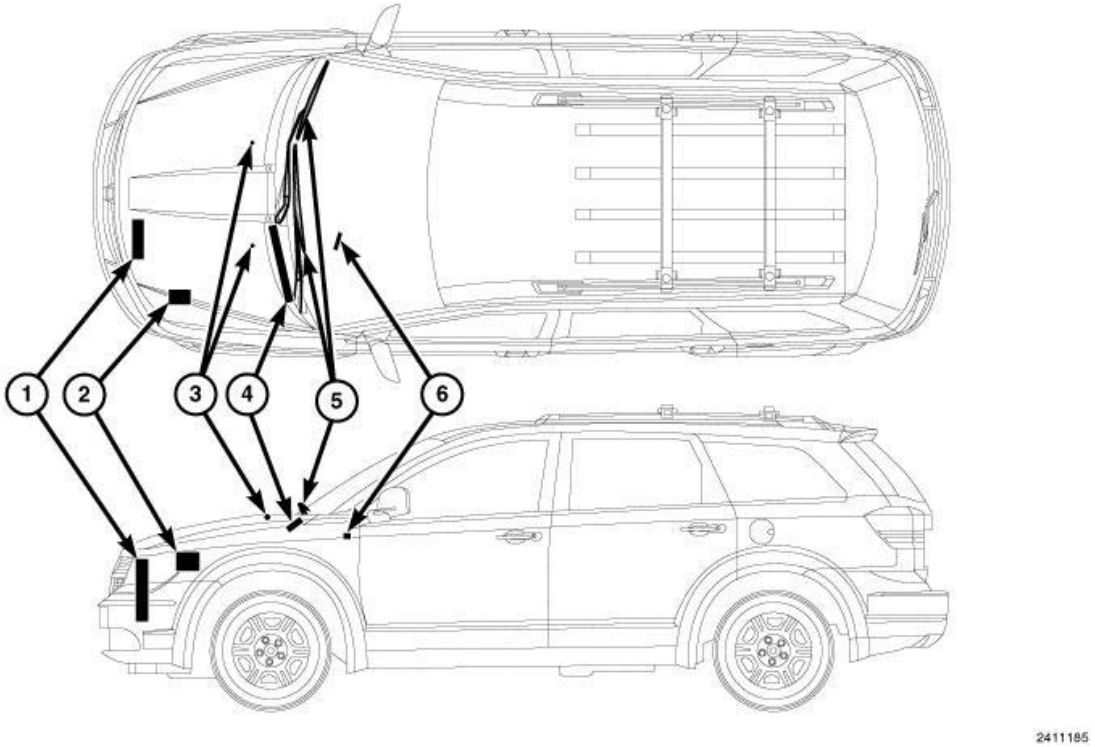

Fig. 70: Right Cable At Crossmember
Courtesy of CHRYSLER LLC

19. Position the four parking brake cable routing clamps along the front of the rear crossmember and install the screws. Tighten the screws to 6 N.m (55 in. lbs.).
20. Install the exhaust system. Refer to **Exhaust System/PIPE, Exhaust - Installation** .

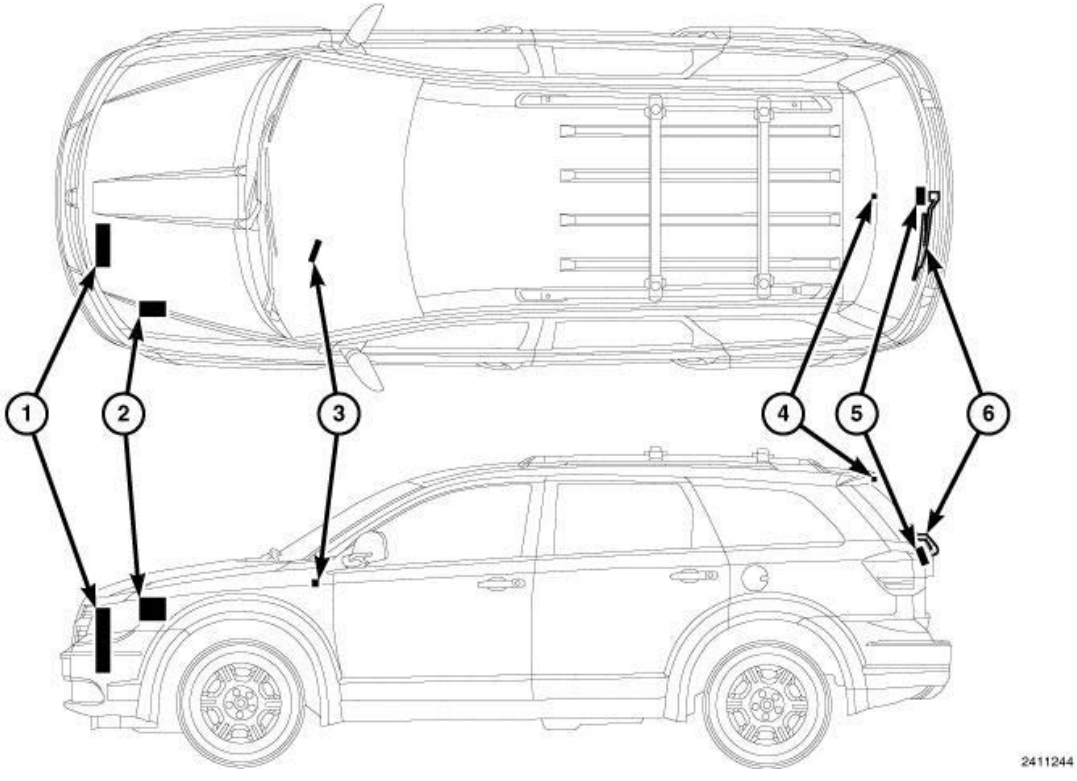

Fig. 71: Wheel Speed Sensor Routing Clamp
Courtesy of CHRYSLER LLC

21. On each side of the vehicle, attach the wheel speed sensor routing clamp (2) to the rear suspension crossmember (3) using the mounting screw (1). Tighten the mounting screw to 20 N.m (15 ft. lbs.).

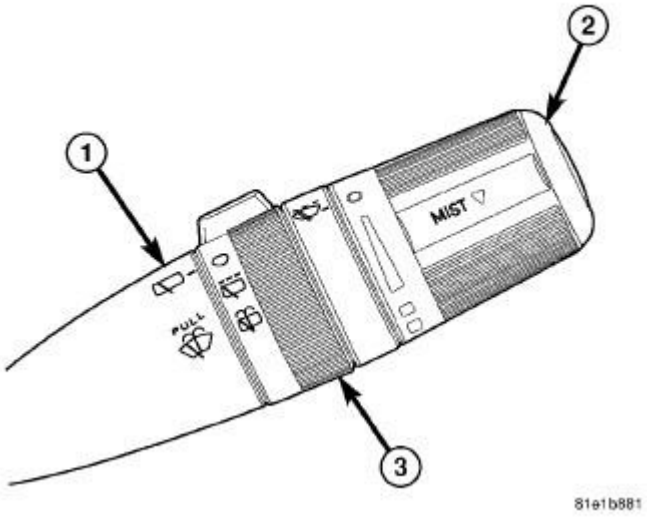

Fig. 72: Hub Nut And Washer
Courtesy of CHRYSLER LLC

22. While a helper applies the brakes to keep the hub (1) from rotating, on each side of the vehicle:
    a. Tighten the hub nut (3) to 245 N.m (181 ft. lbs.).
    b. Insert the cotter pin (2) through the notches in the nut and the hole in half shaft. If the notches in the nut do not line up with the hole in the half shaft, continue to tighten the nut until they do. **Do not loosen the nut.**
    c. Wrap the cotter pin (2) ends tightly around the lock nut.

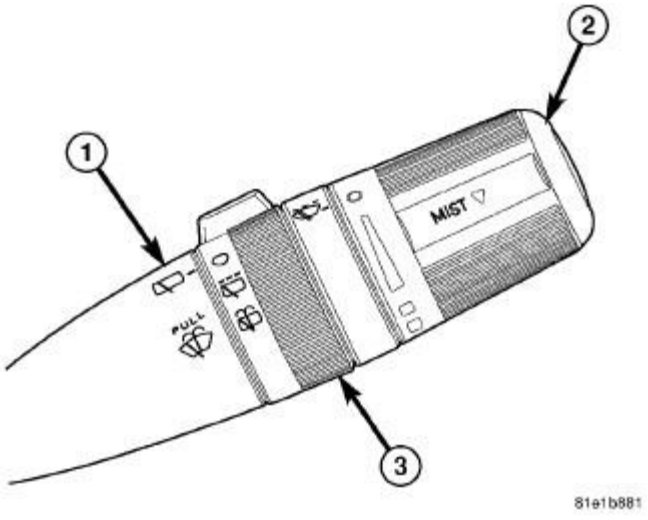

Fig. 73: Tire And Wheel Mounting
Courtesy of CHRYSLER LLC

23. On each side of the vehicle, install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
24. Lower the vehicle.
25. Position the vehicle on an alignment rack/drive-on lift. Raise the vehicle as necessary to access mounting bolts and nuts.
26. Tighten the lower control arm mounting bolt nut at the crossmember to 105 N.m (77 ft. lbs.).
27. Tighten the lower control arm mounting bolt nut at the knuckle to 105 N.m (77 ft. lbs.).
28. Tighten the shock assembly lower mounting bolt nut to 99 N.m (73 ft. lbs.).
29. Tighten the upper control arm mounting bolt nut at the crossmember to 105 N.m (77 ft. lbs.).
30. Tighten the upper control arm mounting bolt nut at the knuckle to 105 N.m (77 ft. lbs.).
31. Tighten the toe link mounting bolt nut at the knuckle to 105 N.m (77 ft. lbs.).
32. Perform wheel alignment as necessary. Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

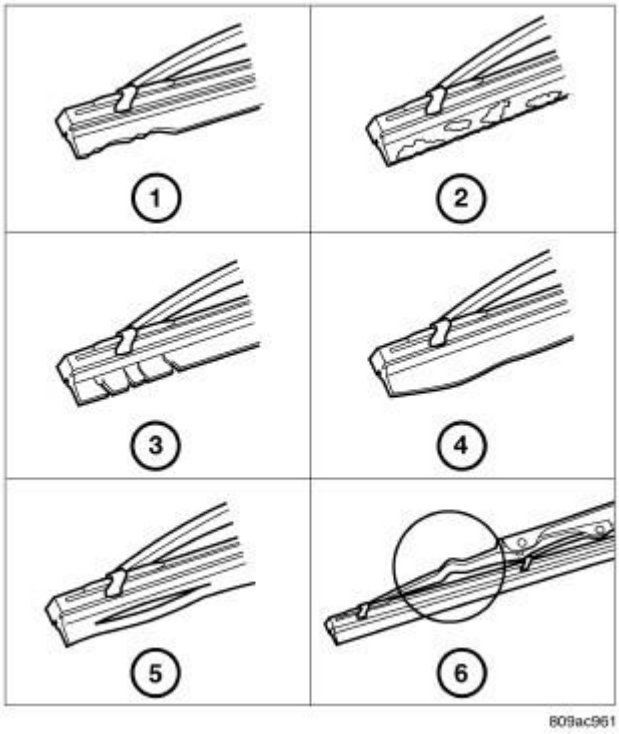

Fig. 74: Rear Toe Adjustment Cam Bolt

Navigation/Telecommunication - Service Information - Journey

DESCRIPTION

DESCRIPTION

TELECOMMUNICATIONS

The hands-free cellular system on this vehicle uses Bluetooth™ technology to provide wireless communication between the operator's compatible cellular telephone and the vehicle's on-board receiver.

The system uses voice recognition technology to control operation. The incoming voice is broadcast through the vehicle's radio speakers, automatically overriding any other audio signals on the front speakers when the hands-free system is in use. A microphone in the rearview mirror picks up vehicle occupant's voices. If a call is in progress when the ignition is switched off, the call will be transferred to the hand-held telephone.

The system will communicate with a telephone that is anywhere within the vehicle. However, covering the hand held phone or the hands-free phone module with a metal object may block the signal. The system will recognize up to seven telephones, each of which is given a spoken identification by the user during the setup process. The system includes Spanish and French voice recognition in addition to English.

The hands free module is contained within the radio for premium systems. With the low line radio, the hands free module is located on the left side of the instrument panel to the left of the steering column.

NAVIGATION

The navigation system offers several new customer features for expanded usability and convenience with hands-free voice-activated operation in addition to the touch screen buttons. The navigation system uses the Bluetooth microphone in the rear view mirror. Navigation routes can be based on a variety of formats including some of the following:

- Destination entry by street intersection, city, zip code, street name, street address and number, state/province/country and phone number
- Stop/change route
- Save current position
- Personal menu, including Guide Me Home (Go Home), Trip Itinerary, List of Saved Locations, Favorite Points of Interest (from a data base), Manage Personal User and Choose User
- Personal Interests including recent routes, address book, Where Am I Now, Emergency (police stations, Dodge dealerships, fire stations, hospitals and emergency care centers), Trail and geo- coordinates
- Route options include shortest, quickest, maximize freeways, minimize freeways, avoid toll roads and avoid ferries
- Navigation can be put into DEMO mode to enhance trip planning

This navigation system will support Traffic Messaging. Traffic Messaging displays voice and pop up warning messages for medium and high priority situations on the route such as road closures due to accidents/hazardous situations and it can even generate a traffic detour for a traffic event located on the route.

OPERATION

TELECOMMUNICATION

Two buttons on the rearview mirror, identified with ISO icons, control the system: A "phone" button turns the system on and off; a "voice recognition" (or voice command) button prompts the hands-free system to listen for a voice command. The system includes the following features:

- Phone book - Stores telephone numbers for later recall by name or other verbal identification, called a voice tag, and memory location.
- Four memory locations - Home, Work, Mobile, and Pager. A maximum of 32 unique names or voice tags may be stored at the same time, with a different number in each of the four memory locations.
- Voice tag dialing - Dials the number associated with a voice tag and memory location.
- Digit dialing - Dials the telephone number by recognizing the names of the digits as they are spoken.
- Receiving calls - A voice prompt notifies the user of an incoming call. Pressing the UConnect button accepts or rejects the call.
- Privacy Mode - Switches the call to the handheld telephone and the hands-free system and back again using the "voice recognition" (or "voice command") button and a voice command, if desired.

NAVIGATION

The navigation system collects data from GPS satellites in orbit around the Earth. This information is sent to the radio to be processed and provides the user with present location and is used to provide the route planing and guidance as the vehicle is driven.

This vehicle has a gas pressurized MacPherson strut type front suspension design.

Each side of the front suspension consists of these major components:

- (1) Strut Assembly
- (2) Fore/Aft Crossmember
- (3) Stabilizer Bar
- (4) Front Suspension Crossmember
- (5) Lower Control Arm
- (6) Hub And Bearing
- (7) Knuckle

Service procedures for the front suspension crossmember and fore/aft crossmember can be found in the **FRAME AND BUMPERS** .

WARNING

WARNINGS AND CAUTIONS

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

WARNING: Do not remove the strut rod nut while strut assembly is installed in vehicle, or before the coil spring is compressed with a compression tool. The spring is held under high pressure.

CAUTION: At no time when servicing a vehicle can a sheet metal screw, bolt, or other metal fastener be installed in the shock tower to take the place of an original plastic clip. It may come into contact with the strut or coil spring.

CAUTION: Wheel bearing damage will result if after loosening the axle hub nut, the vehicle is rolled on the ground or the weight of the vehicle is allowed to be supported by the tires for any length of time.

ARM, LOWER CONTROL

Diagnosis and Testing

LOWER CONTROL ARM

Inspect the lower control arm for signs of damage from contact with the ground or road debris. If the lower control arm shows any sign of damage, look for distortion. Do not attempt to repair or straighten a broken or bent lower control arm. If damaged, the lower control arm is serviced only as a complete component.

Inspect both lower control arm isolator bushings for severe deterioration and replace the lower control arm as required.

Removal

REMOVAL

NOTE: Before proceeding. See WARNINGS AND CAUTIONS .

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

4. Release the lower ball joint (3) from the lower control arm (1) using Remover (2) 9360. Do not lift the knuckle out of the lower control arm at this time.

CAUTION: Upon removing the knuckle from the ball joint stud, do not pull outward on the knuckle. Pulling the knuckle outward at this point can

separate the inner C/V joint on the half shaft thus damaging it.

7. Remove the front bolt (1) attaching the lower control arm (3) to the front suspension crossmember.

8. Remove the nut on the rear bolt (2) attaching the lower control arm (3) to the front suspension crossmember. Remove the bolt.
9. Remove the lower control arm (3) from the crossmember.

Installation

INSTALLATION

1. Place the lower control arm (3) into the front suspension crossmember.
2. Insert the rear bolt (2) up through the crossmember and lower control arm (3). Install the nut on the top-end of the bolt, but do not tighten it at this time.
3. Install, but do not fully tighten, the front bolt (1) attaching the lower control arm (3) to the crossmember.
4. With no weight or obstruction on the lower control arm, tighten the lower control arm **front** mounting bolt (1) to 200 N.m (148 ft. lbs.).
5. With no weight or obstruction on the lower control arm, tighten the lower control arm **rear** mounting bolt nut to 145 N.m (107 ft. lbs.).

6. Attach the stabilizer bar link (1) at each end of the stabilizer bar (2). At each link, install and tighten the nut (3) while holding the stabilizer bar link lower stud stationary. Tighten the nuts to 48 N.m (35 ft. lbs.).

NOTE: If a new or cleaned lower control arm is being installed, it is important to have a film of general purpose grease around the ball joint mounting hole on the lower control arm to avoid any future corrosion issues. Make sure the grease does not get inside the ball joint mounting hole or on the ball joint stud during installation.

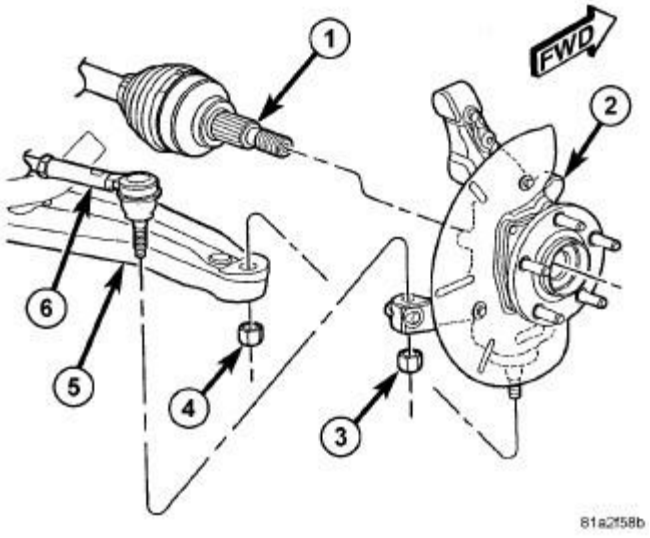

Fig. 14: Front Knuckle Mounting

9. Install the tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten the wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
10. Lower the vehicle.
11. Perform wheel alignment as necessary. See **Standard Procedure**

BALL JOINT, SUSPENSION, LOWER

Diagnosis and Testing

LOWER BALL JOINT

1. Raise the vehicle allowing the front suspension to hang.
2. Remove the tire and wheel assembly.
3. Using Dial Indicator C-3339A, or equivalent, attach the dial indicator mount to the knuckle and align the dial indicator's plunger with the direction of the stud axis, touching the end of the ball joint stud in the lower control arm.
4. Push up on the lower control arm and zero the dial indicator.

NOTE: Use care when applying load to the knuckle as to avoid damaging the ball joint seal boot.

5. From the front of the vehicle, insert a pry bar between the knuckle and lower control arm, resting it on the lower control arm. Use lever principle to push the knuckle up from the lower control arm. Apply the load until the needle of the dial indicator no longer moves.
6. Record the ball joint movement. The end play is acceptable if no more than 1.0 mm (0.039 in.) of end play is achieved back-to-back.
7. Perform this procedure on each side of the vehicle as necessary.

HUB AND BEARING

Description

DESCRIPTION

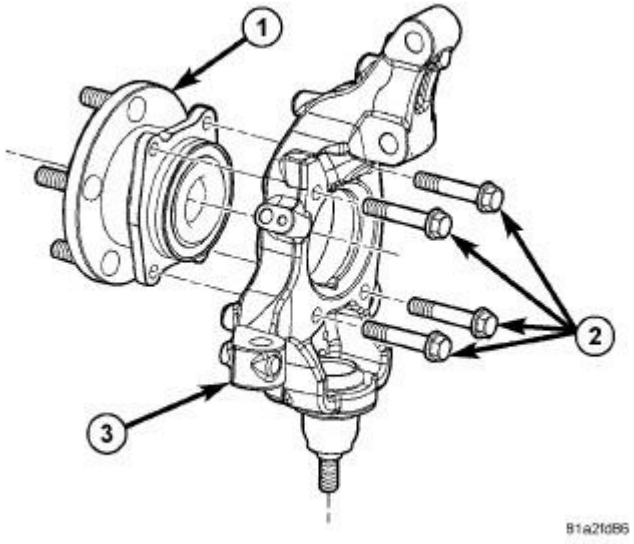

Fig. 31: Front Hub And Bearing Mounting
Courtesy of CHRYSLER LLC

The front wheel bearing and wheel hub of this vehicle are a one piece sealed unit or hub and bearing unit type assembly.

The hub and bearing (1) is mounted to the knuckle using four mounting bolts (2) and to the axle half shaft using a retaining nut. The center of the hub and bearing is splined to match the outer joint of the axle half shaft.

Each front hub and bearing has five wheel mounting studs on the hub flange for mounting the wheel to the vehicle. The wheel mounting studs are the only replaceable components of the hub and bearing. Otherwise, the hub and bearing is serviced as a complete assembly.

Diagnosis and Testing

HUB AND BEARING

NOTE: The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.

The following procedure may be used for diagnosing the condition of the hub and bearing.

1. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Removal**
2. Rotate the wheel hub checking for resistance or roughness.

Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub bearing will require replacement. **Do not attempt to disassemble the bearing for repair.** If the wheel bearing is disassembled for any reason, it must be replaced.

Damaged bearing seals and the resulting excessive grease loss may also require hub and bearing replacement. Moderate grease weeping from the bearing is considered normal and should not require replacement of the hub and bearing.

To diagnose a bent hub, measure hub runout. Refer to **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Diagnosis and Testing**

KNUCKLE, STEERING

Description

DESCRIPTION

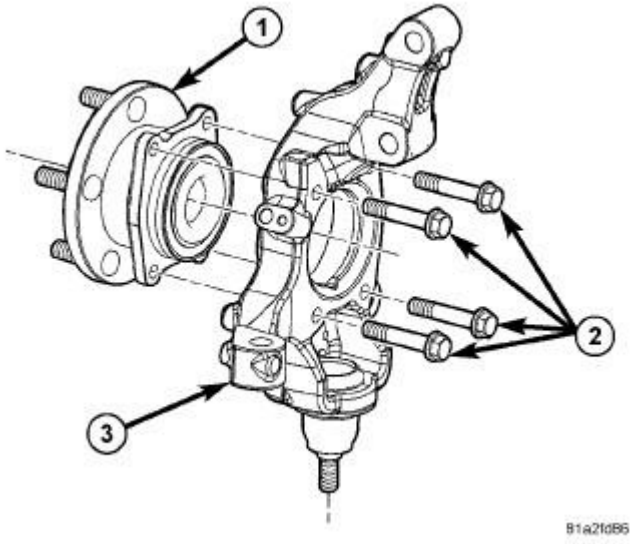

Fig. 38: Front Hub And Bearing Mounting
Courtesy of CHRYSLER LLC

The knuckle (3) is a single casting with legs machined for attachment to the front strut assembly on the top and steering linkage on the trailing end. A ball joint is located on the bottom of the knuckle which attaches to the lower control arm. The knuckle also has two machined, drilled legs on the leading end casting to support and align the front disc brake caliper adapter.

The knuckle supports the hub and bearing (1). A shield (not shown in illustration) is fastened to the knuckle.

Diagnosis and Testing

KNUCKLE

The front suspension knuckle is not a repairable component of the front suspension. It must be replaced if found to be damaged in any way. If it is determined that the knuckle is bent when servicing the vehicle, no attempt is to be made to straighten the knuckle.

Inspect the lower ball joint per the inspection procedure in this Service Information . The lower ball joint can be replaced separately from the knuckle.

9. Support the steering gear using a bungee cord or other to keep the steering gear from lowering when the crossmember is lowered.

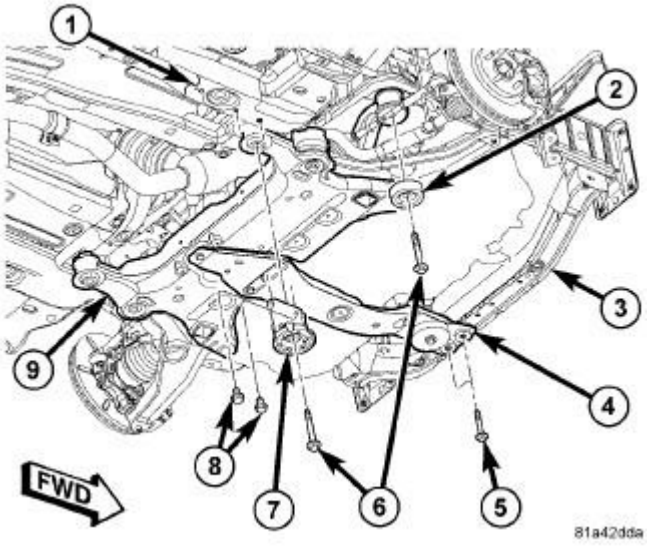

Fig. 70: Front Crossmember Mounting

NOTE: Before removing the front suspension crossmember from the vehicle, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against

the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.

10. Mark the location of the front crossmember (9) on the body near each mounting bolt.
11. Support the crossmember (9) with a transmission jack.
12. Remove the four mounting bolts (6) securing the front crossmember (9) to the body.
13. Remove the mounting screws (8) securing the front crossmember reinforcement brackets (7) (one each side of vehicle) to the body (1). Remove the brackets.
14. Slowly lower the crossmember using the jack until there is enough space present to remove the stabilizer bar between the rear of the crossmember and the body. Due to the fact that the fore-and-aft crossmember is still attached, do not lower crossmember any more than necessary to remove the stabilizer bar.

15. Remove the screws (1) securing the stabilizer bushing retainers (3) to the crossmember.
16. Remove the two stabilizer bushing retainers (3).
17. Utilizing the slit cut into the cushions (bushings), remove the two cushions from the stabilizer bar.
18. Remove the stabilizer bar (2) from the vehicle.

Installation

INSTALLATION

NOTE: Before stabilizer bar installation, inspect the cushions and links for excessive wear, cracks, damage and distortion. Replace any pieces failing inspection.

NOTE: Before installing the stabilizer bar, make sure the bar is not upside-down. The stabilizer bar must be installed so that when in mounted position, the ends of the bar curve under the steering gear tie rods, up to the links.

STRUT, SUSPENSION, ASSEMBLY

Description

DESCRIPTION

A Macpherson type design strut assembly is used in place of the traditional front suspension upper control arm and upper ball joint. The bottom of the strut mounts directly to the steering knuckle using two attaching bolts and nuts going through the strut clevis bracket and knuckle. The top of the strut mounts directly to the strut tower of the vehicle using the three threaded studs on the strut assembly's upper mount.

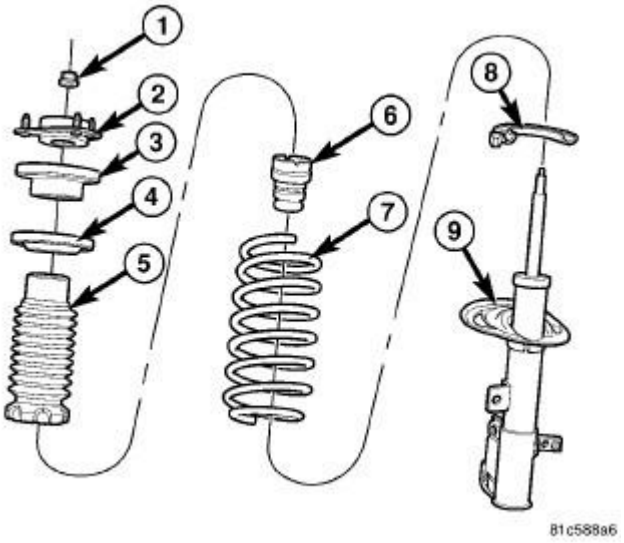

Fig. 79: Strut Assembly (Exploded)
Courtesy of CHRYSLER LLC

The strut assembly includes the following components:

- Upper mount (2)
- Bearing and upper spring seat (3)
- Upper spring isolator (4)
- Dust shield (5)
- Jounce bumper (6)
- Coil spring (7)
- Lower spring isolator (8)

- Strut (damper) (9)

Each component is serviced by removing the strut assembly from the vehicle and disassembling it.

Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. If a coil spring requires replacement, be sure that it is replaced with a spring meeting the correct load rating for the vehicle and its specific options.

Operation

OPERATION

The strut assembly cushions the ride of the vehicle, controlling vibration, jounce and rebound of the suspension.

The coil spring controls ride quality and maintains proper ride height.

The spring isolators isolate the coil spring at the top and bottom from coming into metal-to-metal contact with the upper mounting seat and the strut.

The jounce bumper limits suspension travel and metal-to-metal contact under full jounce condition.

The strut dampens jounce and rebound motions of the coil spring and suspension.

Diagnosis and Testing

STRUT ASSEMBLY

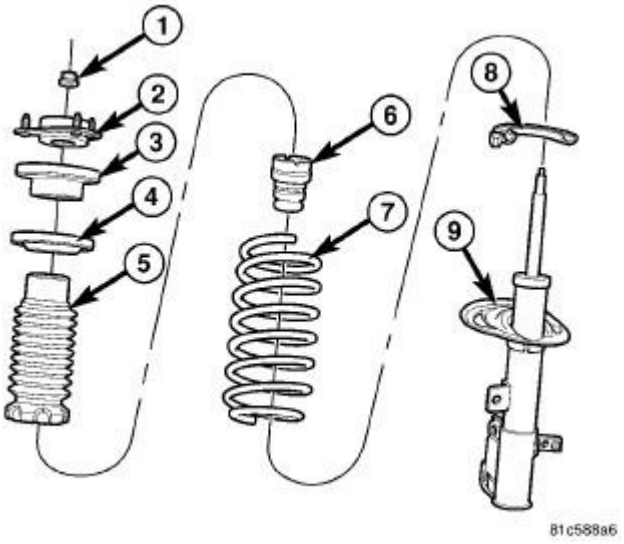

Fig. 80: Strut Assembly (Exploded)
Courtesy of CHRYSLER LLC

Inspect the strut assembly for the following conditions:

- Inspect for a damaged or broken coil spring (7).
- Inspect for a torn or damaged dust shield (5).
- Inspect for torn or deteriorated spring isolators (4, 8).
- Lift the dust shield and inspect the strut assembly for evidence of fluid running from the upper end of the strut fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off lower end of unit). A slight amount of seepage between the strut shaft and strut shaft seal is not unusual and does not affect performance of the strut assembly.
- Inspect the jounce bumper (6) for signs of damage or deterioration.
- Inspect the clearance between the shock tower and the coil spring. Make sure no fasteners are protruding through the shock tower possibly contacting the coil spring and strut. Because of the minimum clearance in this area, installation of metal fasteners could damage the coil spring coating and lead to a corrosion failure of the spring.

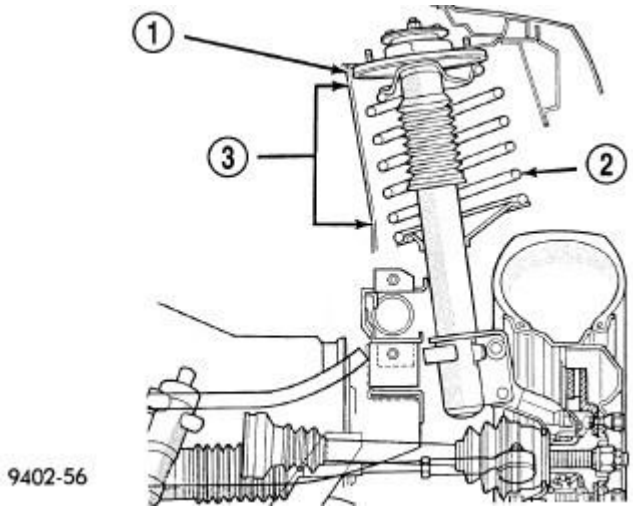

Fig. 81: Shock Tower Area (Typical)
Courtesy of CHRYSLER LLC

CAUTION: At no time when servicing a vehicle can a sheet metal screw, bolt or other metal fastener be installed into the strut tower (1) to take the place of an original plastic clip. Also, do not drill holes into the front strut tower for the installation of any metal fasteners into the shock tower area indicated (3).

CAUTION: The strut assembly-to-knuckle attaching bolts (5) are serrated and must not be turned during removal. Hold the bolts stationary in the knuckle while removing the nuts, then tap the bolts out using a pin punch.

9. While holding the bolt heads stationary, remove the two nuts (2) from the bolts (5) attaching the strut (3) to the knuckle (6).
10. Remove the two bolts (5) attaching the strut (3) to the knuckle (6) using a pin punch.
11. Lower the vehicle just enough to open the hood without allowing the tires to touch the floor.

12. Remove the three nuts (1) attaching the strut assembly (2) upper mount to the strut tower.
13. Remove the strut assembly (2) from the vehicle.
14. For disassembly. See **Disassembly** .

Disassembly

DISASSEMBLY

NOTE: The strut assembly must be removed from the vehicle for it to be disassembled and assembled. See Removal

For the disassembly and assembly of the strut assembly, use strut spring compressor, team PSE tool 223-7400, or the equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

WARNING: Do not remove the strut rod nut before the coil spring is properly compressed. The coil spring is held under pressure. The coil spring must be compressed, removing spring tension from the upper mount and bearing, before the strut rod nut is removed.

1. If both struts are being serviced at the same time, mark both the coil spring and strut assembly according to which side of the vehicle the strut is being removed from.

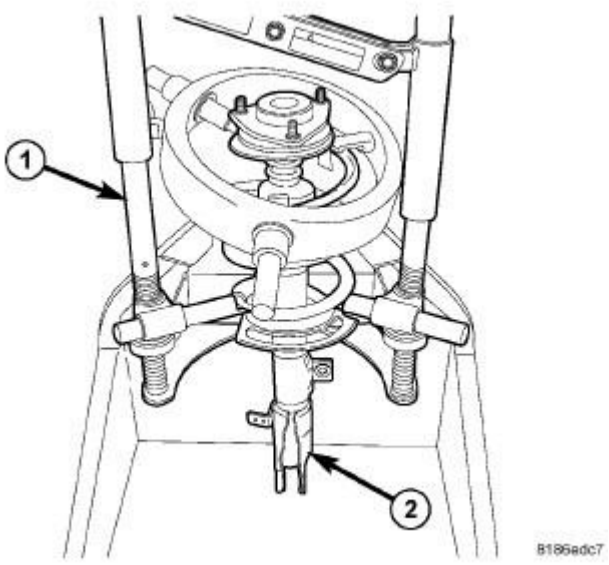

Fig. 88: Identifying Strut Assembly Positioned In Strut Coil Spring Compressor
Courtesy of CHRYSLER LLC

2. Position the strut assembly (2) in the strut coil spring compressor (1) following the manufacturer's instructions and set the lower and upper hooks of the compressor on the coil spring. Position the strut clevis bracket (2) straight outward, away from the compressor.
3. Compress the coil spring until all coil spring tension is removed from the upper mount and bearing.

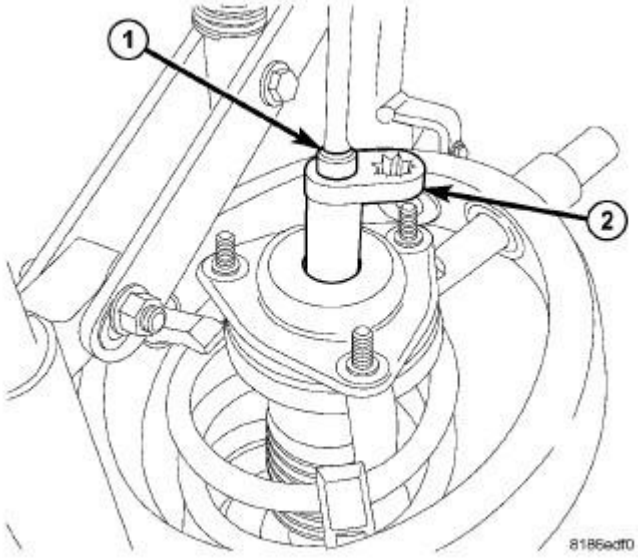

Fig. 89: Special Tools On Strut Rod Nut
Courtesy of CHRYSLER LLC

CAUTION: Never use impact or high speed tools to remove the strut rod nut. Damage to the strut internal bearings can occur.

4. Once the spring is sufficiently compressed, install Strut Nut Wrench (2) 9362, on the strut rod nut. Next, install a deep socket (1) on the end of the strut rod. While holding the strut rod from turning, remove the nut using the strut nut wrench.

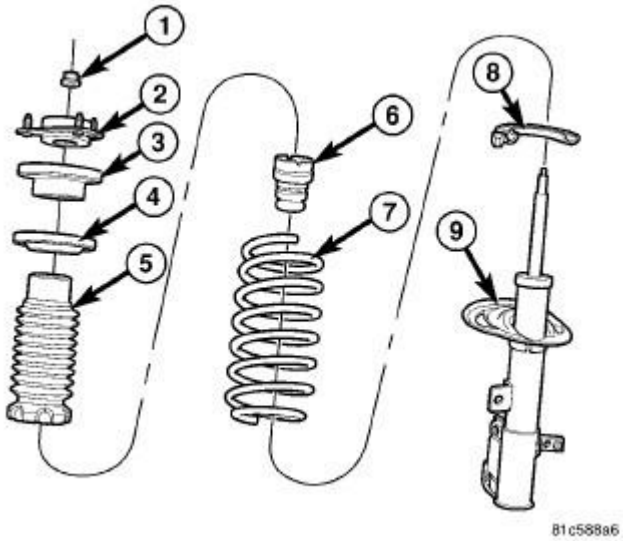

Fig. 90: Strut Assembly (Exploded)

5. Remove the clamp (if installed) from the bottom of the coil spring and remove the strut (damper) (9) out through the bottom of the coil spring.
6. Remove the lower spring isolator (8) from the strut seat.
7. remove the dust shield (5) and jounce bumper (6).
8. Remove the upper strut mount (2) from the top of the bearing and upper spring seat (3).
9. Remove the upper spring seat (3) and isolator (4) from the top of the coil spring (5).

NOTE: If the coil spring needs to be serviced, proceed with the next step, otherwise, proceed with 11.

10. Release the tension from the coil spring by backing off the compressor drive completely. Push back the compressor hooks and remove the coil spring.

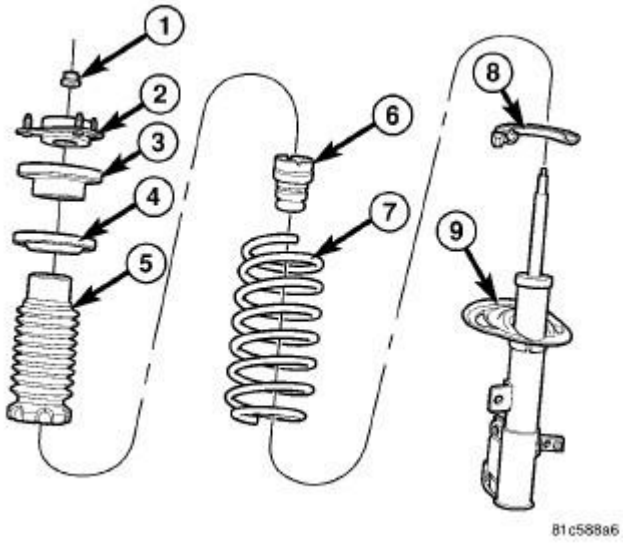

Fig. 91: Strut Assembly (Exploded)
Courtesy of CHRYSLER LLC

11. Inspect the strut assembly components for the following and replace as necessary:

NOTE: For reassembly. See Assembly .

- Inspect the strut (damper) (9) for shaft binding over the full stroke of the shaft.
- Inspect the jounce bumper (6) for cracks and signs of deterioration.
- Inspect the dust shield (5) for cracks and tears.
- Check the upper mount (2) for cracks and distortion and its retaining studs for any sign of damage.
- Check the bearing and upper spring seat (3) for any binding.
- Inspect the upper and lower spring isolators (4, 8) for material deterioration and distortion.
- Inspect the coil spring (7) for any sign of damage to the coating.

Assembly

ASSEMBLY

NOTE: If the coil spring has been removed from the spring compressor, proceed with the next step, otherwise, proceed with 3.

NOTE: To determine the flat coil end of the coil spring for the following step, attempt to stand the coil spring on-end on a flat, level surface. If the coil spring stands on end, the end on the flat surface is the flat coil end. If the coil spring falls over, the end on the flat surface is not the flat coil end. Stand the coil spring on the opposite end to verify.

1. Place the coil spring flat coil end upward (see above note) in the spring compressor following the manufacturer's instructions. Before compressing the spring, rotate the spring so the end of the bottom coil is at approximately the 9 o'clock position as viewed above (or to where the spring was when removed from the compressor). This action will allow the strut (damper) clevis bracket to be positioned outward, away from the compressor once installed.
2. Slowly compress the coil spring until enough room is available for strut assembly reassembly.

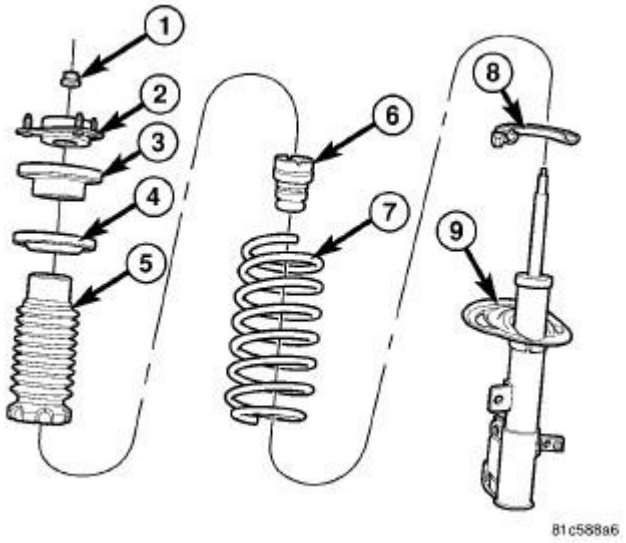

Fig. 92: Strut Assembly (Exploded)
Courtesy of CHRYSLER LLC

3. Install the bearing and upper spring seat (3), and isolator (4) on top of the coil spring (7).
4. Install the upper mount (2) on top of the bearing and upper spring seat (3).
5. Install the lower spring isolator (8) on the spring seat on the strut (damper) (9).
6. Slide the jounce bumper (6) and dust shield (5) onto the strut rod.

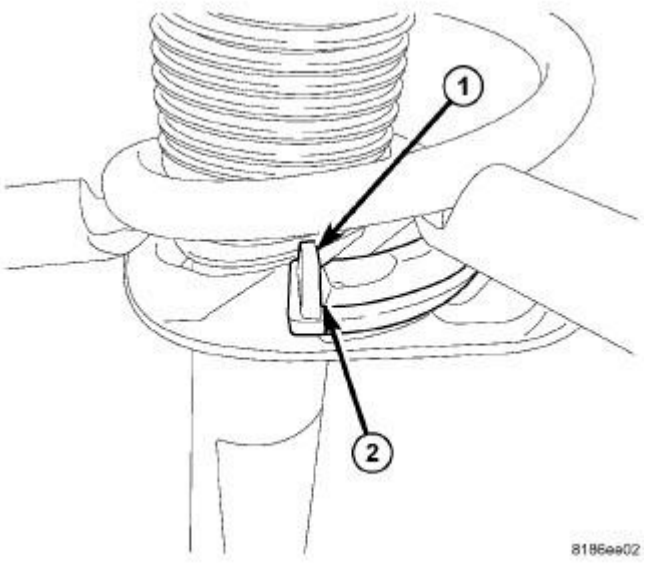

Fig. 93: Coil Spring Against Stop

7. Install the strut up through the bottom of the coil spring and upper spring seat, mount, and bearing until the lower spring seat contacts the lower end of the coil spring. Rotate the strut as necessary until the end of the bottom coil (2) comes in contact with the stop (1) built into the lower spring isolator.

8. While holding the strut in position, install the nut (1) on the end of the strut rod.

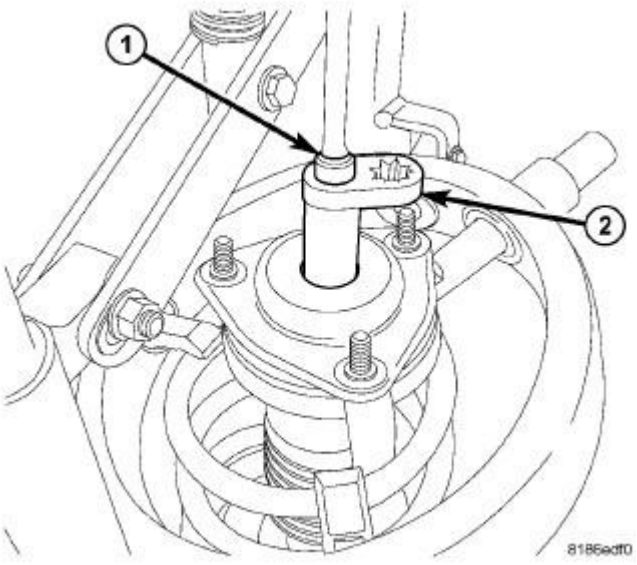

Fig. 95: Special Tools On Strut Rod Nut

CAUTION: Never use impact or high speed tools to remove the strut rod nut. Damage to the strut internal bearings can occur.

9. Install Strut Nut Wrench (2) 9362, on the strut rod nut. Next, install a deep socket (1) on the end of the strut rod. While holding the strut rod from turning, tighten the strut rod nut to 60 N.m (44 ft. lbs.) using a torque wrench on the end of Strut Nut Wrench (2) 9362.

10. Slowly release the tension from the coil spring by backing off the compressor (1) drive completely. As the tension is relieved, make sure the upper mount and bearing align properly. Verify the upper mount does not bind when rotated.
11. Remove the strut assembly from the spring compressor.
12. Install the strut assembly on the vehicle. See **Installation**

9. Install the cowl top screen (3). Install the two push-pins (1) securing the cowl top screen at the ends. Install the remaining push-pins (2).
10. Install the engine appearance cover.

WHEEL ALIGNMENT

DESCRIPTION

DESCRIPTION

Vehicle wheel alignment is the positioning of all interrelated front and rear suspension angles. These angles affect the handling and steering of the vehicle when it is in motion. Proper wheel alignment is essential for efficient steering, good directional stability, and proper tire wear.

The method of checking a vehicle's front and rear wheel alignment varies depending on the manufacturer and type of equipment used. The manufacturer's instructions should always be followed to ensure accuracy of the alignment, except when Chrysler Corporation's wheel alignment specifications differ.

On this vehicle, the suspension angles that can be adjusted are as follows:

Front

- Camber (with cradle shift or service adjustment bolt package)
- Caster (limited adjustment with cradle shift)
- Toe

Rear

- Toe

Check the wheel alignment and make all wheel alignment adjustments with the vehicle standing at its proper curb height specification. Curb height is the normal riding height of the vehicle. It is measured from a certain point on the vehicle to the ground or a designated area while the vehicle is sitting on a flat, level surface. Refer to **CURB HEIGHT MEASUREMENT** in this service information for additional information.

Typical wheel alignment angles and measurements are described in the following paragraphs.

CAMBER

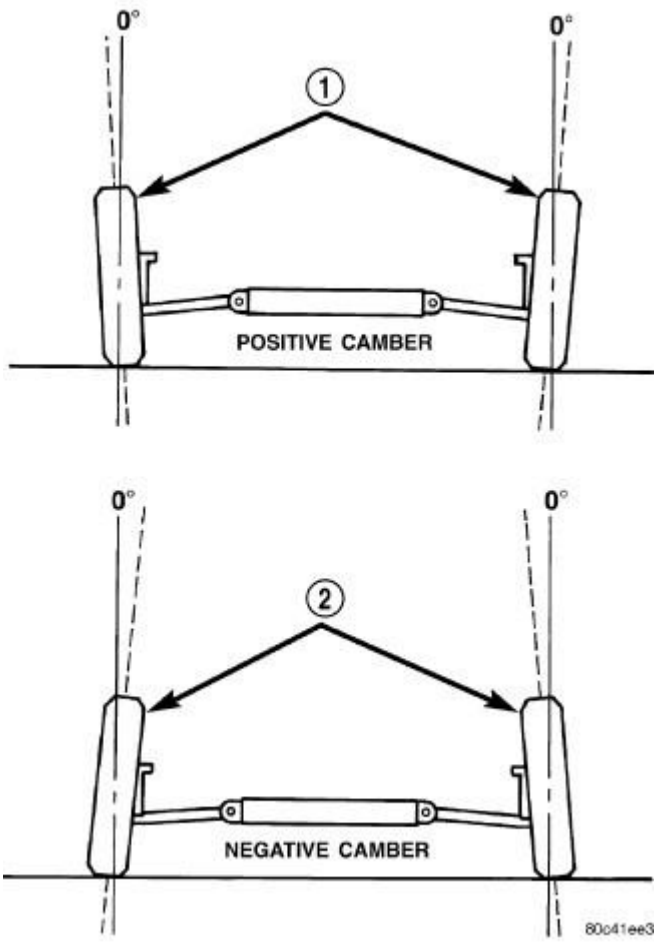

Fig. 103: Camber
Courtesy of CHRYSLER LLC

1 - WHEELS TILTED OUT AT TOP
2 - WHEELS TILTED IN AT TOP

Camber is the inward or outward tilt of the top of the tire and wheel assembly. Inward tilt (2) is known as negative camber. Outward tilt (1) is known as positive camber. Camber is measured in degrees of angle relative to a true vertical line. Camber is a tire wearing angle.

- Excessive negative camber will cause tread wear at the inside of the tire.
- Excessive positive camber will cause tread wear on the outside of the tire.

CROSS CAMBER

Cross camber is the difference between left and right camber. To achieve the cross camber reading, subtract the right side camber reading from the left. For example, if the left camber is -0.7° and the right camber is -0.5°, the cross camber would be -0.2° (-0.7 - (-0.5) = -0.7 + 0.5 = -0.2).

CASTER

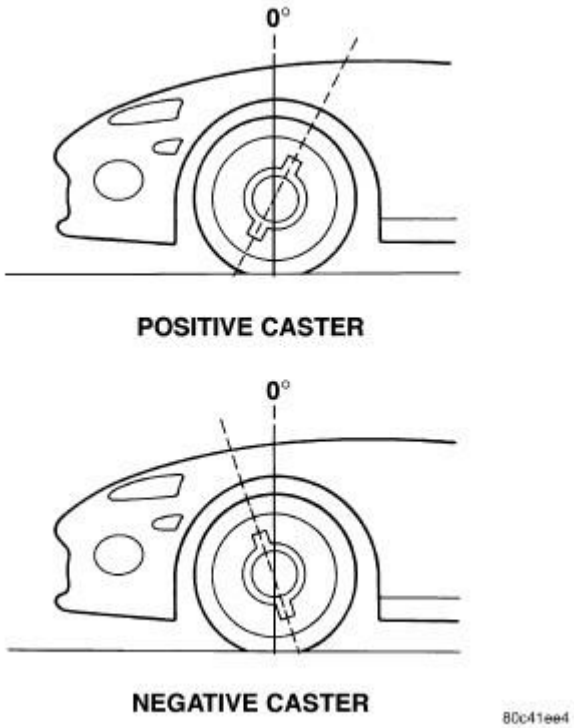

Fig. 104: Caster
Courtesy of CHRYSLER LLC

Caster is the forward or rearward tilt of the steering knuckle in reference to the position of the upper and lower ball joints. Caster is measured in degrees of angle relative to a true vertical center line. This line is viewed from the side of the tire and wheel assembly.

- Forward tilt (upper ball joint ahead of lower) results in a negative caster angle.
- Rearward tilt (upper ball joint trailing lower) results in a positive caster angle.

Although caster does not affect tire wear, a caster imbalance between the two front wheels may cause the vehicle to lead to the side with the least positive caster.

CROSS CASTER

Cross caster is the difference between left and right caster. To achieve the cross caster reading, subtract the right side caster reading from the left. For example, if the left caster is 2.5° and the right caster is 2.7°, the cross caster would be -0.2° (2.5 - 2.7 = -0.2).

TOE

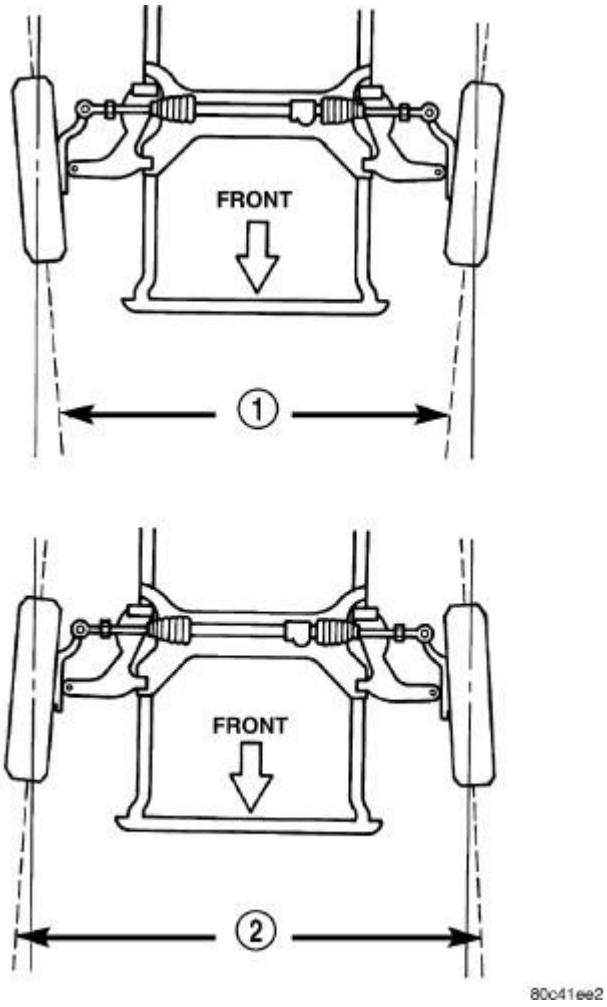

Fig. 105: Toe
Courtesy of CHRYSLER LLC

1 - TOE-IN
2 - TOE-OUT

Toe is the inward or outward angle of the wheels as viewed from above the vehicle.

- Toe-in (1) is produced when the front edges of the wheels on the same axle are closer together than the rear edges.
- Toe-out (2) is produced when the front edges of the wheels on the same axle are farther apart than the rear edges.

Toe-in and toe-out can occur at the front wheels and the rear wheels.

Toe is measured in degrees or inches. The measurement identifies the amount that the front of the wheels point inward (toe-in) or outward (toe-out). Toe is measured at the spindle height. Zero toe means the front and rear edges of the wheels on the same axle are equal distant.

TOE-OUT ON TURNS

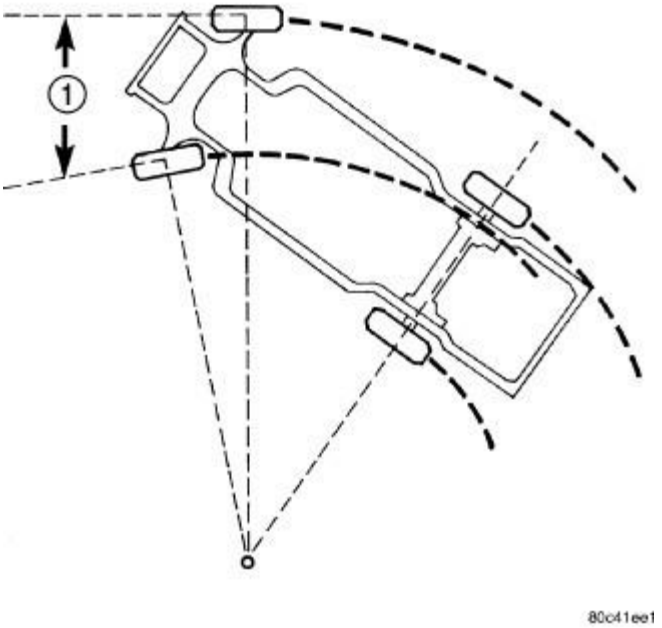

Fig. 106: Toe-Out On Turns
Courtesy of CHRYSLER LLC

1 - TOE-OUT ON TURNS

Toe-out on turns (1), sometimes referred to as Ackerman Steering, is the relative positioning of the front wheels while steering through a turn. This compensates for each front wheel's turning radius. As the vehicle encounters a turn, the outboard wheel must travel in a larger radius circle than the inboard wheel. The steering system is designed to make each wheel follow its particular radius circle. To accomplish this, the front wheels must progressively toe outward as the steering is turned from center. This eliminates tire scrubbing and undue tire wear when steering a vehicle through a turn.

DYNAMIC TOE PATTERN

Dynamic toe pattern is the inward and outward toe movement of the front and rear tires through the suspension's jounce and rebound travel. As the vehicle's suspension moves up and down, the toe pattern varies. Toe pattern is critical in controlling the directional stability of the vehicle while in motion. Front and rear dynamic toe pattern is preset by the factory at the time the vehicle is assembled.

It is not necessary to check or adjust front or rear dynamic toe pattern when doing a normal wheel alignment. The only time dynamic toe pattern needs to be checked or adjusted is if the frame of the vehicle has been damaged.

STEERING AXIS INCLINATION (S.A.I.)

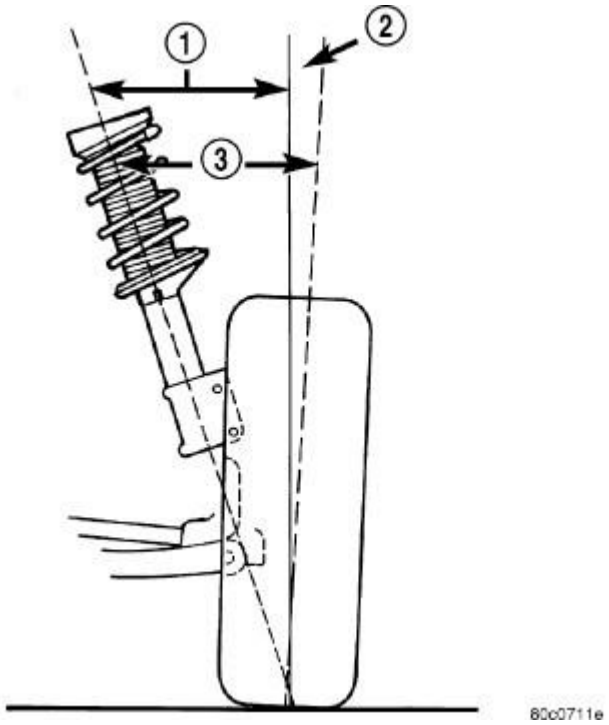

Fig. 107: Identifying Steering Axis Inclination, Included Angle, & Camber
Courtesy of CHRYSLER LLC

1 - S.A.I.
2 - CAMBER
3 - I.A.

Steering axis inclination (1) is the angle between a true vertical line starting at the center of the tire at the road contact point and a line drawn through the center of the upper ball joint (or strut) and the lower ball joint. S.A.I. is built into the vehicle and is not an adjustable angle. If S.A.I. is not within specifications, a bent or damaged suspension component may be the cause.

INCLUDED ANGLE (I.A.)

Included angle (3) is the sum of the S.A.I. angle (1) plus or minus the camber angle (2), depending on whether or not the wheel has positive or negative camber. If camber is positive, add the camber angle to the S.A.I angle. If camber is negative, subtract the camber angle from the S.A.I. angle. Included angle is not adjustable, but can be used to diagnose a frame misalignment or bent suspension component (spindle, strut).

THRUST ANGLE

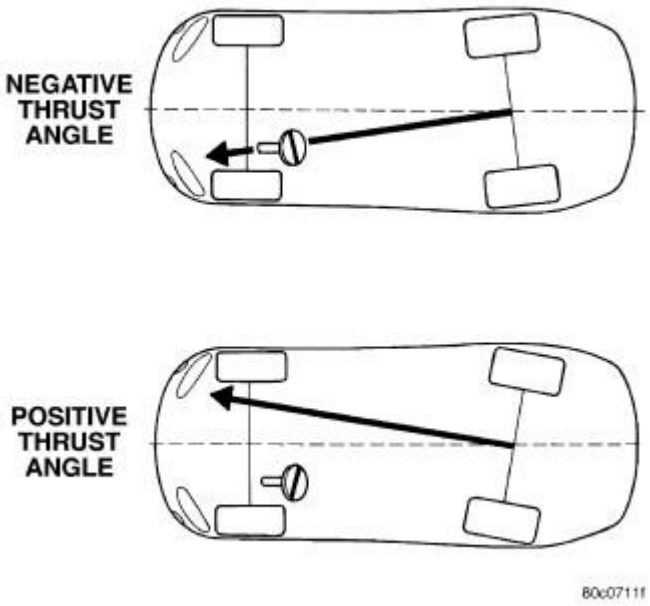

Fig. 108: Thrust Angle
Courtesy of CHRYSLER LLC

Thrust angle is the averaged direction the rear wheels are pointing in relation to the vehicle's center line. The presence of negative or positive thrust angle causes the rear tires to track improperly to the left or right of the front tires (dog tracking).

- Negative thrust angle means the rear tires are tracking to the left of the front tires.
- Positive thrust angle means the rear tires are tracking to the right of the front tires.

Improper tracking can cause undue tire wear, a lead or pull and a crooked steering wheel. Excessive thrust angle can usually be corrected by adjusting the rear wheel toe so that each wheel has one-half of the total toe measurement.

STANDARD PROCEDURE

CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. **Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.**

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the

vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

NOTE: Prior to reading the curb height measurement, the front and rear of the vehicle must be jounced to settle the suspension. Induce jounce by pushing down on the center of the bumper (fascia), using care not to damage the vehicle, moving the vehicle up and down, gradually increasing the suspension travel with each stroke. Release the bumper at the bottom of each stroke, repeating this action several times. Perform this to both front and rear suspensions an equal amount of times.

Measure curb height as follows:

1. Jounce the vehicle. Refer to above note.

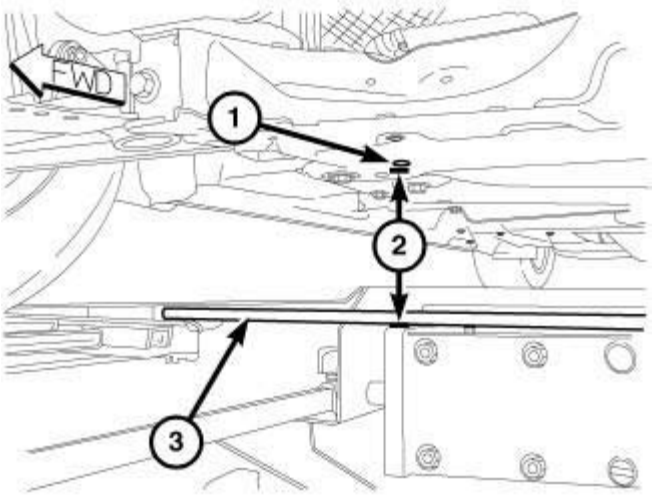

Fig. 109: Front Curb Height Measurement
Courtesy of CHRYSLER LLC

NOTE: On some vehicles it may be necessary to remove an engine belly pan in order to gain access to the lower control arm pivot bolt.

2. Front - On each side of the vehicle, measure the distance (2) from the flat surface behind the PLP hole (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge (3), placed from lift runway to runway, to get an accurate measurement.

3. Rear - On each side of the vehicle, measure the distance (2) from the flat surface below the rear toe adjustment cam bolt (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge (3), placed from lift runway to runway, to get an accurate measurement.
4. Compare the measurements to specifications listed in the following **CURB HEIGHT SPECIFICATIONS** chart. Maximum left-to-right differential is not to exceed 12.5 mm (0.5 in.).
5. If curb height is found to be out of specification and there is no sign of excessive body damage, curb height can be changed by replacing the applicable spring with a spring offering a different check load. See **Removal**

WHEEL ALIGNMENT

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to the vehicle to ensure proper alignment.

1. Verify the fuel tank is full of fuel. If the fuel tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment specifications.
2. The passenger and luggage compartments of the vehicle should be free of any load that is not factory equipment.
3. Check the tires on the vehicle. The tires are to be inflated to the recommended air pressure. All tires must be the same size and in good condition with approximately the same tread wear.
4. Check the front tire and wheel assemblies for excessive radial runout.
5. Inspect all suspension component fasteners for looseness and proper torque.
6. Inspect the lower front ball joints and all steering linkage for looseness and any sign of wear or damage.
7. Inspect the rubber bushings on all the suspension components for signs of wear or deterioration. If any bushings show signs of wear or deterioration, they should be replaced prior to aligning the vehicle.
8. Check vehicle curb height to verify it is within specifications. See **Standard Procedure**

WHEEL ALIGNMENT SETUP

1. Position the vehicle on an alignment rack.
2. Install all required alignment equipment on the vehicle, per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced. Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.

3. Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe-in. See **Specifications**

REAR CAMBER

Rear camber settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as Net Build. The result is no required adjustment of camber after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, rear camber is not considered an adjustable angle.

CAUTION: Do not attempt to adjust the vehicle's wheel alignment by heating or bending any of the suspension components.

FRONT CAMBER AND CASTER

Front camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as Net Build. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles but some adjustment can be made. Camber and caster should be checked to ensure they meet vehicle specifications. See **Specifications**

If individual front camber or caster is found not to meet alignment specifications, each can be adjusted by shifting the front crossmember or by using an available service adjustment bolt package. If an adjustment bolt package installation is necessary, inspect the suspension components for any signs of damage or bending first.

CAUTION: Do not attempt to adjust the vehicle's wheel alignment by heating or bending any of the suspension components.

ADJUSTMENT BY SHIFTING CROSSMEMBER

CAUTION: Always use care when shifting crossmember to avoid damaging other components on the vehicle.

1. Loosen the four bolts fastening the front crossmember to the frame just enough to allow movement of the crossmember. Refer to **Frame and Bumpers/Frame/CROSSMEMBER - Removal**
2. Loosen the bolts fastening the fore/aft crossmember to the frame just enough to allow movement of the crossmember. Refer to **Frame and Bumpers/Frame/CROSSMEMBER - Removal**

CAUTION: When shifting the front crossmember, keep in mind that the front and rear engine mounts are attached to the front crossmember and fore/aft crossmember and should be inspected following the crossmember shift to make sure they are properly aligned.

3. Shift front crossmember as necessary (See following tables) to bring camber or caster into specifications. When shifting crossmember, use care not to move other angles (camber or caster) that are within specifications, out of specifications.

FRONT CAMBER ADJUSTMENT BY SHIFTING CROSSMEMBER*	
Left Camber Below Specification	Move crossmember to the right
Left Camber Above Specification	Move crossmember to the left
Right Camber Below Specification	Move crossmember to the left
Right Camber Above Specification	Move crossmember to the right
Cross Camber Below Specification	Move crossmember to the right
Cross Camber Above Specification	Move crossmember to the left
* For every move to adjust one side of the vehicle, a countermove on the opposite side will occur.	

FRONT CASTER ADJUSTMENT BY SHIFTING CROSSMEMBER	
Left Caster Below Specification	Move left side of crossmember forward
Left Caster Above Specification	Move left side of crossmember rearward
Right Caster Below Specification	Move right side of crossmember forward
Right Caster Above Specification	Move right side of crossmember rearward
Cross Caster Below Specification	Move left side of crossmember forward and right side rearward
Cross Caster Above Specification	Move left side of crossmember rearward and right side forward

4. Tighten all previously loosened fasteners (bolts) securing the crossmember to the vehicle to specifications. Refer to **Frame and Bumpers/Frame/CROSSMEMBER - Installation**
5. Jounce the rear, then front of the vehicle an equal amount of times.
6. Measure camber and caster. If camber and caster are within specifications, proceed to **TOE**TOE. If camber cannot be brought into specifications, perform **CAMBER ADJUSTMENT BOLT PACKAGE INSTALLATION**.

CAMBER ADJUSTMENT BOLT PACKAGE INSTALLATION

1. Raise the vehicle until its tires are not supporting the weight of the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

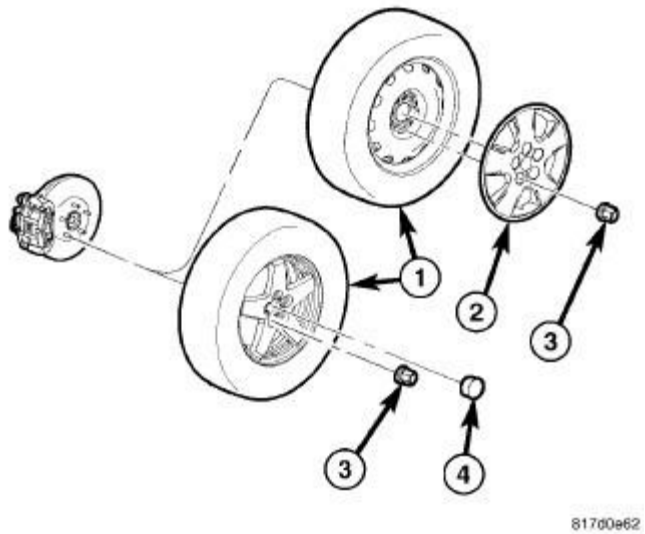

Fig. 111: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

2. Remove the wheel mounting nuts (3), then the front tire and wheel assembly (1).

CAUTION: The strut clevis-to-knuckle attaching bolt shanks are serrated and must not be turned during removal. Remove the nuts while holding the bolts stationary, then tap the bolts out using a punch.

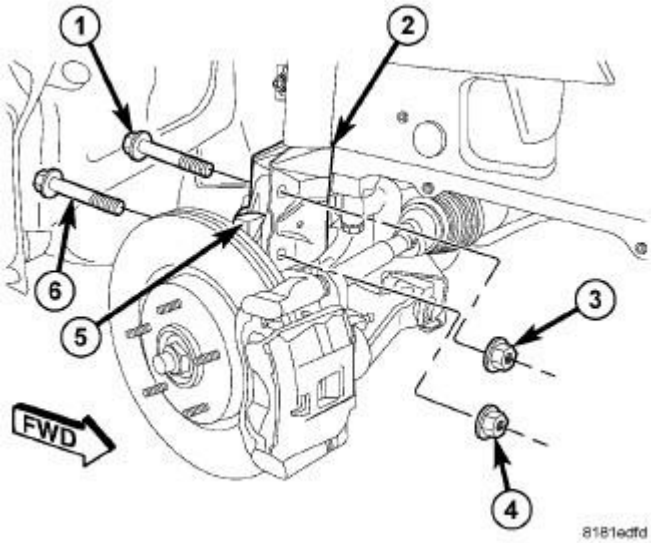

Fig. 112: Strut Clevis Bracket
Courtesy of CHRYSLER LLC

3. Remove the original nuts (3, 4) and upper (1) and lower (6) bolts attaching the strut clevis bracket (2) to the knuckle (5).
4. Separate the knuckle (5) from the strut clevis bracket (2) and position knuckle so it is out of the way of the strut. Use care not to overextend the brake flex hose or axle half shaft.

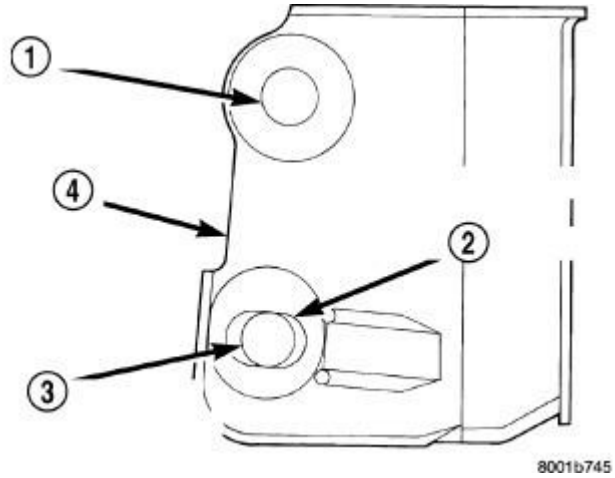

Fig. 113: Strut Clevis Bracket Bolt Hole Grinding Area
Courtesy of CHRYSLER LLC

CAUTION: When slotting the bottom mounting hole (3) on the strut clevis bracket (4), do not enlarge the hole beyond the indentations (2) on the sides of the strut clevis bracket.

5. Using an appropriate grinder and grinding wheel, slot the bottom hole (3) in both sides of the strut clevis

bracket (4).

CAUTION: After slotting the strut clevis bracket hole, do not install the original attaching bolts. Only the service package bolts and dog bone washers must be used to attach the knuckle to the strut once the mounting hole is slotted.

6. Position the strut clevis bracket in line with the upper end of the knuckle, aligning the mounting holes. Install the two service package bolts. **Be sure to place the bolt with the eccentric cam in the bottom (slotted) hole on strut clevis bracket.**
7. Install the dog bone washers provided in the service package and nuts on the replacement bolts. Tighten each nut just enough to hold the knuckle in position while adjusting camber, but still allows the knuckle to move in the clevis bracket.

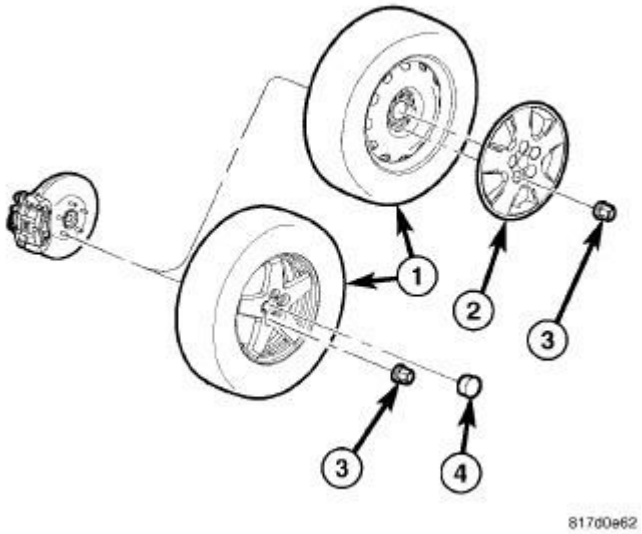

Fig. 114: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

8. Install the tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Install and tighten the wheel mounting nuts (3) to 135 N.m (100 ft. lbs.).
9. Perform the above procedure to opposite side strut as required.
10. Lower the vehicle and jounce the front and rear of the vehicle.
11. Adjust the front camber to the preferred setting using the cam bolt in the lower mounting hole. Once camber is set to specifications, tighten the upper and lower strut service package bolt nuts to 140 N.m (103 ft. lbs.). Again jounce the front and rear of the vehicle, then verify the camber settings.
12. Once camber is within specifications, adjust toe to meet the preferred specification setting. Refer to **TOE** within this wheel alignment service procedure.

TOE

1. Center the steering wheel and lock it in place using a steering wheel clamp.

NOTE: When setting toe, make sure to set rear toe to the preferred specifications before setting front toe to the preferred specifications

NOTE: Perform the following at each rear wheel as necessary.

NOTE: Perform the following at each front wheel as necessary.

CAUTION: Do not twist the inner tie rod-to-steering gear boot (bellows) while turning the inner tie rod during front toe adjustment. It may be necessary to remove the clamp where the boot meets the inner tie rod.

2. While holding the cam bolt head (4) stationary, loosen the toe link mounting cam bolt nut (3).
3. Rotate the cam bolt head (4) left or right until the rear wheel toe for that rear wheel is set to the preferred specification. See **Specifications**
4. While holding the cam bolt head (4) stationary, tighten the toe link mounting cam bolt nut (3) to 100 N.m (74 ft. lbs.).

FRONT TOE

NOTE: Perform the following at each front wheel as necessary.

CAUTION: Do not twist the inner tie rod-to-steering gear boot (bellows) while turning the inner tie rod during front toe adjustment. It may be necessary to remove the clamp where the boot meets the inner tie rod.

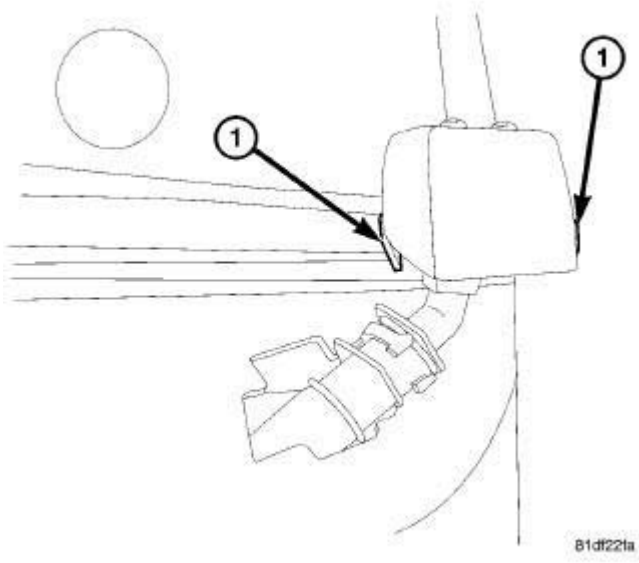

Fig. 119: Tie Rod Jam Nut

5. Loosen the tie rod adjusting jam nut (1). Grasp the inner tie rod (3) and rotate it one way or the other until the front wheel toe is set to the preferred specification. See **Specifications**
6. Tighten the tie rod adjusting jam nut to of 75 N.m (55 ft. lbs.).
7. Make sure the inner tie rod-to-steering gear boot is not twisted. If removed, reinstall the clamp where the boot meets the inner tie rod.

ALL

8. Remove the steering wheel clamp.
9. Remove the alignment equipment.
10. Road test the vehicle to verify the steering wheel is straight and the vehicle does not pull or wander.

2009 SUSPENSION

Rear Suspension - Grand Caravan, Town & Country

DESCRIPTION

DESCRIPTION

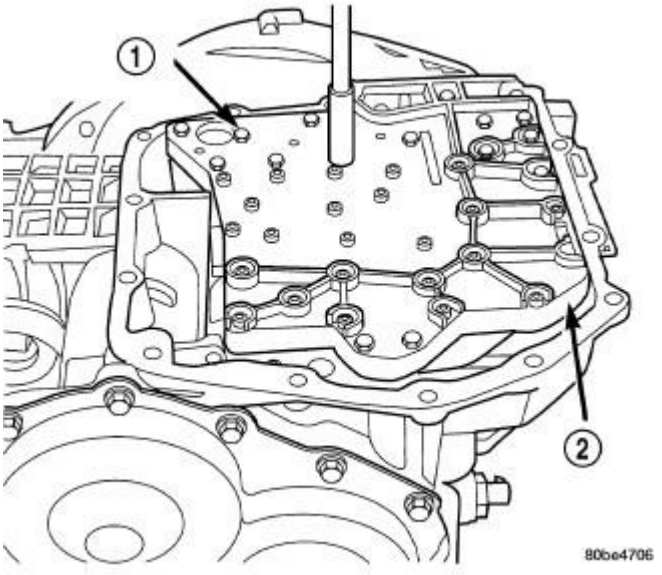

Fig. 1: Identifying Rear Suspension Components
Courtesy of CHRYSLER LLC

The rear suspension design used on this vehicle is a twist beam trailing axle type with vertically mounted coil springs.

The rear suspension consists of these major components:

- Axle (3)
- Coil spring (2 per vehicle) (1)
- Hub and bearing (2 per vehicle)
- Jounce bumper (2 per vehicle)
- Shock absorber (2 per vehicle) (4)
- Track bar (2)

The rear axle has a tubular torsion tube running through the center of its width. It also has two trailing arms, one extending from each end of the axle forward. Each trailing arm has a rubber pivot bushing pressed into it. The bushings can be serviced separately.

The springs used on the rear suspension are the coil type. They are mounted straight above the rear axle beam in

line with the rear wheels. Both ends of the coil spring are identical. Either end of the spring can be the top or the bottom. Coil springs come in various heights and weight loads; be sure the correct spring is in use.

WARNING

WARNINGS AND CAUTIONS

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION: Only frame contact or wheel lift hoisting equipment can be used on this vehicle. It cannot be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used, damage to rear suspension components will occur.

NOTE: If a rear suspension component becomes bent, damaged or fails, no attempt should be made to straighten or repair it. Always replace it with a new component.

19. Lower jack and remove axle from vehicle.

INSPECTION

INSPECTION

Verify proper torque of all axle fasteners.

Inspect the axle looking for damage or bending. If damage is evident, the axle must be replaced.

Inspect for broken or cracked welds at each end of the twist beam within the axle. Inspect for broken or cracked welds at each axle trailing arm bushing bore. If a problem is present, the axle must be replaced.

Inspect the bushings at the leading ends of the axle trailing arms. Look for damage or deterioration of the bushings. Make sure the bushings are centered side-to-side in their bore. If a problem exists, the bushings must be replaced. They can be replaced separately from the axle.

INSTALLATION

INSTALLATION

1. Center the axle beam on a transmission jack or equivalent standing at axle removal height.

3. Place special tool assembly over bushing (2) and trailing arm (5) as shown in **Fig. 35**. Use care not to rotate bushing when installing special tools. When properly installed, Press screw-drive will be toward outside of vehicle.
4. Using hand tools, slowly tighten Press (4) screw-drive, pressing bushing into trailing arm. Tighten Press screw-drive until integrated stop is met. Do not overtighten.
5. Remove tools from axle trailing arm and inspect bushing making sure it is positioned as requested in 1.
6. If the opposite side bushing needs to be installed, repeat 1 through 5 on that side of the vehicle.

HUB AND BEARING

DIAGNOSIS AND TESTING

HUB AND BEARING

NOTE: The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.

The following procedure may be used for diagnosing the condition of the wheel bearing and hub.

1. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Removal** .
2. Rotate the wheel hub checking for resistance or roughness.

Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub and bearing will require replacement. Do not attempt to disassemble the bearing for repair. If the wheel bearing is disassembled for any reason, it must be replaced.

Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease weepage from the bearing is considered normal and should not require replacement of the wheel bearing.

To diagnose a bent hub, measure hub runout. Refer to **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Diagnosis and Testing** .

REMOVAL

REMOVAL

NOTE: Before proceeding, see Rear Suspension - Warning.

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

14. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving the vehicle.

SHOCK ABSORBER, SUSPENSION

DIAGNOSIS AND TESTING

SHOCK ABSORBER

Inspect the shock absorber for damage and evidence of fluid running from the upper end of the fluid reservoir. (Actual leakage will be a stream of fluid running down the side of the reservoir tube and dripping off lower end of unit). A slight amount of seepage between the shaft and shaft seal is not unusual and does not affect performance of the shock absorber.

REMOVAL

REMOVAL

NOTE: Before proceeding, see Rear Suspension - Warning.

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

2. Raise or lower rear axle using jack as necessary until the shock absorber lower mounting bolt (4) can be inserted through the axle flange and shock absorber lower mounting eye.
3. Install nut (3) on the lower mounting bolt (4). Do not bolt at this time.
4. Remove jack.
5. Lower vehicle.
6. Position vehicle on alignment rack/drive-on lift. Raise lift as necessary to access the rear suspension while keeping vehicle at curb (riding) height.

Heated Glass - Service Information - Journey

DESCRIPTION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

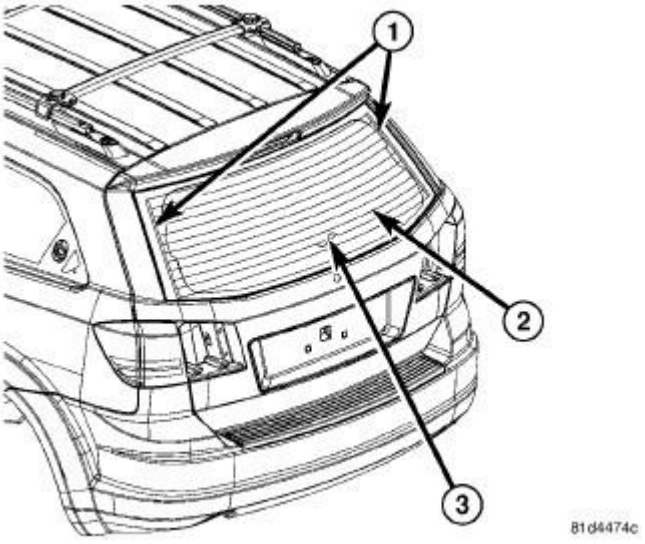

Fig. 1: EBL System
Courtesy of CHRYSLER LLC

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) and a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned on or off by a push-button switch located in the A/C-heater control. Refer to **Heating and Air Conditioning/Controls/CONTROL, A/C and Heater - Description** .

OPERATION

OPERATION

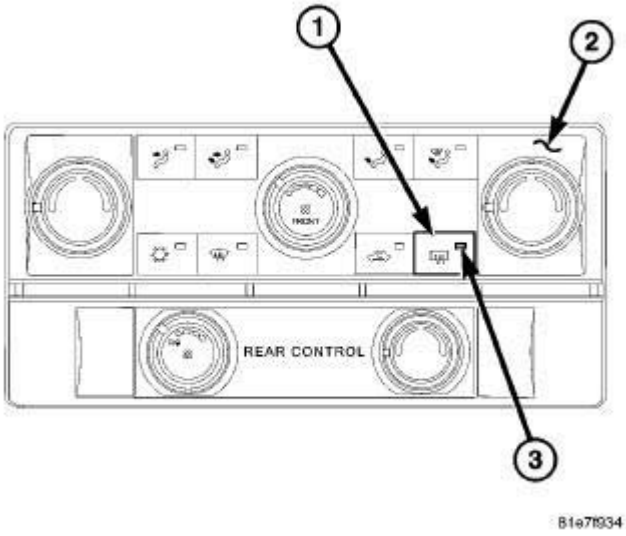

Fig. 2: EBL Switch (MTC)
Courtesy of CHRYSLER LLC

NOTE: Manual tri-zone temperature A/C-heater control shown in illustration. Other A/C-heater controls similar.

The electric backlight (EBL) system is controlled by a momentary push-button switch (1) located on the A/C-heater control (2) in center of the instrument panel. When the rear window defogger switch is pressed to ON with the ignition switch in RUN, the switch sends a request signal on the CAN-B Bus to the totally integrated power module (TIPM) to energize the internal EBL high side driver. When energized, the EBL high side driver provides battery current to the rear window defogger grid lines and the heated side view mirrors (when equipped). The grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

An amber indicator (3) will illuminate to indicate when the EBL system is turned on.

NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.

The EBL system will automatically turn off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent. See **Standard Procedure** .

The EBL control system is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing**

DIAGNOSIS AND TESTING

ELECTRIC BACKLIGHT (EBL) SYSTEM

NOTE: Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear window glass and/or the outside rear view mirror heating grids (when equipped).

NOTE: See appropriate wiring information for circuit descriptions and diagrams of the rear window defogger (EBL) and heated mirror systems.

Operation of the electrical backlight (EBL) system can be confirmed by the following:

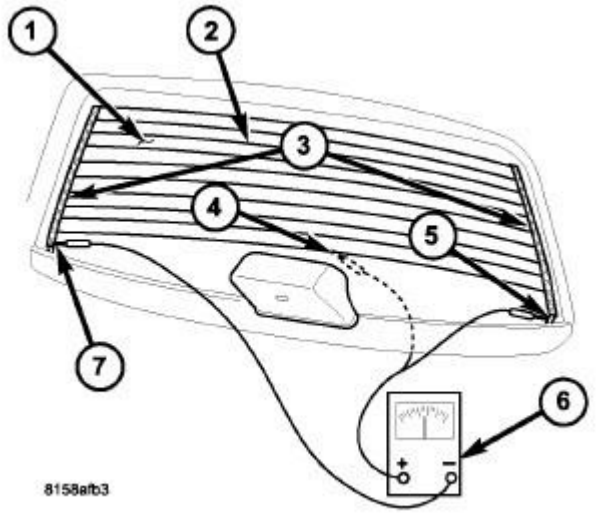

Fig. 3: Rear Window Glass Grid Test
Courtesy of CHRYSLER LLC

NOTE: Typical heated rear window glass shown in illustration.

1. Use a scan tool and check for diagnostic trouble codes (DTCs) related to the rear window defogger switch and the totally integrated power module (TIPM). If no DTCs are found, go to step 2. If any DTCs are found, repair as required, then proceed to step 2.
2. Turn the ignition switch to RUN. Set the rear window defogger switch to ON. Rear window defogger operation can be checked by feeling the rear window glass (1), or the heated outside rear view mirror glass when equipped with heated mirrors. A distinct difference in temperature between the grid lines (2) and the adjacent clear glass or the heated mirror glass should be detected within 3 to 4 minutes of operation.
3. If a temperature difference is not detected, use a 12-volt DC voltmeter (6) and contact the rear glass heating grid terminal A (5) with the positive lead, and terminal B (7) with the negative lead. The

voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:

- Confirm the ignition switch is in RUN.
- Confirm the rear window defogger switch is ON.
- Confirm the EBL feed wire is connected to the heating grid positive terminal and that there is continuity between the TIPM and the heating grid.
- Confirm the EBL ground wire is connected to the heating grid negative terminal and that there is continuity to ground.
- When diagnosing a heated mirror concern, check the heated mirror circuit fuse located in the TIPM. The fuse must be in the receptacle and all electrical connections must be secure.

4. If broken defogger grid lines or bus bars (3) are suspected, use a 12-volt DC voltmeter and contact terminal B with the negative lead and each rear glass heating grid line at its mid-point C (4) with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s). See **Standard Procedure** .
5. If EBL system operation has been verified but the rear window defogger indicator does not illuminate, replace the A/C-heater control. Refer to **Heating and Air Conditioning/Controls/CONTROL, A/C and Heater - Removal** .

GRID, DEFOGGER, REAR

STANDARD PROCEDURE

GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow these instructions may result in serious or fatal injury.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

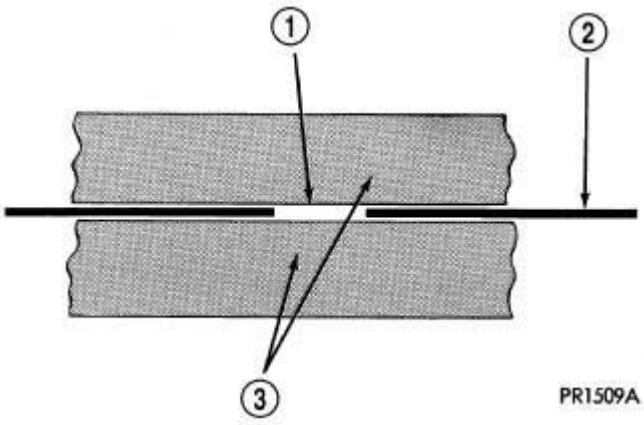

Fig. 4: Grid Line Repair - Typical
Courtesy of CHRYSLER LLC

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

The rear window defogger switch is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The rear window defogger switch and indicator cannot be adjusted or repaired. The A/C-heater control must be replaced if the rear window defogger switch or indicator is inoperative or damaged. Refer to **Heating and Air Conditioning/Controls/CONTROL, A/C and Heater - Removal** .

2009 ACCESSORIES AND EQUIPMENT

Heated Mirrors - Service Information - Journey

DESCRIPTION

DESCRIPTION

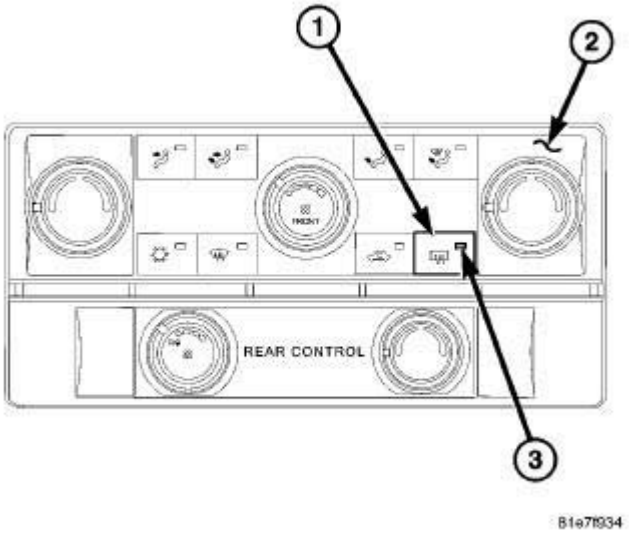

Fig. 1: Rear Window Defogger (EBL) System
Courtesy of CHRYSLER LLC

NOTE: Manual tri-zone temperature A/C-heater control shown. Other A/C-heater controls similar.

When equipped, the heated mirror system operates in concert with the rear window defogger (EBL) system and is controlled by the rear window defogger switch (1) located in the A/C-heater control (2) in the center of the instrument panel. An amber indicator lamp (3) in the rear window defogger switch will illuminate to indicate when the heated mirror system is turned on.

The heated mirror system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the heated mirror system will automatically turn off after about 5 minutes. The heated mirror system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Circuit protection for the heated mirror system is provided by a fuse located in the totally integrated power module (TIPM).

OPERATION

OPERATION

When equipped, the heated mirror system is activated when the rear window defogger (EBL) system is turned on. Refer to **Electrical - Heated/Cooled Systems/Heated Glass - Operation** . When the heated mirror system is activated, an electric heater grid located behind the glass of each outside rear view mirror becomes energized and produces heat to help clear the mirror of ice, snow, or fog.

If the outside mirror heating grids are both inoperative. Refer to **Electrical - Heated/Cooled Systems/Heated Glass - Diagnosis and Testing** .

The heating grid behind each outside mirror glass cannot be repaired and the mirror assembly must be replaced if the heating grid is found inoperative or damaged. Refer to **Body/Exterior/MIRROR, Outside Rearview - Removal** .

Heated Seats - Service Information - Journey

DESCRIPTION

DESCRIPTION

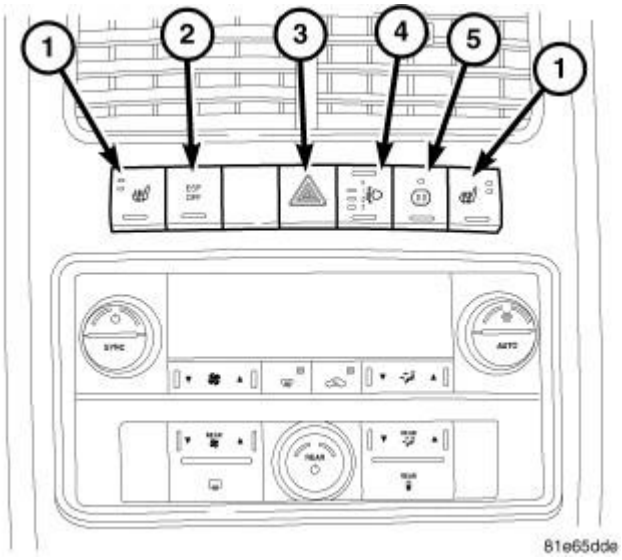

Fig. 1: Accessory Switch Bank Module
Courtesy of CHRYSLER LLC

Vehicles with the heated seat option can be visually identified by the two heated seat switches (1) located in the center stack of the instrument panel. The switches are located on the outer edges of the Accessory Switch Bank Module (ASBM). The ASBM is located just below the vents and just above the heater and air conditioner controls in the center stack area of the instrument panel.

The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI/LO). The heated seat system includes the following major components:

- **Heated Seat Elements** - Four heated seat elements are used per vehicle. Two heated seat elements are integral to each seat, one in the seat back and the other in the seat cushion.
- **Heated Seat Module** - One heated seat module is used per vehicle. The Heated Seat Module is mounted under the Driver front seat. This module contains the control logic and software for the front heated seat system. The module communicates on the Local Interface Network (LIN) data bus.
- **Heated Seat Switches** - Two heated seat switches are used per vehicle, one for each heated seat. Both switches are integral to the ASBM mounted in the instrument panel center stack.
- **Instrument Cluster (CCN)** - The instrument cluster, sometimes referred to as the Cab Compartment Node (CCN) utilizes integrated software and information carried on the LIN data bus. The CCN serves as the link between the heated seat switches and the heated seat module.

OPERATION

OPERATION

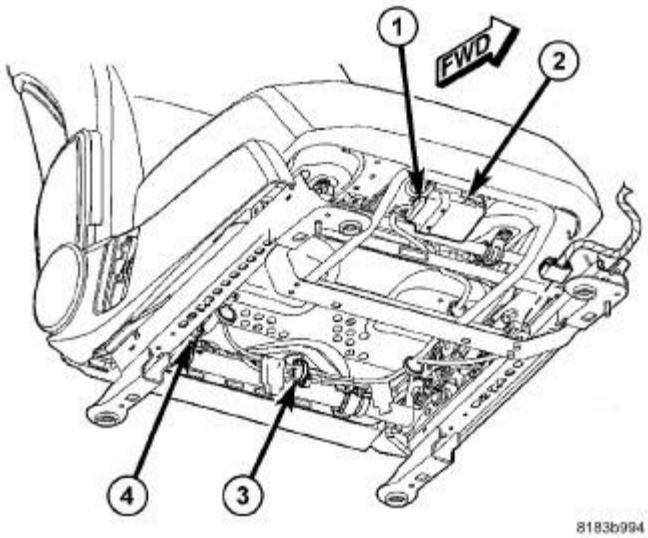

Fig. 2: Locating Heated Seat Module
Courtesy of CHRYSLER LLC

The heated seat system operates on battery current received through a fuse in the Totally Integrated Power Module (TIPM). Fused ignition switch output (Run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the ON position. The heated seat system will turn Off automatically whenever the ignition switch is turned to any position except ON.

A Heated Seat Module (2) is used to control the heated seat system. The module is located under the driver front seat mounted to the seat pan (4). The heated seat module responds to heated seat switch messages and ignition switch status inputs by controlling the 12v output to the front seat heating elements through integral solid-state relays.

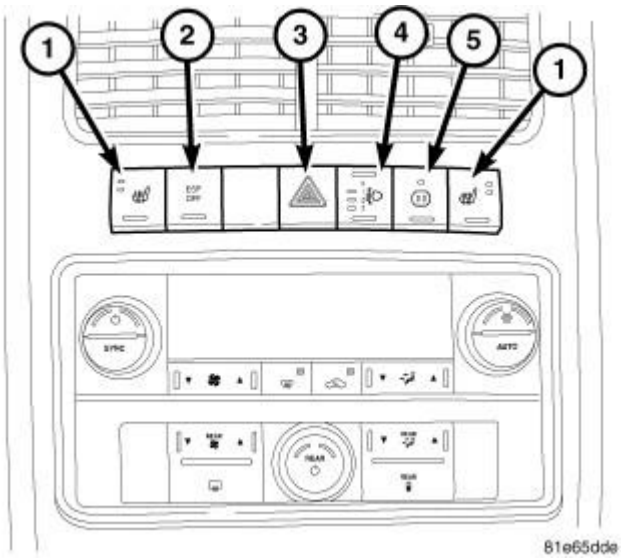

Fig. 3: Accessory Switch Bank Module
Courtesy of CHRYSLER LLC

When either of the heated seat switches (1) are depressed a switch status message is sent to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN), via the Local Interface Network (LIN) data bus. The CCN then sends a message via the LIN data bus to the heated seat module, signaling the module to energize the heating element for the selected seat. Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. The heated seat module sends the LED illumination message to the CNN via the LIN data bus. The CNN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The heated seat module energizes an integral solid-state relay, which supplies battery current to the heating elements. When high-temperature heating is selected, the heaters provide a boosted heat level during the first four minutes of operation after heating is activated. The heat output then drops to the normal high-temperature level. If high-level heating is selected, the control system will automatically switch to the low level after 26 minutes of continuous operation. At that time, the number of illuminated LEDs changes from two to one, indicating the change. Operation on the low setting also turns off automatically after 30 minutes.

The module will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit.

DIAGNOSIS AND TESTING

HEATED SEAT SYSTEM

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

MODULE, HEATED SEAT

DESCRIPTION

DESCRIPTION

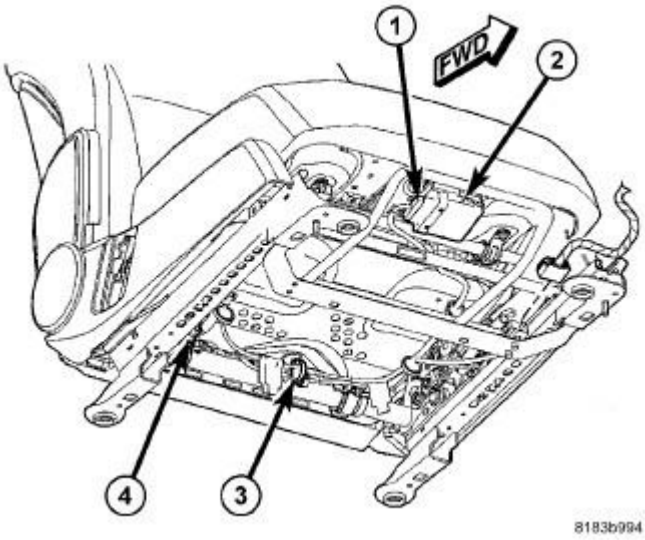

Fig. 4: Locating Heated Seat Module
Courtesy of CHRYSLER LLC

The heated seat module (2) is located under the driver front seat. It has a single electrical connector (1) and a push pin style retainer that secures it to the seat pan (4). The module can be accessed from under the Driver seat with the seat in the full back and up position.

The heated seat module is a microprocessor designed to use the Local Interface Network (LIN) data bus messages from the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

OPERATION

OPERATION

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Local Interface Network (LIN) data bus messages and standard hardwired 12 volt power and ground. In response to the LIN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch LIN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38° C (100.4° F), and the High heat set point is about 42° C (107.6° F).

In addition to operating the heated seat elements, the heated seat module sends LED illumination messages to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN) via the LIN data bus. The CCN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate Diagnostic Trouble Code (DTC).

DIAGNOSIS AND TESTING

HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

REMOVAL

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Position the driver front seat to the full rearward position.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the wire harness connector (4) from the heated seat module (3).
4. Unsnap the heated seat module retaining tab (2) from the seat pan (1).
5. Remove the heated seat module (3) from the vehicle.

INSTALLATION

INSTALLATION

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Install the heated seat module (3) into the vehicle.
2. Position the retaining tab (2) with the mounting hole in the seat pan (1). Firmly apply even pressure to the module (3) until the mounting tab is fully seated.
3. Connect the wire harness connector (4) to the heated seat module (3).
4. Connect the battery negative cable.
5. Check for proper heated seat system operation.

PAD, HEATER

DESCRIPTION

DESCRIPTION

Vehicles equipped with the optional heated seat system have two carbon fiber heated seat elements located in each front seat. One heating element is used for each seat cushion and another for each seat back.

Each of the heated seat elements consist of multiple heating circuits operating in parallel throughout the carbon fiber element. The heated seat elements are captured between the leather trim cover and the seat cushion assembly. If a malfunction occurs in one or more of the individual carbon fiber circuits, the others will continue to provide heat.

The heated seat elements cannot be repaired. If found to be damaged or inoperative, a new heating element

assembly must be installed.

OPERATION

OPERATION

One end of the heated seat element is connected to ground at all times through a splice under the seat. Battery current is directed to the other end of the heated seat element by the heated seat module. The heated seat module will energize the heated seat element when the heated seat switch is depressed in the LOW or HIGH position.

As electrical current passes through the heated seat element, the resistance of the wire used in the element disperses some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

DIAGNOSIS AND TESTING

HEATED SEAT ELEMENT

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

The wire harness connectors for the heating elements are located under the seat.

NOTE: When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.

1. Locate and disconnect the seat element electrical connector.
2. Check the resistance between the circuit leading in and out of the suspect heated seat element. The resistance should be between 3.0 - 5.5 ohms for a seat cushion element and 4.0 - 6.0 ohms for a seat back element. If OK, see **Diagnosis and Testing** . If not OK, replace the inoperative heated seat element.

REMOVAL

REMOVAL

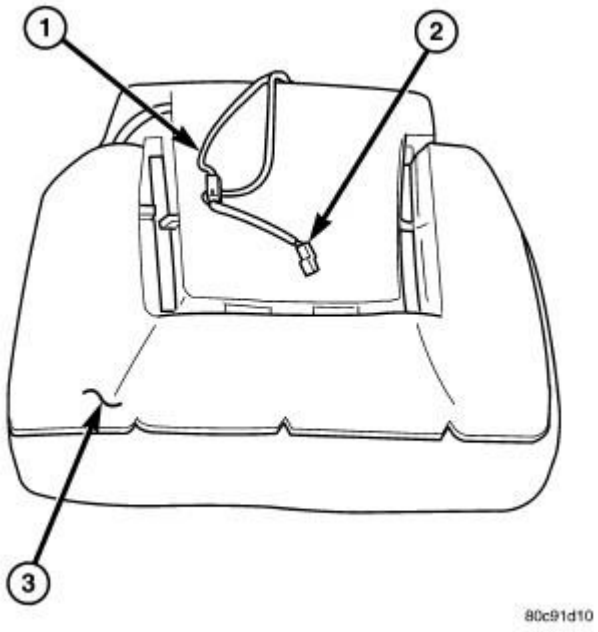

Fig. 7: Removing/Installing Heated Seat Element
Courtesy of CHRYSLER LLC

NOTE: The factory installed heating element can be removed from foam cushion by carefully peeling the element off along the adhesive lines.

NOTE: Heated seat cushion shown in illustration. Heated seat back similar.

1. Disconnect and isolate the battery negative cable.
2. Remove the appropriate seat cushion trim cover or seat back trim cover. Refer to **Body/Seats/COVER, Seat Cushion - Removal** . Refer to **Body/Seats/COVER, Seat Back - Removal** .
3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Peel the heater element off the foam pad, being careful not to remove excessive foam in the process.

INSTALLATION

INSTALLATION

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

NOTE: Heated seat cushion shown in illustration. Heated seat back similar.

1. Peel off the adhesive backing on the back of the replacement heating element (2) and stick on foam pad directly where the original element was placed (there will be adhesive marks on the foam outlining factory installed element) (1).

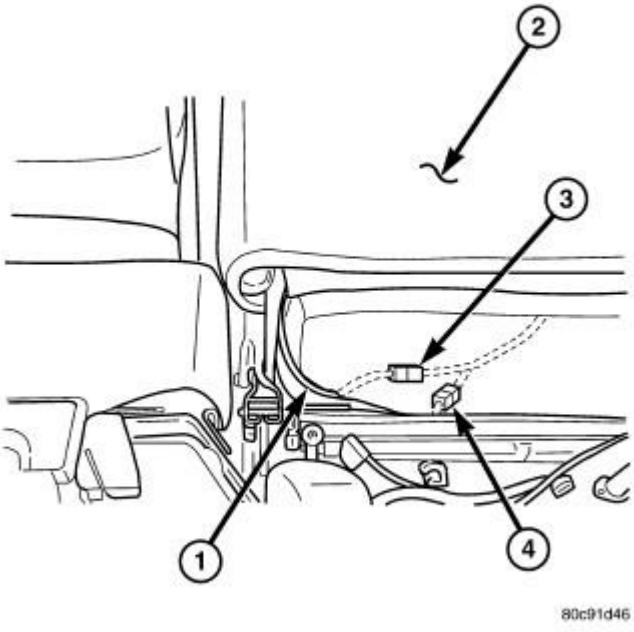

Fig. 9: Connecting New Heating Element Electrical Connectors
Courtesy of CHRYSLER LLC

2. Connect the new heating element electrical connectors (3 AND 4).
3. Connect the battery negative cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion trim cover or seat back trim cover. Refer to **Body/Seats/COVER, Seat Cushion - Installation** . Refer to **Body/Seats/COVER, Seat Back - Installation** .

NOTE: Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover. The factory installed heater element should be completely removed from the system and discarded.

SWITCH, HEATED SEAT

DESCRIPTION

DESCRIPTION

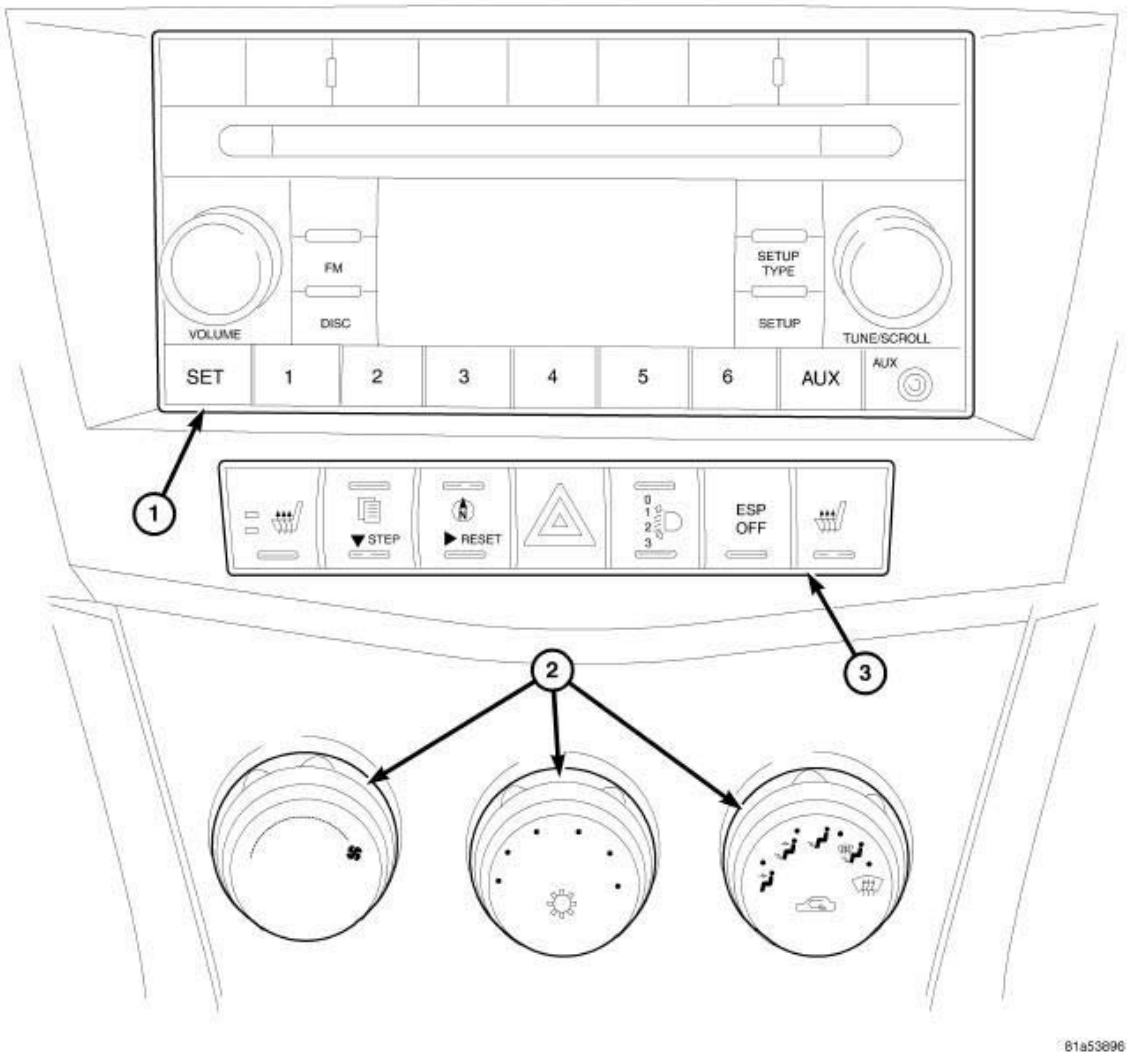

Fig. 10: Locating Accessory Switch Bank Module
Courtesy of CHRYSLER LLC

Two heated seat switches are located in the center stack of the instrument panel. The switches are located on the outer edges of the Accessory Switch Bank Module (ASBM). The ASBM (3) is located just below the radio (1) and just above the heater and air conditioner controls (2) in the center stack area of the instrument panel. If either of the switches is damaged or inoperative the complete ASBM assembly must be replaced.

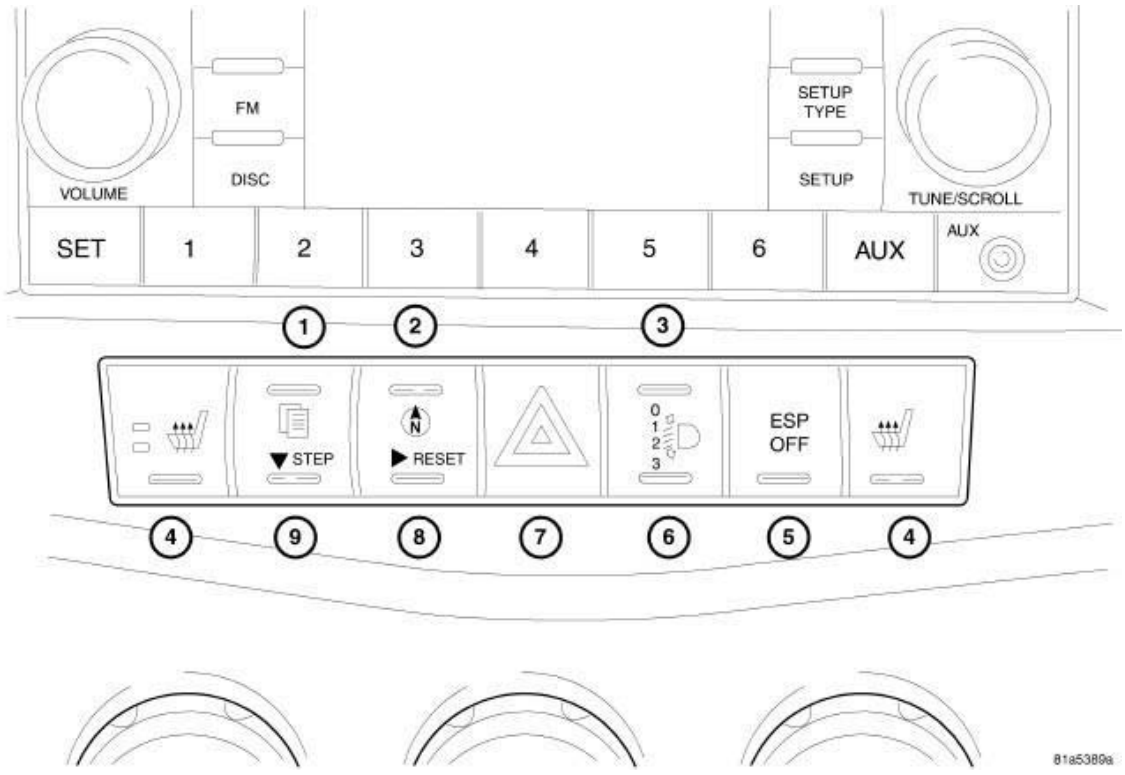

Fig. 11: Identifying Assembly Switch Bank Module Callouts
Courtesy of CHRYSLER LLC

Each heated seat switch (4) provides a resistor-multiplexed signal to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN). Amber Light Emitting Diodes (LEDs) on the outside edge of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The LED indicator lamps in each heated seat switch cannot be repaired. If the LED lamps are inoperative or damaged, or the switch is inoperative or damaged the complete ASBM assembly must be replaced. See **Removal** .

OPERATION

OPERATION

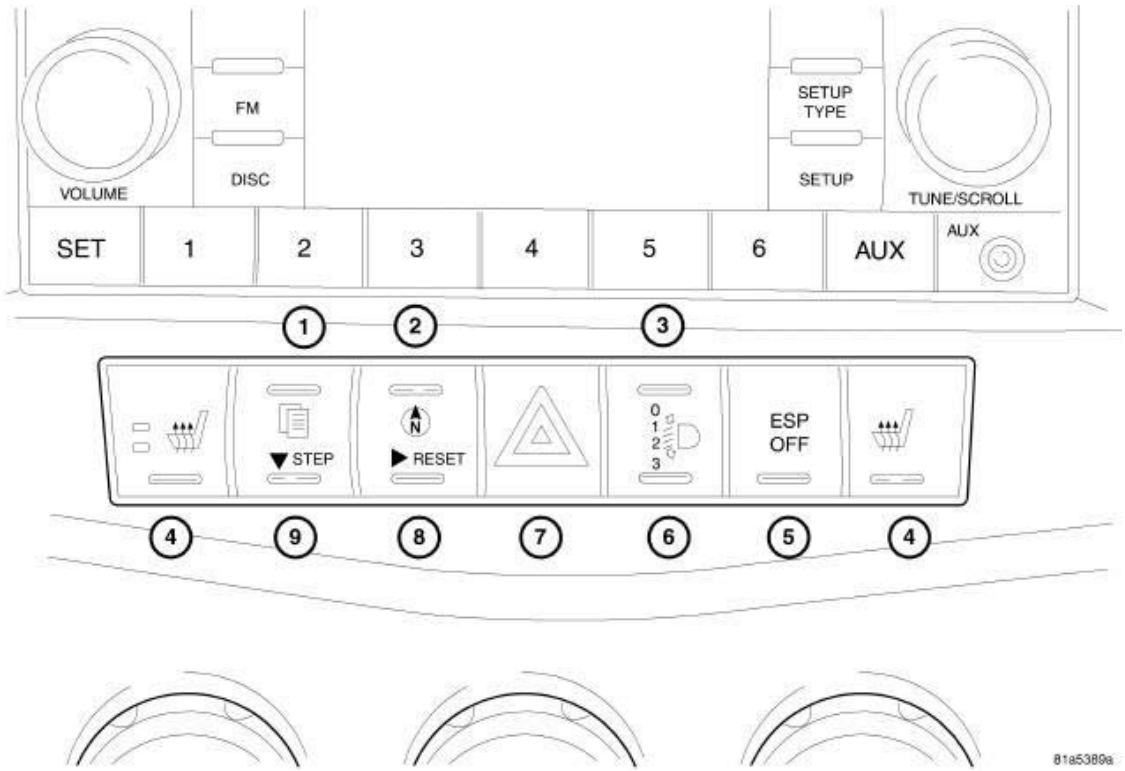

Fig. 12: Identifying Assembly Switch Bank Module Callouts
Courtesy of CHRYSLER LLC

The heated seat switches (4) are active any time the Local Interface Network (LIN) data bus is active. Depressing the heated seat switch provides a switch status message to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN), via the LIN data bus. The CCN is responsible for supplying the LIN data bus message to the heated seat module, signaling the module to power the heated seat element of the selected seat and maintain the temperature setting. If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the CCN will go through the process again to change the temperature setting.

DIAGNOSIS AND TESTING

HEATED SEAT SWITCH

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical

system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The heated seat switches are integral to the Accessory Switch Bank Module (ASBM) and cannot be serviced separately. The complete ASBM assembly must be replaced.

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel from the instrument panel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal** .
3. Remove the four screws (1) that secure the ASBM (2) to the back of the instrument panel center bezel (3) and remove the ASBM.

INSTALLATION

INSTALLATION

NOTE: There are different Accessory Switch Bank Module (ASBM) configurations available based on the option content of the vehicle. Ensure the ASBM being installed matches the vehicle options.

1. Position the ASBM (2) onto the back of the instrument panel center bezel (3).
2. Install the four screws (1) that secure the ASBM to the center bezel. Tighten the screws to 2 N.m (17 in. lbs.).
3. Install the center bezel onto the instrument panel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** .
4. Connect the battery negative cable.
5. Verify heated seat system operation.

Horn System - Service Information - Journey

DESCRIPTION

DESCRIPTION

The dual-note horn system features two electromagnetic horn units. The horn system includes the following major components:

- **Horn** - The two horns are located at the front center of the vehicle, behind the grille.
- **Horn Switch** - The horn switch is mounted under the driver airbag. It consists of four pads that make contact when the horn is pressed.

Vehicles with an optional Electronic Vehicle Information Center (EVIC) and steering wheel mounted switches (except LX) have a unique horn switch electrical architecture. For more information on the EVIC. Refer to **Electrical - Message Systems/Message Center/CENTER, Electronic Vehicle Information - Description** .

OPERATION

OPERATION

The horn system operates on battery current received through a fuse located in the Totally Integrated Power Module (TIPM). The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

On vehicles equipped with an optional Electronic Vehicle Information Center (EVIC), the right EVIC switch is also a Local Interface Network (LIN) bus slave, sharing a LIN input circuit with the Steering Control Module (SCM) within the left multifunction switch, to the CCN (LIN master). Both the right and left EVIC switches also share an IOD feed and a ground feed in common with the SCM.

On vehicles with an EVIC, the right EVIC switch microprocessor is connected to and monitors the outputs of the left EVIC switch. The right EVIC switch also is connected to the horn switch and the remote radio switches through a common sensor signal circuit. The right EVIC switch monitors the horn switch state through a dedicated return circuit and monitors the resistor multiplexed remote radio switches through a second dedicated return circuit. Finally, the right EVIC microprocessor communicates the status of each and every one of these switches to the CCN over the LIN data bus.

DIAGNOSIS AND TESTING

HORN SYSTEM

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the horn fuse from the Totally Integrated Power Module (TIPM).

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

DIAGNOSIS AND TESTING

B1000-A/C SWITCH REQUEST INPUT CIRCUIT/PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. Many of the switches are momentary switches which are normally open or in the Off position and the status changes when the switch button or knob is pushed or turned. An active Diagnostic trouble Code (DTC) indicates that the switch is stuck in an On position. A stored DTC indicates that the switch was stuck in a On position for more than two minutes but has since returned to its normal state of Off.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the A/C On/Off Control Switch is stuck in an On position for more than two minutes. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**
    1. Inspect the A/C Heater Control for an object or debris holding the A/C On/Off Control Switch in an On position.

        NOTE: Using the scan tool you can read the On/Off status of the control switch.

        Is the A/C On/Off control switch being held in or stuck On?

        Yes

        - Clean or repair the A/C Heater Control as necessary. If you are unable to clean the switch to where the switch can work properly, replace and program the A/C Heater Control in accordance with the Service Information.
        - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

        No

        - Go to step 2
2. **A/C HEATER CONTROL**
    1. Turn the ignition on.
    2. Using the scan tool, erase HVAC DTCs.
    3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of two minutes.
    4. Using the scan tool, read HVAC DTCs.

        Does the scan tool display this DTC as Active or is the status of the switch reading On?

        Yes

        - Replace and program the A/C Heater Control in accordance with the Service Information.
        - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

        No

        - Test complete.
        - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   1. Inspect the A/C Heater Control for an object or debris holding the Recirculation mode switch in an On position.

      NOTE: Using the scan tool you can read the On/Off status of the control switch.

      Is the Recirculation mode switch being held in or stuck On?

      Yes

      - Clean or repair the A/C Heater Control as necessary. If you are unable to clean the switch to where the switch can work properly, replace and program the A/C Heater Control in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 2

2. **A/C HEATER CONTROL**
    1. Turn the ignition on.
    2. Using the scan tool, erase HVAC DTCs.
    3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of two minutes.
    4. Using the scan tool, read HVAC DTCs.

    Does the scan tool display this DTC as Active or is the status of the switch reading On?

    Yes

    - Replace and program the A/C Heater Control in accordance with the Service Information.
    - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

    No

    - Test complete.
    - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

B1015-REAR DEFROST SWITCH REQUEST INPUT CIRCUIT/PERFORMANCE

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. Many of the switches are momentary switches which are normally open or in the Off position and the status changes when the switch button or knob is pushed or turned. An active DTC indicates that the switch is stuck in an On position. A stored Diagnostic Trouble Code (DTC) indicates that the switch was stuck in a On position for more than two minutes but has since returned to its normal state of Off.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  If the Electric Back light (EBL) Electronic Rear Defrost switch is stuck in an On position for more than two minutes. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**
    1. Inspect the A/C Heater Control for an object or debris holding the (EBL) Electronic Rear Defrost switch in an On position.

        NOTE: Using the scan tool you can read the On/Off status of the control switch.

        Is the (EBL) Electronic Rear Defrost switch being held in or stuck in an On?

        Yes

        - Clean or repair the A/C Heater Control as necessary. If you are unable to clean the switch to where the switch can work properly, replace and program the A/C Heater Control in accordance with the Service Information.
        - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

        No

        - Go to step 2
2. **A/C HEATER CONTROL**
    1. Turn the ignition on.
    2. Using the scan tool, erase HVAC DTCs.
    3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of two minutes.
    4. Using the scan tool, read HVAC DTCs.

        Does the scan tool display this DTC as Active or is the status of the switch reading On?

        Yes

        - Replace and program the A/C Heater Control in accordance with the Service Information.
        - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

B1031-EVAPORATOR TEMPERATURE SENSOR CIRCUIT LOW

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  The Evaporator Temperature Sensor voltage input to the A/C Heater Control is equal to or below 0.01 volts for a continuous period of five seconds. If the A/C Heater Control detects a valid voltage, the Diagnostic Trouble Code (DTC) will change from active to stored and will stay stored for 100 ignition cycles.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (C121) SENSOR GROUND CIRCUIT
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. See DTC-Based Diagnostics/HVAC - Standard Procedure.

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs after 60 seconds.

      Is this DTC active?

      Yes

      - Go to step 2

      No

- Go to step 5

2. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

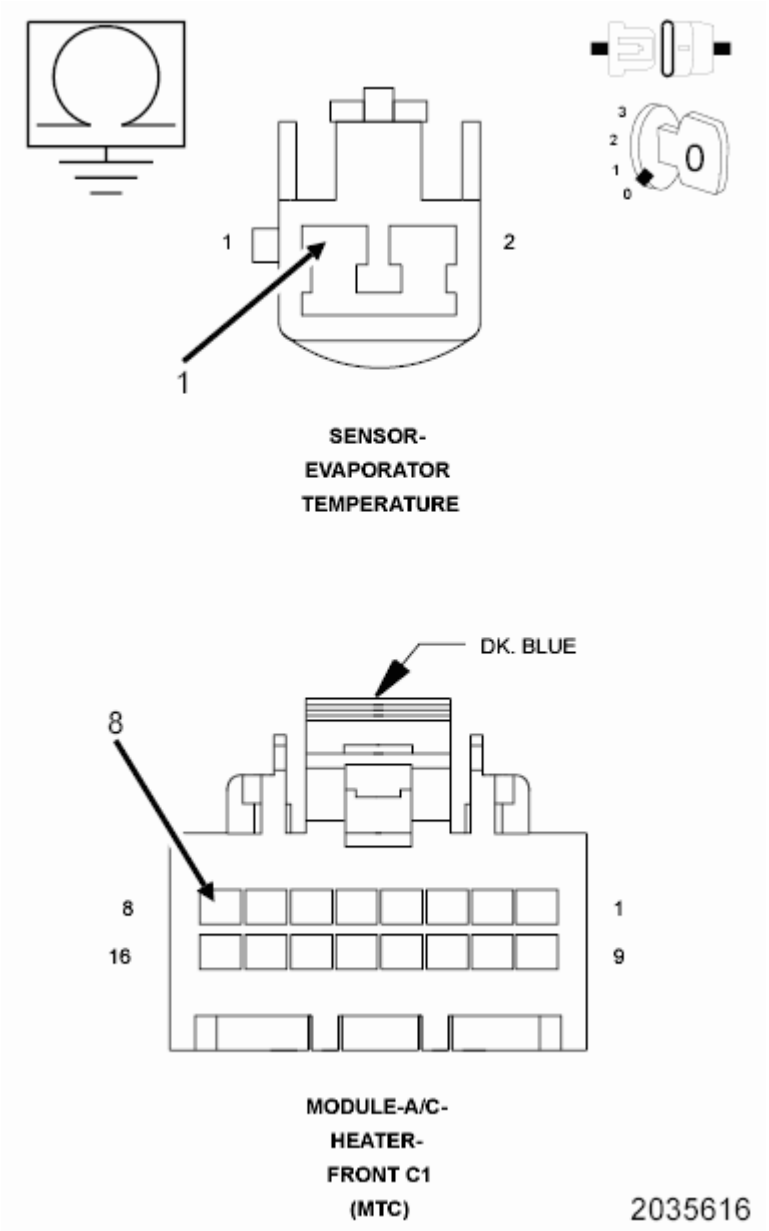

Fig. 1: Checking Evaporator Temperature Sensor Signal Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

1. Turn the ignition off to the lock position.
2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Evaporator Temperature Sensor harness connector.
4. Measure the resistance between ground and the (C21) Evaporator Temperature Sensor Signal

circuit.

Is the resistance below 100k Ohms?

Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 3

3. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (C121) SENSOR GROUND CIRCUIT**

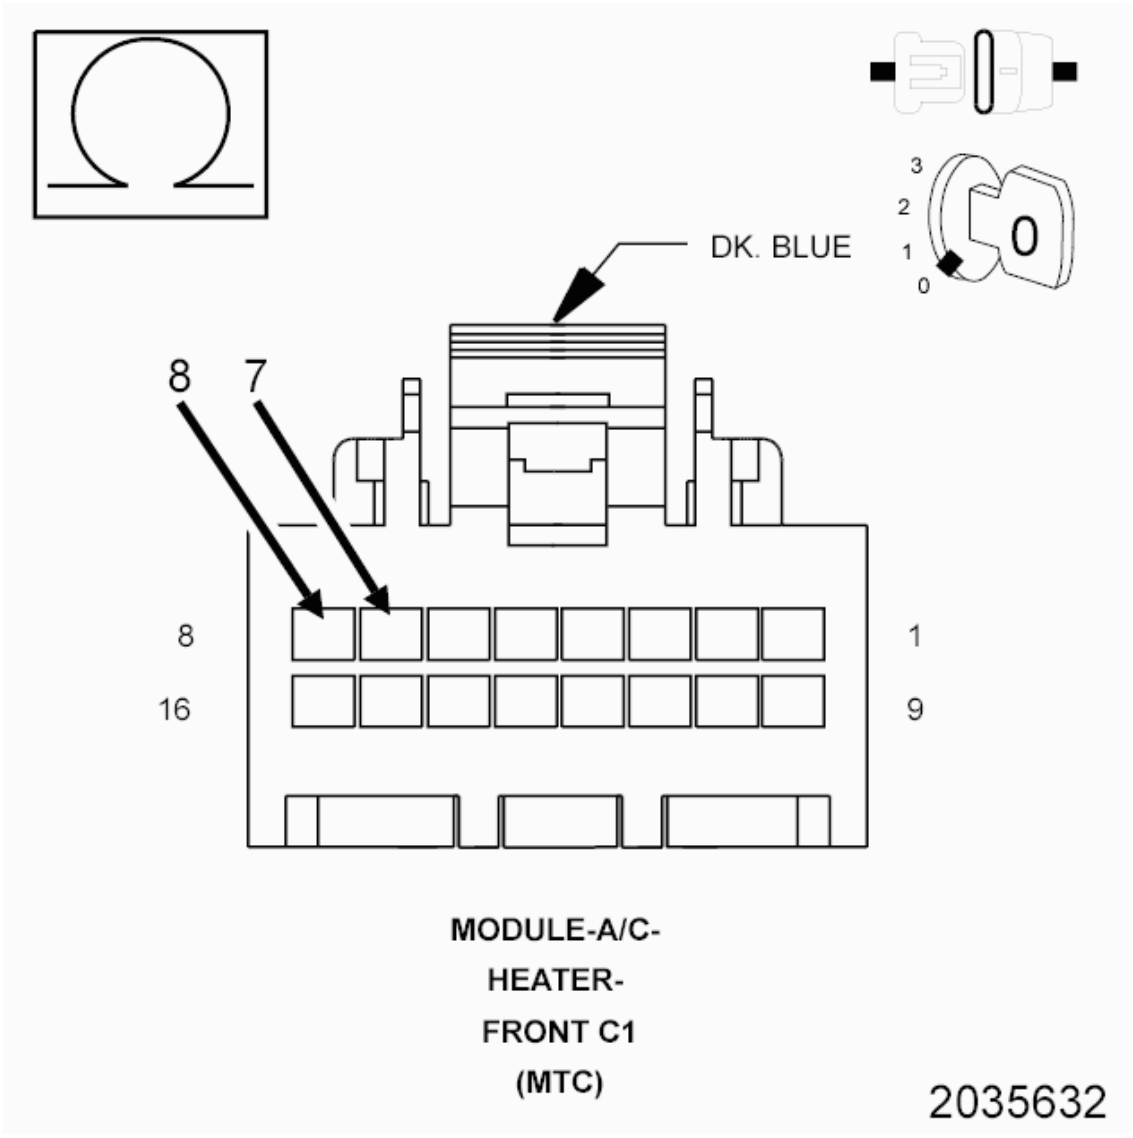

Fig. 2: Checking Evaporator Temperature Sensor Signal Circuit For A Short To Sensor Ground Circuit
Courtesy of CHRYSLER LLC

1. Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to (C121) Sensor Ground circuit.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

No

- Go to step 4

4. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
   1. Replace the Evaporator Temperature Sensor in Accordance with the Service Information.
   2. Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.
   3. Cycle the ignition off for 30 seconds then back on and wait a minimum of 5 seconds.
   4. With the scan tool read HVAC DTCs.

   Does this DTC reset?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, partially broken wires.
   4. Check the connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   5. Wiggle the wiring and connectors while checking for shorted and open circuits.
   6. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. See **DTC-Based Diagnostics/HVAC - Standard Procedure**.

   No

   - Test complete.

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

Theory of Operation

The Evaporator Temperature Sensor resistance changes in conjunction to temperature. The sensor thermistor forms the lower half of a voltage divider and the upper half of the voltage divider is provided by a 9.09K pull up resistor to 5.0 volts.

- **When Monitored:**

  With the ignition on.

- **Set Condition:**

  The Evaporator Temperature Sensor voltage input to the A/C Heater Control is equal to or above 4.9 volts for a continuous period of five seconds. If the A/C Heater Control detects a valid voltage, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
